was to Queen Anne, is her subject, and may be guilty of high treason against her; but in the instance of conjugal fidelity he is not subjected to the same penal restrictions. Hence, if a queen consort is unfaithful to the royal bed, this may debase or bastardize the heirs to the crown; but no such danger can be consequent on the infidelity of the husband to a queen regnant. A queen dowager is the widow of the king, and as such enjoys most of the privileges belonging to her as queen consort. But it is not high treason to conspire her death, or to violate her chastity; because the succession to the crown is not thereby endangered. Yet still, *pro dignitate regali*, no man can marry a queen dowager without special license from the king, on pain of forfeiting his lands and goods.

2. The Prince of Wales, or heir apparent to the crown, and also his royal consort, and the princess royal or eldest daughter of the king, are likewise peculiarly regarded by the laws. For, by statute 25 Edw. III. to compass or conspire the death of the former, or to violate the chastity of either of the latter, is as much high treason as to conspire the death of the king or violate the chastity of the queen; and this upon the same reason as was before given, because the prince of Wales is next in succession to the crown, and to violate his wife might taint the blood-royal with bastardy. And the eldest daughter of the king is also alone inheritable to the crown on failure of issue male, and therefore more respected by the laws than any of her younger sisters; insomuch that upon this, united with other principles, whilst our military tenures were in force, the king might levy an aid for marrying his eldest daughter, and her only. The heir apparent to the crown is usually made Prince of Wales and Earl of Chester, by special creation and investiture; but being the king's eldest son, he is by inheritance Duke of Cornwall, without any new creation.

3. The rest of the royal family may be considered in two different lights, according to the different senses in which the term *royal family* is used. The larger sense includes all those who are by any possibility inheritable to the crown. Such, before the Revolution, were all the descendants of William the Conqueror, who had branched into an amazing extent by intermarriages with the ancient nobility. Since the Revolution and Act of Settlement, it means the Protestant issue of the Princess Sophia, now comparatively few in number, but which in process of time may possibly be as largely diffused. The more confined sense includes only those who are in a certain degree of propinquity to the reigning prince, and to whom therefore the law pays an extraordinary regard and respect; but after that degree is past, they fall into the rank of ordinary subjects, and are seldom considered any further unless called to the succession upon failure of the nearer lines. For though collateral consanguinity is regarded indefinitely with respect to inheritance or succession, yet it is and can only be regarded within some certain limits in any other respect, by the natural constitution of things and the dictates of positive law.

By statute 12 Geo. III. c. 11, no descendant of the body of Geo. II. other than the issue of princesses married into foreign families, is capable of contracting matrimony, without the previous consent of the king signified under the great seal; and any marriage contracted without such a consent is void. It is provided, however, that such of the said descendants as are not above twenty-five, may, after a twelvemonth's notice given to the king's privy council, contract and solemnize marriage without the consent of the crown, unless both houses of parliament shall, before the expiration of the said year, expressly declare their disapprobation of such intended marriage; and all persons solemnizing, assisting, or being present at any such prohibited marriage, shall incur the penalties of the statute of *præmunire*.

Royal Oak, a fair spreading tree at Boscobel, in the parish of Donnington, in Staffordshire, the boughs of which were once covered with ivy, in the thick of which King Charles II. sat in the day-time with Colonel Careless, and in the night lodged in Boscobel House. They are mistaken who speak of it as an old hollow oak, it being then a gay flourishing tree, surrounded with many more. Its poor remains were fenced in with a handsome wall, with this inscription in gold letters: *Felicissimam arborem quam in asylum potentissimi regis Caroli II. Deus op. max. per quem reges regnant, hic crescere voluit.*

Roymungul || Rubens.

ROYMUNGUL, a river of Bengal, which falls into the Sunderbunds, and is strongly affected by the tides. The East India Company have an extensive salt manufactory on its banks.

ROYSTON, a market-town on the northern border of the county of Hertford, and partly within the county of Cambridge, thirty-eight miles from London. There was here an ancient priory, said to have been founded in the reign of Henry II. by a lady of the name of Roysia, from whom the town takes its name. The chapel of the priory now serves as the parish church. There is a large market held on Thursday, at which much corn is sold. There are some considerable brewers. The population amounted in 1811 to 1331, in 1821 to 1474, and in 1831 to 1757.

RSHOW Waldimirow, a city of Russia, in the province of Twer, and the capital of a circle of the same name. It is situated on the river Volga, where it receives the waters of the Ryolenka. It contains twelve churches, 1252 houses, and 7500 inhabitants. It has considerable trade by the river in the productions of the land, and some manufactures. Long. 34. 29. E. Lat. 56. 10. N.

RUABON, a large village or town of the county of Denbigh, in North Wales, 192 miles from London, and four from Wrexham. It is pleasantly situated on an elevation, and has a neat church, with some elegant monuments to the family of Sir Watkins William Wynn, whose magnificent seat of Wynnstay is near to it. The agricultural society established at this place has much contributed to the improvement of the soil and of cultivation. The population amounted in 1801 to 5598, in 1811 to 6122, in 1821 to 8556, and in 1831 to 8353; but it includes the whole parish, which comprehended five townships.

RUANELLI, a valley in the island of Ceylon, famed for its precious stones. The river on which Columbo, the capital, is situated, is navigable to this place by boats. The precious stones and other metallic substances are found in the environs of Ruanelli, amongst the sand and gravel of the river. They consist chiefly of sapphires, topazes, garnets, amethysts, moonstone, tourmalines, and cats-eyes. The land is let on short leases to the highest bidder; and although they are exempted from duties, it produces, after all, but a trifling revenue.

RUBBER, India. See Caoutchouc.

RUBENS, Sir Peter Paul, the most eminent of the Flemish painters, was born in the year 1577, but whether at Antwerp or Cologne is uncertain. His father, who was a counsellor in the senate of Antwerp, had been forced by the civil wars to seek refuge in Cologne; and during his residence there Rubens is commonly said to have been born.

The genius of Rubens, which began to unfold itself in his earliest years, was cultivated with peculiar care, and embellished with every branch of classical and polite literature. He soon discovered a strong inclination for designing, and used to amuse himself with that employment in his leisure hours, whilst the rest of his time was devoted to other studies. His mother, perceiving the bias of her son, permitted him to attend the instructions of Tobias Verhaecht, a painter of architecture and of landscape. He next became the pupil of Adam Van Oort; but he soon found that the abilities of this master were insufficient to answer his elevated ideas. His surly temper, too, was disgustful to Rubens, whose natural disposition was modest and amiable.

Anxious to find an artist whose genius and dispositions were congenial with his own, he became the disciple of Octavio Van Veen, generally known by the name of Otho Venius, a painter of singular merit, and who was not only skilled in the principles of his art, but also distinguished for learning and other accomplishments. Between the master and the scholar a remarkable similarity appeared in temper and inclination; indeed the whole turn of their minds was the same. It was this congeniality of sentiments which animated Rubens with that ardent passion for the art of painting which at length determined him to pursue it as a profession. From this time he gave up his whole mind to it; and so successful were his exertions, that he soon equalled his master.

In order to arrive at that perfection which he already beheld in idea, it became requisite to study the productions of the most eminent artists; and for this purpose he travelled throughout Italy, visiting the most valuable collections of paintings and antique statues with which that country abounds.

Sandrat, who was intimately acquainted with Rubens, informs us that he was recommended to the Duke of Mantua by the Archduke Albert, who had witnessed his talents in the finishing of some fine paintings designed for his own palace. At Mantua he was received by the duke with the most flattering marks of distinction, and had opportunities of improving himself, which he did not neglect. He there carefully studied the works of Julio Romano; and he next visited Rome, where he had an opportunity of examining the productions of Raffaelle. The paintings of Titian and Paul Veronese called him to Venice, where he improved himself in the art of colouring.

He continued in Italy seven years. At length receiving intelligence that his mother was taken ill, he hastened to Antwerp. But his filial affection was not gratified with a sight of her. She died before his arrival. He married soon afterwards; but his wife dying at the end of four years, he retired for some time from Antwerp, and endeavoured to soothe his melancholy by a journey to Holland. At Utrecht he visited Hurtort, whom he greatly esteemed.

The fame of Rubens was now spread all over Europe. He was invited by Mary de' Medici, queen of Henry IV. of France, to Paris, where he painted the galleries in the palace of Luxembourg. These form a series of paintings which delineate the history of Mary; and afford a convincing proof how well qualified he was to excel in allegorical and emblematical compositions. Whilst at Paris he became acquainted with the Duke of Buckingham, who was so taken with his great talents and accomplishments, that he judged him well qualified to explain to Isabella, the wife of Albert the archduke, the cause of the misunderstanding which had taken place between the courts of England and Spain. In this employment Rubens acquitted himself with such propriety, that Isabella appointed him envoy to the king of Spain, with a commission to propose terms of peace, and to bring back the instructions of that monarch. Philip was not less captivated with Rubens, conferring on him the honour of knighthood, and making him secretary to his privy council. Rubens returned to Brussels, and thence passed over into England in 1630 with a commission from the Catholic king to negotiate a peace between the two crowns. He was successful in his negotiation, and a treaty was concluded. Charles I. who then filled the British throne, could not receive Rubens in a public character on account of his profession; nevertheless, he treated him with every mark of respect. Having engaged him to paint some of the apartments of Whitehall, he not only gave him a handsome sum of money, but, as an acknowledgment of his merit, created him a knight; and the Duke of Buckingham, his friend and patron, purchased of him a collection of pictures, statues, medals, and antiques, for the sum of ten thousand pounds.

He returned to Spain, where he was magnificently honoured and rewarded for his services, being created a gentleman of the king's bed-chamber, and named secretary to the council of state in the Netherlands. Rubens, however, did not lay aside his profession. He returned to Antwerp, where he married a second wife, called Helena Forment, who, being an eminent beauty, helped him much in the figures of his women. But he died on the 30th of May 1640, in the sixty-third year of his age, leaving vast riches to his children. Albert his eldest son succeeded him in the office of secretary of state in Flanders.

As Rubens was possessed of all the ornaments and advantages that render a man worthy to be esteemed or courted, he was always treated as a person of consequence. His figure was noble, his manners engaging, and his conversation lively. His learning was universal. Though his favourite study must have occupied him much, yet he found time to read the works of the most celebrated authors, especially the poets. He spoke several languages perfectly, and was an able statesman, as well as an excellent painter. His house at Antwerp was enriched with every thing that was rare and valuable in the arts. It contained one spacious apartment, in imitation of the rotunda at Rome, adorned with a choice collection of pictures which he had purchased in Italy, part of which he sold to the Duke of Buckingham.

His genius qualified him to excel equally in every thing that can enter into the composition of a picture. His invention was so fertile, that, if he had occasion to paint the same subject several times, his imagination always supplied him with something striking and new. The attitudes of his figures are natural and varied, the carriage of the head is peculiarly graceful, and his expression is noble and animated.

He is by all allowed to have carried the art of colouring to its highest pitch. He understood so thoroughly the true principles of the chiaro-scuro, that he gave to his figures the utmost harmony, and a prominence resembling real life. His pencil is mellowed, his strokes are bold and easy, his carnation glows with life, and his drapery is simple but grand, broad, and hung with much skill. The great excellence of Rubens appears in his grand compositions. For as they are to be viewed at a distance, he laid on a proper body of colours with uncommon boldness, and fixed all his tints in their proper places; so that he never impaired their lustre by breaking or torturing them, but touched them in such a manner as to give them a lasting force, beauty, and harmony.

It is generally allowed that Rubens wanted correctness in drawing and designing; some of his figures being heavy and too short, and the limbs in certain parts not being justly sketched in the outline. Though he had spent seven years in Italy in studying those antiques by which other celebrated artists had modelled their taste, and though he had examined them with such minute attention as not only to perceive their beauties, but to be qualified to describe them in a dissertation which he wrote on that subject; yet he seems never to have divested himself of that heavy style of painting which, being peculiar to his native country, he had insensibly acquired. The astonishing rapidity too with which he painted, made him fall into inaccuracies, from which those works that he finished with care are entirely exempted. Amongst his finished pieces may be mentioned the Crucifixion of Jesus Christ between the Two Thieves; but of all his works the paintings in the palace of Luxembourg best display his genius and his style.

It is the observation of Algarotti, that he was more moderate in his movements than Tintoretto, and softer in his chiaro-scuro than Carravaggio; but not so rich in his compositions, nor so light in his touches, as Paul Veronese, in his carnations less true than Titian, and less delicate than Vandyck. Yet he contrived to give his colours the utmost transparency and harmony, notwithstanding their extraordinary deepness; and he possessed a strength and grandeur of style which were entirely his own. See the article Painting.

RUBIN, or ROBOAN, a small island in the Red Sea, at the Straits of Babelmandel, separated from the continent by a channel not above a stone-cast in breadth, which may be forded at low water. Here pilots are taken in for the voyage up the Red Sea, and to its different ports.

RUBRIC, in the canon law, signifies a title or article in certain ancient law-books, and which was so called because written, as the titles of the chapters in our ancient bibles are, in red letters.

RUBY, a species of precious stone, belonging to the siliceous genus. The ruby is of various colours, as, of a deep red colour inclining a little to purple, or the carbuncle of Pliny; the spinell, of the colour of a bright corn poppy flower; and the balass or pale red inclining to violet. Tavernier and Dutens inform us that in the East Indies all coloured gems are named rubies, without regard to what their colours may be; and that the particular colour is added to the name of each in order to distinguish them from one another. The spinell rubies are above half the value of diamonds of the same weight; and the balass is valued at thirty shillings per carat. Tavernier mentions one hundred and eight rubies in the throne of the Great Mogul, from one to two hundred carats, and a round one almost two and a half ounces. There is also mention made by other travellers, of rubies exceeding two hundred carats in weight. According to Dutens, a perfect ruby, if it weigh more than three and a half carats, is of greater value than a diamond of the same weight. If it weigh one carat, it is worth ten guineas; if two carats, forty guineas; three carats, a hundred and fifty guineas; if six carats, upwards of a thousand guineas.

RUCTATION, a ventosity arising from indigestion, and discharging itself at the mouth with a very disagreeable noise.

RUDBECK, Olaus, a learned Swedish physician, was born of an ancient and noble family in 1630. He became professor of medicine at Upsal, where he acquired great applause by his extensive knowledge, and died in 1702. His principal works are twofold, 1. *Exercitatio Anatomica, exhibens ductus novos hepaticos aquosos, et vasa glandularum serosa*, in 4to; 2. *Atlantica, sive Manheim, vera Japheti posterorum sedes ac patria*, four vols. folio. He there endeavours to prove that Sweden was the country whence all the ancient Pagan divinities and our first parents were derived; and that the Germans, English, French, Danes, Greeks, and Romans, with all other nations, originally came from thence. This work, in a complete state, is of the greatest rarity.

RUDDER, in *Navigation*, a piece of timber turning on hinges in the stern of the ship, and which, opposing sometimes one side in the water and sometimes another, turns or directs the vessel this way or that. See the article Ship-Building.

RUDGELEY, a market-town in the county of Stafford, of the hundred of Cuttlestone, 131 miles from London, and seven from Lichfield. It is a well-built place, and contains many manufacturers of hats and of other articles; and being, by means of canals, favoured with water communication with the whole of the interior of the kingdom, has considerable trade. There is a good market, which is held on Tuesday. The population amounted in 1801 to 2030, in 1811 to 2213, in 1821 to 2677, and in 1831 to 3165.

RUDOLSTADT, a city, the capital of the principality of Schwarzburg-Rudolstadt, in Germany. It is situated on the river Saale, over which there is a stone bridge. It is surrounded with walls, is well built and paved, and contains the palace of the prince, two churches, a theological seminary, and two hospitals, with 550 houses, and 4160 inhabitants, who subsist by the expenditure of the government and the college, by making woollen goods, and by breweries and distilleries. Long. 11. 15. 15. E. Lat. 50. 43. 51. N.

RUDDIMAN, Thomas, one of the most eminent grammarians which Scotland has produced, was born in October 1674, at Raggel, in the parish of Boyndie and county of Banff. His father, James Ruddiman, was a farmer, and strongly attached to the house of Stuart.

Mr Ruddiman was instructed in the principles of Latin grammar at the parish school of Boyndie, where his application was so vigorous, and his progress so rapid, that he quickly surpassed all his class-fellows. His master, George Morrison, who was a skilful and attentive teacher, being unwilling to check his ardour for learning, permitted him to follow the impulse of his genius, and to advance without waiting the slow progress of the other boys.

The pleasure which the youthful mind receives from vivid description, though wild and romantic, approaches to ecstasy, and often makes an impression which remains indelible. Whilst at school, the first book which charmed the opening mind of Ruddiman was Ovid's Metamorphoses; nor did he cease to relish the beauties of this author when his judgment was mature, for during the rest of his life Ovid was his favourite poet.

At the age of sixteen he became anxious to pursue his studies at the university; but his father thinking him too young, opposed his inclination. Hearing of the competition trial which was annually held at King's College, Aberdeen, for a certain number of bursaries on the foundation of that university, Ruddiman's ambition was kindled. Without the knowledge of his father, and with only a single guinea in his pocket, which his sister had privately given him, he set out for that place. On the road he was met by a company of gipsies, who robbed him of his coat, his shoes, his stockings, and his guinea. But this misfortune did not damp his enterprising spirit. He continued his journey to Aberdeen, presented himself before the professors as a candidate; and, though he had neither clothes to give him a decent appearance, nor friends to recommend him, he gained the first prize.

After attending the university for four years, he obtained the degree of master of arts, an honour of which he was always proud. The thesis says, the disputation on this occasion lasted *ab aurora usque ad vesperum*, that is, "from morning till night." Though Ruddiman was only twenty years of age when he left the university, it appears from a book entitled *Rhetoricorum Libri tres*, composed before this period, but never published, that he had then read the Roman classics with uncommon attention and advantage.

He was soon after engaged as a tutor to the son of Mr Robert Young of Auldbar, the great grandson of Sir Peter Young, who under the direction of Buchanan had been preceptor of James VI. His income here must have been very small, or his situation unpleasant; for within a year he accepted the office of schoolmaster in the parish of Laurencekirk. The profession of schoolmaster in a country parish at that period could not open any field for ambition, nor any prospect of great emolument; for by an act of parliament passed in 1633, the salary appropriated to this office could not be increased above 200 merks Scotch, or L.11. 2s. 2⅔d. sterling. In discharging the duties of this humble but important station, it is probable that he used Simson's *Rudimenta Grammatica*, which was then generally taught in the northern schools, and by which he himself had been instructed in the principles of Latin grammar.

When Ruddiman had spent three years and a half in this employment, the celebrated Dr Pitcairne happening to pass through Laurencekirk, was detained in that village by a violent storm. Pitcairne wanting amusement, inquired at the hostess if she could procure any agreeable companion to bear him company at dinner. She replied, that the schoolmaster, though young, was said to be learned, and, though modest, she was sure he could talk. Pitcairne was delighted with the conversation and learning of his new companion, invited him to Edinburgh, and promised him his patronage.

When Ruddiman arrived in Edinburgh, the Advocates Library, which had been founded eighteen years before by Sir George Mackenzie, attracted his curiosity and attention, and he was soon afterwards appointed assistant-keeper under Mr Spottiswoode the principal librarian. His salary for executing this laborious office was L.8. 6s. 8d. He had, besides, a small honorary present from those who were admitted advocates, for correcting their theses; and he was also paid for copying manuscripts for the use of the library. The faculty, however, before he had held the office two years, were so highly pleased with his conduct, that they made him a present of fifty pounds Scotch, or L.4. 3s. 4d. sterling.

During the sitting of the Court of Session he attended the library from ten till three. But this confinement did not prevent him from engaging in other laborious duties. A part of his time was occupied in teaching young gentlemen the Latin language. Some he attended at their lodgings, some waited upon him, and some resided in his own house. An exact list of the names of those who attended him, expressing the date of their entry, and the sums which he was to receive from each, has been found in his pocket-book, a curious relic, which is still preserved.

When Ruddiman's merit as a scholar became better known, his assistance was anxiously solicited by those who were engaged in literary publications. Freebairne, a respectable bookseller of that period, prevailed upon him to correct and prepare for the press Sir Robert Sibbald's *Introductio ad historiam rerum a Romanis gestarum in ea Borealis Britanniæ parte quæ ultra murum Picticum est.* For his labour he received L.3 sterling. At the request of Mr Spottiswoode, librarian, he contributed for L.5 sterling his aid to the publication of Sir Robert Spottiswoode's Practiques of the Laws of Scotland.

In 1707 he commenced auctioneer, an employment not very suitable to the dignified character of a man of letters. But to this occupation he was probably impelled by necessity; for upon balancing his accounts at the end of the preceding year, the whole surplus was L.28. 2s. with prospects of L.236. 7s. 6d. Scotch. Ruddiman had a family, and seems to have been a stranger to that foolish pride which has seduced some literary men into the opinion, that it is more honourable to starve than have recourse to an occupation which men of rank and opulence are accustomed to despise. The same year he published an edition of *Voluseni de Animi Tranquillitate Dialogus*, to which he prefixed the life of Volusenus. Volusenus or Wilson was a learned Scotchman, and had the honour to be patronized by Cardinal Wolsey. In 1709 he published *Johnstoni Cantici Solomonis Paraphrasis Poetica*, and *Johnstoni Cantica* with notes, which he dedicated in verse to his friend and patron Dr Pitcairne. The edition consisted of two hundred copies. The expense of printing amounted to L.5. 10s. sterling, and he sold them at a shilling each copy.

The philological talents of Ruddiman were next directed to a more important object, in which they became more conspicuous and useful. Freebairne the bookseller proposed to publish a new edition of the Scottish translation of Virgil's Æneid by Gawin Douglas, bishop of Dunkeld. Of the contributions which some eminent characters of the age presented, the most valuable were supplied by Ruddiman. Freebairne acknowledged in general terms this obligation, but has not done him the justice to inform the reader what these valuable contributions were, and Ruddiman's modesty restrained him from publicly asserting his claim. From the pocket-book which has been already mentioned, it appears that Ruddiman corrected the work and wrote the glossary; and there is strong reason to believe that he was the author of the forty-two general rules for assisting the reader to understand the language of Douglas. To those who wish to be acquainted with the ancient language of this island, the glossary will be a treasure, as it forms a compendious dictionary of the Anglo-Saxon. For this elaborate work Ruddiman was allowed L.8. 6s. 8d. sterling.

The reputation of Ruddiman had now extended to a distance. He was invited by the magistrates of Dundee to be rector of the grammar-school of that town; but the faculty of advocates, anxious to retain him, augmented his salary to L.30. 6s. 8d. sterling, and he declined the offer.

In 1711 he assisted Bishop Sage in publishing Drummond of Hawthornden's works; and performed the same favour to Dr Abercrombie, who was then preparing for the press his Martial Achievements. In 1713 he was deprived of his friend Dr Pitcairne. On this occasion he testified all the respect which friendship could inspire to the memory of his deceased patron and surviving family. He composed Pitcairne's epitaph, and conducted the sale of his library, which was disposed of to Peter the Great of Russia.

In 1714 the Rudiments of the Latin Tongue were published. Eighteen or nineteen Latin grammars, composed by Scotchmen, had appeared before this period; yet such is the intrinsic value of this little treatise, that it soon superseded all other books on the subject, and is now taught in all the grammar-schools in Scotland. It has also been translated into other languages.

He was next called upon to publish the works of Buchanan. The value of these he enhanced by an elaborate preface, his *Tabula Regum Scotiæ Chronologica* and *Propriorum Nominum Interpretatio*. The interpretation of proper names was highly requisite; for Buchanan has so disguised them in the Roman dress, that the original name is scarcely discernible; and the preface puts the reader on his guard against the chronological errors and factious spirit of the history. Ruddiman also added a learned dissertation, entitled *De Metris Buchananæis Libellus*, and subjoined annotations critical and political on the History of Scotland. As he espoused the cause of Queen Mary, he raised against himself a host of enemies, and gave occasion to that celebrated controversy which has been carried on with much keenness and animosity, and with little intermission, even to the present times. For this work Ruddiman was promised L.40 sterling.

He had now been so long accustomed to superintend the press, that he was led to form the plan of erecting a printing-office himself. Accordingly, in the year 1715, he commenced printer in partnership with his brother Walter, who had been regularly bred to the business; and some years afterwards he was appointed printer to the university, along with James Davidson, bookseller.

The first literary society formed in Scotland was instituted in the year 1718. It probably derived its origin from the factious and turbulent spirit of the times. The learned, anxious perhaps to find some respite from the political dissensions of the day, endeavoured to procure it in elegant amusement; for one of the fundamental articles of the new association was, that the "affairs of church and state should not be introduced." Ruddiman and the masters of the high school had the honour to found this society. They were afterwards joined by Lord Kames.

In 1725 was published the first part of his *Grammaticæ Latinæ Institutiones*, which treated of etymology. The second part, which explained the nature and principles of syntax, appeared in 1731. He also wrote a third part on prosody, which is said to be more copious and correct than any other publication on the subject. When urged to give it to the public, he said dryly, "The age has so little taste, that the sale would not pay the expense." Of this work he published an abridgment, to which he subjoined an extract of his prosody.

Ruddiman next engaged in the management of a newspaper, an employment for which his genius and industry seemed to render him well qualified. But those who should expect either much information or amusement from this publication, would perhaps be greatly disappointed. The newspaper which he conducted was the Caledonian Mercury, and was established in 1720, by William Rolland, a lawyer. Ruddiman acted only for five years in the capacity of printer; but upon the death of Mr Rolland in 1729, the property was transferred to him, or to his brother Walter and him conjunctly. This paper continued in the family of Ruddiman till the year 1772, when it was sold by the trustees of his grandchildren. The Caledonian Mercury was at first printed three times a week, on Monday, Tuesday, and Thursday, in a small quarto of four pages, with two columns in each page, and fifty lines in each column; so that the whole paper contained only four hundred lines.

Mr Ruddiman, after the death of Mr Spottiswoode, librarian, remained for some time in his former station; but he was at length appointed keeper of the library, though without any increase of salary; and some years afterwards Mr Goodal, the defender of Queen Mary, succeeded him in the office of sub-librarian.

The assiduous application of Ruddiman, supported by such learning, was entitled to wealth, which now indeed flowed upon him in what was at that period deemed great abundance. On the 1st of October 1735, it appeared, from an exact statement of his affairs, that he was worth L.1882. 5s. 2d. sterling; and on the 20th of May the ensuing year his wealth had increased to L.1985. 6s. 3d. sterling. In 1710 he had valued his effects at L.24. 14s. 9d. sterling.

In 1737 the schoolmasters and teachers in Edinburgh formed themselves into a society, in order to establish a fund for the support of their widows and children. Of this scheme Ruddiman was an active promoter, and was chosen treasurer. Perhaps it was this association which in 1742 gave to the Scotch clergy the idea of forming their widows' fund.

In 1739 he published *Selectus Diplomatum et Numismatum Scotiæ Thesaurus*. This work was projected and begun by Anderson, and hence called Anderson's *Diplomata*, but was finished by Ruddiman. The preface, which is an excellent commentary on Anderson's performance, was written by Ruddiman, and displays a greater extent of knowledge than any of his other productions.

As Ruddiman had imbibed from his father those political principles which attached him to the family of Stuart, he probably did not remain an unconcerned spectator of the civil commotions which, in 1745, agitated Scotland. He did not, however, take any active part in the rebellion. His principles, he has been heard to say, induced him to be a quiet subject and a good citizen. He retired to the country during the summer of 1745; and whilst his fellow-citizens were spilling each other's blood, he was more happily engaged in writing Critical Observations on Burmann's Commentaries on Lucan's *Pharsalia*. The Caledonian Mercury was in the mean time marked with a jealous eye. His son, who had for some time been the principal manager of that newspaper, having copied from an English paper a paragraph which was reckoned seditious, was imprisoned. The solicitation of his father procured his release; but it was too late, for the unhappy young man had contracted a distemper in the tolbooth of Edinburgh which brought him to a premature grave.

During the last seventeen years of his life, Ruddiman was almost incessantly engaged in controversy. To this he was in some measure compelled by the violent attacks which some critics of the times had successively made upon his works. He was first called upon by Benson, auditor in the exchequer, to determine the comparative merit of Buchanan and Johnson as poets. He gave a decided preference to Buchanan in perspicuity, purity, and variety of style; but, like a candid critic, allowed Johnson to be superior in the harmony of his numbers. His next antagonist was Logan, one of the ministers of Edinburgh, a weak and illiterate man, but an obstinate polemic. The subject of contest was, whether the crown of Scotland was strictly hereditary, and whether the birth of Robert III. was legitimate. Ruddiman maintained the affirmative in both points, and certainly far surpassed his antagonist in the powers of reasoning. He proved the legitimacy of Robert by the public records of the kingdom, with a force of argument which admits of no reply; but in discussing the first question, by which he was led to consider the contest between Bruce and Baliol, he was not so successful; for there are many instances in the history of Scotland in which the brother succeeded to the crown in preference to the son. He showed, however, that the Scottish crown was at no period properly elective; and that, according to the old licentious constitution of the kingdom, the right of Bruce, who was the nearest in blood to the royal stock, was preferable to the claim of Baliol, though descended from the eldest daughter.

But the labours of Ruddiman did not end when the pen dropt from the feeble hand of Logan. He was soon called upon to repel the attacks of Love, schoolmaster of Dalkeith, who maintained, in opposition to him, that Buchanan had neither repented of his treatment of Queen Mary, nor had been guilty of ingratitude to that princess. That Buchanan ever repented there is reason to doubt. Whether he was guilty of ingratitude, let the unbiassed determine, when they are assured by authentic records that Mary conferred on him a pension for life of five hundred pounds Scotch.

When Ruddiman had arrived at his eightieth year, and was almost blind, he was assailed by James Man, master of an hospital at Aberdeen, with a degree of rancour and virulence, united with some learning and ability, which must have touched him in a sensible manner, and alarmed his fears for his reputation after his decease. He was called a finished pedant, a furious calumniator, and a corrupter of Buchanan's works. The venerable old man again put on his armour, entered the lists, and gained a complete victory. Man, with all his acuteness, could only point out twenty errors in two folio volumes. Some of these were typographical, some trifling, and some doubtful. Ruddiman, with much pleasantry, drew up against Man an account of four hundred and sixty-nine errors, consisting of fourteen articles, of which two or three may be produced as a specimen: 1. Falsehoods and prevarications, twenty; 2. absurdities, sixty-nine; and, 3. passages from classical authors which were misunderstood by Man, ten. The triumph which he gained over this virulent adversary he did not long enjoy, for he died at Edinburgh on the 19th of January 1757, in the eighty-third year of his age, and was buried in the Greyfriars churchyard, without any monument to distinguish his grave. He was three times married, but left behind him only one daughter, Alison, who was married in 1747 to Mr James Stewart. He is supposed to have died worth L.3000 sterling.

He was of the middle size, of a thin and straight make, and had eyes remarkably piercing. Of his talents and learning his works afford the most satisfactory proofs. His memory was tenacious and exact; and he was so great a master in the Latin language that he has perhaps been equalled by none since the days of Buchanan.

Ruddiman has left a character unstained by vice and distinguished by many virtues. His piety was exemplary.

He spent Sunday in religious employment, and, we are informed, had prayers read to him every morning by his amanuensis when the infirmities of age rendered such an assistance necessary. He was frugal of his time, neither indolent nor fond of amusement, and so remarkably temperate, that it is said he was never intoxicated. Though often forced into controversy, and treated with insolence, he never descended to scurrility, nor cherished resentment against his enemies. His candour was much admired in one instance, in the favourable character, which he published in the Caledonian Mercury, of his antagonist Love after his decease. Upon the whole, it must be allowed that Ruddiman has been of great service to classical literature, and an honour to his native country.

RUDIMENTS, the first principles or grounds of any art or science.

RUDRAPRAYAGA, a celebrated place of Hindu pilgrimage, in the province of Serinagur. It is situated at the confluence of the rivers Alcananda and Calyganga, a large stream which rises in the mountains of Kedar. The confluence of these rivers is esteemed one of the sacred places of ablution, and is annually visited by an immense concourse of pilgrims of both sexes. Long. 79. 2. E. Lat. 30. 19. N.

RUE, Charles de la, a French orator and poet, was born at Paris in the year 1643. He was educated at the college of the Jesuits, where he afterwards became professor of humanity and rhetoric. At an early age his talent for poetry disclosed itself. In 1667, when he was only twenty-four years old, he composed a Latin poem on the conquests of Louis XIV.; which was so much esteemed by Corneille that he translated it into French, presented it to the king, and at the same time passed so high encomiums on the superior merit of the original, that the author was received into the favour of that monarch, and ever after treated by him with singular respect.

De la Rue, anxious to preach the gospel to the Canadians, requested leave of absence from his superiors; but having destined him for the pulpit, they refused to comply with his request. Accordingly, he commenced preacher, and became one of the most eminent orators of his age. In his discourses he would probably have been too lavish of his wit, if he had not been cautioned against it by a judicious courtier. “Continue,” said he, “to preach as you do. We will hear you with pleasure as long as you reason with us; but avoid wit. We value the wit contained in two verses of a song more than all that is contained in most of the sermons in Lent.”

De la Rue died at Paris on the 27th of May 1725, at the advanced age of eighty-two. He was one of those who published editions of the classics for the use of the Dauphin. Virgil, which fell to his share, was published with notes and a life of the poet in 1675, 4to, and is a valuable and useful edition.

RUFFHEAD, Dr Owen, was the son of his majesty’s baker in Piccadilly. His father having bought a lottery ticket for him in his infancy, which happened to be drawn a prize of L.500, this sum was applied to educate him for the law. He accordingly entered in the Middle Temple, and seconded so well the views of his father, that he became a good scholar and an acute barrister. Whilst he was waiting for opportunities to distinguish himself in his profession, he wrote a variety of pamphlets on the politics of the day, and was afterwards distinguished by his accurate edition of the Statutes at Large, in 4to. He now obtained good business, though more as a chamber counsellor in framing bills for parliament than as a pleader; but his close application to study, with the variety of works he engaged in as an author, so impaired his constitution, that after the last exertion of his abilities to defend, by a pamphlet, the conduct of administration towards Mr Wilkes, he was prevented from receiving the reward of a place in the treasury by his death in 1769, at about forty-six years of age. Some time before his death, Bishop Warburton had engaged him to write his long-promised Life of Alexander Pope, which, however, when executed, was very far from giving general satisfaction. The author attributed his ill success to the deficiency of his materials; whilst the public seemed rather to be of opinion that, as a lawyer, he ventured beyond his proper line when he assumed the task of a critic in poetry.

RUFINUS was born about the middle of the fourth century, at Concordia, an inconsiderable town in Italy. At first he applied himself to the belles lettres, and particularly to the study of eloquence. To accomplish himself in this elegant art, he removed to Aquileia, a town at that time so celebrated that it was called a second Rome. Having made himself acquainted with the polite literature of the age, he withdrew into a monastery, where he devoted himself to the study of theology. Whilst thus occupied, St Jerome happened to pass through Aquileia. Rufinus formed an intimate friendship with him; but, to his inexpressible grief, he was soon deprived of the company of his new friend, who continued his travels through France and Germany, and then set out for the East. Rufinus, unable to bear his absence, resolved to follow him. Accordingly, he embarked for Egypt; and having visited the hermits who inhabit the deserts of that country, he repaired to Alexandria to hear the renowned Didymus. Here he was gratified with a sight of St Melania, of whose virtue and charity he had heard much. The sanctity of his manners soon obtained the confidence of St Melania, which continued without interruption during their residence in the East, a period of thirty years. The Arians, who swayed the ecclesiastical sceptre in the reign of Valens, persecuted Rufinus with great cruelty. They threw him into a dungeon, loaded him with fetters, and, after almost starving him to death, banished him to the deserts of Palestine. But from this exile he was relieved by the pecuniary aid of St Melania, who employed her wealth in ransoming those confessors who had been condemned to prison or banishment.

St Jerome, supposing that Rufinus would immediately proceed to Jerusalem, wrote to one of his friends there congratulating him on the prospect of so illustrious a visiter. To Jerusalem he accordingly proceeded, and having built a monastery on the mount of Olives, he there assembled a great number of hermits, whom he animated to virtue by his exhortations. He converted many to the Christian faith, and persuaded more than four hundred hermits who had taken part in the schism of Antioch to return to the church. He also prevailed on many Macedonians and Arians to renounce their errors.

His attachment to the opinions of Origen set him at variance with St Jerome, who, being of a temper peculiarly irritable, not only retracted all the praises which he had lavished upon him, but loaded him with severe reproaches. Their disputes, which were carried to a very indecent height, tended to injure Christianity in the eyes of the weak. Theophilus, their mutual friend, settled their differences; but the reconciliation was of short continuance. Rufinus having published a translation of the principles of Origen at Rome, was summoned to appear before Pope Anastasius. He made a specious apology for not appearing, and sent a vindication of his work, in which he attempted to prove that certain errors, of which Origen had been accused, were perfectly consistent with the opinions of the orthodox. St Jerome attacked Rufinus’s translation. Rufinus composed an eloquent reply, in which he declared that he was only the translator of Origen, and did not consider himself bound to sanction all his errors. Most ecclesiastical historians say that Rufinus was excommunicated by Pope Anastasius;

but for this no good evidence has been adduced. In 407 he returned to Rome; and the year after, that city being threatened by Alaric, he retired to Sicily, where he died in 410.

RUGBY, a market-town of the county of Warwick, in the hundred of Knightlow, eighty-four miles from London. It is situated on the Grand Junction Canal, and has a good market on Saturday. The free-school here is celebrated, and has educated many youths of the first families of the kingdom. The population amounted in 1801 to 1487, in 1811 to 1805, in 1821 to 2300, and in 1831 to 2501.

RUGENWALD, a city of Prussia, in the government of Stralsund, and the capital of the circle of Schlawe-Pollnow. It is situated on the river Wipper, about a mile distant from the Baltic Sea. It is a fortified place, containing 460 houses, with 4100 inhabitants, who have some foreign trade, some ship-building, and manufactures of sailcloth and cordage, with many distilleries and breweries. It is frequented as a sea-bathing place in the summer. Long. 12. 18. E. Lat. 54. 22. N.

RUHNKENIUS, David, a classical critic of great eminence, was born at Stolpen, in Prussian Pomerania, in the year 1723. Of the early part of his studies little is known, but it appears that he was some time at Schlaff, from which he removed to Königsberg, where he met with the celebrated Kant, whose system has so much engaged the attention of Europe. He afterwards repaired to Göttingen to attend the lectures of Gesner, and to enlarge his knowledge of the Greek language. Some time after this period he formed an acquaintance with Ritter and Berger, whilst he resided at Wittemberg, where he continued about two years. His earliest production was a disputation *De Galla Placidia Augusta*, daughter of Theodosius, and the sister of Arcadius and Honorius. Under Berger he studied Roman antiquities and eloquence; under Ritter, jurisprudence and history. He relinquished the study of divinity, for which he was at first designed, and prevailed with his parents to allow him to transfer his residence to Leyden, where he arrived with recommendations to many of the learned. He pursued his studies with avidity and zeal, and accompanied Alberti in his visit to the Spa in the year 1750. Hemsterhuis wished to attach him to Holland, urging him to persevere in the study of the law, as affording an additional chance of employment. This advice he thought proper to follow, and published a translation of some works of Theodorus, Stephanus, and other Greek civilians.

In the year 1755 he went to Paris, where Capperonnier, who was at that time keeper of the king's library, received him kindly. He now formed an acquaintance with Dr Musgrave and Mr Tyrwhitt, who were there for the purpose of examining the manuscripts of Euripides. He had also formed the resolution of going to Spain; but Hemsterhuis recalled him, as he needed his assistance as lecturer in the Greek tongue. In 1755, Ruhnkenius took possession of his office, and read an excellent discourse *De Græcia Artium et Doctrinarum Inventrice*.

About this time he was useful to Ernesti, in his edition of Callimachus; and, in 1761, he succeeded Oudendorp as professor of history and of eloquence, delivering an inaugural oration *De Doctore Umbratico*. About a year after this event, Ruhnkenius was offered the chair of Gesner in the university of Göttingen. This offer he however declined; but, on his recommendation, the office was very worthily bestowed upon Heyne.

In 1764 he married an Italian lady, who, about six years afterwards lost both her speech and sight by a stroke of apoplexy. She had two daughters, one of whom was afterwards blind. The desire of Ruhnkenius to do Ernesti a favour, made him turn his attention to the Memorabilia of Xenophon; and he was led to examine with particular attention the treatise of Longinus on the Sublime. Having risen superior to his domestic misfortunes about the year 1772, he pursued his new edition of Velleius Paterculus, and he prepared a second edition of his *Epistola Critica*, and a collection of *Scholia* on Plato. In the year 1766, he published a valuable tract *De Vita et Scriptis Longini*, in the form of an academical dissertation, to which he prefixed the name of one of his pupils. His Velleius Paterculus appeared in 1779, and in 1780 Homer's reputed hymn to Ceres. In 1786, he published the first part of Apuleius, which had been prepared by Oudendorp, and a new edition of his own Timæus in 1789; and at the same time he collected and published the works of Muretus, in five volumes 8vo.

Both the body and mind of Ruhnkenius were much weakened in consequence of the loss of friends, an attack of the gout, and the misfortunes of the Batavian republic; but he was in some measure relieved by the satisfaction he felt at the dedication of Homer by Wolf, although he was not of that writer's opinion that the works of Homer were written by different authors. He sunk into a kind of stupor on the 14th of May 1798, which in two days put a period to his existence.

His knowledge and learning were unquestionably immense; and he was allowed to be lively, cheerful, and gay, even to an extreme. Many posthumous honours were conferred upon him, and a pension settled on his unfortunate widow. When Whyttenbach took possession of Ruhnkenius's chair, he delivered a discourse on the early age of Ruhnkenius, which he proposed as an example to the Batavian youth who made the belles lettres their study.

RUIB ISLE, a small island in the Eastern Seas, about six leagues from Waygoo, and surrounded by a multitude of smaller islands, with very deep waters between them. Long. 129. 55. E. Lat. 0. N.

RULE, in matters of literature, a maxim, canon, or precept, to be observed in any art or science.

Rule, in a monastic sense, a system of laws or regulations, according to which religious houses are governed, and which the religious make a vow, at their entrance, to observe.

Rules of Court, in *Law*, are certain orders made from time to time in the courts of law, which attorneys are bound to observe, in order to avoid confusion; and both the plaintiff and defendant are at their peril also bound to pay obedience to rules made in court relating to the cause depending between them.

RUM, a species of brandy or vinous spirits, which is distilled from sugar-canes.

Rum, according to Dr Shaw, differs from simple sugar-spirit, in that it contains more of the natural flavour or essential oil of the sugar-cane; a great deal of raw juice and parts of the cane itself being usually fermented in the liquor or solution of which the rum is prepared.

RUMBO, a Malay kingdom, in the peninsula, about sixty miles from the city of Malacca. The sultan and all the principal officers of this state hold their authority immediately from Menangcabow in Sumatra, and have commissions for their respective offices. They have a peculiar dialect, called by the inhabitants of Malacca the language of Menangcabow.

RUMFORD, Count. See Thompson, Sir Benjamin.

RUMINANT, in *Natural History*, is applied to an animal which chews over again what it has eaten before, and which is popularly called chewing the cud.

RUN, a very extensive salt morass in Hindustan, which bounds the western frontier of the province of Gujerat, and communicates with the Gulf of Cutch. It is several hundred miles in length, and exhibits a variety of appearances, being in some places a widely expanded sheet of shallow water, only a few inches deep, and in others an impassable swamp. In some places it is a dry unproductive bank of sand, impregnated with saline particles, adverse to vegetation. Including its windings, it extends over many hundred miles, and sweeps round the north of Cutch. It appears at one time to have been covered with the waters of the ocean.

RUNALA, a town of Hindustan, in the Mahratta territories, and the province of Kandesh, eighty-four miles east from Surat. Long. 74. 30. E. Lat. 21. 17. N.

RUNCIMAN, Alexander, an eminent Scottish painter, was born in Edinburgh in the year 1736. He was the son of an architect, a profession which has a strong affinity to that of painting. The opportunity he thus enjoyed of examining his father's drawings gave him an early propensity to the art in general, which he very soon evinced by making sketches of any remarkable object, either of nature or art, that happened to come in his way. We are unacquainted with the gradual progress of his fertile genius; but it is not to be supposed that he remained long satisfied with the delineations of straight lines, whilst the fascinating beauties of landscape lay open to his inspection. Water that falls over a rugged precipice in the form of cascades, or the foaming surges of the deep when carried like hoar frost with impetuosity into the air, both astonish and delight by their awful grandeur. These objects, and such as these, would naturally fire, at an early period, the genius of Runciman.

He was bound an apprentice to John and Robert Norry in the year 1750, the former of whom was a landscape-painter of very considerable eminence, and by his instructions our young artist made rapid progress. About the year 1755, when only nineteen years of age, he began professionally to paint landscapes; from which it appeared that they were by no means first attempts, as they evinced his ardent application to study before he ventured to appear at the tribunal of the public. Yet although these were excellent, they were nothing more than the dawn of that distinguished eminence to which he afterwards attained. His reputation as a painter of landscape continued to increase during five years; but such was the strength of his genius, and the amazing fertility of his invention, that he could not rest satisfied with eminence in a single department. About the year 1760 he successfully attempted historical painting, in which his mind had more ample scope than in pourtraying the solemn silence of a field, a humble cottage, or a shepherd void of ambition. Six years of his life were devoted to the study and practice of this important branch of the art, notwithstanding his situation was attended with numerous disadvantages. Great, however, as his attainments were in this department, he could never be satisfied with himself till he had studied in Italy those masterly performances which it was his highest ambition to imitate.

He accordingly set out for Italy in the year 1766, when just thirty years of age; and during a residence of five years in that enchanting country, where specimens of his favourite art are met with in all their grandeur and perfection, he continued to copy the best pictures of the ancient masters, in consequence of which his taste was very much corrected and improved. His conceptions were also greatly enlarged by the steady contemplation of so many works of the greatest and most celebrated artists. The art of composition, which it is of the first consequence for an historical painter to understand, was only to be acquired from the study of its principles, as they are exemplified in such highly-finished models; and to these he applied himself with indefatigable industry. He caught the rich yet chaste colouring of the Venetian school with such truth that he was allowed to surpass all his competitors in this valuable quality.

In the year 1771, Runciman returned to his native country in the full possession of such improvements as were to be expected from the opportunities he had enjoyed, and also with a judgment very much matured. It will readily be granted that he had now some claim upon the patronage of his country, and we are happy to add that this was not withheld; for the Board of Trustees, and Sir James Clerk of Pennycuick, were amongst his patrons; and to Mr Robert Alexander in particular, a respectable merchant in Edinburgh, his country was more indebted for fostering his rising genius than to the whole of its nobility.

An academy for the study of drawing and painting was established in Edinburgh by the honourable trustees for the encouragement of the arts in Scotland, of which De la Cour and Pavilon, two French artists of some ability, were successively chosen masters. When Pavilon died in 1771, an application was made to Runciman to take charge of the academy, the laborious and interesting duties of which he discharged much to his own honour and the benefit of his country.

His masterly work in the hall of Ossian at Pennycuick, the seat of his patron Sir James Clerk, was projected and begun by him soon after his return to Edinburgh. The next performance of Runciman was the picture of the Ascension, painted on the ceiling above the altar of the episcopal chapel, Cowgate, Edinburgh.

The fire and the feeling displayed in his King Lear were conceived and executed in a manner not inferior to those of Shakspeare; and the Andromeda, from which Legat took his highly-finished engraving, will bear a comparison, in colouring, with the works of Titian or Correggio. He appears to have regarded his own historical work of Agrippina landing the ashes of Germanicus her husband, as a capital performance, in the execution of which he had bestowed more than ordinary pains.

Whilst his health permitted, which the painting of the hall of Ossian had much impaired, he continued to superintend the business of the academy, and devoted his leisure hours to the drawing of historical pieces. He enjoyed a competency from his office as teacher, which, with the emoluments arising from his other works, made him independent.

Runciman as a man was possessed of great candour and simplicity of manners, having a happy talent for conversation, which made some of the most distinguished literary characters, such as Hume, Robertson, Kames, and Monboddo, extremely fond of his company; but his genuine worth, and his real goodness of heart, were only fully known to his most intimate friends. He could communicate information with great facility, and gave his best advice to young artists, with a view to facilitate the progress of their improvement.

As a painter, his character has been elegantly drawn by a brother artist, Mr John Brown, who was better qualified than most men to make a proper estimate of his merits. "Mr Runciman was an artist by nature, eminently qualified to excel in all those nobler parts of the art, the attainment of which depends upon the possession of the highest powers of the mind. Though for a long period of years labouring under every possible disadvantage, he completed works which, upon the whole, are equal to the best of those of his contemporaries, and in some respects it may be boldly asserted that they are superior. His fancy was fertile, his discernment of character keen, his taste truly elegant, and his conceptions always great. Though his genius seems to be best suited to the grand and serious, yet many of his works amply prove that he could move with equal success in the less elevated line of the gay and pleasing. His chief excellence was composition, the noblest part of the art, in which it is doubted whether he had any living superior. With regard to the truth, the harmony, the richness, and the gravity of colouring; in that style, in short, which is the peculiar characteristic of the ancient Venetian, and the direct contrast to the modern English school, he was unrivalled. His works, it must be granted, like all those of the present times, were far from being perfect; but it was Mr Runciman's peculiar misfortune, that his defects were of such a nature as to be obvious to the most unskilful." The fine arts and his friends were deprived of this distinguished painter on the 21st of October 1785.

RUNGPOOR, a town and district of Hindustan, in the north-eastern extremity of Bengal, situated about the twentieth degree of north latitude. The district is bounded on the north by the Bootan Hills, on the south by Mymunsing, on the east by the Brahmapootra, and on the west by Dinagepore. The river Durlah separates it from Couch Bahar. It is an open country, level, and well watered and productive. It yields in abundance silk, rice, indigo, hemp, and tobacco. Some parts of it are equal in fertility to any part of Bengal; but, on the whole, it is not so well cultivated or so populous as the other parts of this province. Besides the Brahmapootra, the principal rivers are the Teestah and the Durlah; and the chief towns Rungpoor, Mungulhaut, and Guzgotta. The tobacco grown here is mostly consumed in the southern and eastern districts of Bengal. The glandular swellings of the throat are very prevalent amongst the inhabitants, although parts of the district are a hundred miles distant from the Alpine region. This district was taken possession of by the Mahommedans early in the thirteenth century, and was always governed by a military collector. It was at first partially wrested from the rajah of Couch Bahar, when it was formed into a circar, and was finally conquered by the generals of Aurungzebe. It is now under a British establishment of a judge, collector, &c. The result of some queries by the Marquis of Wellesley in 1801 gave a population of 400,000. Rungpoor, the capital, is situated on the eastern bank of the Goggot river. It is a regularly-built town, and carries on a considerable trade with Bootan, Assam, and Calcutta. Long. 89. 5. E. Lat. 25. 47. N.

RUNGPORE, an extensive fortress of Hindustan, which is sometimes, but erroneously, called the capital of Assam. Gergong is the real capital, of which Rungpore is only the fort. It is situated on an island, and can only be approached by a bridge, which was built centuries ago, and remains a monument of the abilities of the Bengal artificers who were employed to construct it. Long. 94. 40. E. Lat. 26. 35. N.

RUNIC, a term applied to the language and letters of the ancient Goths, Danes, and other northern nations. See SCOTLAND.

RUNNER, in nautical language, a rope belonging to the garnet and the two bolt-tackles. It is received in a single block joined to the end of a pendant; it has at one end a hook to hitch into any thing, and at the other a double block, into which is reeved the fall of the tackle, or the garnet, by which means it purchases more than the tackle would without it.

RUNNET, or RENNET, is the concreted milk found in the stomachs of sucking quadrupeds, which have as yet received no other nourishment than their mother's milk. In ruminating animals, which have several stomachs, it is generally found in the last, though sometimes in the next to it. If the runnet is dried in the sun, and then kept close, it may be preserved in perfection for years. Not only the runnet itself, but also the stomach in which it is found, curdles milk without any previous preparation. But the common method is, to take the inner membrane of a calf's stomach, to clean it well, to salt and hang it up in brown paper. When this is used the salt is washed off, then it is maccrated in a little water during the night, and in the morning the infusion is poured into the milk to curdle it.

RUPEE, a silver coin current in the East Indies, equal to about two shillings and sixpence sterling.

RUPERT, Prince palatine of the Rhine, son of Frederick prince elector palatine of the Rhine, and Elizabeth daughter of James I. of England, was born in 1619. He gave proofs of his bravery at the age of thirteen; and in 1642 came over into England, and offered his service to Charles I. his uncle, who gave him a command in his army. At Edgehill he charged with incredible bravery, and made a very great slaughter of the parliamentarians. In 1643 he seized the town of Cirencester, obliged the governor of Lichfield to surrender, and having joined his brother Prince Maurice, reduced Bristol in three days, and passed to the relief of Newark. In 1644 he marched to relieve York, where he gave the parliamentarians battle, and entirely defeated their right wing; but Cromwell charged the Marquis of Newcastle with such an irresistible force, that Prince Rupert was entirely defeated. After this the prince put himself into Bristol, which surrendered to Fairfax after a gallant resistance. The king was so enraged at the loss of this city, so contrary to his expectation, that he recalled all Prince Rupert's commissions, and sent him a pass to go out of the kingdom. In 1648 he went to France, where he was highly complimented by that court, and kindly received by Charles II. who for the time sojourned there. Afterwards he was constituted admiral of the king's navy; attacked the Dutch ships, many of which he took; and having engaged with De Ruyter, obliged him to fly. He died in 1682, and was interred with great magnificence in Henry VII.'s chapel, Westminster. Mr Grainger observes, that he possessed in a high degree that kind of courage which is better in an attack than a defence, and is less adapted to the land-service than that of the sea, where precipitate valour is in its element. He seldom engaged but he gained the advantage, which, however, he generally lost by pursuing it too far. He was better qualified to storm a citadel, or even to mount a breach, than patiently to sustain a siege, and would have furnished an excellent hand to a general of a cooler head.

This prince is celebrated for the invention of prints in mezzotinto, of which he is said to have taken the hint from a soldier's scraping his rusty fusil. The first print of this kind ever published was done by his highness, and may be seen in the first edition of Evelyn's *Sculptra*. The secret is said to have been soon afterwards discovered by Sherwin, an engraver, who made use of a loaded file for laying the ground. The prince, upon seeing one of his prints, suspected that his servant had lent him his tool, which was a channelled roller; but upon receiving full satisfaction to the contrary, he made him a present of it. The roller was afterwards laid aside; and an instrument with a crenelled edge, shaped like a shoemaker's cutting knife, was used instead of it. He also invented a metal called by his name, in which guns were cast; and contrived an excellent method of boring them, for which purpose a water-mill was erected at Hackney-marsh, to the great detriment of the undertaker, the secret dying with the inventor.

RUPERT's Drops, a sort of glass drops with long and slender tails, which burst to pieces on the breaking off those tails in any part. They are said to have been invented by Prince Rupert, and are therefore called by his name.

RUPNAGUR, a town of Hindustan, in the province of Ajmeer, belonging to Dowlet Row Scindia. It is thirteen miles north-east from the city of Ajmeer. Long 74. 58. E. Lat. 26. 43. N.

RUPPIN, a city of Prussia, the capital of a circle of the same name, in the government of Potsdam, which extends over 725 square miles, and comprehends five cities, 97 villages, 84 hamlets, and 54,600 inhabitants. The city is situated on the lake Rhin, whence, by sluices, a stream is carried through it. Although ancient, it is well built, and was formerly fortified. It contains two churches, a gymnasium with six professors, 800 houses, and about 6400 inhabitants. By the lake and a canal which joins the river Havel, the trade is extended to the Elbe. The occupations of the citizens chiefly consist in making woollen goods of various kinds, tanning leather, brewing beer, and distilling corn-spirits. Near to it there is much tobacco cultivated. Long. 22. 48. 47. E. Lat. 52. 55. 59. N.

RUSCIUD, a small river of Persia, which falls into the Persian Gulf, forty-eight miles west of Ormus.

RUSCSUK, or Rusdschuk, a city of Turkey in Europe, and of the district of Silistria. It is situated on the river Danube, at the point where the Kara Lom falls into that great stream. It is fortified, and has extensive suburbs, a fortress, nine mosques, several Greek and Armenian churches, some Jewish synagogues, and a great number of baths. It has 6000 houses, and is supposed to contain 30,000 inhabitants, who make linen, woollen, cotton, and silk goods, and carry on extensive trade by the river. Lat. 43. 51. 3. N.

RUSH, Benjamin, a celebrated American physician, born on the 5th of January 1745, near Bristol, in Pennsylvania, was descended from a family who were originally Quakers, and who had accompanied Penn, in 1683, to his infant colony.

He lost his father at an early age, and having been first placed by his mother at a school kept by the Rev. S. Finley, he proceeded to finish his classical education at the college of Princeton, and there took a degree of bachelor of arts before he was sixteen. He then determined to make the profession of physic the pursuit of his life, and went to study it, first under the care of Dr Redman of Philadelphia, and then at Edinburgh, where he was created a doctor of physic in 1768. At the time of his return from Europe, a new school of medicine was about to be founded in Philadelphia, and he became professor of chemistry immediately upon his arrival. In 1776, he began to take an active part, with the rest of his countrymen, in the political struggle of the day, and he was chosen a member of congress for the state of Pennsylvania; in 1777 he was appointed surgeon-general to the army, and not long afterwards became physician-general. He also contributed his best efforts to the improvement of the internal government of the state which he represented. But he soon withdrew his attention from political affairs, in order to devote it exclusively to medical and literary subjects; and he continued to be actively engaged in the practice of physic for the remainder of his life.

In 1776 he married Miss Julia Stockton of New Jersey. He had by her thirteen children, nine of whom survived him in respectability and prosperity. In 1791, when the two medical colleges of Philadelphia were incorporated into a single university, he was appointed professor of the institutes of medicine, and of clinical practice. In 1793, he greatly distinguished himself by the new and apparently successful modes of practice that he introduced in the epidemic yellow fever, which was then causing great mortality throughout the United States; and which, shortly before his death, he was induced to believe not contagious, but derived from some general causes independently of the previous existence of the disease. He died on the 13th of April 1813, after an illness of five days, of a typhus fever, with some pulmonary symptoms. He had for a considerable part of his life been threatened with consumption, but had combated its attacks with unusual success. The number of his writings is considerable in proportion to their bulk; the times and the state of society in which he lived being such as to produce rather hasty and spirited than highly finished compositions.

1. His inaugural dissertation was entitled *De Concoctione ciborum in ventriculo*, and contained an explanation of the opinions relating to digestion, which he had learned from Dr Cullen. Edinburgh, 1768.

2. Account of the Effects of the Stramonium. American Phil. Trans. i. 1770.

3. On the utility of Wort in ill-conditioned Ulcers. Med. Obs. Inq. iv. 1770; addressed to Dr Huck.

4. Inquiry into the Natural History of Medicine amongst the Indians of North America; an anniversary oration delivered in 1774.

5. Remarks on Bilious Fevers, addressed to Dr Huck. Med. Obs. Inq. v.

6. Account of the Influence of the Revolution on the Human Body; with Observations on the Diseases of Military Hospitals.

7. Inquiry into the Cause of the Increase of Bilious and Intermitting Fevers in Pennsylvania. American Trans. ii.

8. Observations on Tetanus.

9. Inquiry into the Influence of Physical Causes upon the Moral Faculty.

10. Remarks on the Effects of Ardent Spirits upon the Body and Mind.

11. Inquiry into the Causes and Cure of Pulmonary Consumption, in his Medical Inquiries and Observations, i. Phil. 1788. His grand object, in the cure of consumption, is to recommend exercise, and every thing which will enable the patient to take exercise; anticipating a practice which has become somewhat fashionable in England of late years, from its frequent success as a temporary palliative. The subject is continued in the second volume of the Inquiries, published in 1793; and bleeding is very strongly recommended in the earlier and only curable stages. Consumption, he observes, is common in America, though scrofula scarcely ever occurs; and it has sometimes been known to be clearly communicated by infection to the negroes belonging to a family, who had, of course, no consanguinity that could account for a similarity of constitution. Five volumes, in the whole, of this collection, appeared from 1788 to 1798; a second edition was published in 1804, in four volumes 8vo; a third in 1805, revised and enlarged, with a continuation of the Histories of the Yellow Fever from 1793 to 1809; a Defence of Bloodletting as a Remedy for Certain Diseases; A View of the State of Medicine in Philadelphia; An Inquiry into the Sources of the Usual Forms of Summer and Autumnal Diseases in the United States; and the recantation of his opinion of the contagious nature of the yellow fever, already mentioned.

12. Information to Europeans disposed to Emigrate to the United States, in a Letter to a Friend.

13. Observations on the Population of Pennsylvania.

14. Observations on Tobacco.

15. A New Mode of Inoculating Small-Pox, a Lecture. Reprinted, Phil. 1792, 8vo.

16. Essay on the Study of the Latin and Greek Languages, American Museum; condemning it as a waste of time, oppressive to the poor dunces who are tortured into their parts of speech, to the great scandal of a humane and republican country, and subversive of a proper respect for the rights of boys, and, consequently, for the rights of man.

17. Essays, Literary, Moral, and Philosophical, 1798, 8vo, containing a republication of the last article, together with the author's Eulogiums on Dr Cullen and on Professor Rittenhouse, delivered in 1790 and 1796, and with some other miscellaneous papers of less moment. 1806.

18. Lectures on the Cause of Animal Life, 1791.

19. Account of the Sugar Maple Tree. American Trans. iii. 1791.

20. Observations on the Black Colour of the Negro, American Trans. iv. 1792; attributing the blackness to leprosy.

21. History of the Yellow Fever, 1794. This celebrated work has been translated into French and Spanish. At the time of its publication, an almost superstitious dread was entertained by medical men of the use of the lancet in idiopathic fever; and few books have ever had so powerful and extensive an effect in altering the general treatment of a disease as this history had produced in every part of the world. Probably, indeed, it may have carried a number of the younger and bolder practitioners into an opposite extreme; but, with respect to the author's claims

to merit on the occasion, it must be allowed that the innovation showed an uncommon combination of courage with talent and good sense; and the accurate description of the disease that he has given us fully establishes his claim to the character of an accurate nosologist.

22. On the Symptoms and Cure of Dropsy, and especially of Water in the Head. 1793.

23. An Account of the Influenza of Philadelphia in 1789, 1790, 1791.

24. Observations on the State of the Body and Mind in Old Age. 1794.

25. Observations on the Nature and Cure of Gout and Hydrophobia. 1797.

26. Inquiry into the Cause and Cure of the Cholera Infantum. 1797.

27. Observations on Cynanche Trachealis. 1797.

28. Introductory Lectures. 1801. Ed. 2, 1811; with ten new introductory lectures, and two lectures on the Pleasures of the Senses and of the Mind.

29. In 1809 he published the works of Sydenham and of Cleghorn, with Notes, and in 1810 those of Pringle and Hilary.

30. On Diseases of the Mind, 8vo, 1812; an elaborate work, which had long been impatiently expected.

31. A letter on Hydrophobia, 1813; addressed to Dr Hosack, and containing additional reasons for believing the seat of the disease to be chiefly in the blood-vessels; an opinion which, in all probability, has at least tended to shorten the sufferings of several individuals on whom the experiment of profuse depletion has been tried.

Dr Rush's numerous publications obtained him many marks of respect from his contemporaries, and procured him admission, as an honorary member, into the most distinguished literary and philosophical societies of Europe. His name was familiar to the medical world as the Sydenham of America. His accurate observations and correct discrimination of epidemic diseases well entitled him to this distinction; while, in the original energy of his reasoning, he far excelled his prototype. His literary and professional character, indeed, appears to have been greatly influenced by the moral and political sentiments which were prevalent in his day. A love of innovation led him to that proud defiance of established authority which is just as likely to be pernicious as to be salutary. The study of the learned languages he depreciated, in one of his early essays, as unfit for a republican education; and this was the first step to the true Jacobin doctrine, that it was unrepublican and aristocratical to have received any education whatever. In physic, his rejection of the prejudices of antiquity was somewhat more consistent with moderation, and the reform that he attempted was occasionally more successful than his literary speculations; nor can it be denied that there are a multitude of original suggestions in his works, which may very probably be found capable of affording valuable hints to the lovers of medical experiments.

Hosack and Francis in the *American Med. Philos. Register;* Chalmers's *Biographical Dictionary,* XXV. London, 1816, 8vo. (L. L.)

RUSHWORTH, John, the compiler of some very useful historical collections, was born in Northumberland about the year 1607, being descended of honourable ancestors. After attending the university of Oxford for some time, he removed to Lincoln's Inn; but the study of the law not suiting his genius, he soon deserted it, in order to seek a situation where he might more easily gratify his love for political information. He frequently attended the meetings of parliament, and wrote down the speeches both of the king and members. During the space of eleven years from 1630 to 1640, when no parliament was held, he was an attentive observer of the great transactions of state in the star-chamber, the court of honour, and exchequer chamber, when all the judges of England assembled there on cases of great emergency. Nor did he neglect to observe with a watchful eye those events which happened at a distance from the capital. He visited the camp at Berwick, and was present at the battle of Newborn, at the treaty of Ripon, and at the great council of York.

In 1640 he was appointed assistant to Henry Elsynge, clerk to the House of Commons, and thus had the best opportunities of being acquainted with their debates and proceedings. The Commons considered him as a person worthy of confidence; and, in particular, they trusted him with carrying their messages to the king whilst he remained at York. And when the parliament created Sir Thomas Fairfax their general, Rushworth was appointed his secretary, and discharged the office much to the advantage of his master. When Fairfax resigned his commission, his secretary returned to Lincoln's Inn, and was soon afterwards (in 1651–52) chosen one of the committee that was appointed to deliberate concerning the propriety and means of altering or new-modelling the common law. He was elected one of the representatives for Berwick-upon-Tweed to the parliament which Richard Cromwell assembled in 1658, and was re-elected by the same town to the parliament which restored Charles II. to the crown.

After the Restoration, he delivered to the king several books of the privy-council, which he had preserved in his own possession during the commotions which then agitated the country. Sir Orlando Bridgeman, keeper of the great seal, chose him his secretary in the year 1677, an office which he enjoyed as long as Sir Orlando kept the seals. In 1678 he was a third time chosen member for Berwick, and a fourth time in the ensuing parliament in 1679. He was also a member of the parliament which was convened at Oxford. The different offices he had held afforded him favourable opportunities of acquiring a fortune, or at least an independence; yet, whether from negligence or prodigality, he was never possessed of wealth. Having run himself into debt, he was arrested and committed to the King's Bench prison, Southwark, where he lingered for the last six years of his life in the most deplorable condition. His memory and judgment were much impaired, partly by age and partly by the too frequent use of spirituous liquors. He died on the 12th of May 1690.

His Historical Collections of private Passages in State, weighty Matters in Law, and remarkable Proceedings in Parliament, were published in folio at different times. The first part, comprehending the years between 1618 and 1629, appeared in 1659. The copy had been intrusted by Oliver Cromwell to Whitelock, with instructions to peruse and examine it. Upon perusing it, he thought it necessary to make some alterations and additions. The second part was published in 1680; the third in 1692; the fourth and last, which comes down to the year 1648, was published in 1701; and altogether they made seven volumes. These underwent a second edition in 1721; and the trial of the Earl of Strafford was added, which made the eighth. This work has been much applauded by those who condemn the conduct of Charles I., and accused of partiality by those who favour the cause of that unhappy monarch. One person in particular, Dr John Nelson of Cambridge, in a Collection of the Affairs of State, published by the command of Charles II., undertook to prove that Rushworth has concealed truth, endeavoured to vindicate the prevailing detractions of the times, as well as their barbarous actions, and with a kind of rebound to libel the government at second hand. But this accusation seems to be carried too far. His principles indeed led him to show the king and his adherents in an unfavourable light, and to vindicate the proceedings of parliament; yet it cannot justly be affirmed that he has misrepresented or falsified any of the speeches or facts which he has admitted into his collection.

RUSS, a small island in the Eastern Seas, near the west coast of Nassau. Long. 99. 48. E. Lat. 2. 53. S.

RUSSELL, William, a very popular historian, the eldest son of Alexander Russell and Christian Ballantyne, was born in the year 1741 at Windydoors, a farm-house in the parish of Stowe and county of Selkirk. Most of the parish is within the limits of the county of Edinburgh. At an early age he was sent to school in the neighbouring village of Inverleithen, well known as a delightful place of summer resort. Here he acquired an elementary knowledge of the Greek and Latin languages; and private study afterwards enabled him to supply many of the deficiencies of his early education. In 1756 he was removed to Edinburgh, in order to be instructed in writing and arithmetic; and after having attended to these branches for about ten months, he was bound an apprentice to the bookselling and printing business for the term of five years. While engaged in this occupation, he discovered the utmost ardour in literary pursuits; nor was his situation unfavourable to the acquisition of useful and elegant knowledge.

After the completion of his apprenticeship, he published a select collection of modern poems, which was favourably received. The first edition we have not seen; the second bears the subsequent title: "The select Poems of our most celebrated contemporary British Poets: viz. Dr Akenside, Mr Gray, Mr Mason, W. Shenstone, Esq. Mr W. Collins, Lord Lyttelton, Mess. Wartons, Mr Blacklock, Mr Beattie, Mr Ogilvie, *etc.* Vol. I. Second edition, with additions." Edinb. 1764, 12mo. He afterwards congratulated himself on having contributed to extend the popularity of Gray and Shenstone in the northern part of the kingdom. It may be mentioned as a proof of his classical taste, that at this early period of life he entertained the highest admiration for the sublime odes of Gray, which he was accustomed to recite in a wild and enthusiastic manner. In the year 1763, while employed as a journeyman printer, he became a member of a literary association, denominated the Miscellaneous Society, which was composed of students and other young men anxious to exercise their talents and to improve their taste. This juvenile society included other individuals who afterwards rose to distinction. Among these we find Sir Robert Liston, who was employed in several important embassies, and Mr Dalzel, who became professor of Greek in this university.

About the same period he made an attempt to adapt Crebillon's *Rhadamisthe et Zénobie* to the English stage. The manuscript was submitted to the inspection of his two friends Liston and Dalzel; who, after a very careful perusal, stated not a few objections to particular passages, though they do not appear to have condemned the entire performance. This tragedy was at length offered to Garrick: but Murphy's Zenobia was at that time in rehearsal; and if the merit of Russell's play had been more conspicuous, it probably would not have been accepted. In 1764, he issued proposals for publishing a second volume of his collection of poems, which however did not make its appearance. With the view of arranging his materials, he now retired to the country, and about this period of his life he maintained an epistolary correspondence with Lord Elibank, Dr Ogilvie, and Mr Dalzel, by all of whom he seems to have been regarded as a young man of promising talents. In the course of the ensuing year, Lord Elibank, who was himself a man of literature, invited him to his seat in the county of Haddington, where he spent the greater part of the autumn, and had an opportunity of conversing with many distinguished individuals. To this nobleman he seems to have looked for favour and protection. The hope of obtaining preferment through his influence, had induced him to relinquish his original employment; and in the mean time he continued to prosecute his studies, particularly in the departments of history and polite literature.

Having resided with his father till the month of May 1767, he proceeded to London in quest of honour and emolument. But his high hopes were speedily blasted; and after having in vain waited for advancement through the influence of Mr Hume, Lord Elibank, General Murray, and Governor Johnstone, he was under the necessity of contracting his views, and engaging himself as a corrector of the press in the great office of William Strahan, afterwards printer to his majesty. To find himself thus placed in a situation so inadequate to his expectations, must have cast a temporary gloom over his mind; but the freshness of youth, added to the natural vivacity of his mind, would have enabled him to support even greater disappointments. In some brief notices found among his papers after his death, he mentions his expectations of preferment through the interest of these individuals; but he does not aver that his hopes were founded on their promises. The disappointments of human life may very frequently be traced to the unreasonableness of our expectations.

In the year 1769 he quitted the employment of Mr Strahan, and was engaged as overseer of the printing office of Brown and Adlard. During the same year he published an "Ode to Fortitude," which was immediately reprinted at Edinburgh by his former masters, Martin and Wotherspoon. His "Sentimental Tales" appeared in 1770; and from this time he contributed to the periodical publications many essays in prose as well as verse. In 1772 he published a collection of "Fables, Moral and Sentimental," and "An Essay on the Character, Manners, and Genius of Women, from the French of M. Thomas." In 1774 he produced an octavo volume under the title of "Julia, a Poetical Romance." Of this work, which is founded on the *Nouvelle Heloise* of Rousseau, neither the plan nor the execution can be commended. In the estimate of his literary character Russell dissented from the public opinion: his historical works, which have met with a very favourable reception, he considered as greatly inferior to his poetical works, which have been totally neglected. But his friends certainly had no reason to regret that the collective edition of his poems, which he long meditated, never made its appearance. On the death of Hume he produced an elegy which occasioned a sarcastic effusion from another poet. Mickle, who abhorred the scepticism of Hume, and who believed himself to have been materially injured by Smith, concludes his verses with this stanza:

For him shall Russell rant and rave
In hobbling rumbling lays;
And Smith in barbarous sleepy prose
Shall grunt and croak his praise.

Russell is the author of the verses on the death of Dr Armstrong, subscribed W. R. and dated from Gray's Inn, Sept. 10, 1779, which are commonly printed with the poems of that classical writer. Before this period he had apparently relinquished his connexion with the printing-office, and had entirely devoted himself to the pursuits of literature. His "History of America," published in numbers, was completed in the course of the same year. This work was received with some degree of favour; but the splendid merit of Dr Robertson's history precluded all competition. During the same year, 1779, he likewise published, in octavo, the first two volumes of "The History of Modern Europe; with an account of the Decline and Fall of the Roman Empire, and a View of the Progress of Society from the fifth to the eighteenth century. In a Series of Letters from a Nobleman to his Son." Their reception was so favourable as to exceed his most sanguine expectations. His studies experienced a temporary interruption in 1780, when he embarked for Jamaica in order to recover some money, due to him as the heir of his brother James, who, after a residence of several years, had died in that island. He after-

Russell.

wards resumed his historical labours, which were occasionally interrupted by his love of poetry. In the year 1783 he published "The Tragic Muse," a poem addressed to Mrs Siddons. To address verses to a player has been considered as beneath the dignity of the literary character. It would be a crime, said a periodical writer, to sacrifice genius on such an uninteresting occasion: we have more dignified subjects for the poetic Muse than an individual whose excellence is only a dazzling meteor, and must be forgotten in a few years at most. Players have sometimes been extravagantly extolled, particularly by grateful or aspiring poets who have written for the stage, and it will doubtless be granted that a poet may easily find a more dignified theme: but supreme excellence in any ingenious art seems to be no improper subject of panegyric; and so rare and difficult are the fleeting attainments of a great actor, that it may be considered as a generous exertion of poetic talent to rescue them from oblivion.

The three volumes which completed the History of Modern Europe made their appearance in 1784. From the manuscript notices to which we have already referred, it appears that in the composition of each of these five volumes he spent about twelve months. This work, which is the chief foundation of his reputation, possesses great merit as a popular view of a very extensive period of history. The author displays no inconsiderable judgment in the selection of his leading incidents, and in the general arrangement of his materials; and he seems to have studied the philosophy of history with assiduity and success. His narrative is always free from languor; and his reflections are conveyed in a lively and elegant style. It is however to be regretted that he should have adopted the useless expedient of exhibiting his work as a series of letters from a nobleman to his son: every reader is sufficiently aware that Dr Russell did not belong to the order of nobility; and the frequent recurrence of "my dear Philip," is too apt to remind us of Lord Chesterfield. This work has very often been reprinted, and it still continues to maintain its original popularity. Russell closes his history with the peace of Paris in 1763. A continuation, extending to two volumes, was added by the late Dr Coote; and another writer has continued the narrative to the death of William the Fourth.

In the year 1787 he married Isabella Scott, a lady of Eskdale, to whom he had long been attached, and in whom he found a pleasant and intelligent companion. He now entered upon the occupation of a comfortable farm at Knottyholm, in the parish of Canonby and county of Dumfries. He fixed his residence in an elegant cottage, delightfully placed on the brink of the Esk, and at the distance of about five miles from the town of Langholm. This may well be described as "a land of brooks of water, of fountains and depths that spring out of valleys and hills." A more beautiful tract of pastoral country than that which extends for about twelve miles along the banks of the river, it would not perhaps be very easy to mention. Here he spent the remainder of his days. In this neighbourhood there were several intelligent individuals, with whom he lived in habits of intimacy. Of these the most conspicuous was the late Mr Maxwell, who was eminently distinguished for his scientific skill in music.[1]

He had now acquired the reputation of a very popular historian; and in 1792 the university of St Andrews conferred upon him the degree of LL. D. Academical honours have sometimes been more unworthily bestowed. The very favourable reception of his last publication had induced him to retrace his steps; and during the following year he published at London, in two volumes octavo, "The History of Ancient Europe; with a View of the Revolutions in Asia and Africa. In a Series of Letters to a young Nobleman." In the composition of this work, he professes to have been peculiarly studious to found his facts on original authorities, and to clear the narrative of unimportant events. He seems however to have allotted too many of his pages to the poetical details of the Trojan war. This production partakes of the peculiar merits of his modern history; but as the author did not live to complete his design, it never attained to the same popularity. Of these two volumes, the greater proportion relates to the history of Greece; and the same ground has recently been trodden by Dr Gillies and Mr Mitford. Dr Coote, having afterwards been induced to supply what he had left deficient, published "The History of Ancient Europe; in a Series of Letters from a Gentleman to his Son: intended as an accompaniment to Dr Russell's History of Modern Europe." Lond. 1815, 3 vols. 8vo.

Dr Russell did not long survive the publication of his last work. A stroke of palsy suddenly terminated his life, on the 25th of December 1793, after he had completed the fifty-second year of his age. His remains were interred in Westerkirk churchyard, where a plain mural stone distinguishes his grave. He left a widow, who died a few years ago, and an only child, a daughter, who still survives, and continues to reside at Knottyholm.

He had engaged in various projects which he did not live to execute. Besides two complete tragedies, entitled Zenobia and Pyrrhus, he left in manuscript "An Analysis of Bryant's Ancient Mythology," and the following unfinished productions. 1. The Earl of Strafford, a tragedy. 2. Modern Life, a comedy. 3. The Love-Marriage, an opera. 4. Human Happiness, a poem, intended to have been completed in four books. 5. An Historical and Philosophical View of the Progress of Mankind in the Knowledge of the Terraqueous Globe. 6. The History of Modern Europe, part iii. from the peace of Paris in 1763, to the general pacification in 1783, including an Account of the American War, and of the European Transactions in the East Indies. In a Series of Letters from a Nobleman to his Son. 7. The History of England from the beginning of the reign of George III. to the conclusion of the American War. In the composition of the last of these works Dr Russell was engaged at the close of his life. It was to be comprised in three volumes octavo; for the copyright of which Mr Cadell had stipulated to pay him seven hundred and fifty pounds. (x.)

---

[1] John Maxwell, Esq. of Broomholm was born in the year 1726. In July 1754 he succeeded to an estate which has now belonged to the family for more than two centuries. His father was William Maxwell, his mother was a daughter of Scott of Wool in Selkirkshire. By his wife, Wilhelmina Malcolm, he had nine sons, of whom only one now survives. Her father was minister of Ewes, and the grandfather of the late Sir John Malcolm. Mr Maxwell was for many years a justice of the peace and a deputy lieutenant of the county of Dumfries. He was a remarkably handsome man, about six feet high, and possessing a pleasing address. Broomholm, two miles from Langholm, and three from Dr Russell's place of residence, stands in a delightful valley near the junction of the Esk and Tarras, and is surrounded by extensive and lofty woods. He published, but without his name, "An Essay upon Tune; being an Attempt to free the Scale of Music, and the Tune of Instruments, from Imperfection." Edinb. 1781, 8vo. Pp. 290. The ingenious author died in the month of March 1806, at the age of seventy-nine years and ten months. He had a brother named Walter, and a sister named Mary. She was the wife of Mr John Little of Langholm, and the mother of the late Colonel Little, so highly distinguished in the wars of India.

RUSSIA.

History.

Origin of the Russian empire.

About the fifth century, a horde of those nations that roved at large on the banks of the Dnieper and the Volkhof, established themselves in that part of the region bordering on the Dnieper, where is now situated the government of Kief or Kiow. These people were called Slavi, or Slavonians, and had advanced eastward from the shores of the Danube. They appear to have laid the first foundation of the Russian monarchy, and to have built Kief, where they fixed their capital. It is probable that about the same time another tribe of Slavi had settled still farther to the east, in the province of Novgorod, where they built the city still known by that name, as their metropolis. Of the government and transactions of these people we have no regular accounts till the conclusion of the ninth century. It appears, however, from a work of the Emperor Constantine Porphyrogenneta on the administration of the empire, that in his time the city of Novgorod was a place of great importance, and carried on an extensive commerce, both with Constantinople and the countries bordering on the Baltic. The government of the Novgorodians appears to have been republican, but the people were probably rather merchants than warriors. We find them involved in frequent disputes with the neighbouring nations, from whose ravages they suffered considerable losses.

Settlement of the Varagians in Russia.

If we may credit the Russian historians, the Slavi that had settled about Kief and Novgorod must have extended the boundaries of their territory northwards as far as the shores of the Baltic. We find that they were much harassed by a piratical nation who dwelt on the coasts of that sea, and were denominated Varages or Varagians, and who made frequent descents on the Russian coasts, and ravaged the country. It is not improbable that these Varagians formed a part of the Scandinavian nations who, under the names of Danes and Saxons, successively made themselves masters of England. They were occasionally employed by the weaker neighbouring states as mercenary auxiliaries, and in this capacity they were once called to the assistance of the Novgorodians. The auxiliaries, after having overcome the enemies whom they were invited to combat, began to think of availing themselves of the advantages which their bravery had given them over their employers. From allies and servants they soon became the masters of the Slavi; and finding the country about Novgorod superior to that which they had left, they resolved to take up their residence in their new quarters.

An. 860. Establishment of the monarchy under Ruric.

Their leader Ruric built, near the Volkhof, a town whose site is now called Old Ladoga. Here he established the seat of his government. The event appears to have taken place about the year 860; and from this period we may date the commencement of the Russian monarchy. Ruric was assisted by two other chiefs of the Varages, Sinaus and Truvor, who are supposed to have been his brothers, and with whom he divided the territory of which he had possessed himself. Of these, Sinaus took up his residence at Bielo Osero, or the White Lake; while Truvor kept his court at Isborsk, or, according to some, at Twertzog, in the district of Pleskow. The three chiefs having thus divided among them the territories of the Novgorodians, continued to reign in amity with each other for several years.

Opposition of the Slavi.

The Slavi, however, did not immediately submit to the dominion of their new masters. They flew to arms, and chose for their leader Vadim, who by his feats in war had acquired the honourable appellation of the *valiant.* A fierce engagement took place between the Novgorodians and the Varages, which ended in favour of the latter, and the brave Vadim, with several other chiefs of the Novgorodians, lost their lives in the attempt to free their country from its ambitious guests. This new success emboldened Ruric to extend his territories, and to change the seat of government from the insignificant town of Ladoga, to the spacious and opulent city of Novgorod. Soon after, by the death of his partners in sovereignty, he became sole monarch of the conquered territory, where he reigned without further molestation for seventeen years, and became the primogenitor of a long line of descendants, who held the throne without interruption for several centuries. He appears to have been zealous for the strict administration of justice in his dominions, and issued his command to all the boyars, or nobles, who held territories under him, in order to see it exercised in an exact and uniform manner. Ruric assumed the title of grand prince. His dominions extended over the present governments of Riga, Revel, Polotsk, Pscov, Vyborg, St Petersburg, Novgorod, Smolensk, Olonetz, Archangel, Vladimir, Yaroslavl, Kostroma, and Vologda.

An. 879. Regency of Oleg.

As Ruric left only one son, Igor, who was still a minor at his father's death, Oleg, a kinsman of the deceased monarch, took upon him the administration of affairs. Either from the natural restlessness of the Varages, or from the spirit of rebellion manifested by the Novgorodians, which indicated the necessity of employing his people on some active enterprise, the new ruler did not long remain idle. He appears very early to have projected the extension of his territories, by annexing to them the settlement which the Slavi had formed about Kief, against which he soon undertook a formidable expedition. Collecting a numerous army, composed of Slavi, Varages, and Tschudes (a Finnish tribe dwelling in districts embraced in the modern governments of Pscov and Revel), he carried with him the young prince Igor, and opened the campaign with the capture of Lubitch, and of Smolensk the capital of the Krivitsches.

Annexation of Kief to the Russian principality.

Having advanced near the walls of Kief, he did not think it advisable to hazard an open attack. He therefore had recourse to artifice, and leaving behind him the greater part of his troops, he concealed the remainder in the barks that had brought them down the Dnieper from Smolensk. He himself, disguising his name and quality, passed for a merchant sent by Oleg and his ward Igor on business of importance to Constantinople; and he despatched officers to Oskhold and Dir, the two chieftains of the Kievians, requesting permission to pass through their territory into Greece, and inviting them to visit him as friends and fellow-citizens, pretending that indisposition prevented him from paying his respects to them in person. The princes, free from mistrust, accepted Oleg's invitation, and scarcely thought it necessary to take with them their ordinary attendants. They were soon undeceived; for when they arrived at the regent's encampment, they were quickly surrounded by the Varagian soldiers, who sprung from their place of concealment in the barks. Oleg taking Igor in his arms, and casting on the sovereigns of Kief a fierce and threatening look, exclaimed, "You are neither princes nor of the race of princes; behold the son of Ruric." These words, which formed the signal that had been agreed on, were no sooner uttered, than his soldiers rushed on the two princes, and laid them prostrate at the feet of their master. The inhabitants of Kief, thrown into consternation by this bold and treacherous act, made no resistance, but opened the gates of their city to their invader; and thus the two Slavonian states were united under one head.

Having thus made himself master of the key to the eastern empire, Oleg prepared to carry into effect his ambitious designs against Constantinople. Leaving Igor at Kief, he himself embarked on the Dnieper with eighty-thousand warriors, on board of not fewer than two thousand vessels. Their passage down the river met with no obstruction, till they came to that part where its course is embarrassed for nearly fifteen leagues by seven rocks; and here began a series of perils, labours, and fatigues, which none but barbarians could have overcome. They were obliged to unload their barks, and convey them over the rocks; and, in particular, at the fourth rock, they carried their baggage for above six thousand paces, exposed to the perpetual risk of attack from the neighbouring nations with whom they were at war, while thus hampered and encumbered. Having at length reached the mouth of the Dnieper, Oleg drew together his scattered vessels to be repaired, and waited for a favourable wind to carry him across the Black Sea to the mouth of the Dniester. Here the vessels were again refitted, and hence the expedition, coasting along the shores of the Euxine, soon arrived at the Strait of Constantinople.

First Russian expedition against Constantinople.

The inhabitants of the imperial city, on discovering the approach of the barbarians, had drawn a massy chain across the harbour, thus hoping to prevent their landing. In this hope, however, they were deceived. The invaders drew ashore their barks, fitted wheels to their flat bottoms, and converted them into carriages, which by the help of sails they forced along the roads that led to the city, and thus arrived under the walls of Constantinople. In their route they ravaged the whole country, and pillaged and demolished the houses; loaded the inhabitants with irons, and committed other enormities which generally attend the incursions of a barbarous enemy. The weak Leo, who then swayed the sceptre of the Grecian empire, instead of making a manly resistance, is said to have attempted carrying off his enemy by poison; but this not succeeding, he was obliged to purchase from the conqueror an ignominious peace. Oleg on his return made his entrance into Kief laden with the wealth acquired by his victory; and the people, dazzled with such splendid objects, imagined their prince to be endowed with supernatural powers, and looked up to him with a reverence approaching to adoration.

Soon after his return to his own dominions, the Russian monarch despatched deputies to Constantinople with the articles of a treaty, which he required the Greek emperor to sign. This treaty, which is preserved in the Chronicles of Nestor, is extremely curious; and we learn from it many important particulars respecting the internal policy of the Russians at the beginning of the tenth century. Several articles of it show that the Russian laws laid great stress on oaths; that they pronounced the sentence of death against the murderer, instead of inflicting on him only a pecuniary fine, and thus allowing the rich to commit assassination with impunity; that the punishment of offences did not extend to the entire confiscation of goods, and hence the widow and orphan did not suffer for a crime of which they were innocent; that robbery, which attacks only property, was punished by the privation of property; that the citizens, secure in their possessions, were under no apprehension that the sovereign would seize on their heritage, and might even dispose of their effects in favour of friends.

Oleg maintained the sovereign power for thirty-three years; nor does it appear that, Igor, even after he attained the age of majority, had any share in the administration, till the death of his guardian, in 913, left him in full possession of the throne.

An. 913.
Accession of Igor.

Igor had reached his fortieth year before he entered upon the government. He soon discovered marks of the same warlike spirit which had actuated his predecessor. Among the nations that had been subjugated by Oleg, several, on the accession of the new sovereign, attempted to regain their independence; the Drevlians, who dwelt on the banks of the Uscha, in the present district of Vrutsch, being the first to revolt. They were, however, soon quelled, and punished by the imposition of an increased tribute.

Igor had next to contend with more formidable enemies. The Petchenegans, a nation hitherto unknown, quitted their settlements on the Yaik and the Volga, and made incursions into the Russian territory. These people appear to have been at least as powerful and warlike as the Varages; and Igor, finding himself unable to cope with them, concluded a treaty of alliance. About five years afterwards, disputes arose between the new allies, and both had recourse to arms. It appears that the Russians were finally victorious, and the Petchenegans were for some time disabled from giving further molestation.

An. 94
Second
pedition
against
Constan
nople.

The Russian monarch, in imitation of his guardian, soon turned his attention towards the Grecian empire, where depredations might apparently be made with impunity. He equipped an immense armament, consisting, if we may credit the improbable tale of the Russian annals, of ten thousand barks, each carrying forty men, thus forming an army of four hundred thousand warriors. He set sail for Constantinople, without any previous declaration of war, and without any ostensible motive for thus infringing the treaty which had been concluded some years before between Oleg and Leo. In his route he overran and ravaged the provinces of Paphlagonia, Pontus, and Bithynia, plundering the towns, and butchering the inhabitants. For some time the barbarians met with no opposition, as the imperial troops were engaged in distant provinces; but the government of the empire was now in very different hands from those which had held it during the former invasion. The Grecian forces were well appointed, and commanded by two generals of approved ability and courage. These were Theophanes and Phocas, of whom the former commanded the fleet, and the latter the army. The Russians had soon cause to repent their temerity. Theophanes attacked them on board their ships, within sight of the Pharos, and throwing among them the unquenchable Grecian fire, with the effects of which they were wholly unacquainted, produced such confusion, that many plunged into the sea in order to avoid the flames that threatened and pursued them. Their vessels were dispersed, shattered, or burned, and great numbers of their crews perished. The remainder reached the shores of Bithynia; but before they could recover from their consternation, they were met by Phocas, who fell upon them with his troops, and made prodigious slaughter. So great were the losses sustained by Igor in this unfortunate expedition, that he carried back with him scarcely a third of his army. This second naval expedition of the Russians against Constantinople took place in 941.

Though discouraged by the ill success which had attended his first invasion of the Grecian empire, Igor was too much stimulated by the desire of plunder, not to risk a second attempt. Three years afterwards, he collected new forces, took into pay many of the Petchenegans, and again set out for Greece; but before he had advanced beyond the Taurican Chersonesus, the emperor Romanus, informed of his approach, and not choosing to hazard the result of an engagement, sent deputies to the Russian leader, offering to pay him the same tribute which had been given to his predecessor. With this offer Igor complied, and once more retired with his army.

Igor was now far advanced in years; but the insatiable rapacity of his officers, ever craving for fresh spoils from vanquished nations, impelled him to turn his arms against the Drevlians, for the purpose of obtaining from them an increase of their yearly tribute. In this unjust attack he was at first successful, and returned loaded with the contributions which he had levied from that people; but having dismissed great part of his troops with the spoils of the vanquished, and marching with the remainder too far into the country, he fell into an ambuscade, which the Drevlians, now grown desperate, had formed on his approach, in the neighbourhood of Iskorosch. The Russians were soon overpowered, and Igor being made prisoner, was put to death.

A 945.
ency
lga.

Before the death of Oleg, Igor had married a princess of a bold and daring spirit, named Olga, by whom he had one son, Sviatoslaf; but as this boy was very young at the death of his father, the queen-mother Olga assumed the reins of government. Her first care was to take signal vengeance upon the unhappy Drevlians, for having bravely defended themselves against the encroachments of foreign enemies. This tribe, satisfied with the death of their oppressor, appeared desirous of renewing their amicable intercourse with the Russians, and their chief, Male, is even said to have made an offer of his hand to Igor's widow. Olga, with that deep cunning and concealed malice that so often mark the character of the despotic leader of a barbarous people, pretended to listen to their overtures, and received the deputies of Male, but immediately ordered them to be privately put to death. In the mean time she invited a larger deputation from the Drevlian chief, which she treated in the same inhuman manner, taking care that no tidings of either murder should be carried to the Drevlians. She then set out, as if on an amicable visit, to conclude the new alliance, and having proclaimed a solemn entertainment, to which she invited some hundreds of the principal inhabitants of the Drevlian towns, she caused them to be treacherously assassinated. But this was only the first step to the more dreadful vengeance which she had resolved to inflict on this deluded people. She laid waste the whole country of the Drevlians, and in particular the town near which Igor had lost his life. For a long time she could not master the place, as the inhabitants, dreading the horrible fate that awaited them, from the revengeful spirit of Olga, defended themselves with the utmost valour and success. At length, being assured of clemency, upon condition of sending to their besieger all the pigeons of the town, they submitted; but the queen causing lighted matches to be fastened to the tails of the pigeons, set them at liberty. The birds flew to their usual places of residence in the town, which were speedily in a conflagration. The wretched inhabitants endeavouring to escape the flames, fell into the hands of the Russsian soldiers, planted around the town for that purpose, by whom they were put to the sword.

This was the only warlike transaction, if it deserves that name, which took place during the regency of Olga. Though not uncommon in the annals of a barbarous people, it would have been sufficient to hand down her name with detestation to posterity, had she not, in the opinion of her panegyrists, atoned for the enormity by attempting to introduce into her dominions the Christian religion.

Re on of
the avi.

Hitherto the Slavi, and the Scandinavian nations who had taken possession of their territories, were Pagans; and their religious ceremonies, like those of all the surrounding nations, were marked by an absurd and cruel superstition. Their deities seem to have been borrowed, partly from the Greeks and Romans, and partly from the Scythians; but were characterised by peculiar names, and represented by idols of complex workmanship and grotesque appearance. Thus, the god Perune, or Perkune, who was the chief among the Slavonian deities, was personated by an idol whose head was of silver, its ears and mustachios of massy gold, its legs of iron, and its trunk of hard incorruptible wood. It was decorated with rubies and carbuncles, and held in its hand a stone carved, being the symbol of lightning. The sacred fire burned continually before it; and if the priests suffered this to be extinguished, they were doomed to perish in the flames, as enemies of the god. Sacrifices of their flocks to this supreme deity were regarded as trifling. His altar smoked with the blood of captives, and even the children of his worshippers were sometimes immolated to appease his wrath or propitiate his favour.

Conversion of Olga to Christianity.

It is uncertain at what time the light of Christianity began to beam on the nations that occupied the banks of the Dnieper, nor are we acquainted with the circumstances that led to the conversion of the queen-regent. We find, however, that about the middle of the tenth century, she undertook a journey to Constantinople for the express purpose of being initiated into the religion of Jesus. Constantine Porphyrogenneta, who then sat on the imperial throne, received the royal convert with the greatest honour and respect; he himself conducted her to the baptismal font, and, in the character of her sponsor, gave to her the name of Helen. Her example, however, had little influence on her son, or the nation at large. The Russians do not seem to have been very ardent in their religious observances, nor peculiarly attached to the opinions of their forefathers; but the nature of Christianity, and the character of its disciples, were not in their eyes sufficiently striking or alluring to produce any change in their religious system. Olga's son, Sviatoslaf, either from his contempt for the unwarlike character of the Greek Christians, or through fear of the ridicule to which his conversion might subject him from his young companions, disregarded all his mother's solicitations. He did not, however, prevent the people from receiving baptism, and a few proselytes were made. Though the character of Olga, even after her conversion to Christianity, was by no means such as to entitle her to the rank which she afterwards attained among the Russian saints, it appears that she had given her son many wise and prudent instructions respecting the government of his future empire. She travelled with him round the country; superintended the erection of bridges and the making of roads, for the benefit of trade and commerce; built several towns and villages, and founded such laudable institutions, as sufficiently evince her talents for governing a nation. She died about the year 969, at a very advanced age.

Reign of Sviatoslaf.

It is probable that Olga retired from the administration of affairs soon after her conversion to Christianity; for we find Sviatoslaf in full possession of the government long before his mother's death. This prince has been considered as one of the Russian heroes; and if a thirst for blood, a contempt of danger, and a disregard of the luxuries and conveniences of life, be admitted as the characteristics of a hero, he deserves the appellation. His habits rendered him the idol of his army. He took up his habitation in the camp, where he led a life exactly similar to that of the meanest soldier.

An. 965.

His first expedition was against the Kozares, a people who had come from the shores of the Caspian and the sides of the Caucasus, and had established themselves along the eastern coast of the Black Sea. They had rendered tributary both the Kievians, and the Viateches, a Slavonian nation that dwelt on the banks of the Oka and the Volga. Sviatoslaf, desirous of transferring to himself the tribute which the Kozares derived from the latter people, marched against them, and appears to have succeeded in his design. He defeated them in a pitched battle, and took by storm their capital city, Sarkel or Belgorod. It is said by some historians that he even annihilated the nation; and certain it is, that from that time no mention is made of the Kozares.

His alliance with the Greek emperor.

The martial fame of Sviatoslaf had extended to Constantinople; and the Emperor Nicephorus Phocas, who was then harassed by the Ungrians, assisted by his treacherous allies the Bulgarians, applied for succours to the Russian chieftain. A subsidiary treaty was entered into between them, and Sviatoslaf hastened southward with a numerous army. He quickly made himself master of most of the Bulgarian towns along the Danube, and was so elated with his success that he determined to remove the centre of his government from Kief to the city of Pereiaslavatz, now Yamboly, situated upon the shores of that river. He was soon obliged, however, to postpone the completion of this design, on receiving intelligence that his old enemies the Petchenegans had assembled in great numbers, ravaged the Kievian territory, and laid siege to the capital, within the walls of which were shut up his mother and his sons. He hastened to the relief of his family, but before he reached home, the Petchenegans had been induced to raise the siege by an artifice of the Kievian general. Sviatoslaf on his arrival pursued the enemy, defeated them, and obliged them to sue for peace.

His division of the principality.

He now resumed his design of establishing himself on the banks of the Danube, and divided his hereditary dominions among his children. He gave Kief to Yaropolk, the Drevlian territory to Oleg, and on Vladimir, a natural son, born to him by one of the attendants of Olga, he bestowed the government of Novgorod. On his return to Bulgaria, indeed, he found that his affairs had assumed a very different aspect; for the Bulgarians, taking advantage of his absence with his troops, had recovered most of their towns, and seemed well prepared to resist the encroachments of a foreign power. Sviatoslaf, however, soon regained all that he had lost.

During these transactions the Emperor Nicephorus had been assassinated, and John Zimisces, his murderer, had succeeded to the imperial diadem. The new emperor sent ambassadors to the Russian monarch, requiring him to comply with the stipulations of his treaty with Nicephorus, and evacuate Bulgaria, which he had agreed to occupy as an ally, but not as a master. Sviatoslaf refused to give up his newly-acquired possessions, and prepared to decide the contest by force of arms. The particulars of this campaign, and the numbers of the contending armies, are very differently related by the Russian annalists, and the historians of the Grecian empire; the former stating that Sviatoslaf had not more than ten thousand men, and yet was victorious over the troops of Zimisces; while the Grecian historians affirm that the Russians amounted to three hundred thousand, but were defeated, and compelled to abandon Bulgaria. As far as respects the issue of the war, the Grecian writers are probably correct; for it is certain that Sviatoslaf retreated towards Russia with the shattered remains of his army. He did not, however, live to reach the capital; for having, contrary to the advice of his most experienced officers, attempted to return to Kief by the dangerous navigation of the Dnieper, he was intercepted by the Petchenegans near the cataracts of that river. After remaining upon the defensive during winter, exposed to all the horrors of famine and disease, he, on the return of spring, attempted to force his way through the ranks of the enemy; but his troops were defeated, and himself killed in the battle.

An 973. Succession of Yaropolk.

Yaropolk, the sovereign of Kief, may be considered as the successor of Sviatoslaf upon the Russian throne; but his reign was short and turbulent. A war took place between him and his brother Oleg, on account of a base assassination committed by the latter upon the son of his father's friend and privy councillor Svenald. Oleg was defeated and slain, and the other brother, Vladimir, dreading the increased power and ambitious disposition of Yaropolk, abandoned his dominions, which were quickly seized on by the Kievian prince. Vladimir had retired among the Varagians, from whom he soon procured such succours as enabled him to make effectual head against the usurper. While his natural courage was thus increased, his enmity against Yaropolk received an additional spur from an affront inflicted on him by a lady whom he had sought in marriage, but who, despising the meanness of his birth, as being the son of a slave, had rejected his proposals, and offered her hand to Yaropolk. The vindictive Vladimir, on being informed of this insult, attacked the possessions of the lady's father, put both him and his two sons to the sword, and obliged the princess to accept his hand, yet reeking with her parent's blood. He now advanced towards Kief, where Yaropolk was by no means prepared to oppose him. The Kievian prince had indeed been lulled into security by the treacherous report of one of his voyvodes, who was in the interest of Vladimir, and who not only prevented Yaropolk from taking effectual measures for his safety, but found means to raise suspicions in his breast against the inhabitants of his capital, which he thus induced him to abandon. The Kievians, left without a leader, opened their gates to Vladimir; and the wretched Yaropolk, still misled by the treachery of his adviser, determined to throw himself on the mercy of his brother. It is probable that this would have availed him little, as Vladimir seems to have determined on his death; but before he could reach the arms of his revengeful brother, Yaropolk was assassinated by some of his Varagian followers.

An. 981.

By this murder the conqueror acquired the undivided possession of his father's territories, and maintained the sovereignty during a long reign, respected at home, and feared abroad. Indeed, had not the commencement of his reign been stained with the blood of his father-in-law and his brother, we might place him among the most distinguished monarchs of the age in which he lived, as he not only extended and enriched his empire, but was the means of establishing in his dominions, upon a firm and lasting basis, the Christian religion, which, though introduced by Olga, appears hitherto to have made but a very trifling progress.

Reign of Vladimir the Great.

The commencement of Vladimir's reign formed but a continuation of those enormities which had conducted him to the throne. He began with removing Blude, the treacherous voyvode by whom his brother had been betrayed into his power, and to whom he had promised the highest honours and dignities. Accordingly, for three days he suffered Blude to live in all the splendour of a prince. At the end of that period he thus addressed him: "I have fulfilled my promise; I have treated thee as my friend; the honours thou hast received exceed thy most sanguine wishes. To-day, as the judge of crimes and the executor of justice, I condemn the traitor, and punish the assassin of his prince." Having uttered these words, he caused Blude to be put to death. He displayed still more the perfidiousness of his character in his behaviour towards the Varagians, who had assisted in placing him on the throne of his ancestors; for on their requesting permission to go and seek their fortune in Greece, he granted their request, but privately advertised the emperor of their approach, and caused them to be arrested and secured.

Vladimir engaged in numerous wars, and subjected several of the neighbouring states to his dominion. He seized on part of the Polish territories, and compelled the Bulgarians who dwelt in the districts that now form the government of Kazan to do him homage. He subjected the Petchenegans and Khazares, who lay in the immediate neighbourhood of the Kievian state; he reduced to his authority Halitsch and Vladimir, countries which are now called Gallicia and Lubomiria; he conquered Lithuania as far as Memel, and took possession of a great part of the modern Livonia.

Originally a devout Pagan.

His conduct after these successes by no means prognosticated his future zeal for the Christian religion. None of the Russian monarchs appears to have been more devout in the adoration of their heathen deities. It was usual for him to return thanks to the gods for the success which they had granted to his arms, and to show his gratitude by offering on their altars a part of the prisoners he had taken in war. Upon one occasion his piety extended so far, that he resolved on selecting one of his own subjects as the object of his sacrifice, thinking that he should thus more worthily testify his gratitude for the signal favours he had received from heaven. His choice fell upon a young Varagian, who was the son of a Christian, and had been brought up in the new faith. The unhappy father refused the demanded victim. The enraged people, deeming their prince and their religion insulted, assailed the house, and having burst open the doors, butchered both the father and the son, folded in mutual embraces.

Es lishes Ch tiani- ty Rus- sia.

Yet this furious Pagan and bloody warrior afterwards became a most zealous Christian, and a shining example of charity and benevolence to his subjects. The circumstances that led to these important changes are, as well as the martial achievements of this favourite prince, related with great minuteness by the Russian annalists, and give this part of their chronicles the air rather of a historical romance than a narrative of facts. We are told that the fame of Vladimir's military exploits had rendered him so formidable to the neighbouring nations, that each courted his alliance, and strove to render this more lasting by engaging him in the ties of the same religion with themselves. In particular, the Grecian emperors sent to him a philosopher, whose exhortations, though they did not at first induce Vladimir to embrace the Greek ritual, at least succeeded in giving him a favourable opinion of it; so that the philosopher was entertained with respect, and returned home loaded with presents. We are also told, that, determined to act in the most impartial manner with respect to the several religions which he had been invited to embrace, the prince despatched persons remarkable for their wisdom and sagacity to visit the surrounding nations, inspect the religious tenets and ceremonies that distinguished them, and communicate to him the result of their observations. On the return of these deputies, the report of those who had visited the churches of Constantinople, and witnessed the imposing splendour of religious adoration, and the gorgeous decorations of the Greek priests in the superb basilica of St Sophia, proved so satisfactory to Vladimir, that he determined on embracing the Christian religion according to the observances of the Greek church. But though he resolved on baptism, he was too proud to seek from the Greek emperor a priest by whom the solemn ordinance might be performed. He assembled an army selected from all the nations of which his empire was composed, and marching to Taurida, laid siege to Theodosia, which is the modern Kaffa. On sitting down before the walls of this place, he is said to have offered up the following characteristic prayer: "O God, grant me thy help to take this town, that I may carry from it Christians and priests to instruct me and my people, and convey the true religion into my dominions." His prayer was at length granted; for, rather by stratagem than by force, he made himself master of the town, and, through it, of the whole of the Crimea. He might now have received baptism; but his desire of being initiated in the Christian faith seems to have been excited more by ambition than by true devotion. His ruling passion promised to be amply gratified by an alliance with the Grecian emperors, as he would thus acquire some legal claim on the territories which they possessed. He therefore demanded in marriage Anna, the sister of Basilius and Constantine, who jointly held the imperial dignity; threatening, that if they refused his proffered alliance, he would lay siege to Constantinople. After some deliberation, the emperors complied, on condition that Vladimir and his people should become Christians; and these conditions being accepted, the Russian monarch was baptized, took the name of Basilius, received the Grecian princess, and, as the reward of his victories, carried off several popes and archimandrites, together with sacred vessels and church books, images of saints, and consecrated relics

His tered cha ter.

Whatever might have been the considerations that swayed Vladimir in his conversion to the Christian faith, it is certain that his new religion had the happiest influence on his subsequent life and conduct. He not only abjured idolatry himself, and destroyed the idols which he had caused to be raised in his dominions, but he used every exertion to persuade and compel his subjects to follow his example. Before his conversion he is said to have possessed five wives and eight hundred concubines; but after he became a Christian, he maintained an unshaken fidelity towards the imperial princess. As a Pagan he had been lavish of human blood; but after he had adopted the religion of Jesus, he could scarcely be prevailed on to sentence to death a single highway robber. His former delight had been in storming towns and gaining battles; but he now found his greatest pleasure in building churches, and endowing seminaries of education. He encouraged the raising of new cities and towns; peopled the waste districts of his country with the prisoners whom he had taken in war; and not only conducted himself as a sovereign who consulted the welfare of his dominions, but displayed many benevolent and amiable qualities that highly endeared him to his subjects. By thus showing that Christianity had made him both a milder and a wiser prince, he insured from his people a respect for the new religion, whilst the striking example of the sovereign and his nobles could not fail to influence the minds of the inferior orders. Having one day issued a proclamation, ordering all the inhabitants of Kief to repair next morning to the banks of the river to be baptized, the people cheerfully obeyed the order; observing, that if it were not good to be baptized, the prince and the boyars would never submit to the ceremony.

An. 1015. Death and character of Vladimir.

The establishment of Christianity in the Russian dominions forms one of the most prominent features in the reign of Vladimir, and gives him a much juster claim to the title of Great, which has been bestowed on him by historians, than all his numerous victories. We have therefore dwelt on it with the greater minuteness. Indeed the latter transactions of his reign afford but little interest. His last days were embittered by domestic vexations. His wife and one of his favourite sons died long before him; while another of his sons, Yaroslaf, on whom he had bestowed the government of Novgorod, refused to acknowledge him as his liege lord, and applied to the Varagians for assistance against his father. The aged Vladimir, compelled to march against a rebellious son, died of grief upon the road, after a long and glorious reign of thirty-five years.

His improvement of the Russian monarchy.

Notwithstanding the unfavourable circumstances we have noticed, the improvement which Russia owed to this prince was great and permanent. With the Christian religion he imported from Greece the arts which then flourished in that empire; and almost entirely new-modelled the language of his country, by engrafting on it the more refined dialect of the Greeks, and adopting, in a great measure, the letters of their alphabet.

The dominions of Russia, which at first consisted of two principalities, that of Novgorod, bordering on the Baltic, and that of Kief, occupying no very large space on the eastern bank of the Dnieper, were, by the victories of Vladimir, extended westward along the shores of the Baltic into Lithuania and Poland; southward along the shores of the Euxine, so as to include the Crimea and great part of the Bulgarian territories; whilst to the east it extended to the Oka, the Don, and the Volga. He still maintained the seat of government at Kief, of which he was styled grand prince, whilst the other districts were either tributary to that principality, or held of it as their superior.

Partition of his dominions amongst his sons.

Before his death, Vladimir had divided his extensive territories amongst his twelve sons, reserving to himself and his immediate heir the grand principality of Kief. The consequences of this ill-judged distribution were disunion, contention, and almost perpetual warfare amongst the brothers. The most respectable, and in the end the most powerful of these, was Yaroslaf, or, as he is commonly called, Jarislas, prince of Novgorod. This prince, finding that Sviatopolk, who had raised himself to the sovereignty of Kief after his father's death, attempted by assassination, or force of arms, to take possession of the neighbouring principalities, determined to resist him in his encroachments. Collecting an army of Novgorodians, he, in 1016, drove Sviatopolk from Kief, and forced him to seek an asylum with his father-in-law, Boleslas, duke of Poland. Boleslas, easily persuaded to engage in the cause of his son-in-law, accompanied Sviatopolk into Russia with an army, retook Kief, and obliged the Novgorodian prince to retire with precipitation. Whilst he was endeavouring to collect fresh forces to renew the war with Boleslas and Sviatopolk, the latter, by the treachery and perfidy with which he treated his Polish allies, contributed to his own downfall. He caused great numbers of the Poles to be secretly massacred, a transaction by which Boleslas was so incensed, that he plundered Kief, made himself master of several places on the Russian frontiers, and then left his perfidious son-in-law to shift for himself. Sviatopolk now sought assistance from the Petchenegans, and with an army of these auxiliaries offered battle to Yaroslaf, not far from the place where he had, four years before, caused one of his brothers to be murdered. The contest was long and bloody, but terminated in favour of Yaroslaf. Sviatopolk was put to flight, and died soon afterwards.

Reign of Yaroslaf. By this victory Yaroslaf acquired possession of the greater part of his father's dominions, and testified his gratitude for the assistance given him by the Novgorodians, by the attention which he paid to the particular improvement of that state. He drew up for it a code of laws, which are still known by the appellation of the municipal law of Novgorod. He also exerted himself for the welfare of other towns, and of the country at large.

An. 1051. Yaroslaf did not neglect the advancement of the Christian religion. He established a metropolitan in Kief, and thus gave to the Russian clergy a head, who might watch over the morals of the inferior pastors, and provide for the general dissemination of the Christian doctrine. He collected several books on the Greek religion, and caused many of them to be translated into the Russian language.

An. 1054. This monarch is supposed to have died in 1054, and to have reigned thirty-five years. He followed the example of his father, in dividing his territories amongst his sons, though he endeavoured to prevent the dissensions which he himself had witnessed from such a partition, by exhorting them on his death-bed to the most intimate concord, and endeavouring to convince them that they would be respected by their subjects, and feared by their enemies, only whilst they continued to act with unanimity.

Dissensions among the successors of Yaroslaf. We know little of the proceedings of Yaroslaf's successors, except that Isiaslaf, his eldest son, who until 1078 reigned as grand prince of Kief, had frequent disputes with his brothers, in which he was assisted by the Poles, and supported by the influence of the Roman pontiff.

From the death of Isiaslaf to the beginning of the thirteenth century, the history of Russia comprises little else than a continued series of intestine commotions and petty wars with the neighbouring states. The same system of dismemberment was continued by the succeeding princes, and was attended with the same result. There were during this period not fewer than seventeen independent principalities, though these were at length reduced to seven, viz. those of Kief, Novgorod, Smolensk, Vladimir, Tver, Halitch, and Moskva or Moscow. Of these, Kief and Novgorod long continued to be the most powerful, though they could not always maintain their superiority over the others; and towards the latter end of the period which we have mentioned, the district of Vladimir erected itself into a grand principality, and became at least as powerful as Kief and Novgorod.[1]

Inroads of the Poles. During the intestine broils that attended the dismemberment of the Russian monarchy, the ambition of its neighbours, with the folly of the contending princes, who solicited foreign aid against their rivals, contributed to diminish the strength and resources of the empire. In particular, the Poles and the Hungarians availed themselves of these circumstances. By ravaging the towns and villages, carrying off the captives into slavery, and making a prey of whatever appeared most useful, they quickly recompensed themselves for their assistance. The Poles seem to have been the most successful in their depredations, and to have fully revenged themselves for their former humiliation.

Invasion of Tartars. A state of anarchy and confusion, such as we have described, held out a strong temptation to powerful states in the vicinity. In the neighbourhood of the Sea of Aral, not far from the confines of Vladimir and Kief, the wandering hordes of Mongols, or Mongol Tartars, had taken up their residence. They were perhaps descended from the ancient Scythians, and long dwelt on the confines of China. Hence they gradually marched westward, and about the year 1223 arrived on the shores of the Sea of Aral, under the conduct of Tuschi, son of the famous Tschinghis Khan, chief of the Mogul empire. From the Aral, Tuschi conducted his horde along the shores of the Caspian Sea, and gradually approached the Dnieper. In his course he attacked and overcame the Tscherkasses, or Circassians, who on his approach had joined with the Polovtzes to resist the terrible enemy. The defeated Polovtzes gave notice to their neighbours the Russians, of the approaching storm, and invited them to form a common cause against the enemy. In the mean time the Tartars had sent ambassadors to the Russians, hoping to prevent their alliance with the Polovtzes, and thus the more easily to subdue the disunited nations. For this time, however, the Russians were true to their own interest. In concert with the Polovtzes they assembled an army, and prepared to resist the incursions of the Tartars. Both parties met near the small river Kalka, which flows into the Sea of Azof, and a furious engagement took place, ending in the complete overthrow of the Russians and their allies.

---

[1] In the supremacy of these three great principalities, we may trace the division of European Russia into Great, Little, and White Russia; a distinction which long maintained its ground, and in later times gave to the sovereign of this empire the title of monarch or emperor of all the Russias. Great Russia comprehended the principality of Novgorod, and extended northward to the White Sea, eastward to the river Dvina, and the entrance of the Petchora into the Ural Mountains; whilst to the south it bordered on the district of Vladimir, as far as the Volga and the mouth of the Medveditza, and to the west on Lithuania and Prussia, including the tributary tribes on the Baltic, as far as Memel. Its capital was Novgorod. Little Russia extended on the north along the river Ager to White Russia, on the east above the Donetz and the Oka to the Polovtzes and the Petchenegans; whilst to the south it stretched as far as the Tauric Chersonesus, or the Crimea, and to the west along the banks of the river Goryn. This was the principality of Kief, and in that city was the seat of government. The principality of Vladimir received the name of White Russia. It extended northward along the Volga, to the southern boundary of Great Russia; to the east it bordered on the possessions of the Ugres, and the territory of the Mordvines, stretching down the Volga to the mouth of the Oka; and to the south it extended along the Oka to the principality of Riazan, and the Bulgarian territory. The metropolis of this division was at first Shuja, and afterwards in succession Rostof, Susdal, and Vladimir, till at length the seat of government was transferred to Moscow.

The principality of Novgorod appears, during this interval, to have been the most respectable for its commercial intercourse with the neighbouring nations, and for the independent spirit of its internal government. This, though nominally monarchical, seems to have possessed much of a republican character. The princes were evidently dependent on the people, and some ludicrous instances of this dependence are related by the old historians. One of the grand princes had so much displeased his people, that they refused to pay him their usual obedience. As the prince seems to have been aware of the little influence which he possessed in the state, he employed the metropolitan of the principality to negotiate a reconciliation. This prelate, accordingly, by a letter addressed to the Novgorodians, interceded for the sovereign, and pledged himself as surety for his good behaviour.

About thirteen years after this defeat, another horde of Tartars, headed by Baaty Khan, the grandson of Tschinghis Khan, penetrated into Russia, after having attacked and defeated their neighbours the Bulgarians. The invaders soon spread far and wide the terror of their name. Wherever they came, the whole face of nature was laid waste; towns and villages were destroyed by fire; all the men capable of bearing arms were put to the sword, and the children, women, and old men, carried into captivity. If the inhabitants of the towns to which they approached offered a compromise, the faithless barbarians affected to receive their submission, but immediately broke the agreement, and treated those who surrendered to their mercy with as much rigour as those who had endeavoured to defend themselves and had been overcome. If the inhabitants of the open towns and villages came out to meet them, and to receive them as conquerors and friends, death, torture, or the most ignominious bondage, was the reward of their spontaneous submission.

The first state which the Tartars attacked was Riazan, the prince of which applied for assistance to Yury, commonly called by historians George Vsevolodovitch, grand prince of Vladimir. He sent them a few auxiliaries, but these either came too late, or their number was too small. The principality of Riazan fell, and its fall was succeeded by that of Pereiaslavl, Rostof, Susdal, and several others. Like a furious torrent rushing down the mountain side, and irresistibly bearing with it all that impedes its progress, these barbarous hordes poured rapidly along, sweeping all before them in one common devastation. They now approached the principality of Vladimir, and no army appeared to resist them upon the frontiers. They advanced unimpeded to the capital, which, left to its fate by the grand prince, had nothing to expect but the same cruel treatment which the neighbouring cities had received. Yury, with unpardonable negligence, was celebrating a marriage feast, when he ought to have been employed in collecting the means of defence against the enemy, of whose approach to his borders he had received timely intimation. The city of Vladimir, which contained the princess and two of her sons, was left to the protection of a chieftain totally unqualified for its defence; and the inhabitants seemed to share in the pusillanimity of their governor. Instead of annoying the enemy by occasional excursions, and preparing the means of defending the walls against a sudden attack, they gave themselves up to terror and despair; and as they conceived death to be inevitable, they prepared for it, by taking the habits of monks and nuns, in order to insure to themselves a blissful departure. A prey to fear and despondency, the city soon fell into the hands of the Tartars. They one morning scaled the walls, and meeting with little opposition, quickly made themselves masters of the place, when they cast aside every feeling of humanity, and, like beasts of prey, glutted their appetite for blood amongst the wretched inhabitants. The grand princess, and other ladies of distinction, dreading the brutality of the relentless conquerors, had taken refuge in the choir of a church, an asylum which all the assurances of the Tartars that they should suffer no injury could not prevail on them to abandon. It was therefore set on fire by the barbarians, who feasted their ears with the shrieks and groans of the women as the flames surrounded them.

Yury, incensed almost to desperation at the fate of his capital, and the horrible death of his wife and children, was determined to take signal vengeance on the assailants. He assembled all the forces which he could draw together; and though his army was greatly inferior in number to the Tartars, he marched against the enemy, and attacked them with the most determined valour. The struggle was short but bloody. The Tartars were victorious, and the body of Yury was found amongst the slain.

This appears to have been the only vigorous stand made by the Russian princes. The Tartars pushed forward with rapidity, and successively overpowered the principalities of Novgorod and Kief. In the latter city they found immense booty; but this circumstance did not prevent them from repeating here the same bloody scenes which they had acted in the other capitals. The governor was preserved from the cruelties that had been inflicted upon the inhabitants, by the courage he had displayed in defence of the city; and his noble demeanour, when he fell into the hands of the conqueror, acquiring the esteem and affection of that chief, enabled him to obtain a temporary repose to his country.

Succession of Russian princes under the Tartars.

The Tartars had now established themselves in the Russian territories, and their khan or chief, though he did not himself assume the nominal sovereignty, reigned as paramount lord, and placed on the throne any of the native princes whom he found most obsequious to his will, or who had ingratiated themselves by the magnificence of their presents. Till the middle of the fourteenth century, the throne was successively occupied by Yaroslaf II., Alexander Yaroslavitch called Saint Alexander Neffsky, Yaroslaf Yaroslavitch, Vasilii Yaroslavitch, Dimitri Alexandrovitch, Andrei, Daniil, both brothers of Dimitri, Mikaila Yaroslavitch, Yury Danilovitch, Alexander Mikailovitch, Ivan Danilovitch, Simeon Ivanovitch, and Ivan Ivanovitch.

Partial subjugation of Russia by the Poles.

During these several reigns, the miseries of a foreign yoke were aggravated by all the calamities of intestine discord and war; whilst the knights of Livonia, or Brothers of the Short Sword, as they are sometimes called, a kind of military order of religious, on one side, and the Poles on the other, catching at the opportunity, and attacking Russia, took several of its towns, and even some considerable countries. The Tartars and Russians, whose interests were in this case the same, often united to oppose their common enemy; but they were generally worsted. The Livonians took Pleskow, and the Poles made themselves masters of Black Russia, the Ukraine, Podolia, and the city of Kief. Casimir the Great, one of their kings, carried his conquests still farther. He asserted his pretensions to a part of Russia, in right of his relation to Boleslas, duke of Kalitz, who died without issue, and forcibly possessed himself of the duchies of Perzesmylia, Kalitz, and Luckow, with the districts of Sanock, Lubakzow, and Trebowla; of all which countries he made a province of Poland.

The newly-conquered Russians were ill disposed to endure the government of the Poles, whose laws and customs were more contrary to their own than those of the Tartars had been. They joined the latter to rid themselves of the yoke, and assembled an army numerous enough to overwhelm all Poland, but destitute of valour and discipline. Casimir, undaunted by this deluge of barbarians, presented himself at the head of a few troops on the borders of the Vistula, and obliged his enemies to retire.

An. 1362. Reign and successes of Dimitri Ivanovitch.

About the year 1362 Dimitri Ivanovitch received the sovereignty from the Tartar chief, and established the seat of his government at Moscow. This prince possessed considerable ambition, and contrived to inspire the other Russian princes with so much respect for his person and government, that they consented to hold their principalities as fiefs under Dimitri. This increased the consequence of the Russian prince, and excited the jealousy of Mammai the Tartar khan, who determined to take measures for maintaining his superiority. He began by demanding an increase of tribute; but when Dimitri demurred to this new encroachment, the khan not only insisted on his demand, but required the grand prince to appear before him in person. This requisition Dimitri thought proper to refuse, and prepared to support his refusal by force of arms. The terror with which the Tartars had inspired the inhabitants of Russia had now considerably subsided, whilst the hatred which the Russians bore these haughty masters was kept alive by the barbarism of their manners and the difference of their religion. The Christian ministers, justly dreading that the Tartars, in their furious progress, might extirpate Christianity, contributed all in their power to confirm the spirit of revolt amongst the people; and they promised the crown of martyrdom to such as should fall in battle against the infidels. Thus the contest into which the grand prince determined to enter in support of his authority became in some measure a holy war, undertaken in defence of the national religion. This combination of favourable circumstances operated so strongly in favour of Dimitri, and the princes that had confederated with him, that they soon collected an army of two hundred thousand men. With this force the grand prince left Moscow, and marched towards the Don, on the southern bank of which the Tartars were encamped. Arrived at this river, he left it to the choice of his troops, either to cross the river and encounter the enemy on the other side, or to await the attack where they were. The general voice declared for passing over to the assault. He accordingly transported his battalions across the river, that he might cut off all hope of escaping by retreat. The fight now commenced, and though the numbers of the enemy far exceeded their own, the Russians defended themselves valiantly against the furious onset of the Tartars; but as these barbarians were continually relieved by fresh reinforcements, they appeared to be gaining ground. Indeed, nothing but the impossibility of retreating across the river, and the firm persuasion that death would immediately transport them to the mansions of eternal bliss, restrained the Russians from a general flight. At the moment when the day seemed entirely lost, a detachment of the grand prince's army which had been stationed in reserve, and had remained out of the view of the enemy, came up with unabated force, fell on the rear of the Tartars, and threw them into such terror and confusion that they fled with Mammai at their head, leaving the Russians masters of the field.

This glorious victory, which took place in 1380, was attended with numerous advantages to the Russian cause. In particular, it taught the native princes that the Tartars were not unconquerable; and that nothing was wanting to relieve them from the galling yoke under which they had long groaned, but mutual union, courage, and prudence. The Tartars appear to have been so much humbled by this defeat, that for a time they left the Russians to enjoy in peace their recovered liberty. This forbearance, however, was not of long duration. Before the death of Dimitri, returning with increased numbers, they laid siege to Moscow, which, after an obstinate defence, was at length induced to surrender, and Russia once more submitted to her old masters.

An. 1389.
Reign of Vasilii.

Dimitri died in the year 1389, and was succeeded by his son Vasilii Dimitrievitch. In the reign of this prince a new incursion of the Tartars took place, under the great Timur or Tamerlane, who, after having subdued all the neighbouring Tartar hordes, extended his conquests to the Russian territories, took Moscow by assault, and carried off immense plunder.

The grand principality of Vladimir, or, as it may now be called, of Moscow, had, at the end of the fourteenth century, attained its greatest height, whilst that of Kief had proportionally declined. This latter principality was, at the time of which we are now writing, under the dominion of the Poles, having been seized on in 1320 by Gedemin, duke of Lithuania.

Accession of Ivan Vasiliivitch.

The later part of the fifteenth century forms a splendid epoch in the Russian history. At this time, viz. from 1462 to 1505, reigned Ivan Vasiliivitch, or, as he is commonly called, John Basilovitz. This able prince, by his invincible spirit and refined policy, became both the conqueror and deliverer of his country, and laid the first foundation of its future grandeur. Observing with indignation the narrow limits of his power at his accession to the throne, after the death of his father Vasilii the Blind, he began immediately to resolve within himself upon the means of enlarging his dominions. He demanded and obtained in marriage Maria, sister of Michael duke of Twer, whom he soon afterwards deposed, on pretence of revenging the injuries done to his father, and added this duchy to his own territories of Moscow. Maria, by whom he had a son, who died before him, did not live long; and upon her death he married Sophia, daughter of Thomas Palæologus, who had been driven from Constantinople, and forced to seek shelter at Rome, where the pope portioned this princess, in hopes of thus procuring great advantage to the Catholic religion; but his expectations were frustrated, Sophia being obliged to conform to the Greek church after her arrival in Russia.

Incited by his wife to shake off the Tartar yoke.

The Russians certainly owed to this alliance their deliverance from the Tartar yoke. Shocked at the servile homage exacted by these proud victors, when she saw her husband going to meet their ambassadors at some distance from the city, and standing to hear what they had to say, whilst they were at dinner, Sophia told him that she was surprised to find she had married a servant to the Tartars. Nettled at the reproach, Ivan feigned himself ill when the next deputation from the Tartars arrived, and by means of this stratagem avoided a repetition of the humiliating ceremonial. Another circumstance equally displeasing to the princess was, that the Tartars possessed by agreement, within the walls of the palace at Moscow, houses in which their ministers resided; a stipulation which they had made at once to show their power and watch the actions of the grand prince. To rid her husband and herself of these unpleasant neighbours, Sophia sent a formal embassy to the khan, to inform him, that as she had been favoured with a vision from above, commanding her to build a temple in the place where then stood the houses of the Tartar ministers, her mind could not be at ease till she had fulfilled the divine command; she therefore desired his leave to pull them down, and give his people others. The khan consented. The houses within the Kremlin were demolished, and no new ones being provided, the Tartar residents were obliged to leave Moscow; an affront which their prince was not able to revenge, as he was then engaged in a war with the Poles.

His successes against the Tartars.

Ivan, taking advantage of this circumstance, and having gradually increased his forces, now openly disclaimed all subjection to the Tartars, attacked their territories, and made himself master of Kazan. Here he was solemnly crowned with a diadem which is said to be the same that is still used in the coronation of the Russian sovereigns. This took place about the year 1470, and led to a complete emancipation of Russia from the Tartar dominion. Ivan afterwards carried his arms against the neighbouring states. Asiatic Bulgaria, and great part of Lapland, soon submitted to him; and the great Novgorod, a city then so famous that the Russians were accustomed to intimate their idea of its importance by the proverbial expression, Who can resist God and the great Novgorod? was reduced by his generals after a seven years' siege, and yielded immense treasure. After he quitted the city, which had been awed by his presence, the discontents excited at his violent measures broke out into acts of mutiny, upon which he, in 1485, carried off fifty of the principal families, and distributed them through several of the Russian towns. He afterwards removed some thousands of the most considerable inhabitants, and substituted for them more loyal subjects from other places. By these proceedings the flourishing commerce of this city received a considerable shock, and it suffered still more by the imprisonment of all the German merchants, and the confiscation of their effects, with the abolition of the old municipal franchises. Indeed from this period Novgorod never recovered its former splendour.

inva- of Li- a and honia.

After his reduction of this city, Ivan invaded the territories of Livonia and Esthonia, in consequence, as we are told, of an affront offered to him by the inhabitants of Revel. Here, however, he met with a stout resistance, and does not seem to have made much progress. Towards the conclusion of his reign, the Kazanian Tartars, who, though humbled, had continued to inhabit that district, made a hard struggle to shake off the Russian yoke that had been imposed on them; but Ivan had established his authority too firmly for them to accomplish their purpose during his life. He died in 1505, and was succeeded by his son Vasilii Ivanovitch, commonly called Basilius III.

A 1505. rn of lii III.

The Tartars of Kazan were still suffered to maintain a show of independency, by electing their own khans; but a Russian noble, under the denomination of voyvode, was associated with the khan in the government, and took care that the administration should be conducted in such a manner as to secure the interests of his master. About fourteen years after the death of Ivan, however, the Tartars resolved to overturn so humiliating an administration. They murdered the Russian voyvode, expelled their nominal khan, and united themselves with their brethren of the Crimea. With their assistance they assembled a mighty force, entered the Russian dominions, and carried their arms even to the gates of Moscow. The grand prince Vasilii found himself at that time unable to resist the barbarians; and therefore purchased an exemption from general pillage by great presents, and a promise of renewed allegiance. The Tartars retired, but carried off immense booty, and nearly three hundred thousand prisoners, the greater part of whom they sent to Theodosia in the Crimea, and sold to the Turks. This humiliation of Vasilii did not, however, long continue; and he was soon enabled to make head against the Tartars, and to recover possession of the city Kazan, and of Pscove, a city which had been built by the Princess Olga, and was the great rival of Novgorod in wealth and commercial importance. Under this prince all the principalities of Russia were once more united, and they have remained ever since under the dominion of one sovereign.

A 1533. I Vasi- ch II.

It was under the son and successor of Vasilii, Ivan IV., or, as he is styled by the Russian historians, Ivan Vasilii-vitch II., that Russia completely emancipated herself from her subjection to the Tartars, and acquired a vast accession of territory, which extended her empire into the north-east of Asia, and rendered her for the first time superior in extent to any state that had appeared since the Roman empire. Vasilii died in 1533, having reigned twenty-eight years, and lived fifty-five. His son Ivan was only three years old when he succeeded to the throne; and during his minority the state became a prey to anarchy and confusion. But when he attained his seventeenth year, he was able to assume the reins of government without opposition; and, from the important transactions in which he immediately engaged, he must have been possessed of considerable resources.

A 547. Hi ha- rac .

In taking into his own hands the administration of the state, Ivan displayed so much prudence and manly fortitude as soon raised him very high in the estimation of his subjects. At the same time he showed marks of a tyrannical disposition and irritability of temper, which made him rather feared than admired by his friends, whilst they rendered him an object of terror to his neighbours and his enemies. He saw himself surrounded on all sides by contending factions, and to suppress these was the first object of his care. In the choice of means for effecting this, he does not seem to have been very scrupulous, provided they tended to the accomplishment of his end; and in punishing the offences of those who opposed his purpose, his violence of temper not unfrequently led him to confound the innocent with the guilty. He was successful, however, in his great design; and having secured the domestic tranquillity of his dominions, he had leisure to direct his attention to the more remote but not less predominant objects of his ambition. He resolved to attempt liberating his country for ever from the dominion of the Tartars; and he succeeded. In the year 1551 he marched an army in the depth of winter into the district of Kazan, and laid siege to the capital, checking by severe punishments the murmurs of his troops, who loudly and openly expressed their dislike to this expedition.

His siege of the Tartar capital.

Before entering seriously on the siege of Kazan, he built several forts on the frontiers of the Tartar territories, by which he hoped to awe these barbarians, and to prevent them from disturbing the peace of his dominions. He then invested Kazan, and, in the year 1552, made himself master of it by the new, and, to the Tartars, unheard-of method of springing a mine below the walls. The inhabitants that escaped slaughter were offered mercy on condition that they should embrace the Christian faith. By this important conquest, the dominion of the Tartars, who had oppressed the Russians for more than three centuries, was completely and permanently overthrown.

His extension of the Russian territories.

About two years later Ivan extended his conquests eastward to the shores of the Caspian, and took possession of the territory that lay on the right bank of the Volga, round the city of Astracan, which was also inhabited by the Tartar hordes.

His severe treatment of Novgorod.

Ivan, as well as his grandfather, had found it necessary to chastise the inhabitants of Novgorod. But, in the year 1570, this city, being suspected of forming a plot for delivering itself and the surrounding territory into the hands of the king of Poland, felt still more severely the effects of his vengeance. All who had been in any degree implicated in the conspiracy, to the number of twenty-five thousand, suffered by the hands of the executioner. The city of Pscove was threatened with a similar proscription; but Ivan, on their voluntary submission, contented himself with the execution of a few monks, and the confiscation of the property of the most opulent inhabitants. It is not surprising that acts like these should have given to this prince the names of *terrible* and *tyrant*, by which historians have occasionally distinguished him; though it is not a little extraordinary that he should have retained so much interest in the affections of his subjects, that when, to try their attachment, he, in 1575, abdicated the government, and retained only the title of Prince of Moscow, the majority of the nation loudly expressed their wish for him to resume the administration of affairs. We can account for this only by considering the measures which he had adopted for the improvement and the civilization of his people. These were of such a nature as in a great measure to obliterate the remembrance of his cruelty and oppression. He promulgated a new code of laws, composed partly of such ancient statutes as were still in force, and were capable of improvement, and partly of new regulations, which he either contrived himself, or adopted from the neighbouring states. He found it necessary, however, to render many of these laws extremely severe; though their execution was most frequently exemplified in the persons of his nobles, whose proud obstinacy seemed unconquerable by more lenient measures.

Cultivates an intercourse with the neighbouring states.

Ivan cultivated an intercourse with several of the European states, especially with Germany. In 1547, he sent a splendid embassy to the Emperor Charles V., requesting him to permit a number of German artists, mechanics, and literary men, to establish themselves in Russia. Charles readily complied with his request, and several hundred volunteers were collected and assembled at Lubeck, whence they were to proceed through Livonia to Moscow. The Lubeckers, however, afraid lest the improvement of the Russians in arts and manufactures might render them independent of their neighbours, and diminish the commercial intercourse that had long subsisted between their city and the principal towns of Russia, arrested the Germans on their route; and, in concert with the merchants of Revel and Riga, sent a petition to Charles, requesting him to recall the permission he had granted. In consequence of these measures, many of the German artists returned home; but several of them escaped the vigilance of the Lubeckers, and reached Moscow by a circuitous journey. Ivan endeavoured to revenge himself on the Livonians by invading their country, which was strenuously defended by the Teutonic knights; and these champions, finding at last that they were unable to maintain their ground, put the territory under the protection of Poland.

War between the Russians and Swedes.

The Swedes also received a share of the Livonian territories; and this circumstance gave rise to a war between them and the Russians. Ivan invaded Finland; but that country was bravely defended by William of Furstenberg, grand-master of the Livonian knights, with the assistance of the troops of Gustavus Vasa; and it does not appear that Ivan gained much in this expedition, though we are told that the Livonian grand-master ended his life in a Russian prison.

An. 1553. First intercourse between England and Russia.

In 1553, an event happened which first led to an intercourse between Russia and England. Some Englishmen, who were at that time on a voyage of discovery, landed on the shores of the White Sea, where soon after was built the port of Archangel. They were hospitably received by the natives; and intimation of the circumstance being conveyed to Ivan, he sent for the strangers, and was so much pleased with their abilities and deportment, that he resolved to give every encouragement to the English commerce, and thus open a new channel of intercourse with a highly polished nation, by which his subjects might obtain fresh incitements to activity and industry. He expressed the highest esteem for Queen Elizabeth, and requested by his ambassador, that if the ingratitude of his subjects should ever compel him to quit Russia (a circumstance by no means improbable), she would grant him an asylum in her dominions. It was in consequence of this accidental communication between the Russians and the English that England first engaged in a trade to Russia, and promoted this new commerce by the establishment of a company of Russian merchants in London.

Ivan annexes Siberia to the Russian empire.

About twenty years after Astracan had been annexed to the Russian empire, a new acquisition of territory accrued to it from the conquests of a private adventurer, in the unknown regions of Siberia. The steps that led to the acquisition of this immense tract of the Asiatic continent are thus related by Tooke.

"The grand prince, Ivan III. had already sent out a body of men, who penetrated across the Ingrian Mountains, and traversed all the districts as far as the river Oby. But, amidst the urgent affairs of government, the discoveries they made insensibly fell into oblivion. Some years afterwards, a merchant named Stroganof, who was proprietor of some salt-works on the confines of Siberia, was curious to gain a farther knowledge of that country, which was likewise inhabited by Tartars, whose khan resided in the capital Sibir. Perceiving, among the persons who came to him on affairs of trade, men who belonged to no nation with which he was acquainted, he put several inquiries to them concerning the place whence they came, and once sent a few of his people with them back to their country. These people brought with them, at their return from the regions they had now explored, and which proved to be this very Siberia, a great quantity of valuable furs, and thus opened to their master a new road to wealth. However, not so covetous as to wish to keep this treasure to himself, he sent information of it to the court, and the attention of government was once more directed to this country. But the conquest of it, and its conjunction with Russia, was reserved for an adventurer named Timoseycf Yermak. This Yermak, at the head of a gang of Don Kozaks, had made it his practice to rob and plunder the caravans and passengers that occasionally frequented the roads, as well as the inhabitants, wherever he came, and was so fortunate as to escape the search of the Russian troops that had been sent out against him and his band, which consisted of not fewer than six thousand men. On their flight, he and his people accidentally came to the dwelling of Stroganof, where, hearing much talk about Siberia, and being persons who had nothing to lose, and therefore might put all to the hazard, they soon formed a plan to penetrate farther into that country, and there seek at once their safety and their fortune. After numerous struggles and conflicts with the natives, which greatly reduced their numbers, they at length conquered the capital, and shortly after the whole country. Yermak now presented the fruit of his toilsome and perilous victories to his Czar,[1] Ivan, in hopes of obtaining thereby a pardon of his former depredations, which was granted him accordingly; and by the building of several towns, and the constructing a number of forts, the possession of this country was soon permanently secured. The less and the greater Kabardey were also added to Russia in the reign of Ivan. This Czar, however, not only enlarged the circumference of his empire, partly by force of arms and partly by accident, but he resolved to reform his people, to render them more polished, more skilful, and more industrious; but this he found to be the most arduous enterprise he could possibly have undertaken. The insuperable impediments which threw themselves in the way of the execution of this grand work, were the principal incitements to those frequent acts of cruelty and despotism which have covered his memory with so deep a stain."

His victories over the Tartars.

Towards the close of Ivan's reign, a prodigious army of Tartars entered Russia, with a design to subdue the whole country. But Zerebrinoff, the Czar's general, having attacked them in a defile, put them to flight with considerable slaughter. They then retired towards the mouth of the Volga, where they expected a considerable reinforcement; but being closely pursued by the Russians, and the Tartars in alliance with them, they were again defeated, and forced to fly towards Azof, where their army was almost annihilated.

Destruction of Moscow by the Tartars.

From this time the empire of Russia became so formidable that none of the neighbouring nations could hope to make a total conquest of it. The Poles and Swedes indeed continued to be very formidable enemies; and, by the instigation of the former, the Crim Tartars, in 1571, again invaded the country with an army of seventy thousand men, which totally defeated the Russians in a battle fought within eighteen miles of the city of Moscow. The Czar retired with his most valuable effects to a well-fortified cloister; upon which the Tartars entered the city, plundered it, and set fire to several churches. A violent storm which happened at the same time soon spread the flames all over the city, which was entirely reduced to ashes in six hours. The fire likewise communicated itself to a powder magazine at some distance from the city; an accident by which upwards of fifty rods of the city wall, with all the buildings upon it, were destroyed; and, according to the historians, upwards of a hundred and twenty thousand citizens were burned or buried in the ruins. The castle, however, which was strongly fortified, could not be taken; and the Tartars, hearing that a formidable army was coming against them under the command of Magnus duke of Holstein, whom Ivan had made king of Livonia, thought proper to retire. The war, nevertheless, continued with the Poles and Swedes; and the Czar being defeated by the latter after some trifling success, was reduced to the necessity of suing for peace; but the negotiations being broken off, the war was renewed with the greatest vigour. The Livonians, the Poles, and the Swedes, having united in a league against the Russians, gained great advantages over them; and in 1579, Stephen Batory, who was then raised to the throne of Poland, levied an army expressly with a design of invading Russia, and of regaining all that Poland had formerly claimed, which, indeed, was little less than the whole empire. Ivan found his undisciplined multitudes unable to cope with the regular forces of his enemies; their conquests were so rapid that he was soon obliged to sue for peace, which, however, was not granted; and it is possible that the number of enemies which now attacked Russia might have overcome the empire entirely, had not the allies grown jealous of each other. The consequence of this was, that in 1582 a peace was concluded with the Poles, in which the Swedes were not comprehended. However, the Swedes, finding themselves unable to effect any thing of moment after the desertion of their allies, were obliged to conclude a truce; shortly after which, the Czar, having been worsted in an engagement with the Tartars, died in the year 1584.

---

[1] Previous to the reign of Vasilii, the predecessor of the monarch whose transactions we are now relating, the Russian sovereigns held the title of Velikii Kniaz, which has been translated Grand Duke, though it more properly denotes Grand Prince; and by this latter appellation we have accordingly distinguished the preceding monarchs. Vasilii, near the conclusion of his reign, adopted the title of Czar or Emperor; but this title was not fully established till the successes and increasing power of his son Ivan enabled the latter to confirm it both at home and abroad; and since his time it has been universally acknowledged.

An. 1584. Reign of Feodor Ivanovitch.

The eldest son of the late Czar, Feodor (or, as he is commonly called, Theodore) Ivanovitch, was by no means fitted for the government of an empire so extensive, and a people so rude and turbulent, as had devolved to him by the death of his father. Ivan had seen the incapacity of his son, and had endeavoured to obviate its effects by appointing three of his principal nobles as administrators of the empire; whilst to a fourth he committed the charge of his younger son Dmitri or Demetrius. This expedient, however, failed of success; and, partly from the mutual jealousy of the administrators, partly from the envy which their exaltation had excited in the other nobles, the affairs of the empire soon fell into confusion. The weak Feodor had married a sister of Boris Gudonof, a man of great ambition, immense riches, and tolerable abilities. He had long directed his wishes towards the imperial dignity, and began to prepare the way for its attainment by removing Dmitri. This young prince suddenly disappeared; and there is every reason to believe that he was assassinated by the order of Boris. Feodor did not long survive his brother, but died in 1598, not without suspicion of having been poisoned by his brother-in-law. We are told that the Czarina, Irene, was so much convinced of this, that, retiring to a convent, she never afterwards held any communication with her brother.

Accession of Boris, and termination of the dynasty of Ruric.

With Feodor ended the family of Ruric, a dynasty which had enjoyed the supreme power in Russia ever since the establishment of the principality by the Varagian chief, that is, during a period of above seven hundred years. On the death of Feodor, as there was no hereditary successor to the vacant throne, the nobles assembled to elect a new Czar; and the artful Boris having, through the interest of the patriarch, procured a majority in his favour, was declared the object of their choice. He pretended unwillingness to accept the crown, declaring that he had resolved to live and die in a monastery; but when the patriarch, at the head of the principal nobles, and attended by a great concourse of people, bearing before them the cross, and the effigies of several saints, repaired to the convent, where the artful usurper had taken up his residence, he was at length prevailed on to accompany them to the palace of the Czars, and suffer himself to be crowned.

Boris is one instance amongst many of a sovereign who became beneficial to his subjects, though he had procured the throne by unjustifiable means. If we give implicit credit to the historians of those times, he was a murderer and a usurper, though he had the voice of the people in his favour; but by whatever means he had attained the imperial power, he seems to have employed it in advancing the interest of the nation, and in improving the circumstances of his people. He was extremely active in his endeavours to extend the commerce, and improve the arts and manufactures, of the Russian empire; and for this purpose he invited many foreigners into his dominions. Whilst he exerted himself in securing the tranquillity of the country, and defending its frontiers against the incursions of his neighbours, he made himself respected abroad, and received ambassadors from almost all the powers of Europe.

An. 1601. Dreadful famine at Moscow.

Soon after the commencement of his reign, the city of Moscow was desolated by one of the most dreadful famines recorded in history. Thousands of people lay dead in the streets and roads; and in many houses the fattest of the inmates was killed to serve as food for the remainder. Parents are said to have eaten their children, and children their parents; and we are told by one writer of the time that he saw a woman bite several pieces out of her child's arm as she was carrying it along. Another relates, that four women having desired a peasant to come to one of their houses, on pretence of paying him for some wood, killed and devoured both him and his horse. This dreadful calamity lasted three years, notwithstanding all the exertions of Boris to provide for the necessities of the inhabitants.

Invasion of the pretender Dmitri.

During these distresses of the capital, the power of Boris was threatened with annihilation by an adventurer who suddenly started up, and pretended to be the young prince Dmitri, whom all believed to have been assassinated, or, as Boris had given out, to have died of a malignant fever. This adventurer was a monk named Otrepief. He retired from Russia into Poland, where he had the dexterity to ingratiate himself with some of the principal nobles, and to persuade them that he was really the lawful heir to the crown of Russia. The better to insure to himself the support of the Poles, he learned their language, and professed a great regard for the Catholic religion. By this last artifice he both gained the attachment of the Catholic Poles, and acquired the friendship of the Roman pontiff, whose blessing and patronage in his great undertaking he further secured, by promising that, as soon as he should have established himself on the throne, he would make every exertion to bring the Russians within the pale of the Catholic church. To the external graces of a fine person, the pretended Dmitri added the charms of irresistible eloquence; and by these accomplishments the Polish voyvode of Sandomir was so much captivated that he not only espoused his cause, but promised to give him his daughter in marriage as soon as he should be placed on the throne of his fathers. This respectable man exerted himself so warmly in behalf of his intended son-in-law, that he brought over even the king of Poland to his party. The Kozaks of the Don, who were oppressed by Boris, hoping to gain at least a temporary advantage by the disturbance excited in favour of the adventurer, eagerly embraced the opportunity of declaring in his favour. The news soon penetrated into Russia; and although Boris did all in his power to destroy the illusion, by prohibiting all intercourse between his subjects and the Poles, and by appealing to the evidence of the murdered prince's mother in proof of his death, the cause of the pretender continued to gain ground. Many circumstances concurred to interest the Russian people in favour of Otrepief. The courtiers of the usurper, who had long been jealous of his elevation, pretended to believe his assertions; whilst those who were persuaded that the young prince had been murdered by order of the present Czar, regarded this event as a judgment from heaven. The greater part of the nation appear to have been persuaded that the pretender was the real Dmitri; and as they believed that he had been miraculously preserved, they piously resolved to concur with the hand of Providence in assisting him to recover his just rights. Thus, before he had set foot in Russia, a numerous party was formed in his behalf. He soon made his appearance on the frontiers with a regiment of Polish troops, and a body of Kozaks. Boris sent an army to oppose him; but though the number of these troops greatly exceeded the small force of the invaders, the latter were so animated by the eloquence of their leader, and the intrepidity and personal bravery which he displayed in the field of battle, that, after a bloody conflict, the army of Boris was defeated, and the pretended Dmitri remained master of the field.

His successes.

This victory served still further to strengthen the belief that Dmitri was favoured by heaven, and consequently could not be an impostor. To confirm the good opinion which he had evidently acquired, the victor treated his prisoners with great kindness; caused the dead to be decently interred; and gave strict injunctions to his troops to behave with humanity in the towns through which he passed. This gentle behaviour, when contrasted with the horrible excesses committed by the soldiers of Boris, wherever the people appeared to show any inclination towards the cause of the invader, gained Dmitri more adherents than even the persuasion that he was the lawful sovereign of the country. Unluckily for Boris, likewise, the superstition of the Russians was about this time directed against him, by the appearance of a comet, and by the more than usual coruscations of the aurora borealis, phenomena which were immediately regarded as manifest demonstrations that the Almighty was pouring out his phials of wrath on the devoted country. Boris, unable to resist the torrent of public opinion in favour of his rival, is said to have taken poison, and thus hastened that fate which he foresaw awaited him if he should fall into the hands of his enemies.

An. 1605.

The death of Boris took place in the year 1605; and though the principal nobility at Moscow placed his son Feodor on the throne, the party of Dmitri was now so strong, that Feodor was dethroned and sent to prison with his mother and sister, within six weeks after his accession.

He ascends the Russian throne.

The successful monk had now attained the summit of his ambitious hopes, and made his entry into Moscow with the utmost magnificence. Not deeming himself secure, however, whilst the son of Boris remained alive, he is said to have caused him to be strangled, together with one of his sisters. The new Czar, though he evidently possessed great abilities, seems to have been deficient in point of prudence. Instead of conciliating the favour of his subjects, he openly displayed his predilection for the Poles, conferring on them high posts and dignities, and even conniving at the extravagance and enormities which they committed. This impolitic conduct, together with his partiality for the Catholic religion; his marked indifference towards the public worship of the national church, and his want of reverence for the Greek clergy; his marrying a Polish lady; his affectation of Polish manners; his inordinate voluptuousness, and the contempt with which he treated the principal nobility; so exasperated the Russians, that discontents and insurrections arose in every quarter of the empire. The populace of the capital were at length roused to fury, by a rumour that a timber fort which he had caused to be constructed before Moscow, was intended to serve as an engine of destruction, and that at a martial spectacle which the Czar was preparing for the entertainment of his bride, the Poles, and other foreigners that composed his body guard, were from this building to cast firebrands into the city, and then slaughter the inhabitants. The people were still further incensed by the clergy, who declaimed against Dmitri as a heretic, and by Schuiskoy, a nobleman who had been condemned to death by the Czar, but had afterwards been pardoned. This nobleman put himself at the head of the enraged mob, and led them to attack the palace. They entered it by assault, put to the sword all the Poles whom they found within its walls, and afterwards extended their massacre to such as were discovered in other parts of the city. Dmitri himself, in attempting to escape, was over taken by his pursuers, and thrust through with a spear; and his dead body, being brought back into the city, lay for three days before the palace, exposed to every outrage that malice could invent or rage inflict. His father-in-law and his wife escaped with their lives, but were detained as prisoners, and the Czarina was confined at Yaroslaf.

Unsettled state of Russia.

Schuiskoy, who had pretended to be actuated by no other motives than those of the purest patriotism, now aspired to the vacant throne, and had sufficient interest to carry his election. His reign was short and uninteresting, and indeed from this time till the accession of the house of Romanof in 1613, the affairs of Russia have little to gratify our curiosity. Schuiskoy's reign was disturbed by the pretensions of two fictitious Dmitris, who successively started up, and declared themselves to be either the late Czar, or the prince whom he had personated; and his neighbours the Swedes and Poles, taking advantage of the internal dissensions in the empire, made many successful incursions into Russia, set fire to Moscow, and massacred above a hundred thousand of the people. The Russians, dissatisfied with the reigning prince, treated with several of the neighbouring potentates for the disposal of the imperial crown. They offered it to Vladislaf, or Uladislas, son of Sigismund, king of Poland, on condition that he should adopt the Greek persuasion; but as he rejected this preliminary, they turned their eyes first on a son of Charles IX. of Sweden, and then on a young native Russian, Mikhail Feodorovitch, of the house of Romanof, a family which was distantly related to their ancient Czars, and of which the head was then metropolitan of Rostof, and as such held in great estimation. The influence of the clergy, who exerted themselves for Mikhail, both by personal intrigues and by the dissemination of pretended revelations from heaven, silenced the supporters of the other claimants; and after a long series of confusion and disaster, there ascended the Russian throne a new family, whose descendants have raised the empire to a state of grandeur and importance unequalled in any former period.

Having traced Russia through the obscurer stages of its history, we are now to witness its sudden elevation amongst the powers of Europe, and to accompany it in its hasty strides towards that importance which it has lately assumed. But before we enter on the transactions that have enriched the pages of the Russian annals since the accession of the house of Romanof, it may not be uninteresting to take a general view of the state of the empire at the beginning of the seventeenth century.

State of the empire at the beginning of the 17th century.

At this period the government of Russia may be considered as a pure aristocracy, since the supreme power rested in the hands of the nobles and the superior clergy. In particular, the boyars, or chief officers of the army, who were also the privy counsellors of the prince, possessed a very considerable share of authority. The election of the late princes Boris, Dmitri, and Schuiskoy, had been conducted principally by them, in concert with the inhabitants of Moscow, where was then held the seat of government. The common people, especially those of the inferior towns, though nominally free, had no share in the government or in the election of the chief ruler. The boors, or those peasants who dwelt on the noblemen's estates, were almost completely slaves, and transferable with the land on which they dwelt. An attempt to annul this barbarous vassalage had been made, both by Boris and by Schuiskoy; but, from the opposition of the nobles, it was abandoned.

The laws then in force consisted partly of the municipal laws drawn up for the state of Novgorod by Yaroslaf, and partly of an amended code, called *Sudebnik*, promulgated by Ivan Vasiliivitch II. By this Sudebnik the administration of the laws was made uniform throughout the empire, and particular magistrates were appointed in the several towns and districts, all subject to the czar as their chief. The Sudebnik consisted of ninety-seven articles, all containing civil laws; as the penal statutes are only briefly mentioned in some articles, so as to appear either connected with the civil, or as serving to illustrate them. The criminal laws were contained in a separate code, called *Gubnaia Gramota*, which is now lost, but is referred to in the civil code. In neither of these codes is there any mention of ecclesiastical affairs; but these were regulated by a set of canons drawn up in 1542, under the inspection of Ivan Vasiliivitch, in a grand council held at Moscow. In the civil statutes of the Sudebnik, theft was punished in the first instance by restitution; or, if the thief were unable to restore the property stolen, he became the slave of the injured party till by his labour he had made sufficient compensation. Of murder nothing is said, except where the person slain was a lord or master, when the murderer was to be punished with death. There is no mention of torture, except in cases of theft.

Before the accession of the house of Romanof, the commercial intercourse which the cities of Novgorod and Pscov, formerly held with the Hanse Towns, had entirely ceased; but this was in some degree compensated by the newly established trade between Russia and England, the centre of which was Archangel. This trade had been lately increased by the products derived from the acquisition of Siberia, in exchange for which the English principally supplied the Russians with broad cloth. In 1568, an English counting-house was established at Moscow, and about the same time the Russian Company was incorporated. Previously to the fifteenth century, the trade of the Russians had been carried on merely by barter; but during that century the coinage of money commenced at Novgorod and Pscov; and from this time their commerce was placed on an equal footing with that of the other European nations.

Except in the article of commerce, the Russians were deplorably behind the rest of Europe; and though attempts had been made by Ivan I., Ivan Vasiliivitch II., and Boris, to cultivate their manners and to improve the state of their arts and manufactures, these attempts had failed of success.[1]

An. 1613. Mikhail makes peace with the Swedes and Poles.

At the accession of Mikhail, who was crowned in June 1613, the Swedes and Poles were in possession of several parts of the empire; and to dislodge these intruders was the first object of the new czar. Aware of the difficulty of contending at once with both these formidable enemies, he began by negotiating a treaty of peace with Sweden. This was not effected without considerable sacrifices. Mikhail agreed to give up Ingria and Karelia, and to evacuate Esthonia and Livonia. Thus freed from his most dangerous enemy, he prepared to oppose the Poles, of whom a numerous body had entered Russia, to support the claims of their king's son Vladislaf. Mikhail proceeded, however, in a very wary manner, and instead of opposing the invaders in the open field, he entrapped them by ambuscades, or allured them into districts already desolated, where they suffered so much from cold and hunger, that in 1619 they agreed to a cessation of hostilities for fourteen years and a half, on condition that the Russians should cede to Poland the government of Smolensk.

His prudent conduct.

Thus freed from external enemies on terms which, though not very honourable, were the best that the posture of his affairs admitted, Mikhail applied himself to arranging the internal economy of his empire. He began by placing his father at the head of the church, by conferring on him the dignity of patriarch, which had become vacant. The counsels of this venerable man were of great advantage to the emperor, and contributed to preserve that peace and tranquillity by which his reign was in general distinguished. His next step was to form treaties of alliance with the principal commercial states of Europe. He accordingly sent ambassadors into England, Denmark, Holland, and the German empire; and Russia, which had hitherto been considered rather as an Asiatic than a European power, became so respectable in the eyes of her northern neighbours, that they vied with each other in their eagerness for establishing with her commercial relations.

Mikhail also commenced those improvements of the laws which we shall presently see more fully executed by his son and successor; but the tide of party ran so high, that he could effect only a very imperfect reformation. He was also obliged to put his frontiers in a state of defence, by providing for the expiration of the truce with Poland, which now drew nigh; and as no permanent peace had been established, both parties began to prepare for a renewal of hostilities. Indeed the armistice was broken by the Russians, who, on the death of Sigismund, king of Poland, appeared before Smolensk, justifying the infringement of the treaty, on the pretence that it was concluded with Sigismund, and not with his successors. Nothing of consequence, however, was then executed; and the Russian commander, after having lain there in perfect indolence, with an army of fifty thousand men, for two years, at length raised the siege. Mikhail attempted to engage the Swedes in an alliance with him against Poland; but failing in this negotiation, he concluded a new treaty, which continued unbroken till his death. This event happened in 1645.

---

[1] Tooke furnishes the following characteristic features of the state of Russia in the sixteenth century.

The houses were in general of timber, and badly constructed, except that in Moscow and other great towns there were a few built of brick.

That contempt for the female sex which is invariably a characteristic of defective civilization, was conspicuous among the Russians. The women were kept in a state of perfect bondage, and it was thought a great instance of liberality if a stranger were but permitted to see them. They were scarcely ever allowed to quit the house, even for the purpose of going to church, though attendance on divine worship was considered of the highest importance.

The men of the middle ranks always repaired about noon to the market, where they transacted business, conversed about public affairs, and attended the courts of judicature to hear the causes that were going forward. In agreements and bargains the highest asseveration was, "If I keep not my word, may it turn to my infamy;" a custom extremely honourable to the nation, as they held the disgrace of having forfeited their word to be the deepest degradation.

If the wife was so dependent on her husband, the child was still more dependent on his father; for parents were allowed to sell their children. Masters and servants entered into a mutual contract respecting the terms of their connection; and a written copy of this agreement was deposited in the proper court, where, if either party broke the contract, the other might lodge his complaint.

Single combat still continued to be the last resource in deciding a cause; and to this the judge resorted in cases which he knew not otherwise how to determine. But duels out of court were strictly prohibited; and when these took place, and either party fell, the survivor was regarded as a murderer, and punished accordingly. Personal vengeance was forbidden, under the strictest penalty. The nobles were universally soldiers, and were obliged to appear when summoned, to assist the prince in his wars. Till the end of the sixteenth century the boor was not bound to any particular master. He tilled the ground of a nobleman for a certain time on stated conditions. Thus he either received part of the harvest or of the cattle, a portion of wood, hay, &c.; or he worked five days for the master, and on the sixth was at liberty to till a piece of ground set apart for his use. At the expiration of the term agreed on, either party might give up the contract; the boor might remove to another master, and the master dismiss the boor that did not suit him.

An. 1645.
Accession of Alexei Mikhailovitch.

Mikhail was succeeded by his son Alexei; but as the young prince was only fifteen years of age at the time of his father's death, a nobleman named Morosof had been appointed his governor and regent of the empire. This man possessed all the ambition of Boris, without his prudence and address; and in attempting to raise himself and his adherents to the highest posts in the state, he incurred the hatred of all ranks of the people. Though, by properly organizing the army, he provided for the defence of the empire against external enemies, he shamefully neglected internal policy, and connived at the most flagrant enormities in the administration of justice. These abuses went so far that the populace once stopped the czar as he was returning from church to his palace, calling aloud for righteous judges. Although Alexei promised to make strict inquiry into the nature and extent of their grievances, and to inflict deserved punishment on the guilty, the people had not the patience to await this tardy process, and proceeded to plunder the houses of those nobles who were most obnoxious to them. They were at length pacified, however, on condition that the author of their oppression should be brought to condign punishment. One of the most nefarious judges was executed; and the principal magistrate of Moscow was killed in a tumult. The life of Morosof was spared at the earnest entreaty of the czar, who engaged for his future good behaviour.

Similar disturbances had broken out at Novgorod and Pscov; but they were happily terminated, chiefly through the exertions of the metropolitan Nicon, a man of low birth, who, by his reputation for extraordinary piety and holiness, had raised himself to the patriarchal dignity, and was high in favour with Alexei. The pacific conduct of the neighbouring states did not long continue, though indeed we may attribute the renewal of hostilities to the ambition of the czar.

War with Sweden and Poland.

The war with Poland was occasioned by Alexei's supporting the Kozaks, a military horde, who had left the northern shores of the Dnieper, and retired further to the south. Here they had established a military democracy, and during the dominion of the Tartars in Russia had been subject to the khan of those tribes; but after the expulsion or subjugation of the Tartars, the Kozaks had put themselves under the guardianship of Poland, to which kingdom they formerly belonged. As the Polish clergy, however, attempted to impose on them the Greek faith, they threw off their allegiance to the king of Poland, and claimed the patronage of Russia. Alexei, who seems to have sought a pretext for a rupture with that state, gladly received them as his subjects, hoping, by their assistance, to recover the territories which had been ceded to Poland by his father. He began by negotiation, and sent an embassy to the king of Poland, complaining of some Polish publications, in which reflections had been cast on the honour of his father, and demanding that, by way of compensation, the Russian territories formerly ceded should be restored. The king of Poland of course refused so arrogant a demand, and both parties prepared for war. The Russians, assisted by the Kozaks, were so successful in this contest, that the king of Sweden became jealous of Alexei's good fortune, and apprehensive of an attack. He therefore determined to take a very active part in the war, especially as the Lithuanians, who were extremely averse to the Russian dominion, had sought his protection. The war with Sweden commenced in 1656, and lasted for two years, without any important advantage being gained by either party. A truce was concluded in 1658 for three years, and at the termination of this period a solid peace was established. In the mean time the war with Poland continued, but was at length terminated by an armistice, which was prolonged from time to time during the remainder of Alexei's life.

The reign of this monarch is as remarkable for turbulence as that of his predecessor had been for tranquillity. No sooner was peace established with the neighbouring states than fresh commotions shook the empire from within. The Don Kozaks, who now formed a part of the Russian population, felt themselves aggrieved by the rigour with which one of their officers had been treated, and, placing at their head Radzin, the brother of the deceased, broke out into open rebellion. Allured by the spirit of licentiousness and the hopes of plunder, vast numbers, both of Kozaks and inferior Russians, flocked to the standard of Radzin, and formed an army of nearly two hundred thousand men. This force, however, ill armed and quite undisciplined, was formidable merely from its numbers. Radzin himself seems to have placed no reliance on the courage or fidelity of his followers, and eagerly embraced the first opportunity of procuring a pardon by submission. Having been deceived into a belief that this pardon would be granted on his surrendering himself to the mercy of the czar, he set out for Moscow, accompanied by his brother; but when he had arrived within a short distance of the capital, whither notice had been sent of his approach, he was met by a cart containing a gallows, on which he was immediately hanged. His followers, who had assembled at Astracan, were surrounded by the czar's troops, taken prisoners, and twelve thousand of them hung on the gibbets in the highways.

Commencement of a war with Turkey.

The authority which Alexei had obtained over the Donskoi Kozaks excited the jealousy of the Sublime Porte, which justly dreaded the extension of the Russian territory on the side of the Crimea, a peninsula at that time belonging to Turkey. After a successful attempt on the frontiers of Poland, a Turkish army entered the Ukraine, and the Russians made preparations to oppose them. Alexei endeavoured to form a confederacy against the infidels among the Christian potentates of Europe; but the age of crusading chivalry was over, and the czar was obliged to make head against the Turks, with no assistance but that of the king of Poland. The Turkish arms were for some years victorious, especially on the side of Poland; but at length a check was given to their successes by the Polish general Sobieski, who afterwards ascended the throne of that kingdom. Hostilities between the Turks and Russians were not, however, terminated during the reign of Alexei, and the czar left to his successor the prosecution of the war.

Alexei's improvements of the laws.

The reign of Alexei is most remarkable for the improvements introduced by him into the Russian laws. Before his time the *Emannoy Ukases*, or personal orders of the sovereign, were almost the only laws of the country. These edicts were as various as the opinions, prejudices, and passions of men; and before the days of Alexei they produced endless contentions. To remedy this evil, he made a selection, from all the edicts of his predecessors, of such as had been current for a hundred years, presuming that these either were founded in natural justice, or during so long a currency had formed the minds of the people to consider them as just. This digest, which he declared to be the common law of Russia, and which is prefaced by a sort of institute, is known by the title of the *Uloshenìè* or *Selection*. It was long the standard law-book, all edicts prior thereto being declared to be obsolete. He soon made his new code, however, more bulky than even the Selection; and the additions of his successors are beyond enumeration. This was undoubtedly a great and useful work; but Alexei performed another still greater.

Though there were many courts of judicature in this widely-extended empire, the emperor was always lord paramount, and could take a cause from any court immediately before himself. But as several of the old nobles had the remains of principalities in their families, and held their own courts, the sovereign or his ministers, at a distance up the country, frequently found it difficult to bring a culprit out of one of these hereditary feudal jurisdictions, and to try him by the laws of the empire. This was a very dangerous limitation of imperial power, and the more so that some families claimed even a right of replevance. A fortunate opportunity soon offered of settling the dispute, and Alexei embraced it with great ability.

Some families on the old frontiers were taxed with their defence, for which they were obliged to maintain regiments; and as they were but scantily indemnified by the state, it sometimes required the exertion of authority to make them keep up their levies. When, by the conquest of Kazan, the frontiers were far extended, these nobles found the regiments no longer burdensome, because, by the help of false musters, the formerly scanty allowance much more than reimbursed them for the expense of the establishment. The consequence was, that disputes arose among them about the right of guarding certain districts, and lawsuits were necessary to settle their respective claims. These were tedious and intricate. The emperor ordered all the family archives to be brought to Moscow, and all documents on both sides to be collected. A time was fixed for the examination; a fine wooden court-house was built; every paper was lodged under a guard; and the day was appointed when the court should be opened and the claims heard. But on that morning the house, with all its contents, was in two hours consumed by fire. The emperor then said, "Gentlemen, henceforward your rank, your privileges, and your courts, are the nation's, and the nation will guard itself. Your archives are unfortunately lost, but those of the nation remain. I am the keeper, and it is my duty to administer justice for all and to all. Your rank is not private, but national, attached to the services you are actually performing. Henceforward Colonel Buturlin (a private gentleman) ranks before Captain Viazemsky (an old prince)."

The Russians owe more to this prince than some of their historians seem willing to acknowledge; and there appears to be no doubt that several of the improvements attributed to Peter the Great were at least projected by his father. Under Alexei a considerable trade was opened with China, from which country silks, and other rich stuffs, were brought into Russia, and exchanged for the Siberian furs. The exportation of Russian products to other countries was also increased; and we are assured that Alexei had even projected the formation of a navy, and would have executed the design, had he not been perpetually occupied in foreign wars and domestic troubles.

A 1676.
R n of
F lor.

Alexei died in 1676, leaving three sons and six daughters. Two of the sons, Feodor and Ivan, were by a first marriage; the third, Peter, by a second. The two former, particularly Ivan, were of a delicate constitution, and some attempts were made by the relations of Peter to set them aside. These attempts, however, proved unsuccessful, and Feodor became the successor of Alexei.

The reign of this prince was short, and distinguished rather for the happiness which the nation then experienced, than for the importance of the transactions which took place. He continued the war with the Turks for four years after his father's death, and at length brought it to an honourable conclusion, by a truce for twenty years, after the Turks had acknowledged the Russian right of sovereignty over the Kozaks. Feodor died in 1682, but before his death nominated his half-brother Peter his successor.

An. 1682.
Intrigues of the Princess Sophia.

The succession of Peter, though appointed by their favourite czar Feodor, was by no means pleasing to the majority of the Russian nobles, and it was particularly opposed by Galitzin, the prime minister of the late czar. This able man had espoused the interest of Sophia, the sister of Feodor and Ivan, a young woman of eminent abilities and the most insinuating address. Sophia, upon pretence of asserting the claims of her brother Ivan, who, though of a feeble body and weak intellect, was considered as the lawful heir of the crown, had really formed a design of securing the succession to herself; and with that view, had not only insinuated herself into the confidence and good graces of Galitzin, but had brought over to her interests the Strelitzes, who were the body-guard of the czars, and at this time were about fourteen thousand in number. These licentious soldiers assembled for the purpose, as was pretended, of placing on the throne Prince Ivan, whom they proclaimed czar by acclamation. During three days they roved about the city of Moscow, committing the greatest excesses, and putting to death several of the chief officers of state who were suspected of being hostile to the designs of Sophia. Their employer did not, however, entirely gain her point; for as the new czar entertained a sincere affection for his half-brother Peter, he insisted that this prince should share with him the imperial dignity. This was at length agreed to; and on the 6th of May 1682, Ivan and Peter were solemnly crowned joint emperors of all the Russias, while the Princess Sophia was nominated their copartner in the government.

Joint reign of Ivan and Peter I.

From the imbecility of Ivan and the youth of Peter, who was now only ten years of age, the whole power of the government rested with Sophia and her minister Galitzin, although till the year 1687 the names of Ivan and Peter only were annexed to the imperial decrees. Scarcely had Sophia established her authority when she was threatened with deposition, from an alarming insurrection of the Strelitzes. This was excited by their commander Prince Kovanskoi, who had demanded of Sophia that she should marry one of her sisters to his son, but had met with a mortifying refusal. In consequence of this insurrection, which threw the whole city of Moscow into terror and consternation, Sophia and the two young czars took refuge in a monastery about twelve leagues from the capital; and before the Strelitzes could follow them thither, a considerable body of soldiers, principally foreigners, was assembled in their defence. Kovanskoi was taken prisoner, and instantly beheaded; and though his followers at first threatened dreadful vengeance on his executioners, they soon found themselves obliged to submit. From every regiment was selected the tenth man, who was to suffer as an atonement for the rest; but this cruel punishment was remitted, and only the most guilty among the ringleaders suffered death.

An. 1687.
The party of Peter gains ground.

The quelling of these disturbances gave leisure to the friends of Peter to pursue the plans which they had formed for subverting the authority of Sophia; and about this time a favourable opportunity offered, in consequence of a rupture with Turkey. The Porte was now engaged in a war with Poland and the German empire, and both these latter powers had solicited the assistance of Russia against the common enemy. Sophia and her party were averse to the alliance; but as there were in the council many secret friends of Peter, these had sufficient influence to persuade the majority that a Turkish war would be of advantage to the state. They even prevailed on Galitzin to put himself at the head of the army, and thus removed their principal opponent. It is difficult to conceive how a man, so able in the cabinet as Galitzin, could have suffered his vanity so far to get the better of his good sense, as to accept a military command, for which he certainly had no talents. Assembling an army of nearly three hundred thousand men, he marched towards the confines of Turkey, and there consumed two campaigns in marches and countermarches, and lost nearly forty thousand men, partly in unsuccessful skirmishes with the enemy, but chiefly from disease.

While Galitzin was thus trifling away his time in the south, Peter, who already began to give proofs of those great talents which afterwards enabled him to act so conspicuous a part in the theatre of the north, was strengthening his party among the Russian nobles. His ordinary residence was at a village not far from Moscow, and here he had assembled round him a considerable number of young men of rank and influence, whom he called his play-mates. Among these were two foreigners, Lefort a Genevese, and Gordon a Scotchman, who afterwards signalized themselves in his service. These young men had formed a sort of military company, of which Lefort was captain; and the young czar, beginning with the situation of drummer, gradually rose through every subordinate office. Under this appearance of a military game, Peter was secretly establishing himself in the affections of his young companions, and effectually lulled the suspicions of Sophia, till it was too late for her to oppose his machinations.

An. 1689. Peter obtains the undivided sovereignty.

About the middle of the year 1689, Peter, who had now attained his seventeenth year, determined to make an effort to deprive Sophia of all share in the government, and to secure to himself the undivided sovereignty. On occasion of a solemn religious meeting that was held, Sophia had claimed the principal place, as regent of the empire; but this claim was strenuously opposed by Peter, who, rather than fill a subordinate situation, quitted the place of assembly, and, with his friends and adherents, withdrew to the monastery of the Holy Trinity, which had formerly sheltered him and his copartners from the fury of the Strelitzes. This was the signal for an open rupture. Sophia, finding that she could not openly oppose the party of the czar, attempted to procure his assassination; but as her design was discovered, she thought proper to solicit an accommodation. This was agreed to, on condition that she should give up all claim to the regency, and retire to a nunnery. The commander of the Strelitzes, her agent in the assassination of Peter, was beheaded, and the minister Galitzin sent into banishment to Archangel.

He establishes a military and naval force.

Peter now saw himself in undisputed possession of the imperial throne; for though Ivan was still nominally czar, he had voluntarily resigned all share in the administration of affairs, and retired to a life of obscurity. The first object to which the czar directed his attention was the establishment of a regular and well-disciplined military force. He had learned by experience how little dependence was to be placed on the Strelitzes; and these regiments he determined to disband. He commissioned Lefort and Gordon to levy new regiments, which, in their whole constitution, dress, and military exercises, should be formed on the model of other European troops. He next resolved to carry into execution the design which had been formed by his father, of constructing a navy. For this purpose he first took a journey to Archangel, where he employed himself in examining the operations of the shipwrights, and occasionally taking a part in their labours; but as he learned that the art of ship-building was practised in greater perfection in Holland, and some other maritime countries of Europe, he sent thither several young Russians to be initiated into the best methods of constructing ships of war.

His successes against the Turks.

The war with Turkey still languished, but Peter was resolved to prosecute it with vigour, hoping to get possession of the town of Azof, and thus open a passage to the Black Sea. He placed Gordon, Lefort, and two of his nobles, at the head of the forces destined for this expedition, and himself attended the army as a private volunteer. The success of the first campaign was but trifling; and Peter learned that his deficiency of artillery and his want of transports prevented him from making an effectual attack on Azof. These difficulties, however, were soon surmounted. He procured a supply of artillery and engineers from the emperor and the Dutch, and found means to provide a number of transports. With these auxiliaries he opened the second campaign, defeated the Turks on the Sea of Azof, and made himself master of the town. Peter was so elated with these successes, that on his return from the seat of war he marched his troops into Moscow in a triumphal procession, in which Lefort as admiral of the transports, and Schein as commander of the land forces, bore the most conspicuous parts, while Peter himself was lost without distinction in the crowd of subaltern officers.

He now resolved to form a fleet in the Black Sea; but as his own revenues were insufficient for this purpose, he issued a ukase, commanding the patriarch and other dignified clergy, the nobility, and the merchants, to contribute a part of their income towards fitting out a certain number of ships. This proclamation was extremely unpopular, and, together with the numerous innovations which Peter was every day introducing, especially his sending the young nobles to visit foreign countries, and his own avowed intention of making the tour of Europe, contributed to raise against him a formidable party. The vigilance and prudence of the czar, however, extricated him from the dangers with which he was threatened, and enabled him to carry into execution his proposed journey.

An. 1700. Peter engages in a war with Charles XII. of Sweden.

In returning to his own dominions, Peter passed through Rawa, where Augustus king of Poland then was. The czar had determined, in conjunction with Augustus and the king of Denmark, to take advantage of the youth and inexperience of Charles XII. who had just succeeded to the Swedish throne; and in this interview with Augustus, he made the final arrangements for the part which each was to take in the war. Augustus was to receive Livonia as his part of the spoil, while Frederick king of Denmark had his eye on Holstein, and Peter had formed designs on Ingria, formerly a province of the Russian empire.

Defeated by the Swedes.

In the middle of the year 1700, Charles had left his capital to oppose these united enemies. He soon compelled the king of Denmark to give up his designs on Holstein, and sign a treaty of peace; and being thus at liberty to turn his arms against the other members of the confederacy, he resolved first to lead his army against the king of Poland; but on his way he received intelligence that the czar had laid siege to Narva with an army which some authorities calculate at a hundred thousand men. On this he immediately embarked at Carlscrona, though it was then the depth of winter, and the Baltic was scarcely navigable; and soon landed at Pernaw in Livonia with part of his forces, having ordered the rest to Revel. His army did not exceed twenty thousand men, but it was composed of the best soldiers in Europe, while that of the Russians was little better than an undisciplined multitude. Every possible obstruction, however, had been thrown in the way of the Swedes. Thirty thousand Russians were posted in a defile on the road, and this corps was sustained by another body of twenty thousand drawn up some leagues nearer Narva. Peter himself had set out to hasten the march of a reinforcement of forty thousand men, with whom he intended to attack the Swedes in flank and rear; but the celerity and valour of Charles baffled every attempt to oppose him. He set out with four thousand foot and an equal number of cavalry, leaving the rest of the army to follow at their leisure. With this small body he attacked and defeated the Russian armies successively, and pushed his way to Peter's camp, for the attack of which he gave immediate orders. This camp was fortified by lines of circumvallation and contravallation, by redoubts, and by a line of a hundred and fifty brass cannons placed in front; and it was defended by an army of eighty thousand men; yet so violent was the attack of the Swedes, that in three hours the intrenchments were carried, and Charles, with only four thousand men, that composed the wing which he commanded, pursued the flying enemy, amounting to fifty thousand, to the river Narva. Here the bridge broke down with the weight of the fugitives, and the river was filled with their bodies. Great numbers returned in despair to their camp, where they defended themselves for a short time, but were at last obliged to surrender. In this battle, thirty thousand were killed in the intrenchments and the pursuit, or drowned in the river; twenty thousand surrendered at discretion, and were dismissed unarmed, while the rest were totally dispersed. A hundred and fifty pieces of cannon, twenty-eight mortars, a hundred and fifty-one pairs of colours, twenty standards, and all the Russian baggage, fell into the hands of the Swedes; and the Duke de Croy, the Prince of Georgia, and seven other generals, were made prisoners. Charles behaved with the greatest generosity to the conquered. Being informed that the tradesmen of Narva had refused credit to the officers whom he detained prisoners, he sent a thousand ducats to the Duke de Croy, and to every other officer a proportional sum.

Peter was advancing with forty thousand men to surround the Swedes, when he received intelligence of the dreadful defeat at Narva. He was greatly chagrined; but comforting himself with the hopes that the Swedes would in time teach the Russians to beat them, he returned to his own dominions, where he applied himself with the utmost diligence to the raising of another army. He evacuated all the provinces which he had invaded, and for a time abandoned all his great projects, thus leaving Charles at liberty to prosecute the war against Poland.

As Augustus had expected an attack, he endeavoured to draw the czar into a close alliance with him. The two monarchs had an interview at Birzen, where it was agreed that Augustus should lend the czar fifty thousand German soldiers, to be paid by Russia; that the czar should send an equal number of his troops to be trained up to the art of war in Poland; and that he should pay the king three millions of rix-dollars in the space of two years. Of this treaty Charles had notice, and, by means of his minister Count Piper, entirely frustrated the scheme.

Re wed ex ons of ter.

After the battle of Narva, Charles became confident and negligent, while the activity of Peter increased with his losses. He supplied his want of artillery by melting down the bells of the churches, and constructed numerous small vessels on the lake of Ladoga to oppose the entrance of the Swedes into his dominions. He took every advantage of Charles's negligence, and engaged in frequent skirmishes, in which, though often beaten, he was sometimes victorious. He contrived to make himself master of the river Neva, and captured Nyenschantz, a fortress at the mouth of that river. Here he laid the foundation of that city which he had long projected, and which was to become the metropolis of his empire. At length, in 1704, he became master of Ingria, and appointed his favourite Prince Menzikoff to be viceroy of that province, with strict orders to make the building of the new city his principal business. Here edifices were already rising in every quarter, and navigation and commerce were increasing in vigour and extent.

De of the vedes.

In the mean time Augustns king of Poland, though treating with Charles for the surrender of his dominions, was obliged to keep up the appearance of war, which he had neither ability nor inclination to conduct. He had been lately joined by Prince Menzikoff with thirty thousand Rnssians; and this obliged him, contrary to his inclination, to hazard an engagement with Meyerfeldt, who commanded ten thousand men, one half of whom were Swedes. As at this time no disparity of numbers whatever was reckoned an equivalent to the valour of the Swedes, Meyerfeldt did not decline the combat, though the army of the enemy was four times as numerous as his own. With his own countrymen he defeated the enemy's first line, and was on the point of defeating the second, when Stanislas, with the Poles and Lithuanians, gave way. Meyerfeldt then perceived that the battle was lost; but he fought desperately, that he might avoid the disgrace of a defeat. At last, however, he was oppressed by numbers, and forced to surrender; suffering the Swedes for the first time to be conquered by their enemies. The whole army were taken prisoners excepting Major-general Krassau, who having repeatedly rallied a body of horse formed into a brigade, at last broke through the enemy, and escaped to Posnania. Augustus had scarcely sung *Te Deum* for this victory, when his plenipotentiary returned from Saxony with the articles of the treaty, by which he was to renounce all claim to the crown of Poland in favour of his rival Stanislas. The king hesitated and scrupled, but at last signed them; after which he set out for Saxony, glad at any expense to be freed from such an enemy as the king of Sweden, and from such allies as the Russians.

Peter determines to continue the war.

The czar Peter was no sooner informed of this extraordinary treaty, than he learned also the cruel fate of his plenipotentiary Patkul, a Livonian emigrant, whom Charles claiming as a subject, seized and executed. Peter immediately sent letters to every court in Christendom, complaining of this breach of the law of nations. He entreated the emperor, the queen of Britain, and the states-general, to revenge this insult on humanity. He stigmatized the compliance of Augustus with the opprobrious name of pusillanimity; and exhorted them not to guarantee a treaty so unjust, but to despise the menaces of the Swedish bully. So well, however, was the prowess of the king of Sweden known, that none of the allies thought proper to irritate him, by refusing to guarantee any treaty which he thought proper to accept. At first, Peter thought of revenging Patkul's death by massacring the Swedish prisoners at Moscow; but from this he was deterred, by remembering that Charles had many more Russian prisoners than he himself had of Swedes. In the year 1707, however, he entered Poland at the head of sixty thousand men, and, assembling a diet, solemnly deposed Stanislas, with the same ceremonies which had been used with regard to Augustus. The appearance of a Swedish army under King Stanislas and General Lewenhaupt put a stop to this invasion, and the czar retired into Lithuania, giving out as the cause of his retreat, that the country could not supply him with the provisions and forage necessary for so great an army.

Charles visits Augustus.

During these transactions Charles had taken up his residence in Saxony, where he gave laws to the court of Vienna, and in a manner intimidated all Europe. At last, satiated with the glory of having dethroned one king, set up another, and struck all Europe with terror and admiration, he began to evacuate Saxony in pursuit of his great plan, the dethroning the czar Peter, and conquering the vast empire of Russia. While the army was on full march in the neighbourhood of Dresden, he took the extraordinary resolution of visiting King Augustus with no more than five attendants. Although he had no reason to imagine that Augustus either did or could entertain any friendship for him, he was not uneasy at the consequences of thus putting himself entirely in his power. He reached the palace door of Augustus before it was known that he was in the city; and he entered the elector's chamber in his boots before the latter had time to recover from his surprise. He breakfasted with him in a friendly manner, and then expressed a desire of viewing the fortifications. While he was walking round them, a Livonian, who had formerly been condemned in Sweden, and served in the troops of Saxony, thought he could never have a more favourable opportunity of obtaining pardon. He therefore begged of King Augustus to intercede for him, being fully assured that his majesty could not refuse so small a favour to a prince in whose power he then was. Augustus accordingly made the request, but Charles refused it in such a manner that he did not think proper to ask it a second time. Having passed some hours in this extraordinary visit, he returned to his army, after having embraced and taken leave of the king he had dethroned.

He marches against the Russians.

The armies of Sweden, in Saxony, Poland, and Finland, now exceeded seventy thousand men; while the available force of Russia amounted to about a hundred thousand. Peter, who had his army dispersed in small parties, instantly assembled it on receiving notice of the king of Sweden's march, was making all possible preparations for a vigorous resistance, and was on the point of attacking Stanislas, when the approach of Charles struck his whole army with terror. In the month of January 1708, Charles passed the Niemen, and entered the south gate of Grodno just as Peter was quitting the place by the north gate. Charles at this time had advanced some distance before the army, at the head of six hundred horse.

The Russians again defeated.

The czar having received intelligence of his situation, sent back a detachment of two thousand men to attack him; but these were entirely defeated, and thus Charles became possessed of the whole province of Lithuania. The king pursued his flying enemies in the midst of ice and snow, over mountains, rivers, and morasses, and through obstacles which appeared to be insurmountable. These difficulties, however, he had foreseen, and had prepared to meet them. As he knew that the country could not furnish provisions sufficient for the subsistence of his army, he had provided a large quantity of biscuit, and on this his troops chiefly subsisted, till they came to the banks of the Beresina, in view of Borisow. Here the czar was posted, and Charles intended to give him battle, after which he could the more easily penetrate into Russia. Peter, however, did not think proper to come to an action, but retreated towards the Dnieper, whither he was pursued by Charles, as soon as he had refreshed his army. The Russians had destroyed the roads and desolated the country, yet the Swedish army advanced with great celerity, and in their march defeated twenty thousand Russians, though intrenched to the very teeth. This victory, from the circumstances in which it was gained, was one of the most glorious that ever Charles had achieved. The memory of it was preserved by a medal struck in Sweden with this inscription; *Sylvæ, paludes, aggeres, hostes, victi.*

Peter attempts to make peace, but is unsuccessful.

When the Russians had repassed the Dnieper, the czar, finding himself pursued by an enemy with whom he could not cope, resolved to make proposals for an accommodation. Charles made only this arrogant reply, "I will treat with the czar at Moscow;" a taunt which was received by Peter with the coolness of a hero. "My brother Charles," said he, "affects to play the Alexander, but he shall not find in me a Darius." He still, however, continued his retreat, and Charles pursued so closely that daily skirmishes took place between his advanced guard and the rear of the Russians. In these actions the Swedes had generally the advantage, though their petty victories cost them dear, by contributing to weaken their force in a country where it could not be recruited. The two armies came so close to each other at Smolensk, that an engagement took place between a body of Russians composed of ten thousand cavalry and six thousand Kalmuks, and the Swedish vanguard, composed of only six regiments, but commanded by the king in person. Here the Russians were again defeated; but Charles, having been separated from the main body of his detachment, was exposed to great danger. With one regiment only he fought with such fury as to drive the enemy before him, when they thought themselves sure of making him prisoner.

An. 1708. Charles advances towards Moscow.

By the 3d of October 1708, Charles had approached within a hundred leagues of Moscow; but Peter had rendered the roads completely impassable, and had destroyed the villages on every side, so as to cut off every possibility of subsistence to the enemy, while the season was far advanced, and the severity of winter was approaching. In these circumstances, the king, at length sensible that he had committed a perilous mistake, endeavoured to retrieve it by a step which proved yet more calamitous. He resolved, before attacking the Russian capital, to achieve the conquest of the Ukraine, where Mazeppa, a Polish gentleman, was general and chief of the Kozaks. Mazeppa having been affronted by the czar, readily entered into a treaty with Charles, whom he promised to assist with thirty thousand men, great quantities of provisions and ammunition, and with all his treasures, which were falsely stated to be immense. The Swedish army advanced towards the river Disna, where they had to encounter the greatest difficulties; a forest above forty leagues in extent, filled with rocks, mountains, and morasses. To complete their misfortunes, they were led thirty leagues out of the right way; all the artillery was sunk in bogs and marshes; the provision of the soldiers, which consisted of biscuit, was exhausted; and the whole army were spent and emaciated when they arrived at the Disna. Here they expected to have met Mazeppa with his reinforcement; but instead of that, they perceived the opposite banks of the river covered with a hostile army, and the passage itself rendered almost impracticable. Charles, however, was still undaunted; he let his soldiers by ropes down the steep banks; they crossed the river either by swimming, or on rafts hastily put together, drove the Russians from their post, and continued their march. Mazeppa soon after appeared, having with him about six thousand men, the broken remains of the army he had promised. The Russians had got intelligence of his designs, defeated and dispersed his adherents, laid his town in ashes, and taken all the stores collected for the Swedish army. However, he still hoped to be useful by his intelligence in an unknown country; and the Kozaks, out of revenge, crowded daily to the camp with provisions.

Greater misfortunes still awaited the Swedes. When Charles entered the Ukraine, he had sent orders to General Lewenhaupt to meet him with fifteen thousand men, six thousand of whom were Swedes, and a large convoy of provisions. Against this detachment Peter now bent his whole force, and marched against him with an army of sixty-five thousand men. Lewenhaupt had received intelligence that the Russian army consisted of only twenty-four thousand, a force to which he thought six thousand Swedes superior, and therefore disdained to intrench himself. A furious contest ensued, in which the Russians were defeated with the loss of fifteen thousand men. Now, however, affairs began to take another turn. The Swedes, elated with victory, prosecuted their march into the interior; but, from the ignorance or treachery of their guides, they were led into a marshy country, where the roads were made impassable by felled trees and deep ditches. Here they were attacked by the czar with his whole army. Lewenhaupt had sent a detachment to dispute the passage of a body of Russians over a morass; but finding his detachment likely to be overpowered, he marched to support them with all his infantry. Another desperate battle ensued. The Russians were once more thrown into disorder, and were just on the point of being totally defeated, when Peter gave orders to the Kozaks and Kalmuks to fire upon all that fled; "Even kill me," said he, "if I should be so cowardly as to turn my back." The battle was now renewed with great vigour; but notwithstanding the czar's positive orders, and his own example, the day would have been lost, had not General Bauer arrived with a strong reinforcement of fresh Russian troops. The engagement was once more renewed, and continued without intermission till night. The Swedes then took possession of an advantageous post, but were next morning attacked by the

Russians. Lewenhaupt had formed a sort of rampart with his waggons, but was obliged to set fire to them to prevent their falling into the hands of the Russians, while he retreated under cover of the smoke. The czar's troops, however, arrived in time to save five hundred of these waggons, filled with provisions destined for the distressed Swedes. A strong detachment was sent to pursue Lewenhaupt; but so terrible did he now appear, that the Russian general offered him an honourable capitulation. This was rejected with disdain, and a fresh engagement took place, in which the Swedes, now reduced to four thousand, again defeated their enemies, and killed five thousand on the spot. After this Lewenhaupt was allowed to pursue his retreat without molestation, though deprived of all his cannon and provisions. Prince Menzikoff was indeed detached with a body of forces to harass him on his march; but the Swedes were now so formidable, even in their extremity, that Menzikoff dared not to attack them, so that Lewenhaupt with his four thousand men arrived safe in the camp of Charles, after having destroyed nearly thirty thousand of the Russians.

This may be said to have been the last successful effort of Swedish valour against the troops of Peter. The difficulties which Charles's army had now to undergo exceeded what human nature could support; yet still they hoped by constancy and courage to subdue them. In the severest winter known for a long time, even in Russia, they made long marches, clothed like savages in the skins of wild beasts. All the draught-horses perished; thousands of soldiers dropt down dead through cold and hunger; and by the month of February 1709 the whole army was reduced to eighteen thousand. Amidst numberless difficulties these penetrated to Pultava, a town on the eastern frontier of the Ukraine, where the czar had laid up magazines, of which Charles resolved to obtain possession. Mazeppa advised the king to invest the place, in consequence of his having correspondence with some of the inhabitants, by whose means he hoped it would be surrendered. He was, however, deceived. The besieged made an obstinate defence; the Swedes were repulsed in every assault, and eight thousand of them were defeated, and almost entirely cut off, in an engagement with a party of Russians. To complete his misfortunes, Charles received a shot in his heel from a carabine, which shattered the bone. For six hours afterwards, he continued calmly on horseback, giving orders, till he fainted with the loss of blood; after which he was carried into his tent.

Ba e of
Pu va.

For some days the czar, with an army of seventy thousand men, had lain at a small distance, harassing the Swedish camp, and cutting off the convoys of provision; but now intelligence was received that he was advancing as if with a design of attacking the lines. In this situation, Charles, wounded, distressed, and almost surrounded by enemies, is said to have, for the first time, assembled a grand council of war, the result of which was, that it was determined to march out and attack the Russians. Voltaire, however, asserts that the king did not relax one iota of his wonted obstinacy and arbitrary temper; but that, on the 7th of July, he sent for General Renschild, and told him, without any emotion, to prepare for attacking the enemy next morning.

The 8th of July 1709 is remarkable for the battle which decided the fate of Sweden. Charles, having left eight thousand men in the camp to defend the works and repel the sallies of the besieged, began by break of day to march against his enemies with the rest of the army, consisting of twenty-six thousand men, of whom eighteen thousand were Kozaks. The Russians were drawn up in two lines behind their intrenchments, the horse in front, and the foot in the rear, with chasms to suffer the horse to fall back in case of necessity. General Slippenbach was despatched to attack the cavalry, which he did with such impetuosity that they were broken in an instant. They, however, rallied behind the infantry, and returned to the charge with so much vigour, that the Swedes were disordered in their turn, and Slippenbach was made prisoner. Charles was now carried in his litter to the scene of confusion. His troops, re-animated by the presence of their leader, returned to the charge, and the battle became doubtful, when a blunder of General Creuk, who had been despatched by Charles to take the enemy in flank, and a successful manœuvre of Prince Menzikoff, decided the fortune of the day in favour of the Russians. Creuk's detachment was defeated, and Menzikoff, who had been sent by Peter with a strong body to post himself between the Swedes and Pultava, so as to cut off the communication of the enemy with their camp, and fall upon their rear, executed his orders with so much success as to intercept a corps de reserve of three thousand men. Charles had ranged his remaining troops in two lines, with the infantry in the centre, and the horse on the two wings. They had already twice rallied, and were now again attacked on all sides with the utmost fury. Charles in his litter, with a drawn sword in one hand, and a pistol in the other, seemed to be everywhere present; but new misfortunes awaited him. A cannon-ball killed both horses in the litter; and scarcely were these replaced by a fresh pair, when a second ball struck the litter in pieces, and overturned the king. The Swedish soldiers, believing him killed, fell back in consternation. The first line was completely broken, and the second fled. Charles, though disabled, did every thing in his power to restore order; but the Russians, emboldened by success, pressed so hard on the flying foe, that it was impossible to rally them. Renschild and several other general officers were taken prisoners, and Charles himself would have shared the same fate, had not Count Poniatowski, father of the future favourite of Catherine II., with five hundred horse, surrounded the royal person, and with desperate fury cut his way through ten regiments of the Russians. With this small guard the king arrived on the banks of the Dnieper, and was followed by Lewenhaupt with four thousand foot and all the remaining cavalry. The Russians took possession of the Swedish camp, where they found a prodigious sum in specie; while Prince Menzikoff pursued the flying Swedes, and, as they were in want of boats to cross the Dnieper, obliged them to surrender at discretion. Charles escaped with the utmost difficulty, but at length reached Otchakof, on the frontiers of Turkey.

By this decisive victory, Peter remained in quiet possession of his new acquisitions on the Baltic, and was enabled to carry on, without molestation, the improvements which he had projected at the mouth of the Neva. His haughty rival, so long and so justly dreaded, was now completely humbled, and his ally the king of Poland was again established on his throne. During the eight years that had elapsed from the battle of Narva to that of Pultava, the Russian troops had acquired the discipline and steadiness of veterans, and had at length learned to beat their former conquerors. If Peter had decreed triumphal processions for his trifling successes at Azof, it is not surprising that he should commemorate by similar pageants a victory so glorious and so important as that of Pultava. He made his triumphal entry into Moscow for the third time, and the public rejoicings on this occasion far exceeded all that had before been witnessed in the Russian empire.

An. 1711.
Dangerous situation of Peter at the Pruth.

The vanquished Charles had, in the mean time, found a valuable friend in the monarch in whose territories he had taken refuge. Achmet II. who then filled the Ottoman throne, had beheld with admiration the warlike achievements of the Swedish hero; and, alarmed at the late successes of his rival, determined to afford Charles the most effectual aid. In 1711, the Turkish emperor assembled an immense army, and was preparing to invade the Russian territories, when the czar, having intimation of his design, and expecting powerful support from Cantemir, hospodar of Moldavia, a vassal of the Porte, resolved to anticipate the

Turks, and to make an inroad into Moldavia. Forgetting his usual prudence and circumspection, Peter crossed the Dnieper, and advanced by rapid marches as far as Yassy or Jassy, the capital of that province, which is situated on the river Pruth; but his temerity had nearly cost him his liberty, if not his life. The particulars of his dangerous situation, with the manner in which he was extricated from it by the prudent counsel of his consort Catherine, and the treaty of the Pruth, which was the result of that counsel, have been already related under the head of Catherine I.

An. 1721. Advantageous peace with Sweden.

By this treaty, in which the interests of Charles had been almost abandoned, Peter saw himself delivered from a dangerous enemy, and returned to his capital to prosecute those plans for the internal improvement of his empire which justly entitled him to the appellation of Great. Before we enumerate these improvements, however, we must bring the Swedish war to a conclusion. The death of Charles, in 1718, had left the Swedish government deplorably weakened, by the continual drains of men and money occasioned by his mad enterprises, and little able to carry on a war with a monarch so powerful as Peter. At length, therefore, in 1721, this ruinous contest, which had continued ever since the commencement of the century, was brought to a conclusion by the treaty of Nystadt, by which the Swedes were obliged to cede to Russia, Livonia, Esthonia, Ingria, a part of Karelia, the territory of Vyborg, the isle of Oesel, and all the other islands in the Baltic, from Courland to Vyborg; for which concessions they received back Finland, that had been conquered by Peter, together with two millions of dollars, and the liberty of exporting duty free, from Riga, Revel, and Arensberg, corn to the annual amount of fifty thousand roubles. In consequence of this great accession to the Russian empire, Peter received from his senate the title of Emperor and Autocrat of all the Russias, and the ancient title of czar fell into disuse.

Peter's national improvements.

The improvements introduced by Peter into the internal policy of the empire must be acknowledged to have been numerous and important. He organized anew the legislative assembly of the state; he greatly ameliorated the administration of justice; he new-modelled the national army; he entirely created the Russian navy; he rendered the ecclesiastical government milder and less intolerant; he zealously patronized the arts and sciences; he erected an observatory at St Petersburg, and by publicly proclaiming the approach of an eclipse, and the precise time at which it was to take place, taught his subjects no longer to consider such a phenomenon as an omen of disaster, or an awful menace of divine judgment. He enlarged the commerce of his empire, and gave every encouragement to trade and manufactures. He formed canals, repaired the roads, instituted regular posts, and laid down regulations for a uniformity of weights and measures. Lastly, he in some measure civilized his subjects, though it is evident that he could not civilize himself.

Character of Peter.

Various have been the estimates formed of the character of Peter by those who have detailed the events of his reign. It is certain that to him the Russian empire is indebted for much of that splendour with which it now shines among the powers of Europe. As a monarch, therefore, he is entitled to our admiration; but as a private individual we must consider him as an object of detestation and abhorrence. His tyranny and his cruelty admit of no excuse; and if we were to suppose, that in sacrificing the heir of his crown he emulated the patriotism of the elder Brutus, we must remember that the same hand which signed the death-warrant of his son, could with pleasure execute the sentence of the law, or rather of his own caprice, and, in the moments of dissipation and revelry, could make the axe of justice an instrument of diabolical vengeance or of cool brutality.

An. 1725. Reign of Catherine.

Peter was succeeded by his consort Catherine, in whose favour he had, some years before his death, altered the order of succession. As the character of this princess, and the transactions of her short reign, have been fully detailed under her life, we shall here only notice in the most cursory manner the events that took place. From the commencement of her reign, Catherine conducted herself with the greatest benignity and gentleness, and thus secured the love and veneration of her subjects, which she had acquired during the life of the emperor. She reduced the annual capitation tax; ordered the numerous gibbets which Peter had erected in various parts of the country to be cut down; and caused the bodies of those who had fallen victims to his tyranny to be decently interred. She recalled the greater part of those whom Peter had exiled to Siberia; paid the troops their arrears; and restored to the Kozaks those privileges and immunities of which they had been deprived during the late reign, while she continued in office most of the servants of Peter, both civil and military. In her reign the boundaries of the empire were extended by the submission of a Georgian prince, and the voluntary homage of the Kubinskian Tartars. She died on the 17th of May 1727, having reigned about two years. She had settled the crown on Peter the son of the Czarovitch Alexei, who succeeded by the title of Peter II.

An. 1727. Reign of Peter II.

Peter was only twelve years of age when he ascended the imperial throne, and his reign was short and uninteresting. He was guided chiefly by Prince Menzikoff, whose daughter Catherine had decreed him to marry. This ambitious man, who, from the mean condition of a pye-boy, had risen to the first offices of the state, and had, during the late reign, principally conducted the administration of the government, was now, however, drawing towards the end of his career. The number of his enemies had greatly increased, and their attempts to work his downfall at last succeeded. A young nobleman of the family of the Dolgoruki, who was one of Peter's chief companions, was excited by his relations, and the other enemies of Menzikoff, to instil into the mind of the young prince feelings hostile to that minister. In this commission he succeeded so well, that Menzikoff and his whole family, not excepting the young empress, were banished to Siberia, and the Dolgorukis took into their hands the management of affairs. These artful counsellors, instead of cultivating the naturally good abilities of Peter, encouraged him to waste his time and exhaust his strength in hunting and other athletic exercises, for which his tender years were by no means calculated. It is supposed that the debility consequent on such fatigue increased the natural danger of the small-pox, with which he was attacked in January 1730, and from which he never recovered.

An. 1730. Anne duchess o Courland succeeds t the imperial throne.

Notwithstanding the absolute power with which Peter I. and the Empress Catherine had settled by will the title to the throne, the Russian senate and nobility, upon the death of Peter II. ventured to set aside the order of succession which those sovereigns had established. The male issue of Peter was now extinct; and the Duke of Holstein, son to Peter's eldest daughter, was by the destination of the late empress entitled to the crown; but the Russians, for political reasons, filled the throne with Anne duchess of Courland, second daughter to Ivan, the eldest brother of Peter, though her eldest sister, the Duchess of Mecklenburg, was still alive. Anne's reign was extremely prosperous; and though she accepted the crown under limitations which some thought derogatory to her dignity, yet she broke them all, asserted the prerogative of her ancestors, and punished the aspiring Dolgoruki family, who had imposed those restrictions, with a view, as it is said, that they themselves might govern. She raised her favourite Biren to the duchy of Courland; and was obliged to give way to many severe executions on his account. Few transactions of any importance took place during the reign of Anne. She followed the example of her great predecessor Peter, by interposing in the affairs of Poland, where she had sufficient interest to establish on the throne Augustus III. She entered into a treaty with the shah of Persia, by which she agreed to give up all title to the territories that had been seized by Peter I. on the shores of the Caspian, in consideration of certain privileges to be granted to the Russian merchants.

In 1735, a rupture took place between Russia and Turkey, occasioned partly by the mutual jealousies that had subsisted between these powers ever since the treaty on the Pruth, and partly by the depredations of the Tartars of the Crimea, then under the dominion of the Porte. A Russian army entered the Crimea, ravaged part of the country, and killed a considerable number of Tartars; but having ventured too far, without a sufficient supply of provisions, it was obliged to retreat, after sustaining a loss of nearly ten thousand men. This ill success did not discourage the court of St Petersburg; and in the following year another armament was sent into the Ukraine, under the command of Marshal Munnich, while another army under Lascy proceeded against Azof. Both these generals met with considerable success; the Tartars were defeated, and the fort of Azof once more submitted to the Russian arms. A third campaign took place in 1737, and the Russians were now assisted by a body of Austrian troops. Munnich laid siege to Otchakof, which soon surrendered, while Lascy desolated the Crimea.

No material advantages were, however, gained upon either side; and disputes arose between the Austrian and Russian generals. At length, in 1739, Marshal Munnich, having crossed the Bog at the head of a considerable army, defeated the Turks in a pitched battle near Stavutshan; made himself master of Yassy, the capital of Moldavia; and before the end of the campaign reduced the whole of that province under his subjection. These successes of the Russian arms induced the Porte to propose terms of accommodation; and in the end of 1739 a treaty was concluded, by which Russia again gave up Azof and Moldavia, and, to compensate the loss of above a hundred thousand men, and vast sums of money, gained nothing but permission to build a fortress on the Don.

a impri-
s ment of
I n VI.

Upon the death of Anne, which took place in 1740, Ivan, the son of her niece the Princess of Mecklenburg, was, by her will, entitled to the succession; but as he was no more than two years old, Biren was appointed to be administrator of the empire during his minority. This nomination was disagreeable to the emperor's father and mother, and unpopular among the Russians. Count Munnich was employed by the princess to arrest Biren, who was tried and condemned to die, but was sent into exile to Siberia.

The administration of the Princess Anne of Mecklenburg and her husband was upon many accounts disagreeable, not only to the Russians, but to other powers of Europe; and the Princess Elizabeth, daughter of Peter the Great by Catherine, formed such a party, that in one night's time she was proclaimed empress of the Russias, and the Princess of Mecklenburg, her husband, and son, were made prisoners. The fate of this unhappy family was peculiarly severe. All but Ivan were sent into banishment, to an island at the mouth of the Dvina, in the White Sea, where the Princess Anne died in childbed in the year 1747. Ivan's father survived till 1775, and at last ended his miserable career in prison. The young emperor Ivan was for some time shut up in a monastery at Oranienburg, when, on attempting to escape, he was removed to the castle of Schlusselburg, where he was cruelly put to death.

1741.

c liza-

The chief instrument in rousing the ambition of Elizabeth, and procuring her elevation to the throne, was her physician and favourite Lestocq, who, partly by his insinuating address, and partly by the assistance of French gold, brought over to Elizabeth's interest most of the royal guards. During the short regency of Anne of Mecklenburg, a new war had commenced between Russia and Sweden; and this war was carried on with considerable acrimony and some success by Elizabeth. The Russian forces took possession of Abo, and made themselves masters of nearly all Finland. But at length, in 1743, in consequence of the negotiations that were carrying on regarding the succession to the Swedish crown, a peace was concluded between the two powers, on the condition that Elizabeth should restore the greater part of Finland.

An. 1742.
Peter duke of Holstein-Gottorp made Grand Duke of Russia.

Soon after her accession, Elizabeth determined to nominate her successor to the imperial throne, and had fixed her eyes on Charles Peter Ulric, son of the Duke of Holstein-Gottorp, by Anne, daughter of Peter the Great. This prince was accordingly invited into Russia, persuaded to become a member of the Greek church, and proclaimed Grand Duke of Russia, and heir of the empire. The ceremony of his baptism was performed on the 18th of November 1742, when he received the name of Peter Feodorovitch. He was at this time only fourteen years of age; but before he had attained his sixteenth year, his aunt had destined him a consort in the person of Sophia Augusta Frederica, daughter of Christian Augustus prince of Anhalt-Zerbst-Dornburg. This princess, on entering the Greek church, took the name of Catherine which she afterwards bore on the throne.

Elizabeth engages in the Seven Years' War.

Having thus settled the order of succession, Elizabeth began to take an active part in the politics of Europe. The death of Charles VI. emperor of Germany, had left his daughter, Maria Theresa queen of Hungary, at the mercy of the enterprising king of Prussia, till a formidable party was organized in her behalf. To this confederacy the empress of Russia acceded, and in 1747 sent a considerable body of troops into Germany, to the assistance of the empress-queen. The events of this long and bloody contest have been fully detailed in the article PRUSSIA, comprehending the greater part of those transactions in the reign of Elizabeth that do not particularly regard the internal policy of the empire. The more private transactions of the court of St Petersburg, as far as they are connected with the intrigues of her niece Catherine and the follies of the Grand Duke Peter, have also been related in our life of CATHERINE II. Elizabeth died on the 5th of January 1762, the victim of disease brought on by intemperance. With her character as a private woman we have little business here. Her merits as a sovereign are fairly estimated in the following sketch of her character by Tooke.

Character of Elizabeth.

"Elizabeth, as empress, governed but little of herself, it being properly her ministers and favourites who dictated her regulations and decrees. Of this number, besides Bestuchef, was also Razumofsky, to whom, it has been said, the empress was even privately married. At the beginning of her reign, it is true, she went a few times to the sitting of the senate; but the matters transacted there were by much too serious for her mind; and, accordingly, she very soon left off that practice altogether, contenting herself by confirming with her signature the resolutions of that assembly, and the determinations of her minister, or the conference, which supplied the place of the council.

"Her character in general was mild, as was evident from the tears it cost her whenever she received accounts from Prussia even of victories gained by her own army, on account of the human blood by which they must necessarily have been purchased. Yet even this delicate sensibility did not restrain her from prosecuting the war into which she had entered from a species of revenge, and for the purpose of humbling the king of Prussia, and, even on her death-bed, from exhorting the persons who surrounded her to the most vigorous continuation of it. It also proceeded from this sensibility, that immediately on her accession to the government she made the vow never to put her signature to a sentence of death. A resolution which she faithfully kept, though it cannot be averred to have been for the benefit of the empire; since, in consequence of it, the number of malefactors who deserved to die was every day increasing, insomuch that even the clergy requested the empress to retract her vow, at the same time urging proofs that they could release her from it. All the arguments they could use, however, were of no avail to move the conscientious monarch; she would not give effect to any sentence of death, although the commanders in the army particularly would have been glad that her conscience had yielded a little on that point. They declared that the soldiers were not to be restrained from their excesses by the severest corporal punishments they could employ; whereas such was their dread of a solemn execution, that a few examples of that nature would have effectually kept them in awe.

Her improvements in the empire.

" Commerce and literature, arts, manufactures, handicrafts, and the other means of livelihood, which had been fostered by the former sovereigns, continued their course under Elizabeth with increasing prosperity. The country products were obtained and wrought up in greater quantities, and several branches of profit were more zealously carried on. The sum appointed for the support of the Academy of Sciences founded by Peter I. at St Petersburg, was considerably augmented by Elizabeth; and she moreover established, in 1758, the academy still subsisting for the arts of painting and sculpture, in which a number of young persons are brought up as painters, engravers, statuaries, architects, &c. At Moscow she endowed a university and two gymnasia.

" The Empress Elizabeth herself having a good voice, music, which Anne had already much encouraged, found under her administration a perpetual accession of disciples and admirers; so that even numbers of persons of distinction at St Petersburg became excellent performers. The art of acting plays was now also more general among the Russians. Formerly none but French or Italian pieces were performed on the stage of St Petersburg, whereas now Sumarokof obtained celebrity as a dramatic poet in his native language, and, in 1756, Elizabeth laid the foundation of a Russian theatre in her residence. Architecture likewise found a great admirer and patroness in her, St Petersburg and its vicinity being indebted to her for great embellishments and numerous structures.

" The magnificence which had prevailed under Anne at the court of St Petersburg was not diminished during her reign, and the court establishment therefore amounted to extraordinary sums. Elizabeth, indeed, in this respect did not imitate her great father; and accordingly in the Seven Years' War the want of a well-stored treasury was already very sensibly felt.

" The population of the empire was considerably increased under her reign; and so early as 1752, according to the statement in an account published by an official person, it was augmented by one fifth.

" Elizabeth continued the practice of her predecessors in encouraging foreigners to come to settle in her empire. Emigrant Servians cultivated a considerable tract of land, till then almost entirely uninhabited, on the borders of Turkey, where they built the town of Elizabethgorod, and multiplied so fast, that in the year 1764 a particular district was formed of these improvements, under the name of New Servia. Only the Jews Elizabeth was no less resolute not to tolerate than her father had been; insomuch that, so early in her reign as 1743, they were ordered to quit the country on pain of death.

" The army was augmented under Elizabeth, but certainly not improved. There were now no longer at the head of it such men as the foreigners Munnich, Keith, or Loevendal, who, besides their personal courage and intrepidity, possessed the soundest principles of the art of war; and, what is of no less consequence in a commander, kept up a strict discipline, and took care that the laws of subordination were punctually observed. The excessive license which the regiments of guards, particularly the life company of the Preobajerskoy guards, presumed to exercise, under the very eyes of the empress in St Petersburg, afforded no good example to the rest of the army; and Elizabeth, in appointing those soldiers of that life company who had been most guilty of flagrant disorders, and the basest conduct, to be officers in the marching regiments, gives us no very high idea of what was required in an officer, but rather serves easily to explain whence it arose that such frequent complaints were made of insubordination. A great number of excellent regulations that had been introduced into the army, and always enforced by foreigners, especially by Munnich, were suffered by the Russian generals to fall into total disuse. The bad effects of this negligence were very soon perceived; and it was undoubtedly a circumstance highly favourable to the Russian troops, that for several years successively in the war which we have had occasion so often to mention, they had to engage with such a master in the military art as the king of Prussia, and by their conflicts with him, as well as by their connection with the Austrians, and in the sequel with the Prussian soldiery, had an opportunity of learning so many things, and of forming themselves into regular combatants.

She establishes a political inquisition.

" Elizabeth tarnished her reign, however, by the institution of a political court of inquisition, under the name of a secret state chancery, empowered to examine into and punish all such charges as related to the expression of any kind of displeasure against the measures of government. This, as is usual in such cases, opened a door to the vilest practices. The lowest and most profligate of mankind were now employed as spies and informers, and were rewarded for their denunciations and calumnies against the most virtuous characters, if these happened by a look, a shrug of the shoulders, or a few harmless words, to signify their disapprobation of the proceedings of the sovereign."

An. 1762. Accession of Peter III.

The grand duke ascended the throne by the name of Peter III. This prince's conduct has been variously represented. He entered on the government possessed of an enthusiastic admiration of the virtues of the king of Prussia, with whom he immediately made peace, and whose principles and practice he seems to have adopted as patterns for his imitation. He might have surmounted the effects even of these peculiarities, unpopular as they then were in Russia; but it is said that he aimed at reforms in his dominions which Peter the Great durst not attempt; and that he even ventured to cut off the beards of his clergy. He was certainly a weak man, who had no opinions of his own, but childishly adopted the sentiments of any person who took the trouble to teach him. His chief amusement was buffoonery; and he would sit for hours looking with pleasure at a merry-andrew singing drunken and vulgar songs. He was a stranger to the country, its inhabitants, and their manners; and suffered himself to be persuaded by those about him, that the Russians were fools and beasts unworthy of his attention, except to make them, by means of the Prussian discipline, good fighting machines. These opinions regulated his whole conduct, and prepared the way for that revolution which faults of a different kind tended to hasten.

His imprudences.

Becoming attached to a lady of the noble family of Vorontzoff, he disgusted his wife, who was then a beautiful woman in the prime of life, of great natural talents and great acquired accomplishments; whilst the lady whom he preferred to her was but one degree above an idiot. The Princess Dashkoff, the favourite's sister, who was married to a man whose genius was not superior to that of the emperor, being *dame d'honneur* and lady of the bed-chamber, had of course much of the empress's company. Similarity of situations knit these two illustrious personages in the closest friendship. The princess, being a zealous admirer of the French *économistes*, could make her conversation both amusing and instructive. She retailed all her statistical knowledge; and finding the empress a willing hearer, she spoke of her in every company as a prodigy of knowledge, judgment, and philanthropy. Whilst the emperor, by his buffoonery and attachment to foreign manners, was daily incurring more and more the hatred of his subjects, the popularity of his wife was rapidly increasing; and some persons about the court expressed their regret that so much knowledge of government, such love of humanity, and such ardent wishes for the prosperity of Russia, should only furnish conversations with Catharina Romanovna (the Princess Dashkoff). The empress and her favourite did not let these expressions pass unobserved, but continued their studies in concert; and whilst the former was employed on her famous code of laws for a great empire, the latter always reported progress, till the middling circles of Moscow and St Petersburg began to speak familiarly of the blessings which they might enjoy if these speculations could be realized.

Meanwhile Peter III. was giving fresh cause of discontent. He had recalled from Siberia Count Munnich, who was indeed a sensible, brave, and worthy man; but Munnich, as he was smarting under the effects of Russian despotism, and had grounds of resentment against most of the great families, did not much discourage the emperor's unpopular conduct, trying only to moderate it and give it a system. Peter, however, was impatient. He publicly ridiculed the exercise and evolutions of the Russian troops; and hastily adopting the Prussian discipline, without digesting and fitting it for the constitution of his own forces, he completely ruined himself by disgusting the army.

Ca erine fo s a party her fa r.

In the midst of these imprudences, indeed, Peter was sometimes disturbed by the advice of virtuous counsellors. But these remonstrances produced only a temporary gleam of reformation, and he soon relapsed into his accustomed sensuality. What he lost in popularity was gained by the emissaries of Catherine. Four regiments of guards, amounting to eight thousand men, were speedily brought over by the three brothers Orlof, who had contrived to ingratiate themselves with their officers. The people at large were in a state of indifference, out of which they were partially roused by the following means. A little manuscript was handed about, containing principles of legislation for Russia, founded on natural rights, and on the claims of the different classes of people, which, insensibly formed, became so familiar as to appear natural. In that performance was proposed a convention of deputies from all the classes, and from every part of the empire, to converse, but without authority, on the subjects of which it treated, and to inform the senate of the result of their deliberations. It passed for the work of her majesty, and was much admired.

While Catherine was thus high in the public esteem and affection, the emperor took the alarm at her popularity, and in a few days came to the resolution of confining her for life, and then of marrying his favourite. The servants of that lady betrayed her to her sister, who imparted the intelligence to the empress. Catherine saw her danger, and instantly formed her resolution. She must either tamely submit to perpetual imprisonment, and perhaps a cruel and ignominious death, or contrive to hurl her husband from his throne. No other alternative was left her, and the consequence was what was undoubtedly expected. The proper steps were taken. Folly fell before abilities and address, and in three days the revolution was accomplished.

Pe de-thed an ut to de .

When the emperor saw that all was lost, he attempted to enter Cronstadt from Oranienbaum, a town on the Gulf of Finland, thirty versts, or nearly twenty-six miles, from St Petersburg. The sentinels at the harbour presented their muskets at the barge; and though they were not loaded, and the men had no cartridges, he drew back. Munnich received him again, and exhorted him to mount his horse and head his guards, swearing to live and die with him. He said, "No, I see it cannot be done without shedding much of the blood of my brave Holsteiners. I am not worthy of the sacrifice."

Six days had already elapsed since the revolution, and that great event had been apparently terminated without any violence that might leave odious impressions upon the mind of the public. Peter had been removed from Peterhof to a pleasant retreat called Ropscha, about thirty miles from St Petersburg; and here he supposed he should be detained but a short time previous to his being sent into Germany. He therefore transmitted a message to Catherine, desiring permission to have for his attendant a favourite negro, and that she would send him a dog, of which he was very fond, together with his violin, a bible, and a few romances; telling her that, disgusted with the wickedness of mankind, he was resolved henceforth to devote himself to a philosophical life. However reasonable these requests, not one of them was granted, and his plans of wisdom were turned into ridicule.

In the mean time the soldiers were amazed at what they had done. They could not conceive by what fascination they had been hurried so far as to dethrone the grandson of Peter the Great, in order to give his crown to a German woman. The majority, without plan or consciousness of what they were doing, had been mechanically led on by the movements of others; and each individual now reflecting on his baseness, after the pleasure of disposing of a crown had vanished, was filled only with remorse. The sailors, who had never been engaged in the insurrection, openly reproached the guards in the tippling-houses with having sold their emperor for beer. One night a band of soldiers attached to the empress took the alarm, from an idle fear, and exclaimed that their mother was in danger, and that she must be awaked, that they might see her. During the next night there was a fresh commotion more serious than the former. So long as the life of the emperor left a pretext for inquietude, it was thought that no tranquillity was to be expected.

On the sixth day of the emperor's imprisonment at Ropscha, Alexei Orlof, accompanied by an officer named Teploff, came to him with the news of his speedy deliverance, and asked permission to dine with him. According to the custom of that country, wine glasses and brandy were brought previous to dinner; and while the officer amused the czar with some trifling discourse, his chief filled the glasses, and poured a poisonous mixture into that which he intended for the prince. The czar, without any distrust, swallowed the potion, on which he immediately experienced the most severe pains; and on his being offered a second glass, on pretence of its giving him relief, he refused it, with reproaches against him that offered it. He called aloud for milk, but the two monsters offered him poison again, and pressed him to take it. A French valet-de-chambre, greatly attached to him, now ran in. Peter threw himself into his arms, saying in a faint tone of voice, "It was not enough, then, to prevent me from reigning in Sweden, and to deprive me of the crown of Russia. I must also be put to death."

The valet-de-chambre presumed to intercede for his master; but the two miscreants forced this dangerous witness out of the room, and continued their ill treatment of the czar. In the midst of this tumult the younger of the Princes Baratinsky came in, and joined the two former. Orlof, who had already thrown down the emperor, was pressing upon his breast with both his knees, and firmly griping his throat with his hand. The unhappy monarch now struggling with that strength which arises from despair, the two other assassins threw a napkin round his neck, and put an end to his life by suffocation.

It is not known with certainty what share the empress had in this event; but it is affirmed that on the very day on which it happened, while the empress was beginning her dinner with much gaiety, an officer, supposed to be one of the assassins, precipitately entered the apartment with his hair dishevelled, his face covered with sweat and dust, his clothes torn, and his countenance agitated with horror and dismay. On entering, his eyes, sparkling and confused, met those of the empress. She arose in silence, and went into a closet, whither he followed her. A few moments afterwards she sent for Count Panin, the former governor of Peter, who was already appointed her minister, and, informing him that the emperor was dead, consulted him on the manner of announcing his death to the public. Panin advised her to let one night pass over, and to spread the news next day, as if they had received it during the night. This counsel being approved, the empress returned with the same countenance, and continued her dinner with the same gaiety. On the day following, when it was published that Peter had died of an hæmorrhoidal colic, she appeared bathed in tears, and proclaimed her grief by an edict.

The corpse was brought to St Petersburg, there to be exposed. The face was black, and the neck excoriated. Notwithstanding these horrible marks, in order to assuage the commotions, which began to excite apprehension, and to prevent impostors from hereafter disturbing the empire, it was left three days exposed to all the people, with only the ornaments of a Holstein officer. The soldiers, disbanded and disarmed, mingled with the crowd, and as they beheld their sovereign, their countenances indicated a mixture of compassion, contempt, and shame. They were soon afterwards embarked for their country; but, as the sequel of their cruel destiny, almost all of these unfortunate men perished in a storm. Some of them had saved themselves on the rocks adjacent to the coast; but they again fell a prey to the waves, while the commandant of Cronstadt despatched a messenger to St Petersburg to know whether he might be permitted to assist them. Thus fell the unhappy Peter III. in 1762, in the thirty-fourth year of his age, after having enjoyed the imperial dignity only six months.

Catherine II. ascends the imperial throne.

On her accession, Catherine behaved with great magnanimity and forbearance towards those who had opposed her elevation, or were the declared friends of the deceased emperor. She gave to Prince George, in exchange for his title of Duke of Courland, conferred on him by Peter, the government of Holstein. She reinstated Biren in his dukedom of Courland, received into favour Marshal Munnich, who had readily transferred his fidelity from the dead to the living, and even pardoned her rival the Countess Vorontzoff, and permitted her to retain the tokens of her lover's munificence. She permitted Gudovitch, who was high in the confidence of Peter, and had incurred her particular displeasure, to retire to his native country. Perhaps the most unexpected part of her conduct towards the friends of Peter, was her adhering to the treaty of peace which that monarch had concluded with the king of Prussia six months before. The death of his inveterate enemy Elizabeth had relieved Frederick from a load of solicitude, and had extricated him from his dangerous situation. He now, as he thought, saw himself again involved in a war with the same formidable power; but, to his great joy, he found that Catherine, from motives of policy, declined entering on a war at the commencement of her reign.

An. 1764. Assassination of the dethroned czar.

In one particular the empress showed her jealousy and her fears. She increased the vigilance with which the young prince Ivan was confined in the castle of Schlusselburg, from which Peter III. had expressed a resolution to release him. Not long after her accession, this unfortunate prince was assassinated, though whether this event was to be imputed to the empress or her counsellors, cannot be positively determined. But a manifesto published by the court of St Petersburg, and supposed to have been written by the empress herself, admitted that the prince was put to death by the officers of his guard, alleging that this was necessary, in consequence of an attempt to carry him off.

Chronological sket of the affairs of R sia durin the reign of Cathe rine II.

Were we to offer a detailed account of the principal transactions that took place during the long reign of Catherine, we should far exceed the limits within which this article must be confined, and should at the same time repeat much of what has already been given under other heads. As the events that distinguished the life of Catherine, however, are too important to be wholly omitted, we shall present our readers with the following chronological sketch of them, referring for a more particular account to Tooke's Life of Catherine II., and to the articles CATHERINE II., BRITAIN, FRANCE, POLAND, PRUSSIA, SWEDEN, and TURKEY, in this work.

An. 1766.

The year 1766 presented at St Petersburg the grandest spectacle that perhaps was ever seen in Europe. At an entertainment, which the empress chose to name a carousal, the principal nobility appeared in the most sumptuous dresses, sparkling with diamonds, and mounted on horses richly caparisoned, in a magnificent theatre erected for that purpose. Here all that has been read of the ancient jousts and tournaments was realized and exceeded in the presence of thousands of spectators, who seemed to vie with each other in the brilliancy of their appearance.

An. 1768. Establishment of a code of laws.

In 1768, the empress composed instructions for a new code of laws for her dominions; and the same year she submitted to the danger of inoculation, in order that her subjects, to whom the practice was unknown, might be benefited by her example.

War with the Turk

In the same year a war broke out with the Ottoman Porte. The various events of this long and important conflict, which continued for seven years, must here be only briefly enumerated, as they will hereafter be more particularly noticed under the article TURKEY. In this war our countryman Greig, then an admiral in the Russian service, highly distinguished himself by his conduct in a naval engagement with the Turks, in the harbour of Tschesme, in the Archipelago, in which the Turkish fleet was entirely defeated, and their magazines destroyed. This took place on the 4th of November 1772.

An. 1769. Progress and conclu sion of th war with Turkey.

In the beginning of the year 1769, the khan of the Crimea made an attack on the territory of Bachmut, on the river Bog, where he was several times bravely repulsed, with his army of Tartars and Turks, by Major-General Romanius and Prince Prosorofskoi. At the same time were fought the battles of Zekanofca and Soroca on the Dnieper, when the large magazines of the enemy were burned. In February the Polish Kozaks in the voyvodeship of Braclau put themselves under the Russian sceptre. In the same month the Nisovian Saparogian Kozaks gained a battle in the deserts of Krim. In March the Polish rebels were subdued, and their town taken, by Major-General Ismailof. On the 2d of April the fort of Taganrog, on the Sea of Azof, was taken. On the 15th the Russian army, under the general-in-chief Prince Galitzin, crossed the Dniester. On the 19th a victory was gained by Prince Galitzin near Chotzim. On the 21st the Turks were defeated not far from Chotzim by Lieutenant-General Count Soltikof. The 29th, an action was fought between the Russian Kalmucks and the Kuban Tartars, to the disadvantage of the latter. June the 8th, the Turks were defeated at the mouth of the Dnieper, near Otchakof. An action took place on the Dniester on the 19th, when the troops of Prince Prosorofskoi forced the Turks to repass the river in great disorder. Chotzim was taken on the 19th of September. Yassy, in Moldavia, was taken on the 27th of September. Bukarescht, in Wallachia, was taken, and the hospodar made prisoner, in November 1770. A victory was gained by the Russians under Generals Podhorilshany and Potemkin, near Fokshany. The town of Shursha was taken by Lieutenant-General Von Stoffeln, February 4. A Russian fleet appeared in the port of Maina, in the Morea, on the 17th February. Mistra, the Lacedæmon of the ancients, and several other towns of the Morea, were taken in February. Arcadim in Greece surrendered, and a multitude of Turks were made prisoners, in the same month. The Turks and Tartars were driven from their intrenchments near the Pruth, by Count Romantzof, Prince Repnin, and General Bauer, 11th–16th June. Prince Prosorofskoi gained several advantages near Otchakof, June 18. The Russian fleet, under Count Alexei Orlof, gained a complete victory over the Turks near Tschesme, 24th June; the consequence of this victory was the destruction of the whole Turkish fleet, near Tschesme, where it was burned by Admiral Greig on the 26th of June. A battle was fought on the Kagul, in which Count Romantzof defeated the Turkish army, consisting of a hundred and fifty thousand men, and took their camp, and all the artillery, July 21. The fortress Bender was taken July 22. The town of Ismail was taken by Prince Repnin, July 26; Kilia by Prince Repnin, August 21; and Akjerman in October. Brailof was taken on the 10th of November 1771; the town of Kaffa, June 29; and numberless other victories were obtained by sea and land, till peace was concluded on the 13th January 1775. By this the Crimea was declared independent of the Porte, and all the vast tract of country between the Bog and Dnieper was ceded to Russia, besides the Kuban and the isle of Taman, with free navigation in all the Turkish seas, including the passage of the Dardanelles, privileges granted to the most favoured nations, and stipulations in behalf of the inhabitants of Moldavia and Wallachia.

In 1779, the empress intending to divide the empire into viceroyalties, began in January with the viceroyalty of Orlof. March 21st, a new treaty was signed at Constantinople between Russia and the Porte. May 13th, the treaty of peace between the belligerent powers in Germany and the French king was signed under the mediation of her majesty. In October, a ship built at Taganrog, named the Prince Constantine, sailed to Smyrna with Russian commodities. December 3d, the viceroyalty of Voronetsk was instituted; and the 27th, Count Romantzof Zadunaiski opened the viceroyalty of Kursk with great solemnity.

In 1783, May 7th, the empress instituted a seminary for the education of young persons of quality at Kursk. June 21st, a treaty of commerce was concluded with the Ottoman Porte. July, the institution of the other viceroyalties of the empire followed in succession. On July 21st, the empress published a manifesto by her commander-in-chief Prince Potemkin, in the Krim, in regard to the taking possession of that peninsula, the Kuban, and the island of Taman. The 24th, a treaty was concluded with Heraclius II. czar of Kartalinia and Kachetti, by which he submitted himself, his heirs and successors for ever, with his territories and dominions, to the sceptre of her majesty, her heirs and successors. On the 29th, accounts were received from the camp of Prince Potemkin, at Karas-Basar, that the clergy, the beys, and other persons of distinction, with the towns of Karas-Basar, Bachtshiserai, Achmetchet, Kaffa, Kosloff, with the districts of Turkanskoikut and Neubasar, and that of Perekop, in the peninsula of the Krim, together with the hordes of Edissank and Dshambolusk, the sultan Alim Giray, and his vassals, with all the Budshaks and Bashkirs there, and all the tribes dwelling beyond the river Kuban, the sultan Boatur Giray and his vassals, took the oath of allegiance to her imperial majesty, and with willing hearts submitted for ever to her glorious sway. On the 30th the hospodar of Wallachia was deposed, and Draco Sutzo set up in his place. September 22d, her majesty raised Gabriel, archbishop of Novgorod and St Petersburg, to the dignity of metropolitan. October 21st, in the great hall of the Academy of Sciences, the new institution of the Imperial Russian Academy was opened, after a most solemn consecration by the metropolitan Gabriel, and others of the clergy, under the presidency of the Princess Dashkoff. November 7th, the empress became mediatrix for accommodating the differences between the king of Prussia and the city of Dantzig. The school for surgery was opened at St Petersburg on the 18th. December 13th, a school commission was instituted for superintending all the public schools. On the 28th, an act was concluded with the Ottoman Porte, by which the possession and sovereignty of the Krim, the Kuban, and Taman, were solemnly made over to the empress.

An. 1784,
Georgia
annexed to
the Russian empire.

1784. January 1st, the senate, in a speech by Field-Marshal Count Razomofskoi, performed the ceremony, repeated annually, of most humbly thanking her majesty for the benefactions which she had graciously bestowed on the whole empire in the preceding year. October 14th, the Lesgiers, having crossed the river Alasan, and invaded the dominions of Georgia, were repulsed with great loss by a detachment of Russian troops. December 29th, Katolikos Maksim, the serdar and court-marshal Prince Zeretelli, and the chief justice Kuinichese, ambassadors from David, czar of Imeretia, were admitted to a public audience of her majesty, at which they submitted, in the name of the czar, him and his subjects to the will and powerful protection of her imperial majesty, as the rightful head of all the sons of the orthodox eastern church, and sovereign ruler and defender of the Georgian nations.

An. 1785.
Several
provincial
schools established.

1785. The 12th of January, Maurocordato, hospodar of Wallachia, was deposed, and Alexander Maurocordato, his uncle, restored to that dignity. The 21st, the empress visited the principal national school, and passed a long time in examining the classes, and the proficiency of the youth in that seminary; on which occasion a marble tablet was fixed in the wall of the fourth class, with this inscription, in gold letters: THOU VISITEST THE VINEYARD WHICH THINE OWN HAND HATH PLANTED. April 21st, the privileges of the nobility were confirmed, and on the same day the burghers of towns constituted into bodies corporate, by a particular manifesto. The public school in Voronetsk was opened. July 14th, a manifesto was issued, granting full liberty of religion and commerce to all foreigners settling in the regions of Mount Caucasus, under the Russian government. September 15th, the public school at Nishnei Novgorod was opened. October 12th, the Jesuits in White Russia, in a general assembly, elected a vicar-general of their order. November 1st, a treaty of commerce was concluded with the emperor of Germany. The 24th, the Russian consul in Alexandria made his public entry on horseback, an honour never before granted to any power; erected the imperial standard on his house, with discharge of cannon, &c. December 28th, a Russian mercantile frigate, fully freighted, arrived at Leghorn from Constantinople.

An. 1786. The roads repaired at the expense of government. A loan bank established.

1786. The 29th of January, the empress confirmed the plan of a navigation school. February 12th, by a decree, the usual slavish subscriptions to petitions were to be discontinued; and, instead of them, only the words *humble* or *faithful subject*, and in certain cases only *subject*, were ordained to be used. March 2d, the empress granted the university of Moscow a hundred and twenty-five thousand roubles, and all the materials of the palace Kremlin, for increasing its buildings. The 25th, a decree was passed for making and repairing the roads throughout the whole empire at the sole expense of the crown, and four millions of roubles were immediately allotted for the road between St Petersburg and Moscow. April 10th, a new war establishment for the army was signed; 23d, the hospodar of Wallachia was deposed, and Mavroyeni set up in his place. June 28th, the empress instituted a loan bank at St Petersburg, to the fund whereof she allotted twenty-two millions to be advanced to the nobility, and eleven millions to the burghers of the town, on very advantageous terms. August 5th, there were published rules to be observed in the public schools. October 4th, a large Russian ship, with Russian productions, from St Petersburg, arrived at Cadiz. November 24th, the empress erected public schools at Tambov. December 14th, Prince Ypsilanti was appointed hospodar of Moldavia, in the room of the deposed Maurocordato. December 31st, a treaty of commerce and navigation was concluded between Russia and France.

An. 1787. Renewal of hostilities with Turkey.

1787. March, public schools were endowed and opened at Rostof, Uglitsh, Molaga, and Romanof, in the viceroyalty of Yaroslavl; also at Ustiug and Arasovitz, in the viceroyalty of Vologda. April 21st, a manifesto was issued for promoting peace and concord among the burghers of the empire. The 25th, took place the concerted interview between the empress and the king of Poland, near the Polish town of Konief. The treaty of commerce with England being expired, the British factory were informed that they must henceforward pay the duties on imports in silver money, like the other nations who had no commercial treaty. May 7th, the empress hearing that the emperor of Germany was at Cherson, proceeded thither, and met him there on the 12th. June 28th, the twenty-fifth anniversary of her reign, she displayed various marks of her bounty. The debtors to the crown were forgiven, prisoners released, imposts taken off, soldiers rewarded, &c. The 12th July, the new-built school at Riga, called a *Lyceum*, was solemnly dedicated. August 5th, Bulgakoff, the Russian ambassador at the Ottoman Porte, was imprisoned in the Seven Towers, contrary to the law of nations, which the empress regarded as a public declaration of war. 21st, The Turkish fleet at Otchakof attacked the Russian frigate Skorui and the sloop Bitingi, but was repulsed and put to flight by the bravery of the latter. Many signal advantages were gained over the Turks; several public schools founded in various parts of the empire between this and August following, during which time the war broke out with Sweden.

An. 1788. War with Sweden.

1788. August 12th, in the expedition beyond the Kuban, the Russian troops entirely routed a company of four thousand Arutayans and Alcasinians; eight hundred of the enemy were slain, and five villages destroyed. 15th, The surrender of the Turkish fortress of Dubitsha took place. 18th, The Turks made a violent sortie from Otchakof, but were repulsed by the Russian yagers, and, after a battle of four hours, were driven back with the loss of five hundred men. 23d, A fierce battle was fought between the Russian troops and Sacubanians, in which the latter lost a thousand men. The Russian fleet kept the Swedish blocked up in Sveaborg ever since the battle of July 6th. The Swedish army left the Russian territory in Finland. September 18th, The town and fortress of Chotzim surrendered to the Russians, with the garrison of two thousand men, a hundred and fifty-three cannon fourteen mortars, and much ammunition. 19th–29th, A small Russian squadron from the fleet at Sevastopol, cruising along the coast of Anatolia, destroyed many of the enemy's vessels, prevented the transporting of the Turkish troops, and returned with great booty. 20th, Ussenier Shamanachin, chief of the Bsheduchovians, was, on his petition, admitted a subject of Russia. 26th, A numerous host of Kubanians and Turks were beaten on the river Ubin, with the loss of fifteen hundred men. November 7th, Prince Potemkin, at the head of his Kozaks, took the island Beresan, with many prisoners and much ammunition. December 6th, the town and fortress of Otchakof were taken by Prince Potemkin Tavritsheskoi; nine thousand five hundred and ten of the enemy were killed, four thousand taken prisoners, a hundred and eighty standards, three hundred and ten cannons and mortars. All the inhabitants were taken prisoners, amounting to twenty-five thousand; the Russians lost nine hundred and fifty-six killed and eighteen hundred and twenty-four wounded. December 19th, General Kamenskoy gained considerable advantages over the Turks near Gangur.

An. 1789 Numerous victories over the Turks and Swedes.

1789. April 16th, Colonel Rimskoy Korsakoff was surrounded by the Turks, who were beaten, with great slaughter, by Lieutenant-General Von Derfelden. 17th–28th, Some Russian cruisers from Sevastopol effected a landing on Cape Karakarman, burnt six mosques, and carried off great booty. 20th, General Derfelden drove the Turks from Galatch, gained a complete victory, killed two thousand, took fifteen hundred prisoners, with the seraskier Ibrahim Pasha, and the whole camp. Several skirmishes took place between the Russians and Swedes in Finland, always to the advantage of the former. May 31st, another victory was gained over the Swedes. June 5th, Sulkof was taken from the Swedes, and Fort St Michael on the 8th. July 15th, Admiral Tchitchagoff engaged the Swedish fleet under the command of the Duke of Sudermania; but no ship was lost on either side. 21st, A battle was fought at Fokshany, to the great loss of the Turks, and Fokshany was taken. August 13th, the Russian galley fleet fought the Swedish under Count Ehrenschwerdt, the former took a frigate and five other ships, and two thousand prisoners. August 21st, another sea-fight took place, and Prince Nassau Siegen made good his landing of the Russian troops in sight of the king of Sweden at the head of his army. September 7th, Prince Repnin attacked the seraskier Hassan Pasha near the river Seltska, and took his whole camp. 11th, Count Suwaroff and prince of Saxe-Cobourg engaged near the river Kymnik the grand Turkish army of nearly a hundred thousand men, and gained a complete victory; from which Count Suwaroff received the surname Kymnikskoi. 14th, The Russian troops under General Ribas took the Turkish citadel Chodshabey, in the sight of the whole of the enemy's fleet. 30th, The fortress Palanka being taken, the town of Belgorod or Akjerman surrendered to Prince Potemkin Tavritsheskoi. November 4th, the town and castle of Bender submitted at discretion to the same commander.

An. 1790. Peace wit Sweden.

1790. April 24, General Numsen gained a victory over the Swedes near Memel. May 2, a sea-fight took place off Revel, in which the Russians captured the Prince Charles of sixty-four guns from the Swedes; and in this engagement those two gallant English officers Captains Trevennian and Dennison were killed. 23d, The fleet under Vice-Admiral Kruse engaged the Swedish fleet near the island Siskar in the Gulf of Finland, without any advantage being gained on either side, though they fought the whole day. 24th, An action was fought at Savataipala, when the Swedes were forced to fly. June 6th, the Swedes were defeated by Major Buxhovden, on the island Uransari. June 22, the whole Swedish fleet, commanded by the Duke of Sudermania, was entirely defeated by Admiral Tchitchagoff and the Prince of Nassau Siegen; on this occasion five thousand prisoners were taken, amongst whom were the centre admiral and two hundred officers. 28th, General Denisoff defeated the Swedes near Davidoff. July 9th, Admiral Ushakoff obtained a victory over the Turkish fleet commanded by the capudan pasha, at the mouth of the Straits of Yenikali. August 3d, peace was concluded with Sweden, without the mediation of any other power. August 28th, 29th, an engagement took place on the Euxine, not far from Chodshabey, between the Russian admiral Ushakoff and the capudan pasha, when the principal Turkish ship, of eighty guns, was burnt, one of seventy guns and three others taken, the admiral Said Bey being made prisoner, and another ship sunk; the rest made off. September 30th, a great victory was obtained over the Turks by General Germann, with much slaughter, and the seraskier Batal Bey, and the whole camp, were taken. October 18th, Kilia surrendered to Major Ribas. November 6th, 7th, the fortress Cultsha and the Turkish flotilla were taken. December 11th, the important fortress of Ismail, after a storming for seven hours without intermission, surrendered to Count Suwaroff, with the garrison of forty-two thousand men; thirty thousand eight hundred and sixteen were slain on the spot, two thousand died of their wounds, nine thousand were taken prisoners, with two hundred and sixty-five pieces of cannon, an incredible store of ammunition, &c. The Russians lost only eighteen hundred and fifteen killed, and two thousand four hundred and fifty wounded.

A 1791. T Turks r atedly d ated, a obliged t ake p e.

1791. March 25th–31st, the campaign opened by the troops under Prince Potemkin, not far from Brailof, when the Turks were defeated in several battles, in which they lost upwards of four thousand men. June 5th, the troops under General Golenitshef Kutusoff, near Tultsha, drove the Turks beyond the Danube, and at Babada entirely routed a body of fifteen thousand men, of whom fifteen hundred were left dead upon the field. 22d, The fortress Anapuas was taken by storm, when the whole garrison, consisting of twenty-five thousand men, were put to the sword, excepting one thousand who were taken prisoners. 28th, The troops under Prince Repnin attacked the Turkish army, consisting of nearly eighty thousand men, commanded by the grand vizir Yussuf Pasha, eight pashas, two Tartar sultans, and two beys of Anatolia; and after a bloody battle of six hours, entirely routed them: five thousand Turks were killed in their flight. June 28th, Sudskuk Kale was taken. July 31st, Admiral Ushakoff beat the Turkish fleet on the coasts of Rumelia. Prince Repnin and Yussuf Pasha signed the preliminaries of peace between the Russian empire and the Ottoman Porte, by which the Dniester was made the boundary of the two empires, with the cession of the countries lying between the Bog and Dniester to Russia. August 15th, 16th, at Pilnitz, near Dresden, a congress was held by the emperor of Germany, the king of Prussia, the elector of Saxony, the Count d'Artois, &c. &c. One of the most important events in this year was the death of Prince Potemkin, at Yassy in Moldavia, on the 15th October.

A 1792. F inva- si of Po- la

1792. Early in this year Bulgakoff, the Russian minister at Warsaw, declared war against Poland; and the Polish patriots raised an army in which Thaddeus Kosciuszko soon bore a conspicuous part.

In 1788, the diet of Poland had abrogated the constitution which the empress of Russia had, in 1775, compelled that nation to adopt, and had formed an alliance with the king of Prussia, by way of defence against the further encroachments of the Russian despot. Three years after, viz. on the 3d of May 1791, the new constitution, which was intended further to destroy the ambitious hopes of Catherine, was decreed at Warsaw. (See POLAND.) These were affronts which the Russian empress could not forgive, and in one of the *conciliabula*, in which the ministers of state, and the favourite for the time being, sat to regulate the affairs of the north of Europe, and to determine the fate of the surrounding nations, the annihilation of the Polish monarchy was resolved on.

The declaration of war above mentioned was denounced by Bulgakoff at an assembly of the diet. That body received the declaration with a majestic calmness, and resolved to take measures for the defence of the nation. The generous enthusiasm of liberty soon spread throughout the state, and even the king pretended to share in the general indignation. An army was hastily collected, and the command of it bestowed on Prince Joseph Poniatowsky, a general whose inexperience and frivolous pursuits were but ill adapted to so important a charge.

In the mean time several Russian armies were preparing to overwhelm the small and disunited forces of the Poles. A body of eighty thousand Russians extended itself along the Bog, another of ten thousand was collected in the environs of Kief, and a third of thirty thousand penetrated into Lithuania. While these armies were carrying murder and desolation throughout the Polish territories, Catherine was employing all her arts to induce the neighbouring powers to join in the partition of Poland; and in this she was but too successful. A treaty was accordingly concluded between the empress and the king of Prussia, by which each appropriated to itself a share of the remains of Poland. Stanislas Augustus, the powerless head of that state, was prevailed on to make a public declaration that there was a necessity for yielding to the superiority of the Russian arms.

1793. On the 9th of April the Polish confederation of the partisans of Russia assembled at Grodno; and on this occasion the Russian general placed himself under the canopy of that throne which he was about to declare for ever vacant, and the Russian minister Sievers produced a manifesto, declaring the intention of his mistress to incorporate with her domains all the Polish territory which her arms had conquered. An. 1793.

The Russian soldiers dispersed throughout the provinces committed depredations and ravages of which history furnishes but few examples. Warsaw became especially the theatre of their excesses. Their general, Igelstrom, who governed in that city, connived at the disorders of the soldiers, and made the wretched inhabitants feel the whole weight of his arrogance and barbarity. The patriots of Poland had been obliged to disperse, their property was confiscated, and their families reduced to servitude. Goaded by so many calamities, they once more took the resolution to free their country from the oppression of the Russians, or perish in the attempt. Some of them assembled, and sent an invitation to Kosciuszko, to come and lead them on against the invaders of their freedom.

Kosciuszko had retired to Leipsig, with a few other Poles, all eminent for patriotism and military ardour. These hesitated not a moment in giving their approbation to the resolution adopted by their indignant countrymen; but they were sensible that, in order to succeed, they must begin by emancipating the peasants from the state of servitude under which they then groaned. Kosciuszko and Zagonchek repaired with all expedition to the frontiers of Poland, and the latter proceeded to Warsaw, where he held conferences with the chief of the conspirators, and particularly with several officers, who declared their detestation of the Russian yoke. All appeared ripe for a general insurrection; and the Russian commanders, whose suspicions had been excited by the appearance of Kosciuszko on the frontiers, obliged that leader and his confederates to postpone for a time the execution of their plan. In order to deceive the Russians, Kosciuszko retired into Italy, and Zagonchek repaired to Dresden, whither Ignatius Potoski and Kolontay had gone before him. On a sudden, however, Zagonchek appeared again at Warsaw, but was impeached by the king to General Igelstrom, and, in a conference with the general, was ordered to quit the Polish territory. He must now have abandoned his enterprise altogether, or immediately proceed to open insurrection. He chose the latter.

An. 1794. Attempts of the patriots to oppose the encroachments of Russia.

1794. Kosciuszko was recalled from Italy, and arrived at Cracow, where the Poles received him as their deliverer. Here he was joined by some other officers, and took the command of his little army, consisting of about three thousand infantry and twelve hundred cavalry. On the 24th of March was published the manifesto of the patriots, in which they declared the motives for their insurrection, and called on their countrymen to unite in the glorious attempt to free the republic from a foreign yoke. Kosciuszko was soon joined by three hundred peasants armed with scythes, and some other small reinforcements gradually came in. A body of seven thousand Russians had collected to oppose the movements of this little army, and a battle took place, in which the patriots were successful.

While the insurrection had thus auspiciously commenced on the frontiers, the confederates of the capital were nearly crushed by the exertions of the Russian general. Hearing at Warsaw of the success of Kosciuszko, Igelstrom caused all those whom he suspected of having any concern in the insurrection to be arrested; but these measures served only to irritate the conspirators. On the 18th of April they openly avowed their confederacy with the patriots of the frontiers, and proceeded in great numbers to attack the Russian garrison. Two thousand Russians were put to the sword, and the general, being besieged in his house, proposed a capitulation; but, profiting by the delay that had been granted him, he escaped to the Prussian camp, which lay at a little distance from Warsaw.

Wilna, the capital of Lithuania, followed the example of Warsaw; but the triumph of the insurgents was there less terrible, as Colonel Yasinsky, who headed the patriots, conducted himself with so much skill, that he made all the Russians prisoners without bloodshed. The inhabitants of the cantons of Chelm and Lublin also declared themselves in a state of insurrection, and three Polish regiments who were employed in the service of Russia espoused the cause of their country. Some of the principal partisans of Russia were arrested, and sentenced to be hanged.

Kosciuszko exerted himself to the utmost to augment his army. He procured recruits among the peasants, and to inspire them with the more emulation, he adopted their dress, ate with them, and distributed rewards among such as appeared most to merit encouragement. All his attempts to inspire the lower orders of the Poles with the ardour of patriotism were, however, unavailing. A mutual distrust prevailed between the nobles and the peasants, and this was fomented by the arts of Stanislas and the other partisans of Russia.

The empress had sent into Poland two of her best generals, Suwaroff and Fersen. For some time Kosciuszko succeeded in preventing the junction of these commanders, and several engagements took place between the Russians and patriots, in which the former were generally successful. At length, on the 4th of October, the fate of Poland was decided by a sanguinary conflict between Kosciuszko and Fersen, at Macieyovitch, a small town of Little Poland, about sixty miles from Warsaw. The talents, valour, and desperation of Kosciuszko could not prevent the Poles from yielding to superior numbers. Almost the whole of his army was either cut in pieces or compelled to surrender at discretion, and the hero himself, covered with wounds, fell senseless on the field of battle, and was made prisoner.

Final dismemberment of Poland.

The small number that escaped fled to Warsaw, and shut themselves up in the suburb of Praga. Hither they were pursued by Suwaroff, who immediately laid siege to the suburb, and prepared to carry it by storm. On the 2d of November he gave the assault, and having made himself master of the place, put to the sword both the soldiers and the peaceable inhabitants, without distinction of age or sex. It is computed that twenty thousand persons fell victims to the savage ferocity of the Russian general; and, covered with the blood of the slaughtered inhabitants, the barbarian entered Warsaw in triumph.

Thus terminated the feeble resistance of the Polish patriots. The partition of the remaining provinces was soon effected, and Stanislas Augustus, who had long enjoyed merely the appearance of royalty, and had degraded himself by becoming the instrument of Russian usurpation, retired to Grodno, there to pass the remainder of his days, on a pension granted him by the empress.

An. 179

1795. On the 18th of February, a treaty of defensive alliance between the empress of Russia and his Britannic majesty was signed at St Petersburg. The ostensible object of this treaty was to maintain the general tranquillity of Europe, and more especially of the north; and by it Russia agreed to furnish Great Britain with ten thousand infantry and two thousand horse in case of invasion; while Great Britain was, under similar circumstances, to send her imperial majesty a squadron consisting of two ships of seventy-four guns, six of sixty, and four of fifty, with a complement of four thousand five hundred and sixty men. On the 18th of March was signed the act by which the duchy of Courland, together with the circle of Pilten, all of which had lately belonged to the Duke of Courland, but had long retained only the shadow of independence, submitted themselves to the Russian dominion.

Dispute with Sweden.

In this year there took place between the courts of St Petersburg and Stockholm a dispute which threatened to terminate in a war. Gustavus III. had been assassinated by Ankerstroem at a masquerade, on the 15th of March 1791; and the young king Gustavus Adolphus being still a minor, the Duke of Sudermania, his uncle, had been appointed regent of the kingdom. The regent had determined to effect a marriage between his nephew and a princess of the house of Mecklenburg; but Catherine publicly declared that the late king had betrothed his son to one of her grand-daughters. The misunderstanding hence originating was increased by the rude and indecorous behaviour of the Baron von Budberg, the Russian minister at Stockholm; and matters seemed tending to an open rupture, when, in the year 1796, a French emigrant named Christin effected a reconciliation, and General Budberg, the baron's uncle, was sent as ambassador to Stockholm from the Russian court. In consequence of this reconciliation, the young king, attended by the regent, and a numerous train of Swedish courtiers, set out on a visit to St Petersburg, where they arrived on the 24th of August, and an interview took place between the empress and her royal visiters, for the purpose of finally adjusting the projected matrimonial alliance. Gustavus Adolphus was much pleased with the appearance of the Grand Duchess Alexandra, but informed the empress, that by the fundamental laws of Sweden he could not sign the marriage-contract before the princess had abjured the Greek religion; and as neither the solicitations nor the flatteries of Catherine could prevail on the young monarch to depart from the received custom of his country, the negotiation ended, and the next day Gustavus and his retinue quitted St Petersburg.

The last transaction of importance in the reign of Catherine was her invasion of the Persian territories, undertaken for the purpose of acquiring certain possessions on the shores of the Caspian. A Russian army entered Daghestan, and made itself master of Derbent, but was afterwards defeated by the Persians under Aga Mahmoud. The death of the empress took place, as we have elsewhere stated, on the 9th of November of this year; and the Grand Duke Paul Petrovitch ascended the throne under the title of Paul I.

An. 1796. Reign of Paul.

Paul Petrovitch had attained his forty-second year before the death of his mother placed him on the imperial throne; but for many years before her death he had lived in a state of comparative obscurity and retirement, and had apparently been considered by the empress as incapable of taking any active part in the administration of affairs. It is well known that Catherine never admitted him to any participation of power, and kept him in a state of the most abject and mortifying separation from court, and in almost total ignorance of the affairs of the empire. Although by his birth he was generalissimo of the armies, president of the admiralty, and grand admiral of the Baltic, he was never permitted to head even a regiment, and was interdicted from visiting the fleet at Cronstadt. From these circumstances, it is evident that the empress either had conceived some jealousy of her son, or saw in him some mental imbecility, which appeared to her to disqualify him for the arduous concerns of government. There is little doubt, from the circumstances which distinguished his short reign, that Catherine had been chiefly influenced in her treatment of the grand duke by the latter consideration. There were certainly times at which Paul displayed evident marks of insanity, though he occasionally gave proofs of a generous and tender disposition, and even of intellectual vigour.

It is generally believed that, a short time before her death, Catherine committed to Plato Zuboff, her last favourite, a declaration of her will, addressed to the senate, desiring that Paul should be passed over in the succession, and that on her death the Grand Duke Alexander should ascend the vacant throne. As soon as Zuboff was made acquainted with the sudden death of the empress, he flew to Pavlovsk, about twenty-three miles from St Petersburg, where Paul occasionally resided; but meeting the grand duke on the road, he, after a short explanation, delivered up the important document. Paul, charmed with his zeal and loyalty, rewarded the favourite, by permitting him to retain the wealth and honours which had been heaped on him by his mistress, while a general and rapid dispersion soon took place among the other adherents of the late sovereign. On the day following the death of his mother, Paul made his public entry into St Petersburg, amidst the acclamations of all ranks of people.

S ular fu al of P III.

One of the first measures adopted by the new emperor excited considerable surprise, and divided the opinions of the public with respect to the motives by which it had been suggested; some attributing it to his respect for the memory of his late father, and others to a culpable reflection on that of his mother. He ordered the corpse of Peter III. to be removed from the sepulchre in which it had been deposited in the church of St Alexander Nefsky, solemnly crowned it, and caused it to lie in state for three weeks, while it was watched day and night by the only two remaining conspirators who had assisted at his assassination. After this dreadful mark of his justice on the murderers of his father, surely more terrible to the guilty mind than death itself, he consigned the ashes to the sepulchre of Catherine II. in the cathedral of St Peter and St Paul, obliging the assassins to walk in the procession as chief mourners.

Few political events of any importance marked the reign of Paul previously to the year 1798, when, in consequence of a treaty between him and the emperor of Germany, a Russian army of forty-five thousand men, under Field-Marshal Suwaroff, joined the imperialists in the Austrian territories in Italy. The progress of Suwaroff, his successes over Moreau, and his final recall by his master, have already been related in the article France.

An. 799. Tr y of alli e between Rus- sia d Bri- tain

In 1799, Paul entered into a treaty of offensive and defensive alliance with his Britannic majesty. This treaty was signed at St Petersburg on the 22d of June, having been preceded by a provisional treaty between the same powers at the end of the year 1798. By the latter, which was fortified by a relative treaty with Austria, it had been stipulated that Paul should assist the king of Prussia, if the latter could be persuaded to join his arms to the allied powers against France, with forty-five thousand men, and that the king of Great Britain should pay to Russia a subsidy of L.75,000 sterling per month; and in case the king of Prussia should refuse to join the coalition, the same number of troops, in consideration of the same subsidy, should be employed, as occasion might require, to assist the common cause. By the new treaty, the emperor of Russia, instead of the forty-five thousand troops, engaged to furnish seventeen thousand five hundred and ninety-three, with the necessary artillery, to be employed in an expedition against Holland; and six ships, five frigates, and two transports, for the purpose of transporting part of the invading army from Britain to the continent. In consideration of these succours, the court of London engaged to advance to Russia a subsidy of L.44,000 sterling per month; to pay the sum of L.58,929. 10s. sterling for the expenses of equipping the fleet; and after the period of three months had elapsed from such equipment, to pay a further subsidy of L.19,642. 10s. sterling per month, as long as the fleet should remain under the command of his Britannic majesty.

In consequence of this treaty, a Russian fleet joined that of Britain in Yarmouth Roads, and took part in the unfortunate expedition to the coast of Holland, which was undertaken in the summer of 1799. The military fame of Russia was more augmented by the share which its army under Suwaroff took in the campaign of Italy during the same year, although the victories which won for the veteran his name of Italinski were far more than overbalanced by the misfortunes which ensued in Switzerland under the emperor's favourite Korsakoff. But in December 1800, Paul, after having laid an embargo on the British shipping which lay in his ports, openly abandoned his relations with our country, and proclaimed, in confederacy with Sweden and Denmark, to whom Prussia afterwards added herself, the great Northern Coalition with France against Great Britain.

An. 1801. Paul's challenge to the sovereigns of Europe.

In the beginning of the year 1801, all Europe was astonished or amused by a paragraph which appeared in the Hamburg Gazette of the 16th of January. It was dated from Petersburg, the 30th December 1800, and is as follows.

"We learn from Petersburg, that the emperor of Russia, finding that the powers of Europe cannot agree among themselves, and being desirous to put an end to a war which has desolated it for eleven years past, intends to point out a spot to which he will invite all the other sovereigns, to repair and fight in single combat; bringing with them, as seconds and squires, their most enlightened ministers and their most able generals, such as Messrs Thugot, Pitt, and Bernstorff; and that the emperor himself proposes being attended by Generals Count de Pahlen and Khutosof. We know not if this report be worthy of credit; however, the thing appears not destitute of some foundation, and bears strong marks of what he has been often taxed with."

This paragraph was immediately copied or translated into all the public papers, and it was strongly affirmed by many that it was the composition of Paul himself. This has since been confirmed by the poet Kotzebue, who was employed by the emperor of Russia to translate the original into German, for the express purpose of its being inserted in the Hamburg Gazette.[1]

---

[1] This paragraph is such a curious *morceau* of witty insanity, that we shall here give the original French, as written by Paul himself, and published by Kotzebue in his account of his exile into Siberia. "On apprend de Petersbourg, que l'Empereur de Russie, voyant que les puissances de l'Europe ne pouvoient s'accorder entr'elles, et voulant mettre fin a une guerre qui la désoloit depuis onze ans, vouloit proposer un lieu où il inviteroit tous les autres Souverains, de se rendre et y combattre en champ clos, ayant avec eux pour écuyers juges de camp et heros des armes leurs ministres les plus eclairés et les généraux les plus habiles, tels que MM. Thugot, Pitt, Bernstorff; lui-même se proposant de prendre avec lui les généraux C. de Pahlen et Khutosof. On ne sçait si on doit y ajouter foi; toutefois, la chose ne paroit pas destituée de fondement, en portant l'empreinte de ce dont il a souvent été taxé."

Other marks of the emperor's derangement.

This was not the only mark of mental derangement displayed by the unhappy monarch. The army, which formed his favourite employment, was tormented by incessant caprices affecting its discipline; and the press, the native Russians, and the resident foreigners, suffered tyrannical and unaccountable restrictions. His favours and his displeasure were alternately experienced by some of his most distinguished courtiers and adherents. Stanislas, the deposed king of Poland, partook by turns of his beneficence and his severity; and at length, on the death of that monarch, Paul assisted at his funeral, commanded in person the guards that attended on the ceremony, and uncovering himself with the utmost emotion, saluted the coffin as it passed. To the memory of the aged Suwaroff, who is said to have fallen a broken-hearted victim to the distraction of his imperial master, he raised a colossal statue of bronze; and on the days when he reviewed his troops in the square where the figure had been erected, he used to command them to march by in open order, and face the monument. Notwithstanding the important service that had been rendered him by Zuboff, the emperor soon became disgusted with him; spoke of him to his friends with great asperity; at length denounced him as a defaulter to the imperial treasury of half a million of roubles; and, convinced of the justice of the allegation, proceeded to sequestrate the vast estates which belonged to him and his two brothers. Driven to desperation by such conduct, the second brother of the favourite one day walked up boldly to the emperor upon the parade, and with manly eloquence represented the injustice of his measures. Paul received him without anger, heard him without interruption, and restored the property; but soon afterwards he ordered Plato Zuboff to reside on his estate, though he again restored him to favour.

Conspiracy formed against the emperor.

It is not surprising that these instances of folly and caprice should alarm and disgust many of the nobles. In particular, Count Pahlen, the governor of St Petersburg, with some other men of rank, entered into a confederacy with Zuboff and his brothers for removing the emperor. In their conferences, which were managed with great prudence and discretion, it was resolved that Paul should die, and that the day of the festival called Maslaintza, the 11th of March O. S. 1801, should be the day for executing the awful deed. At the time of this plot, the emperor and his family resided in the new palace of St Michael, an enormous quadrangular pile standing at the bottom of the summer gardens. Paul being anxious to inhabit this palace soon after he was crowned, the masons, carpenters, and various artificers, toiled with incredible labour, by day and by torch-light, under the sultry sun of the summer, and in all the severity of a polar winter; and in three years this enormous and magnificent fabric was completed. The whole is moated round; and when the stranger surveys its bastions of granite, and numerous draw-bridges, he is naturally led to conclude that it was intended for the last asylum of a prince at war with his subjects. Those who have seen its massive walls, and the capaciousness and variety of its chambers, will easily admit that an act of violence might be committed in one room, and not be heard by those who occupy the adjoining one; and that a massacre might be perpetrated at one end, and not known at the other. Paul took possession of this palace as a place of strength, and beheld it with rapture, because his imperial mother had never even seen it. While his family were here, by every act of tenderness endeavouring to soothe the terrible perturbation of his mind, there were not wanting those who exerted every stratagem to inflame and increase it. These people were constantly insinuating that every hand was armed against him. With this impression, which added fuel to his burning brain, he ordered a secret staircase to be constructed, which, leading from his own chamber, passed under a false stove in the anti-room, and led by a small door to the terrace.

His assassination.

It was the custom of the emperor to sleep in an apartment next to the empress's, upon a sofa, in his regimentals and boots, whilst the grand duke and duchess, and the rest of the imperial family, were lodged at various distances, in apartments below the story which he occupied. On the 10th March, the day preceding the fatal night, whether Paul's apprehension, or anonymous information, suggested the idea, is not known; but conceiving that a storm was ready to burst upon him, he sent for Count Pahlen: "I am informed," said the emperor, "that there is a conspiracy on foot against me; do you think it necessary to take any precaution?" The count, without betraying the least emotion, replied, "Sire, do not suffer such apprehensions to haunt your mimd; if there were any combinations forming against your majesty's person, I am sure I should be acquainted with it." "Then I am satisfied," said the emperor; and the governor withdrew. Before Paul retired to rest, he, beyond his usual custom, expressed the most tender solicitude for the empress and his children, kissed them with all the warmth of farewell fondness, and remained with them for a considerable time. He afterwards visited the sentinels at their different posts, and then retired to his chamber. Soon after the emperor had retired, the guard that was always placed at his chamber door was, on some pretext, changed by the officers who had the command for the night, and who were engaged in the conspiracy. One man only remained. This was a hussar whom the emperor had honoured with particular marks of attention, and who always slept at night in the antechamber, at his sovereign's bed-room door. This faithful soldier it was found impossible to remove, except by force, which at that time the conspirators did not think proper to employ. Silence now reigned throughout the palace, disturbed only by the pacing of the sentinels, or by the distant murmurs of the Neva; and only a few straggling lights were to be seen, irregularly gleaming through the windows of the palace. In the dead of the night, Zuboff and his friends, amounting to eight or nine persons, passed the draw-bridge, ascended the staircase that led to the emperor's apartments, and met with no opposition till they reached the antechamber, where the faithful hussar, awakened by the noise, challenged them, and presented his fusee. Though they must have admired the brave fidelity of the guard, neither time nor circumstances would admit of an act of generosity which might have endangered their whole plan of operations. Zuboff therefore drew his sabre, and cut the poor fellow down. In the mean time, Paul, roused by the unusual bustle, sprang from his couch. At this moment the whole party rushed into his chamber. The unhappy sovereign, anticipating their design, at first endeavoured to intrench himself behind the chairs and tables; but soon recovering some share of his natural courage, he assumed a high tone, told them they were his prisoners, and required them to surrender. Finding that they fixed their eyes steadily and fiercely upon him, and continued to advance, he implored them to spare his life, declared his willingness instantly to relinquish the sceptre, and to accept of any terms which they might dictate. He even offered to make them princes, and to confer on them orders and estates. Regardless alike of his threats and promises, they now began to press on him, when he made a convulsive effort to reach the window, but failed in the attempt; and, indeed, had he succeeded in his endeavour to escape that way, the height from the window to the ground was so great, that the expedient would probably have only put a more speedy period to his existence. As the conspirators drew him back, he grasped a chair, with which he knocked down one of the assailants, and a desperate conflict now took place. So great was the noise, that notwithstanding the massive walls and double folding doors that divided Paul's apartments from those of the empress, she was disturbed, and began to call for help, when a voice whispered in her ear, commanding her to remain quiet, and threatening that if she uttered another word she should instantly be put to death.

Paul was now making his last struggle, when one of the party struck him on the temple with his fist, and laid him prostrate on the floor. Recovering from the blow, the unhappy monarch again implored his life. At this moment the heart of one of the conspirators relented, and he was observed to hesitate and tremble, when a young Hanoverian who was present exclaimed, we have passed the Rubicon; if we spare his life, we shall, before the setting of to-morrow's sun, become his victims; on saying which he took off his sash, turned it twice round the naked neck of the emperor, and giving one end to Zuboff, he himself drew the other, till the object of their attack expired.

A ession o Alexan- d Paulo- v h.

The Emperor Alexander, Paul's eldest son, was in his twenty-fourth year when he ascended the throne, and from his amiable disposition had acquired the love and respect of all his subjects. The first measure which he adopted, his proclamation, and his first imperial orders, all tended to encourage and confirm the confidence with which the people beheld him ascend the throne of his forefathers. He solemnly promised to tread in the steps of Catherine II.; he allowed every one to dress according to his own fancy; he exonerated the inhabitants of the capital from the trouble and duty of alighting from their carriages on the approach of the imperial family; he dismissed the court advocate, who was universally and justly detested; he suppressed the secret inquisition, that had become the scourge of the country; he restored to the senate its former authority, set at liberty the state prisoners, and recalled from Siberia several of the exiles. He even extended his mercy to the assassins of the late emperor. Zuboff was ordered not to approach the imperial residence, and the governor of the city was transferred to Riga.

It is not easy to explain the motives that induced Alexander to forego that vengeance which justice seemed to demand on the heads of his father's assassins. It has been attributed by one of his panegyrists to a forlorn and melancholy conviction that the murderers had been prompted to commit the bloody deed solely by a regard for the salvation of the empire. This conviction might have induced the young monarch to diminish the weight of the punishment which piety and justice called on him to inflict, but can scarcely account for his total forbearance.

A cable di sition o lexan- de owards B ain.

Alexander, on his accession to the throne, appeared desirous to cultivate the friendship of the neighbouring states, and especially that of Great Britain. His late father, among other projects, had procured himself to be elected grand-master of the knights of Malta, and had laid claim to the sovereignty of that island. This claim, which had nearly produced a rupture between the courts of London and St Petersburg, Alexander consented to abandon, though he expressed a wish to be elected grand-master of the order, by the free suffrages of the knights. A confederacy, as we have seen, had been formed among the northern powers of Europe, with a view to oppose the British claim to the sovereignty of the seas; but by the spirited interference of the British court, especially with the cabinet of St Petersburg, the good understanding between Britain and the northern states was re-established, and the embargo which had been laid on British vessels in the Russian ports was taken off. Alexander, however, earnestly desired to maintain peaceful relations with France; and expressed this wish, both in public manifestos, and in private communications addressed to the First Consul.

T ty of a and co erce wi Swe- de

Early in the same year there was signed at St Petersburg a treaty of amity, commerce, and navigation, between Russia and Sweden, to continue for twelve years, by which Sweden was allowed to import into Russia, alum, salt herrings, and salt, on the payment of one half of the duties then exacted, and into Russian Finland the produce of Swedish Finland duty free; while the importation of Russia into Sweden, of hemp, linen, and tallow, was allowed at one half of the existing duties, and of linseed at two thirds. The most remarkable part of this treaty was the recognition, by the court of St Petersburg, of the northern confederacy, which the amicable adjustment with Britain appeared to have done away. The commerce of Russia had now recovered its former splendour. The exports from the city of Riga alone, for the year ending July 1801, amounted to 6,770,638 roubles, and of these exports England alone imported to the value of 2,509,853 roubles.

An. 1802. Russia guarantees the sovereignty of Malta to the knights of St John of Jerusalem.

On the 25th of March 1802 was signed at Amiens the definitive treaty of peace between the belligerent powers of Europe, by one material article of which the islands of Malta, Gozo, and Comino, were to be restored to the knights of St John of Jerusalem, under the protection and guarantee of France, Great Britain, Austria, Spain, Russia, and Prussia; and his Sicilian majesty was invited to furnish two thousand men, natives of his states, to serve in garrisons at the different fortresses of the said islands, for one year after their restitution to the knights, or until they should be replaced by a force deemed sufficient by the guaranteeing powers. Some time after the conclusion of this treaty, disputes arose among the contracting powers relative to the sovereignty of Malta, which the emperor of Russia insisted should be yielded to Naples, otherwise he would not undertake to guarantee the order, and would separate from it the priories of Russia. The result of these disputes is well known, as they afforded a reason for renewing the bloody contest which so long desolated Europe.

Prudent regulations of the Emperor Alexander.

During the short interval of peace, the emperor of Russia made several prudent regulations in the internal administration of his empire. On the 12th of September 1801, a manifesto had been published, proclaiming the union of Georgia, or Russian Grusinia, with the empire; and on the 1st of April 1802, Alexander sent a deputation to establish the new government at Teflis, the capital of the province. On the 28th of May the emperor wrote a letter to the chamberlain Wittostoff, president of the commission for ameliorating the condition of the poor of St Petersburg, in which he recommended to the commission to follow the example of a similar establishment at Hamburg, in selecting proper objects for their charitable bequests, preferring the humble and industrious pauper to the idle and sturdy beggar. He also offered considerable premiums to persons who should introduce any new or advantageous mode of agriculture, or who should bring to perfection any old invention, open any new branch of commerce, establish any new manufacture, or contrive any machine or process that might be useful in the arts.

An. 1803. A voyage of discovery set on foot.

Early in the year 1803, the emperor fitted out, at his own expense, two vessels for a voyage of discovery round the world, under the command of Captain Krusenstern. These ships were provided with every necessary for accomplishing the object of the voyage; and several men of eminence for science and literature, among whom was Churchman the American astronomer, volunteered their services on this occasion.

An. 1804. Establishment of an university in Lithuania.

In the beginning of 1804 the emperor established a university at Kharkof, in Lithuania, for the cultivation and diffusion of the arts and sciences in that part of the Russian empire; and Mr Fletcher Campbell, a Scotch gentleman, was employed to procure masters for this new institution. Some time after, the emperor ordered that meteorological observations should be regularly made at all the universities and public schools, and the results published. It appears that at the end of this year the sums allotted by the Russian government for defraying the expenses of these institutions amounted to 2,149,213 roubles, besides a gift of nearly 60,000 roubles towards erecting the new university.

History.

Emancipation of the Jews in Russia.

About this time an imperial ukase was published, granting to the Jews a complete emancipation from the shackles under which that devoted people had long groaned, and allowing them the privileges of educating their children in any of the schools and universities of the empire, or establishing schools at their own expense.

Dispute with France.

For some time the genius of discord, which had again actuated the minds of the European sovereigns, failed to extend her baleful influence over the Russian empire; but it was scarcely possible that the emperor should long remain an impartial spectator of the renewed disputes between his more powerful neighbours. An important change had, in the latter end of 1802, taken place in the ministry of the empire; and Count Worontzoff, brother of the late ambassador at London, had been appointed great chancellor-in-chief of the department of foreign affairs, with Prince Adam Czartoryski for his assistant. How far this change in the councils of the empire influenced the political measures of the court of St Petersburg, it is not easy to determine; but in the latter end of 1803, Alexander appeared to view with a jealous eye the presumption and violence exercised by France among the German states, and the encroachments which she appeared desirous of making on the freedom of the Baltic. Alexander had offered his mediation between Great Britain and France, but without effect; and both these parties strove to bring over the Russian emperor to their alliance. France seems to have held out to the ambition of Alexander the bait of a partition of the Turkish territories, the dismemberment of which had long been a favourite object with his predecessors. At length, however, the court of London prevailed, and the Russian ambassador, by his master's orders, took leave of the First Consul of the French republic, though without demonstrating any intentions of immediate hostility. A new levy of a hundred thousand men was immediately ordered, to recruit the Russian army; and, to prevent any jealousy on the side of Turkey, assurances were given to the Sublime Porte of the amicable intentions of Russia towards that power.

An. 1805. Treaty of concert between Great Britain and Russia.

On the 11th of April 1805 a treaty of concert was concluded between Great Britain and Russia, in which the two governments agreed to adopt the most efficacious means for forming a general league of the states of Europe, to be directed against the power of France. From the terms of the treaty, its objects appear to have been, first, the evacuation of the country of Hanover and the north of Germany; secondly, the establishment of the independence of the republics of Holland and Switzerland; thirdly, the re-establishment of the king of Sardinia in Piedmont; fourthly, the future security of the kingdom of Naples, and the complete evacuation of Italy, the island of Elba included, by the French forces; fifthly, the establishment of an order of things in Europe, which might effectually guarantee the security and independence of the different states, and present a solid barrier against future usurpation.

For the prosecution of the great objects of this treaty, it was proposed by the first article that an army of five hundred thousand men should be levied; but in a subsequent separate article, the contracting parties, after observing that it was more desirable than easy to assemble so large a force, agreed that the treaty should be carried into execution as soon as it should be possible to oppose to France an active force of four hundred thousand men. It was understood and stipulated that these troops should be provided by the powers of the continent who should become parties to the league, and subsidies should be granted by Great Britain in the proportion of L.1,250,000 sterling for every hundred thousand men, besides a considerable additional sum for the necessary expense occasioned in bringing them into the field.

History.

Open rupture with France.

About this time the occupation of Genoa by the French, on the pretence that that republic was too feeble to support itself against the attacks of Great Britain, was communicated to the different courts of Europe, and excited in every quarter the highest indignation. The Emperor Alexander, in particular, was incensed at this new outrage. Such an open violation of those principles which were justly regarded as essential to the general safety, committed not only during the peace of the continent, but when passports had been delivered to his ambassador, in order that a negotiation might be commenced for the purpose of providing for the permanent security and repose of Europe, he considered as an indecent insult to his person and crown. He issued immediate orders for the recall of M. Novosiltzoff; and the messenger despatched upon this occasion was commanded to repair with the utmost diligence to Berlin. M. Novosiltzoff had not yet left that city; he immediately therefore returned his passports to the Prussian minister of state, Baron de Hardenberg, and at the same time delivered, by order of his court, a spirited memorial explanatory of the object of his mission, and of the circumstances which had led to its termination.

The recall of the Russian envoy appeared to be the signal of hostilities on the part of Russia and Austria against France. These hostilities may be said to have commenced and terminated in the autumn of this year. The military operations that distinguished this short but bloody conflict, the rapid successes of the French, the capitulation of Ulm on the 17th of October, the occupation of Vienna by the French on the 12th of the same month, and the sanguinary battle of Austerlitz on the 27th of November, have been already noticed under the head of **France**. The consequences of these disastrous events were, first a cessation of hostilities, and at length a treaty of firm alliance between France and Russia.

An. 1806.

But before Alexander finally stooped to the imperial eagles of Napoleon, he was determined to make one more effort to preserve his independence. The Russian envoy at Paris, D'Oubril, had hastily concluded a preliminary treaty of peace between his master and the emperor of the French, which he signed at Paris on the 8th of July 1806, and instantly set out for St Petersburg to procure the ratification of his master. When the terms of this convention were laid before the privy council by Alexander, they appeared so derogatory to the interests of Russia, that the emperor refused them his sanction, and declared that the counsellor of state, D'Oubril, when he signed the convention, had not only departed from the instructions he had received, but had acted directly contrary to the sense and intention of the commission with which he had been intrusted. His imperial majesty, however, signified his willingness to renew the negotiations for peace, but only on such terms as were consistent with the dignity of his crown and the interests of his empire.

Alliance with Prussia against France.

In the mean time the king of Prussia began, when it was too late, to see the folly and imprudence of the neutrality which he had so long maintained, and he at length prepared to oppose his now feeble efforts to the growing power of France. He brought together in the summer of this year an army of at least two hundred thousand men, near Weimar and Jena, while the French myriads assembled in Franconia and on the frontiers of Saxony. Previously to the commencement of hostilities, his Prussian majesty issued a spirited manifesto, in which he explained his motives for abandoning his plan of neutrality, and appealed to Europe for the justice of his cause. He entered into an alliance with the Emperor Alexander, and with the king of Sweden; and it was expected that these united forces would at length hurl the tyrant of Europe from his throne, or at least compel him to listen to equitable terms of pacification. These expectations were, however, miserably disappointed. The same extraordinary success was still to attend the arms of France, and the north of Europe was again condemned to submit in silence to her yoke.

On the 13th of October 1806, the Prussians received a dreadful check at the battle of Jena; and on the 27th of the same month Napoleon entered Berlin. While the French were thus successful, the troops of the Emperor Alexander occupied Prussian Poland, and took up their residence at Warsaw; but they were soon attacked by the French under Murat, who on the 28th entered Warsaw with his cavalry, on which the Russians retreated across the Vistula, burning the bridge over which they had passed. On the 26th of December, a dreadful engagement took place between the Russians commanded by General Benningsen, and the French under Generals Murat, Davoust, and Lannes. The scene of action was at Ostralenka, about sixty miles from Warsaw, and the fighting continued for three days. The loss was immense on both sides, though the advantage appears to have been on the side of the French. According to French accounts, the Russian army lost twelve thousand men in killed and wounded, together with eighty pieces of cannon, and all its ammunition waggons; while the Russian account states the loss of the French at five thousand men.

A[illegible]807.
Ba[illegible]e of
Ey[illegible]u.

In the beginning of February 1807, the Russians obtained a partial advantage in the battle of Eylau. According to the account of this battle, given by General de Budberg in a despatch to the Marquis of Douglas, the British ambassador at St Petersburg, the Russian general Benningsen, after having fallen back for the purpose of choosing a position which he judged well adapted for manœuvring the troops under his command, drew up his army at Preussisch Eylau. During four days successively his rear-guard had to withstand several vigorous assaults; and on the 7th of February, at three o'clock in the afternoon, the battle became general throughout the whole line of the main army. The contest was destructive, and night came on before it could be decided. Early on the following morning the French renewed the attack, and the action was contested with obstinacy on both sides; but towards the evening of that day the assailants were repulsed, and the Russian general remained master of the field. In this action Napoleon commanded in person, having under him Augereau, Davoust, Soult, Ney, and Bessières at the head of the imperial guards. The loss of the Russians in that engagement was by themselves stated at above six thousand men, while they estimated that of the French, probably untruly, at nearly double that number.

Ba[illegible]e of
Fri[illegible]land.

This was the last important stand made by the Russian army. In May, Dantzig, defended by eighteen thousand Russians and Prussians, surrendered to the French. Several actions succeeded at Spanden, at Lamitten, at Guttotadt, and at Heilsberg, in all of which the French had the advantage, till at length, on the 14th of June, the Russians appeared in considerable force upon the bridge of Friedland, whither the French army under Napoleon was advancing. At three in the morning the report of cannon was first heard, and at this time Marshals Lannes and Mortier were engaged with the Russians. After various manœuvres, the Russian troops received a check, and filed off towards Königsberg. In the afternoon the French army drew up in order of battle, having Marshal Ney on the right, Lannes in the centre, and Mortier on the left, while Victor commanded a corps de reserve, consisting of the guards. At half-past five the attack began on the side of Marshal Ney; and notwithstanding the different movements of the Russians to effect a diversion, the French soon carried all before them. The loss of the Russians, according to the usual exaggerations of the French bulletins, was estimated at from ten thousand to fifteen thousand men, and twenty-five of their generals were said to have been killed, wounded, or taken. In consequence of this victory the French became masters of all the country round Königsberg, and Marshal Soult entered that city in triumph. Thus concluded the campaign in Germany, in which the Russians sustained a loss of at least thirty thousand of their choicest troops.

War declared against Russia by Turkey.

While these military operations were going forward on the continent of Europe, the emissaries of France were busily employed at Constantinople in exciting the divan to declare against their ancient enemies. They at length succeeded; for on the 30th of December 1806 war with Russia was proclaimed, and twenty-eight regiments of janissaries assembled under the command of the grand vizir. But the disturbances which broke out in the latter end of May 1807 prevented any operations of importance from taking place; and the pacification which was soon concluded between Russia and France, though it did not entirely put a stop to the war between the former power and Turkey, in some measure diminished their hostile preparations.

Treaty of Tilsit.

The defeats which the allied armies had sustained in Prussia and Poland rendered peace, on almost any terms, a desirable object; and Alexander found himself constrained to meet, at least with the appearance of friendship, the conqueror of his armies. Propositions for an armistice had been made by the Prussian general to Murat near Tilsit, and after the battle of Friedland the Russian prince Labanoff had a conference, on similar views, with the prince of Neufchatel, soon after which an armistice was concluded between the French and Russians. On the 25th of June an amicable meeting took place on the river Niemen, between the emperors of France and Russia, and adjoining apartments were fitted up for the reception of both courts in the town of Tilsit. This politic friendship was soon after cemented by the treaty of Tilsit, concluded between the emperor of the French on the one part, and the emperor of Russia and the king of Prussia (whom it despoiled of a fourth of his dominions) on the other, on the 7th and 12th of July in this year. Thenceforth, until Napoleon's star began to wane, Alexander was his firm partisan; and his faithlessness towards his former allies gave them no temptation to repose further confidence in him.

Rupture with Britain.

The conclusion of the treaty of Tilsit was notified to the court of London on the 1st of August; and at the same time a proposal was made from his imperial majesty for mediating a peace between France and Britain. This mediation, however, was declined on the part of Great Britain, until his Britannic majesty should be made acquainted with the stipulations of the treaty of Tilsit, and should find them such as might afford him a just hope of the attainment of a secure and honourable peace. This declining of the mediation of Russia was no doubt expected by the court of St Petersburg; but it served as a pretext for binding more closely the alliance between that power and France, by breaking off her connection with Great Britain. Accordingly, in October, Lord Granville Leveson Gower, who had succeeded the Marquis of Douglas as British envoy, received a note from the government, intimating that, as a British ambassador, he could no longer be received at the court of St Petersburg, which he therefore soon after quitted. An embargo was laid on all British vessels in the ports of Russia, and it was peremptorily required by Napoleon and Alexander that Sweden should abandon her alliance with Great Britain.

An additional ground of complaint against the British court was furnished by the attack on Copenhagen, and the seizure of the Danish fleet, in the beginning of September; and though Lord Gower had attempted to justify these measures on the plea of anticipating the French in the same transaction, the emperor of Russia expressed, in the warmest terms, his indignation at what he called an unjust attack on a neutral power. A considerable Russian fleet joined the French; but the combined squadrons were compelled to seek for shelter in the Tagus, where they remained blocked up by the British, till they were surrendered by the convention of Cintra; and another fleet of fifteen sail of the line that proceeded up the Mediterranean, and advanced as far as Trieste, shared a similar fate.

On the 26th of October the emperor of Russia published a declaration, notifying to the powers of Europe that he had broken off all communication between his empire and Great Britain, until the conclusion of a peace between this power and France. In a counter-declaration, published at London on the 10th of December, his Britannic majesty repels the accusations of Russia, while he regrets the interruption of the friendly intercourse between that power and Britain. His majesty justifies his own conduct, and declares, that when the opportunity for peace between Great Britain and Russia shall arrive, he will embrace it with eagerness; satisfied if Russia shall manifest a disposition to return to her ancient feeling of friendship towards Great Britain, to a just consideration of her own true interests, and to a sense of her own dignity as an independent nation.

An. 1808. Renewed negotiations with Britain.

In October 1808, a meeting took place at Erfurt between the emperors of France and Russia, and a letter was drawn up under their signature, addressed to his Britannic majesty. The object of this letter was, to induce the king of Great Britain to enter into negotiations for a general peace, and with that view it was despatched by Count Romanzoff, the Russian minister at Erfurt, to Mr Canning, the British secretary of state for foreign affairs. It was answered by an official note, requiring the emperors, as an indispensable condition of any treaty with Britain, to receive Sweden as a party, to protect the interests of Portugal and of the ex-king of Naples, and to extend the benefits of the projected arrangements to Ferdinand VII. of Spain. These requisitions were evidently quite inconsistent with Napoleon's views; the emperors refused to accede to them; and all hope of accommodation was in the mean time at an end.

War with Sweden.

The demand of concurrence in the views of France and Russia made on Sweden was formally repeated in a declaration of the Emperor Alexander, published at St Petersburg on the 10th of February in this year. In this declaration his imperial majesty intimated to the king of Sweden that he was making preparations to invade his territories; but that he was ready to change the measures he was about to take, to measures of precaution only, if Sweden would, without delay, join Russia and Denmark in shutting the Baltic against Great Britain, until the conclusion of a maritime peace. He professed that nothing could be more painful to him, than to see a rupture take place between Sweden and Russia; but that his Swedish majesty had it still in his power to avoid this event, by resolving without delay to adopt that course which could alone preserve strict union and perfect harmony between the two states.

The king of Sweden, however, determined to abide by the measures which he had for some time pursued, and to adhere to the terms of the convention which had just been concluded between him and the king of Great Britain. In consequence of this determination, a Russian army entered Finland in the beginning of March, under the command of General Buxhovden, and advanced against Helsingfors, which was occupied by a single battalion of a Swedish regiment. This small force retired into the fortress of Sweaborg, where they maintained themselves with great bravery till the 17th of April, when they were obliged to capitulate. The loss of this fortress, though inconsiderable in itself, so highly enraged the king of Sweden, that he dismissed the naval and military commanders who had been concerned in the capitulation.

On the 27th of April, some slight advantage was gained over the Russians near Rivolax, by the Swedish army under General Count Klinspor; but this was only a partial gleam of success. The Russians soon overran almost all Finland, took possession of Wasa, Old and New Carleby, and reduced under subjection the whole province of which Wasa is the capital. The army of Field-Marshal Klinspor, which originally consisted of sixteen thousand regulars, and many boors, was, by the end of the campaign, reduced to little more than nine thousand men.

The king of Sweden sent some reinforcements to his army in Finland; but the forces which should have supported Klinspor were foolishly employed in a fruitless attempt to conquer Norway; and in 1809 the Swedes were compelled to cede Finland to Russia.

Russia continued to appear in the unworthy character of Napoleon's ally; and when Austria made an effort in 1809 to recover her losses, a Russian army advanced to co-operate with the French. The diversion which this produced was one cause of the final success of Napoleon, whose situation after the battle of Aspern was extremely critical. When Austria was at last compelled to accept of peace on humiliating terms, Russia received as the reward of her services the district of Tarnopol in Galicia, with a population of four hundred thousand souls. This district was restored to Austria in 1815.

In 1811, hostilities commenced between Russia and the Porte. It is of little consequence to inquire into the causes of this rupture; a powerful and ambitious government in the neighbourhood of a weak one never wants pretexts for war. The result might have been serious, if not fatal to the Porte, had not the prospect of a more arduous struggle induced Russia to suspend her efforts in that quarter, and conclude a peace on condition of receiving a part of Moldavia and Bessarabia.

The great contest was now approaching which was to try the resources of Russia, and ultimately to raise her to unexampled greatness. The seizure by France of the territories of the Prince of Oldenburg, who was the emperor of Russia's brother-in-law, on the one hand, and the admission of British produce into the Russian harbours on the other, furnished the ostensible grounds of the quarrel. After some fruitless negotiations, Napoleon dismissed the Russian ambassador, and left Paris to join the army on the 9th of May 1812. The events of this disastrous expedition into Russia have been minutely related in the article France; and the reader does not require to be reminded of those lamentable sufferings of the French army, which were its principal result. The spirited resistance of Russia now roused Prussia and Austria; and early in 1813 a league was formed between these powers, to which Bavaria and other small states acceded. The battle of Leipsic, fought on the 18th of October, led to the final overthrow of the French domination. In all the transactions which followed, Russia bore a leading part. At the congress of Vienna in 1814, the duchy of Warsaw, consisting of part of the original conquests of Austria and Prussia in Poland, was assigned to Russia, which thus ultimately obtained about four fifths of the territory and three fourths of the population of that ancient kingdom.

Russian accessions of territory for fifty years before 1815.

In passing to the new system of foreign policy which has prevailed in Russia, as well as in the rest of Europe, since the year 1815, we must pause for a moment to remark the accessions of territory which the empire had made during the half century which preceded that epoch. The reign of Catherine II. had, as we have seen, been by far the most fertile in foreign acquisitions. Her conquests included the Crimea, which was an incorporated portion of Russia since 1783; Georgia, gained in 1785, though, as we have observed, not formally annexed till 1801; Bessarabia, with a part of Moldavia, and other Turkish possessions, finally secured to Russia by the treaty of Bukarescht in 1812; Courland, acquired in 1795; and the extensive spoils of Poland in 1793 and 1794. Paul's reign made no permanent addition of importance, except some districts within the Persian frontier. Alexander's gave to Russia in the first years of the present century several of the tribes of the Caucasus; Finland in 1809; Daghestan and other large territories ceded by Persia in 1813; and in 1814, Napoleon's grand duchy of Warsaw, which was erected into a kingdom of Poland. The total population of these new Russian provinces cannot at the very least be estimated under fifteen millions, and probably exceeds that number.

xan-
's fo-
n policy
r 1815.

During the ten years of Alexander's reign which succeeded the peace, and ended with his death in 1825, he acquired no new territory as a substantive addition to his dominions, but occupied himself assiduously in that indirect augmentation of Russian influence on the states around the frontier, which had before his time formed, and has since continued to form, the first step in all the schemes of conquest projected by his ambitious nation. The objects of Alexander's foreign policy after 1815 were chiefly three; the suppression of constitutional, or, as they were called by preference, revolutionary movements, in the central and southern states of Europe; the weakening of Turkey, and the gradual reduction of that power into a state of dependence on the cabinet of St Petersburg, so as to pave the way for the Russians towards the sovereignty of the Levant; and the extension of the Russian influence in Persia and those adjacent states, which must form the stepping-stones by which the Muscovites will strive to pass, if they shall ever make the attempt, to the throne of British India. For the attainment of the first of these great ends, there was formed, under the guidance and by the suggestion of Alexander, that league of princes which has been named the Holy Alliance; a confederacy whose bitter fruits have been tasted in full measure by Italy and Spain, but whose conception is in one view an encouraging tribute to the growing enlightenment of the world, since it is the earliest instance in which despots, conspiring against truth and freedom, have condescended to speak the language of Christianity and peace. In reference to Turkey, the policy of Alexander aimed at gradually detaching the Porte from its friendly relations with Great Britain and other European powers, and insidiously advancing towards a position in which the sultan should find himself powerless against his neighbours and his own subjects, until Russia should stretch forth her protecting hand; but a check was administered to this train of diplomacy, and a peculiar relation introduced between the courts of Constantinople and St Petersburg, by the insurrection of Greece in 1821. To the founder and head of the Holy Alliance the Greeks must have appeared to be mere rebels, whom it was his duty as a neighbouring sovereign to assist in punishing; while to the watchful power which desired by every available means to weaken and circumscribe the power of Turkey, such an opportunity as the Greek revolution was unusually tempting, and indeed the sultan's ministers openly alleged that the disturbances had been fomented by Russian agents. The result of the rising in Greece has been related in our article on that country; and the other misunderstandings between Russia and Turkey, the principal of which related to the appointment of the hospodars in Wallachia and Moldavia, were not sufficient to disturb the diplomatic system which was resumed after the Greek question had been settled by the interposition of the other great European powers. The designs of the emperor on the side of India chiefly exhibited themselves in intrigues among the northern neighbours of our possessions in that country; and the system scarcely came to light till after Alexander's death.

Al n-
de inter-
nal overn-
me

In the internal government of the empire, Alexander introduced many salutary changes, especially in the early part of his reign; but here, not less than in his foreign policy, the last ten years of his life exhibited a marked contrast to its earlier portion. The transition in his mind from a love of liberal institutions to a distrust of every thing that seemed to threaten the stability of thrones, began almost with his alliance with Napoleon, but reached full maturity after that extraordinary man's fall. In the first year of his reign he abolished the literary censorship, and afterwards restored it with less absurd but not less severe rules than those of his father. He at one time patronized both the education of the young and the general dissemination of religious knowledge; but after the peace the missionary societies were suppressed, and very harsh measures adopted against the universities. In several particulars a better spirit prevailed. That tolerant disposition towards the various sects of Christianity, of which we have remarked more than one instance in passing, had already become systematic, and was never departed from. The emancipation of the peasants from their state of serfdom was long a favourite object with the emperor, who was able to attain it in Courland, Livonia, and one or two other provinces, and used openly to lament that private interests and prejudices had baffled his good intentions elsewhere. Another plan of his, which was connected with the scheme just mentioned, was that of the military colonies, of which Dr Lyall has published an interesting account. The advantages which this system promised to confer were these: the diminution of the expenses of the army in times of peace, and the easy training of a large agricultural population to the trade of war. For these purposes villages were built on the crown-estates along the western frontier of the empire, and in these, soon after the peace, formidable detachments of soldiers were settled with their families, and mixed among the boors who, belonging to the crown, had previously been the sole or the principal inhabitants of the districts. The whole male population of these new settlements was to occupy itself alternately in rural labour and military exercises; and while the troops who had already seen service were always in a position to take the field again, the boors were gradually to qualify themselves for acting as a corps de reserve, and for filling up vacancies. The plan excited considerable opposition; and although the obstacles were finally to appearance vanquished, and the colonies speedily mustered four hundred thousand fighting men, yet new difficulties have arisen since Alexander's death, and the present emperor has abandoned the idea of extending the principle, or making it permanent.

Alexander's death.

During the last few years of Alexander's life he appears to have been completely miserable. To family misfortunes, religious despondency, and disappointment in political schemes, was added the continual terror of conspiracies in the heart of the empire, which were said to have ramifications everywhere, and to aim at nothing less than a total revolution, and the assassination of the whole royal family. Those constant travels through the several Russian provinces in which Alexander was engaged for two or three years before his death, have been mainly attributed by some writers to his dread of poison or the dagger. In the course of one of these journeys he died at Taganrog, on the Sea of Azof, on the 1st day of December 1825.

Resignation of the Grand Duke Constantine.

Alexander's brother, the Grand Duke Constantine, whose conduct as governor of Poland has been described in our article on the history of that country, was immediately proclaimed emperor at St Petersburg; and whatever may have been the feelings of the Russians themselves, foreigners who were acquainted with the new sovereign by his general reputation, looked on his accession with pity for his subjects and alarm for the peace of Europe. But the danger had been foreseen and averted by Alexander and the rest of the family. Constantine had been induced to resign his claims to the crown by a formal deed executed in 1822. The senate, on opening the will of Alexander, found it to contain a nomination of his second brother, the Grand Duke Nicholas, as his successor in the empire. The act of resignation was at the same time discovered, and in a few days there arrived from Warsaw a communication from Constantine, in which he acknowledged the existence and validity of the deed, and anew waived his right of succession.

Accession of Nicholas I.

Accordingly Nicholas I. ascended the throne, announcing the event by a proclamation of the 23d of December 1825. The disturbance of the natural order of succession was seized by the discontented as a favourable pretext for insurrection; and the reign of the new emperor was opened by a military mutiny in St Petersburg, which, after having been suppressed with bloodshed, was followed by several executions, and many imprisonments and banishments to Siberia. Nicholas, and his spouse, the princess royal of Prussia, were crowned at Moscow in 1826, and at Warsaw in 1829. The latter of these two ceremonies did not long precede the revolution of Poland, which has been the most remarkable event of the emperor's reign. It is unnecessary to repeat the circumstances of that unfortunate struggle. The whole character and policy of Nicholas have been similar to those of his brother since 1815, with, however, an additional degree of force and boldness, which may be attributable partly to the natural progress of the political tactics which were common to both, and partly to the more energetic will and greater attachment to military principles and forms which distinguish the younger brother.

The foreign policy of Nicholas.

If we look to the three questions which were described above as forming the main business of Alexander in his foreign policy, we find the position of Russia regarding them to have remained, with slight alterations, the same since the commencement of the new reign as it was before. The anti-constitutional views of the Holy Alliance have been necessarily modified, but not abandoned; although Nicholas speedily recognised the title of Louis Philippe to the French throne, and took an active share in the conferences of the five powers at London for arranging the affairs of Belgium and Holland. On the side of Turkey, Russia has, during the last fifteen years, been rapidly gaining strength. The treaty of Akjerman between the two powers in 1826, extending the principles laid down in the peace of Bukarescht, was ill executed on both sides; and the mutual misunderstanding, being still further complicated by the emergence of the Greek question, issued first in the battle of Navarino, and afterwards in a regular war of two years between Russia and the Porte. The first campaign, in 1828, was favourable to Russia, but not completely decisive; that of 1829 was celebrated for the successful passage of the Balkan by the Russian general Diebitsch, and was closed in September by the peace of Adrianople, in which Turkey consented to several articles both humiliating and injurious. Russia received but a slight direct accession of territory, but obtained a confirmation of the right of her vessels to navigate the Black Sea, a definitive settlement of frontier towards Turkey, and a recognition of such restrictions on the Turkish government of Moldavia and Wallachia as materially weakened the sultan's power. The fortresses of these provinces were moreover to be garrisoned by Russian troops, till the Porte should have paid to Russia the expenses of the war; and accordingly the provinces were not evacuated till 1834. Diplomatic skill, and other means less justifiable, strengthened the hold of Russia on the Porte, whose weakness was completely exposed in 1832, when Russian troops appeared as its protectors against its own rebellious subject the viceroy of Egypt. Turkey, in short, has in the mean time thrown herself unreservedly under the influence of Russia, and it appears not improbable that the course of events may very soon allow that influence a yet more favourable field. The most conspicuous incident of recent Russian history on the side of India has been the war with Persia, commenced in 1826, carried on successfully by the generals Yermoloff and Paskewitsch, and terminated in 1828 by the cession of some important provinces to Russia. (See PERSIA.) Since that time, both in Persia and in the neutral countries on the frontiers of British India, there is little reason to doubt that the Russian diplomacy has been acquiring an increasing influence. The only actual accession of territory to Russia in this quarter that deserves notice was given in 1829 by the revolt of the Kirghis Tartars, formerly subject to China, who now placed themselves under the sovereignty of Russia, and brought the Russian frontier nearer by another step to our Asiatic possessions.

Invasions and insurrections.

Internally Russia has had to contend with incursions of the Caucasian hordes from beyond the frontier, with revolts of the Lesghians and other tribes nominally subject to the empire, and lately with an extensive and spirited insurrection of the Circassians, which it has not yet been possible to quell.

Internal government.

The domestic government of Nicholas has little to distinguish it from that of his brother. Education has been to some extent more favoured than it had recently been by Alexander; the Catholic and Lutheran churches continue to receive the support of the government, which has also aided missions to the Calmucks and other nomadic hordes; trade and manufactures have been furthered by regulations devised with much intelligence; and the laws have since 1826 received a tolerably complete revision and concentration.

STATISTICS.

The Russian empire is of enormous extent, of vast resources, and of great capacity of improvement. It forms a connected territory, extending from the frontiers of Germany and Prussia, and the shores of the Gulf of Bothnia, eastward to the sea which separates Asia from America, thus embracing nearly one half of Europe and all the north of Asia. Beyond Behring's Straits it extends over a portion of the north-west territory of America, embracing at the same time a number of islands situated in the ocean which washes the northern shores of Europe and Asia, and flows between Asia and America. Its most westerly point is in longitude 18° 20′ 15″, and its most easterly in 209° 14′ east from Greenwich, thus extending through about 190 degrees of longitude. Its northern and southern boundaries have deep indentations; the extreme points of the former are in 78° 4′, and of the latter in 38° 40′ of north latitude. This empire embraces about the one-ninth (some estimate it as high as the one-seventh) part of the habitable globe, the one-fourteenth part of the northern hemisphere, and above the one twenty-eighth part of the superficies of our planet. The whole of China is not equal to two thirds of Russia; and the Roman empire, at the period of its greatest extension, did not comprehend more than one fourth of the territory which now bows to the sceptre of the czar. Some have included the mountains of Caucasus, others the whole of the Caspian Sea, whilst some again have omitted the one and not the other. A very elaborate calculation of the superficies of Russia has, within these few years, been published by M. Sernoff, who has invented an improved method of computing areas, by which he can allow for the inequalities of boundaries. "Russia in Europe, including Russian Poland and the islands of the Baltic and German Ocean, contains 2,078,646$\frac{73}{100}$ English square miles, of which 151,048$\frac{61}{100}$ lie within the frigid zone, and 1,927,598$\frac{12}{100}$ within the temperate zone. Siberia (under which designation are included the islands of the North Frozen Ocean, except Nova Zembla, and of the Pacific Ocean, as well as the peninsula of Alyaska in America) contains 4,866,643$\frac{76}{100}$ English square miles, of which 1,130,495$\frac{26}{100}$ are situated within the frigid zone, and 3,786,147$\frac{81}{100}$ within the temperate zone. It is impossible to calculate the exact area of Nova Zembla, as the southern coast of that island has not been laid down; but if it be supposed to extend in the form of a circle between the promontories of Nikolskoï and Winter, the area would amount to $83,271\frac{32}{100}$ English square miles. Thus the whole superficial extent of the Russian empire is about $7,028,561\frac{81}{100}$ English square miles, of which $1,364,815\frac{81}{100}$ lie within the frozen, and $5,663,745\frac{92}{100}$ within the temperate zone." According to an estimate previously made by Kraft, Russia has a superficies of 7,023,252 English square miles, including 571,858 miles of steppes possessed by the Kirghises, which however are omitted by M. Sernoff. We are inclined to adopt the computation of the latter writer as the nearest approximation to the truth; for perfect accuracy is not to be expected where so many liabilities to error exist. In the statistical account of this great empire, we shall describe the European and the Asiatic possessions of Russia separately; its American territory, and the islands in the Polar and Eastern Oceans, coming under the latter head.

Russia in Europe.

Russia in Europe is bounded on the south by the Caucasus and the Black Sea; on the north by the Arctic Ocean, especially by its great gulf the White Sea; on the east by the river Kara Baïgarama, the Ural chain of mountains, the river Ural to its embouchure in the Caspian, and thence by the shores of this sea to the eastern extremity of the Caucasus; and on the west by the principality of Moldavia, Austria, Prussia, the Baltic Sea, and the dominions of Sweden. Excluding Nova Zembla and the archipelago of Spitzbergen, but including the part of Poland which has been absorbed by this vast empire, European Russia lies between 18° 20′ 15″ and 64° 20′ 15″ of east longitude, and between 40° and 70° of north latitude. Its extreme length, from the northern declivities of the Caucasian range, near the sources of the river Samour, to the banks of the Muonio, near Ekontekis in East Bothnia, is 1840 miles of sixty to a degree; and its breadth, from the west side of the Ural chain, near the sources of the Sylva, in the government of Perm, to the western limits of Volhynia, on a line with Loutsk, is 1300 miles. In comparison with its size, Russia has less sea-coast than any other great European power. Its line of coast on the Frozen Ocean is about 920 miles in length, on the Baltic Sea about 1230, and on the Black Sea and the Sea of Azof about 1280; forming altogether a district of sea-coast about 3430 miles in length. Thus a greatly preponderating part of the country is cut off from all maritime intercourse and influence, except by means of navigable rivers and canals, which at best are but an indifferent substitute for the ocean. Owing to this circumstance, and the interruptions occasioned by the ice in the Arctic Sea, and in a considerable portion of the Baltic for the greater part of the year, Russia has made less progress in commerce and civilization than other nations of Europe more favourably situated.

Ge ral asp.

European Russia, together with Poland, belongs entirely to that immense level plain which begins in the north of Germany, and extends over the whole east of Europe. From the Carpathian to the Ural range, a distance of five hundred leagues, all is one immense undulating plain, without a mountain to break the monotonous level of the horizon, or oppose a barrier to the winds. A great portion of it, in the south especially, consists of those immense levels called *steppes*, that, like the pampas of South America, present to the eye only a dead flat for many hundreds of miles. Here and there indeed the surface is diversified by some large ancient tumuli, supposed to be the burial-places of the ancient Scythians, and in a few places there are small tablelands; but the latter swell so gently above the surrounding level as scarcely to be perceptible. Of these, the most worthy of notice are the Valdaï Hills and the forest of Volkonskoï, situated in the governments of St Petersburg, Moscow, Tver, and Tula, the loftiest summit of which, lying between the villages of Polosehva and Mosti, and the towns of Ostasekov and Valdaï, is only 1064 French feet in height. No part of the forest of Volkonskoï is very rugged; on the contrary, it is a gently sloping plain. But the rivers and the deeply-indented lakes are encompassed by steep banks of slate, gypsum, and limestone mixed with shells. Masses and blocks of granite are scattered on the surface. This ridge, or rather plateau, is rich in iron, sulphur pyrites, vitriol, alum-earth, a species of coal, petrifactions, salt springs, and lime and gypsum quarries. Here are situated, within the distance of a hundred miles, the sources of the rivers Volga, Dvina, Dnieper, Don, Oka, Volchow, Lowat, Pola, Kolp, and others less distinguished. To the north-east, the land gradually slopes to the almost flat shores of the Baltic Sea, and is for the most part covered with immense forests, marshes, and turf-moors. Between this ocean inlet and the White Sea, on the north-north-west, lies a tract of country which is richer in water than any other in Europe. Here a multitude of lakes, large and small, are united together like a network of water, and between them extend those rocky ridges which, on the north-west, rise into the inferior Finnish chain of hills. These, however, sink again towards the lake Enara and the river Tana, without joining the Scandinavian system of mountains. Proceeding south-west from the interior hills of Voldaï, the land also gradually sinks, and becomes encumbered by immense marshes, situated between Minsk and Volhynia. Through these the river Priepetz, the great feeder of the Dnieper, takes its way, constituting their drain or outlet. The northern declivities of the Carpathian Mountains only in a few places cross the borders of the Austrian territory, and enter Russia, but not as hills of any height. Near the sources of the Oder, they proceed towards the Vistula, and along this stream, as a plateau eight hundred feet in height, which, eastwards between Pilica and the above river, rises into groups of mountains, which extend, in five parallel chains, having a breadth of about fifty miles, for a distance of ninety miles. In two places they reach about two thousand feet in height, which are the loftiest points in Poland. Upon the other side, in the east, the declivities of the Carpathian range extend as a broad plateau across the whole of Southern Russia. It thus separates the low land of the interior from the maritime country of the Black Sea. Unlike the table-land of Volkonskoï, which bears on its broad surface lakes and fens, this southern plateau consists of large steppes, penetrated by the rivers Dniester, Dnieper, and Don, which here form cataracts. Between the last-named stream and the Volga it rises as a continuation of the Lower Volga range, which, under the name of the Irgeni Hills, extends southwards to the Caucasus. On the peninsula of Crimea, a wholly insulated chain of mountains rises to a considerable height, and runs from east to west nearly a hundred and twenty miles, close to the coast of the Black Sea. In one part it attains an elevation of 4740 feet, and in another 4600 feet. Along the eastern boundary of European Russia, the Ural mountain chain extends from the shores of the Frozen Ocean southwards towards the Caspian Sea, for a distance of nearly 1500 miles, unconnected with any other mountain system of Europe. The northern portion of the Ural chain, from the Straits of Waygats to the sources of the Petchora, consists of rough, naked, limestone rocks, which in one place, Padwinski, are 6500 feet in height. This part of the country is comparatively little known. The middle portion of the chain, as far as the sources of the Oufa, called the Verchoturic Urals, forms a broad tableland of moderate elevation, overspread with morasses. Further to the south the Urals rise again in height, and become thickly wooded, whilst in the government of Orenburg they expand in broad ramifications on both sides of the river Ural. The chain, with all its branches, sinks towards the Caspian, without coming into contact on the east with the mountain systems of Asia. It is called at different points the Orenburg, Baschkir, and Kirghis Urals, and sends out an offshoot on the south-west, between the rivers Ural and Samara, the Obschtschei-Syrt, which stretches to the banks of the Volga. The Sok Mountains form a part of this spur of the Urals. There are seven defiles or passes through this great range, the most practicable of which are the roads from Perm and Orenburg into Asia. Between the southern declivities of the Urals and the Caspian Sea and Aral, there is an opening of about two hundred and eighty miles in breadth, through which, more than once, the hordes of Asia in former times have poured like a flood over Europe.

Steppes.

Steppes, or plains, are an important feature of the geography of Russia, as well as of that of Tartary, with which the term is more frequently associated. The most important of these are the following: 1. The Steppe of Petchora, which stretches along both sides of the rivers Dvina and Petchora, from the Icy Ocean and White Sea, to the northern part of the government of Vologda. It is called Tundra, and consists of turf-moor covered with moss. In the north it is destitute of wood; in the south it is thickly wooded, and has many small fresh-water lakes. 2. The little Jaroslav Steppe, situated between Koslov and Tambov, a plain rich in flowers, and fifty versts[1] in diameter. In connection with it may be mentioned the great steppe between Tambov and Kopersk, which is plentifully supplied with water, very fruitful, and rich in vegetables and pasture. 3. The Steppe of the Don, belonging to the Don Cossacks. This immense plain, wholly destitute of hills, is about 57,600 geographical square miles in extent; in some parts it is fruitful, but in general the soil is barren and uncultivated. 4. The Kuban Steppe, extending from Kuban to the Manitch. The soil is very unproductive, and rests on a bed of sandy limestone. 5. The Steppe of Azof, which extends on both sides of the Lower Manitch, to the Sea of Azof and the Lower Don; but it is as worthless as the former. 6. The Steppe of Taurida, a gentle declivity of the northerly and easterly mountains of Taurida, inclining towards Kertsch and the Bosphorus, the Putrid Sea (a branch of the Sea of Azof), and the Straits of Perekop. The soil near the mountains is poor and unproductive; but farther down it becomes claycy and fruitful, and towards the sea is impregnated with salt. Similar to the Steppe of Taurida are those of Vosnesenks and Otchakof. 7. The Steppe of Nogais on the Black Sea and the Sea of Azof, from the Lower Don to the Lower Dnieper. It is a dry unwooded tract, of some value to the wandering tribes, but nearly useless to the settled countryman. 8. The Steppe of Astracan, stretching between the Don, the Volga, and the Caucasus; and, 9. the Steppe of Kalmytz. According to Pallas, both of these immense plains must at one time have been covered with the waters of the Caspian Sea. But, in fact, the whole country appears at some period of remote antiquity to have lain beneath the tide of the ocean. Two large oases must be noticed as occurring in the midst of these steppes; they form the country of the Little Russians, and that of the Don Cossacks.

Rivers.

M. Huot, in his new edition of Malte-Brun's great geographical work, thus mentions the rivers of Russia. "The soil of Russia is so slightly undulated, that to consider the spaces traversed by its rivers as true basins, would be an abuse of terms; notwithstanding that it contains the most important water-courses in Europe. It would not perhaps be more exact to apply the same name to the Black, Caspian, and Baltic Seas, or to the Icy Ocean, in one or other of which all its waters disembogue. I prefer designating by the denomination of declivities the inclination of the soil to these several seas, and hence shall term them the Tauric, Caspian, Icy, and Baltic declivities. The Tauric, to which I give the name because all the water-courses which descend on this side have their embouchures around the peninsula of Taurida, is watered by the Dniester, the Dnieper, the Bog, and the Don; the Caspian, the waters of which fall into the sea of that name, is furrowed by the Terek, the Volga, and the Ural; the Icy declivity, formed by the tracts which incline towards the White Sea and Icy or Frozen Ocean, is watered by the Petchora, the Mezen, and the Northern Dvina; lastly, the Baltic comprehends all the streams which fall into the Baltic, the most important being the Tornéo or Tornéa, the Neva, the Southern Dvina or the Düna, and the Niemen." Some eminent German geographers have also adopted this plan of classifying the rivers according to the seas into which they discharge themselves; and as it has several advantages over the usual method of describing the streams of a country in the order of their size and importance, we shall follow it.

In the declivity which slopes to the Black Sea and the Sea of Azof, there is, 1. the Danube, whose northern arm forms part of the southern boundary between Russia and Turkey. Below Galatz it receives its last tributary the Pruth, which descends from the mountains of Gallicia or Austrian Poland, and separates Bessarabia in Russia from Moldavia in Turkey. 2. The Dniester, which rises also in Gallicia, and flows with many serpentine windings towards Russia. Below Chotzim it is broken by rapids, so that near Bender boat-navigation is interrupted, and without receiving any tributaries of importance it falls into the Black Sea at the broad but shallow estuary or Lake of Ovidovo. 3. The Dnieper, which has its source in the government of Smolensko, on the southern slope of the Volkouski Wood, and empties itself into the Black Sea below Kerson. This noble stream receives many tributaries, amongst which, on the right, flow in the Berezina, the Priepetz, and the Bug, and on the left the Soj, the Desna, the Sem, Sula, Psiol, Vorskla, and others. This river is the ancient Borysthenes. It is connected by canals with the Dvina and the Niemen. 4. The Don, which originates in the small lake of Ivanovsko, in the government of Riasan. After intersecting the Cossack territory to which it gives name, it discharges itself below Tcherkask into the Sea of Azof, by several mouths. In summer it is shallow; in spring it overflows its low banks to a great extent, and forms unhealthy morasses. By means of navigable canals it is connected with the rivers Shat, Upa, Oka, and Volga. Its principal affluents on the right are the Sosna and Donetz, and on the left the Voronej (on which stream Peter the Great built his ships for the Black Sea), the Khoper, Medveditsa, and the Manitch. 5. The Kuban, which descends from the northern side of Elburz in the Caucasus, flows first north and then west, upon the boundary between Asia and Europe. It separates into two main branches, the northern of which falls into the Sea of Azof, and the southern into the Black Sea.

---

[1] As we shall have frequent occasion to mention Russian weights and measures, we here present a table, to which the reader can refer, in order to understand what the calculations are equivalent to in English.

A verst is 3520 English feet; consequently three versts are equal to two English miles.

A dessaitine is equal to $2\frac{7}{10}$ths English acres nearly.

A chetwert is equal to 5·952 Winchester bushels; consequently 100 chetwerts are equivalent to 74·4 English quarters.

A vedro is equal to $3\frac{1}{4}$th English wine gallons.

A rouble, that is, a paper rouble, the only basis of commercial calculations, is equal to $10\frac{1}{2}$d., which is very nearly the value of a French franc. But the rouble fluctuates with the exchange.

A pood or poud is always reckoned in commerce as equal to thirty-six pounds English.

On the Caspian declivity we have, 1. the Volga, the largest river in Europe. It originates in the government of Tver, near the village of Volgo Verkovie, in the forest of Volkouski, in north latitude 57° 4′ 37″. It traverses Lakes Sterj, Peno, and Volga, and on receiving the waters of Lake Seligher, it becomes navigable, and falls into the Caspian Sea by eight principal arms, which have in all sixty-five mouths, forming about seventy islands. It has a number of tributaries, the principal of which, on the left, is the Kama, or Little Volga, which has a course of about a thousand miles in length. Before the Volga receives the Kama, the rivers Tverza, Mologa, Ounja, Vetlouga, and others, join it on the left; and on the right the Oka, which descends from the water-shed where the Don and the Dnieper originate. The Soura, which flows from the mountains of Volga, is another large tributary, which joins it on the right. The Volga is nearly two thousand miles in length. Its breadth at Astracan, where it embraces many islands, is nearly five leagues at the greatest height of the water. The depth of its waters varies from seven to eighteen feet. In the winter it is covered with ice throughout its whole extent, but there are always many apertures in the south, from which currents of air escape, and hence they are termed the lungs of the Volga. During summer the Volga is crowded with thousands of boats, constructed in the well-wooded countries of Northern Russia, and bearing down from the interior all kinds of commodities. Their return being difficult, they are generally broken up and sold at Astracan. This noble river is the principal commercial road of the interior of the Russian empire. It encircles the central table-land, receiving, as we have seen, the Oka, the principal river in this fertile region. It communicates in the upper part of its course by the canal of Vichnei-Volotchock, with the Lakes Ladoga and Onega; and, lastly, the Kama conveys to it all the waters of Eastern Russia. "The town of Astracan," says Malte-Brun, "may be supposed an Alexandria on a Scythian Nile, but the river enters an inland sea; it does not communicate with the ocean, and the countries which it waters are inhabited by barbarous nations; still, however, the advantages which human industry may derive from the majestic courses of the Volga and the Danube are not as yet realized." The term "barbarous" is now scarcely merited. 2. The Ural, or Oural, so called in conformity to a decree of Catherine II. It descends from the eastern declivities of the mountains bearing the same name, and flowing in a smooth channel sufficiently deep for small vessels, traces for a considerable distance the eastern and southern frontiers of the government of Orenburg, and the eastern limits of Europe. On the right it receives the Sakmara, on the left the Ilek, and after a course of above a thousand miles falls into the Caspian near Gouriev. 3. The Terek. This stream rises at the base of the Kazbek; receives on the right the rivers Songa and Aksai, on the left the Ourong, Tcherek, Bekhar, and Malka; and enters the Caspian by three principal mouths, between the Gulfs of Kouma and Agrakhan.

On the declivity of the Frozen Ocean we have, 1. the Petchora, which rises in the Ural mountain range, and traverses the most solitary deserts of Russia, the governments of Archangel and Vologda. Its steep calcareous banks are broken by caverns and ravines; and hence its name Petchoran, which in the Russian language signifies caverns. After receiving, amongst other tributaries, the Oussa on the right and the Tyra on the left, it falls into the Arctic Ocean in north latitude 67° 10′, its mouths forming an immense estuary. The length of its course is about 670 miles. 2. The Mezen, which originates in some bogs in the government of Vologda, and after a course of five or six hundred miles discharges itself into a bay of the same name on the shores of the White Sea, almost under the polar circle. 3. The Dvina, which name the rivers Soukhona and Joug receive after their junction near Weliki-Oust-Joug. The Soukhona flows from Lake Koubinskoe, in the government of Vologda; it is united with Lake Bielo by means of a canal, and also with the rivers Volga and Neva in the same manner. The Joug rises in the same government, but is a much smaller stream. The Dvina does not assume the dimensions of a large river till after the junction of the Vychegda, which falls into it on the right. The latter is united with the Volga by means of Catherine's Canal. Near Kholmogory it divides into several arms, and after a course of above 700 miles falls into a gulf of the same name. Its mouth is greatly obstructed by a bar of mud. 4. The Onega, which is the outlet of several lakes, but not that of Onega, although it be situated in the neighbourhood. There are other rivers which fall into the White Sea and Arctic Ocean, but none of them are of any great moment.

The declivity of the Baltic Sea contains a variety of rivers. 1. The Tornéo, or Tornéa. It originates in Swedish Lapland, and, after the confluence of its great tributary the Muonio, down to its embouchure in the Baltic Sea, it forms the boundary between Russia and Sweden. The Muonio, likewise, traces for some distance the limit of the empire on this side. The Tornéa has a course of about 280 miles. 2. The Neva, in several respects a remarkable river. "The Neva," says Colonel Jackson,[1] "though it be called a river, is more properly a bosphorus or strait. Its length, from Schlusselburg, at the south-west angle of the Ladoga Lake, to its mouth, is sixty-nine versts; its direction that of a straight line from east to west; its medium breadth about 1500 feet; and its depth, in many places considerable, is generally in the channel about fifty feet. The water of the Neva is remarkably pure, and though the first use of it by strangers generally produces slight diarrhœa, yet it is very wholesome and extremely palatable. This fine river is the grand and only outlet for the superabundant waters of four great basins, each of which has an extensive natural reservoir of its own. These reservoirs are the Lakes Onega, Ilmen, Saïma, and Ladoga; the latter receiving the drains of the other three. Ten different streams flow into the Onega, whose length from north to south is 190 versts, and its breadth from east to west seventy versts. It discharges into the Ladoga by the Sveer, a river 202 versts long, and of very unequal breadth. The Ilmen is fifty-five versts long from north-east to south-west, and about thirty wide from north-west to south-east. It receives eleven streams, and has its outlet into the Ladoga by the Volkoff, 206 versts long, with a medium breadth of 1400 feet. The Saïma, which is rather a collection of lakes, of gulfs, and bays, of all shapes and sizes, communicating with each other, than a regularly-formed and single sheet of water, is estimated by Peter Friccius at 130 versts long in the direction of west-south-west to east-north-east, and 120 from north to south; but on the Swedish side it is about 280 versts more. It pays its tribute to the Ladoga by means of the Voksha or Voxa, a river about 180 versts long, and not navigable in consequence of its several cascades, of which the most considerable, that of Imatra, has a fall of upwards of thirty-two feet. Besides the Sveer, Volkoff, and the Voxa, the Ladoga receives the waters of thirteen other streams. This, the largest lake of Europe, is about 175 versts long and 105 broad, and of an oval form. The surfaces of the four lakes are thus estimated. The Onega, 430 leagues, of 25 to a degree; the Ilmen, 36; the Saïma, 210; and the Ladoga, 830 degrees." At St Petersburg the Neva di-

Statistics.

vides into several deltoid branches, the largest of which is 1260 feet across, and bears along a mass of about 74,000 cubic feet of water in a second, while the Nile in the same time furnishes but 21,800 cubic feet. It moves at the rate of about two miles and one furlong in an hour; but notwithstanding the immense mass of water which is borne along, and the speed with which it moves, taking one year with another, for five months of the year the navigation is interrupted by its being frozen over, the ice sometimes exceeding three feet in thickness. 3. The Düna, or Southern Dvina. This river originates in a fen on the western declivities of the forest of Volkonskoï, in the government of Tver, not far from the sources of the Volga. It soon becomes deep enough to be navigable, but its course is broken by falls and sand-banks; it falls into the Bay of Riga, without having received any affluents of importance on its way. 4. The Niemen, which rises in the forests of Kopislov, in the government of Minsk. It flows first in a northerly direction, and then bending to the west, enters Prussia under the name of Memel. On the right it receives the Vilia, a navigable stream; and on the left one or two others, but they are small and unimportant. 5. The Vistula. This river rises in the principality of Teschen, in Eastern Silesia, at the foot of the western Carpathian range of mountains. It flows in an easterly direction to Cracow, where it becomes navigable, and as far as Sandomir forms the boundary line between Gallicia and Poland. Amongst its confluents, the most important are, the Bug, which originates on the northern side of a chain or lofty ridge of hills separating the chalky lands of Volhynia from the rich plains of Podolia; the Priepetz, a feeder of the Dnieper, which unites the Bug and the Niemen in spring and autumn; and at Sierock it receives the Narew, a river which flows from the plains of Lithuania, and is believed by the common people to be fatal to water-snakes. Its other tributaries are the Pilica, which originates in the heights above Warsaw; the San, which rises not far from the sources of the Dniester; and the Bzura. 6. The Wartha. This river rises in a plateau near Kromolow, in Cracow, flows in a broad channel like the Vistula, and inundates the neighbouring fields. After receiving the Ner, it becomes navigable, and though not so deep as the Vistula, has the appearance of a large river. After receiving the Prosna, which for a great distance forms the boundary between Poland and Prussia, the Wartha enters the Prussian territory, and adds its waters to the Oder.

Lakes, seas, and coasts.

The Baltic, the Black Sea, and the Caspian, will be found described in this work, each under its own proper head. In the foregoing account of the rivers of Russia, we have noticed four of the most considerable sheets of water in this country. Deep in the interior are a few pretty large collections of water; but lakes are not a characteristic of Russia, except in the north-west part, where Finland is situated. Here immense numbers of winding lakes of varied form and dimensions intersect the country in all directions, giving rise to numerous rivers; but none of them irrigates a great extent of country. All these, surrounded by flat and bleak shores and frozen plains, present little that is striking in point of scenery, and afford few facilities for internal intercourse. The coasts of Russia are deeply penetrated by large arms of the sea, forming gulfs, bays, and the like. Besides the Black and Baltic Seas, we have the Sea of Kara, which is the most easterly, and bathes at once Europe and Asia. It is four hundred and fifty miles in length; but navigation is almost constantly interrupted by ice at its northern entrance. On the extreme west is the Bieloe More, or White Sea, which itself embosoms a number of bays and gulfs of considerable size. The largest of these are the Gulfs of Mezen, Dvina, and Onega, so called from the rivers which flow into them; and Kandalask, which communicates with Lake Kovdozero. The White Sea is about the same length as that of Kara, with a breadth of from sixty to seventy miles. Between these two great inlets of the Arctic Ocean occur other gulfs, the most considerable being Tcheskaïa, which is separated from the White Sea by the peninsula of Kaniskaia Zemlia, and that formed to the east of this by the estuary of the river Petchora.

Statistics.

Capes, &c.

The extensive inlets of the sea above mentioned of course form numerous promontories and other projections of land. In looking over a good map, the most striking which meets the eye is Cape Kamin or Canin, the north-western extremity of the peninsula of Kaniskaia Zemlia. This neck of land, which separates the Gulf of Tcheskaïa from the White Sea, stretches directly north into the Arctic Ocean, a distance of about 150 miles. Its breadth is between forty and fifty miles. Cape Onega projects into the White Sea near the bottom of that gulf, and forms the Bay of Archangel on the north-east, and the Bay of Onega on the south-west.

Geology.

In European Russia, the predominating kinds of rocks, or, to use the language of geology, formations, are tertiary and alluvial; those of an older date, says Professor Jameson, namely, the secondary, transition, and primitive series, occupying but comparatively small space. The two latter occur in the Ural chain, in Finland, and Russian Lapland, in some parts of Karelia, Olonetz, Crimea, Caucasus, the Valdaï plateau, and Sandomir Mountains, Revel, the country around Lake Ilmen and Vologda, and the tract extending from Brody across the Bug and the Dnieper. The secondary lands frequently appear rising like little islands in the great Russo-Polish plains. Amongst the formations of this class of rocks are found coal, lime, gypsum, chalk, and salt, which will be afterwards noticed. The tertiary rocks, which occupy vast tracts of the low country, are clay, loam, limestone, brown coal, with gypsum, and in many tracts, as in Austrian Poland, rich deposits of rock-salt. There is a tertiary limestone almost peculiar to this part of Europe, and extensively distributed throughout Poland, Podolia, and Southern Russia. "It occurs, however," says Jameson, "in the basin of Vienna, and Hungary, and in France. It is the last dépôt of that sea which covered all the country to the north of the Carpathians, from the Baltic Sea to the foot of that chain, and to the Black Sea, in the middle of which rose the mountains of Sandomir, and the plateau south-west, in the form of islands. It is covered by a marly clay, and a sand formed by the last great alluvial catastrophe, which gave to Europe its present form, and buried in its dépôts remains of unknown species of the elephant, mastodon, rhinoceros, &c." In Central Poland there is a clay, with lignite or brown coal, resting upon chalk, which is supposed by some geologists to be the oldest members of the tertiary formations. The alluvial formation consists of an old and new deposit, the former being composed of a great stratum of marly clay or loam, interspersed with numerous blocks of granite and other primitive rocks. It covers vast tracts of country in Poland, varying in thickness from thirty to a hundred feet. The soil which it forms in the south of Poland is excellent; but as it advances northward it becomes less and less productive, and more and more intermixed with sands, gravels, and primitive blocks. It is this deposit which contains such an immense quantity of fossil remains of animals, including great whales. An alluvial sand, different from the sand of rivers, is widely distributed in Poland, and connected with the great sandy plain of Northern Germany. Vast numbers of large and small primary blocks occur in this plain, and which, from their identity with the rocks of Sweden and Finland, it is believed, on good grounds, have been transported from these countries by a débâcle flowing from the north-east to the south-west. The same débâcle has also formed the marly clay or alluvial loam; it has interred the elephants and other animals of unknown antiquity; it has broken up the chalk plains of the north, and separated Denmark from Sweden, and, in general, given to the Baltic, and the Gulfs of Bothnia and Finland, their present forms.

erals. coal, cop- &c.

The great mineral repositories of this empire occur in the Ural and Altaic chains; those in European Russia are few in number, and of little importance. A tract called the central mining district of Russia extends from the Oka to near the town of Kalouga, including portions of the governments of Niznei-Novgorod, Vladimir, Tambov, Riazan, and Kalouga. But it is for the most part a poor sandy district, containing iron ore; and as the metal is manufactured in the localities where it is found, several extensive iron-works are situated at intervals along the line mentioned. The ore is described as occurring in regular beds, sixty feet below the surface. It is of several varieties, the lightest coloured producing the most iron. Few minerals occur in that large and sandy plain which we have noticed as forming the northern and central portion of Poland. The land, as in all the northern countries on our globe, is incrusted with a ferruginous deposit, and every marsh and every meadow contains iron in a greater or less proportion. The iron is of indifferent quality; and the existing veins of lead, gold, and silver, which, it appears, were once productive, lie beyond the Russian territory. At Petrozavodsk, near Lake Onega, in Finland, there are iron-works, which, it is believed, are the largest in the north of Russia. Bog-iron ore abounds in the neighbourhood; and for a long time this was the only kind smelted; but thirteen different mines are now wrought. Vast quantities are obtained by simply dragging the lakes. Another great iron-work of the same description is situated four versts from St Petersburg, on the road to Riga. Finland also yields copper and tin, but only one mine of the former is wrought. Coal is found in very inconsiderable quantities in European Russia. There is a small mine worked at Tula, another at Bakhmout in the government of Ikaterinoslav, but neither seem to be of much utility. In Southern Poland and Cracow there are numerous beds of black bituminous coal, resembling that of Great Britain, some of which are thirty feet in thickness. These occur in the secondary formation. In the tertiary districts deposits of brown coal are met with, which also yields amber, the exudation of a dicotyledonous tree. Russia possesses a great treasure in the numerous salt-lakes and marshes of the Siberian steppes, and the country to the north of the Caspian Sea. There are also mines of salt dispersed throughout the empire, and from these sources immense quantities are annually obtained, the amount increasing indefinitely with the population. There is a tract of country called the Northern Salt District, which stretches in a line parallel with the Petersburg limestone, for a thousand versts. It makes its first appearance in the island of Oesel, and is worked in several parts of the south of Livonia. Quarries of gypsum are also situated in this great tract. A central salt district is described as existing in the course of the Volga. Along the course of the river Kama there is also a rich and extensive marl, salt, and gypsum tract, probably connected on the south with that of the Volga, and on the north with that of Vologda. The principal salt-works are in the neighbourhood of Solikamsk; and the gypsum grottoes of Koungour, in the government of Perm, are of great size and magnificence. There are in Poland large mines of rock-salt, which annually yield immense supplies of the article. They form part of that enormous layer of fossil-salt which extends along the Carpathian Mountains, and is large enough to supply the consumption of all the nations of the earth for an indefinite period of time. Copper-sand is found throughout a vast tract of country extending over the governments of Perm, Viatka, and Oufa. It completely skirts the south and west sides of the Ural Mountains. The sand is of a dull red or green colour, and is usually worked for copper. It contains fossil-wood impregnated with the metal. But it is in the Asiatic territory of Russia that the most abundant mines of copper are found, as well as those of gold, silver, platina, and other metals.

Soil.

In a country of such vast dimensions, the soil must of course vary considerably in different situations. There is a vast tract of territory 65,000 geographical square leagues in extent, which possesses a peculiar and rather remarkable soil. Indeed, Ritter, in his *Erdkunde*, informs us that there is only one other place on the surface of the earth where any thing similar in soil has been discovered, and that is the north of Hindustan. It consists entirely of decomposed vegetable matter, and is deposited in a thick layer. It is situated in the south of Russia, stretching in a broad belt from Volhynia in a north-easterly direction, to the foot of the Ural chain, near Perm. It is prolonged on one side from this to the shores of the Black Sea; and on the other it stretches from Perm to Orenburg, and thence to the Caspian Sea. All this vast tract, exceeding in extent France, Spain, and Prussia united, is covered throughout with a stratum of vegetable mould, which varies in thickness from three to five feet. It is so extremely productive as to stand in no need of manure. Its fertility is shown in the large returns of grain, especially rye, which it yields, and in the excellent breeds of cattle which are reared upon it. From the thinness of the population, this vegetable mould is far from being wholly laid out in corn-fields; vast tracts still remaining unoccupied. The soils of the steppes which cover so large a portion of the surface of Russia we have already adverted to when describing these plains. What remains to be said regarding the soil of this country must be stated in reference to specific localities, a general description being impracticable.

The country between the Dniester and the Dnieper has a soil impregnated with nitre, a substance deleterious to vegetation; yet, as soon as it is removed or diminished, wheat, millet, and the arbute melon, may be cultivated with great success. The mildest and most fruitful region in all the Russian empire is that continuation of valleys arranged in natural amphitheatres at the southern base of Taurida, along the coasts of the Black Sea. Proceeding eastward, we meet the government of Astracan, only part of the soil of which is fertile. This portion includes the low districts on the banks of the Volga, the Ural, and the Terek, and is by no means large; but here vegetables attain an enormous size. The soil is impregnated with saline and bituminous substances. Higher up, the land on the Volga becomes sandy and unproductive. The soil of Little Russia and the Polish Ukraine is partly sandy and not very fruitful, partly very rich and fertile. A great part of Western Russia is sandy, and intersected by vast marshes and bogs. Large tracts are covered with immense forests, the retreat of the bear, wolf, and wild boar; whilst not an inconsiderable portion of this westerly territory ranks amongst the most fertile in the empire.

Climate.

It thus appears, with regard to the soil of Russia, taking a summary view of it along with the climate, that from the forty-fourth to the fiftieth parallel of north latitude, comprising Bessarabia, Podolia, Kherson, Ikaterinoslav, and Taurida, it is for the most part low and level, little wooded, partly very fruitful, partly arid and unfruitful, and here and there impregnated with salt. The winters are short, with little snow; but in some parts the cold is severe. The spring is early and mild; the summer is of long duration, with oppressive heat and little rain; autumn follows late in the year. In the heat of summer a dangerous disease called *jassia* is generated; it is fatal to the lower animals as well as to man. Violent whirlwinds are frequent. The south of Russia is subject to a north-easterly wind called *mitel*, often accompanied by snow, which is drifted with great violence, and much dreaded by the inhabitants. The middle or temperate district, extending from 50° to 57°, has a rough and long-continued winter, especially in the eastern territory. This district is the largest and wealthiest portion of the empire, and forms broad, open, undulating plains, over which, as far as the declivities of the Ural chain upon the east, only slight elevations break the monotonous level. The northern district, from 57° to 67°, in European Russia, has a much milder climate than the same parallels in Asia. With the exception of the wooded mountains of Finland on the west, it is, as far as the Urals, a continuation of the former flat land, upon which forests, meadows, marshes, and moor-ground, alternate with one another. The poor, meagre soil, only insures the husbandman a return as far as the sixtieth parallel. The winter here is long and severe, there being six or seven months in which travelling is prosecuted on sledges. Mercury freezes in the winter, and the autumn is foggy. Here only slow-growing wood succeeds, and beyond 67° is confined to dry, stunted shrubs. From 64° the rearing of cattle is always difficult, and agriculture is limited to roots. Under the parallel of 66° the sun does not set on the 21st of June, nor rise above the horizon on the 21st of December. According to observations by the Imperial Russian Academy of Sciences, extending over twenty years, from 1777 to 1797, the duration of winter in St Petersburg extends from the end of September to the beginning of May. Snow and ice set in about the 9th of October, and continue to the beginning of May. Upon an average, 230 days of the 365 are reckoned as belonging to winter. For 160 of these, that is, from the 27th of November till the 19th of April, the waters are bound fast with ice. In winter the east wind prevails for 113 days, and the west sixty-eight days. In summer the westerly wind prevails for 110 days, and the easterly for eighty-four days. The quantity of rain which falls is from ten to eleven French inches; the number of rainy days is reckoned at about eighty. In 1774 there were reckoned forty-eight appearances of the northern lights; but since 1782 their number has decreased in a remarkable degree, especially within the last fifteen years. In the arctic or hyperborean region, extending from 67° to 74°, the rigours of the climate tell upon man and other animals, as well as upon vegetation; for neither attain the full size nor the complete development of their members. In Archangel the sun rises on the 11th of December at twenty-three minutes past ten, and sets about our mid-day, thirty-seven minutes past one; whilst on the 10th of June it rises thirty-seven minutes past one in the morning, and does not disappear below the horizon until twenty-three minutes past ten in the evening. But beyond 67° the climate is one long summer day and long winter night. The summer, however, is much overcast with vapours, which obscure, and sometimes wholly conceal, the sun. The dark and dreary reign of winter is greatly alleviated by clear moonlight and the brilliant apparition of the aurora borealis. Trees cease entirely about 67°, only hardy shrubs being able to endure the intense cold of the climate. In St Petersburg in 1732 the cold was 33° below zero, and in Tornéa 37°. On the 12th of January 1809, quicksilver froze into a solid mass in Moscow, and was extended with a hammer like lead. As this metal becomes solid about 33°, we may reckon the degree of cold in this case as about 35° below zero. Earthquakes were almost unknown in this country till the 17th of November 1821, when Kief and other places were visited by one, which shook the buildings with violence, but did no material damage.

Vegetable productions.

From the vast extent of this empire, and the great range of its temperature, it is not surprising that the productions of every clime are found, or may be successfully cultivated, in some parts of its wide-spread surface. On the east, the great chain of the Urals separates by a bold line the northern European from the northern Asiatic botany; and over this vast expanse winter reigns with excessive severity, while the almost tropical temperature of the brief summer brings the productions of the vegetable kingdom to sudden maturity; and this rapid growth is followed by as rapid a decay in autumn.

Forests.

The forests of Russia are in several respects an important feature of the country; firstly, as a physical characteristic, from their overspreading such enormous tracts of country; secondly, in a commercial point of view, from the timber, tar, pitch, potash, and turpentine, which they afford, forming important items of trade; and, thirdly, from their supplying fuel in a country nearly destitute of coal. An able writer thus describes them: "Estimating the surface of European Russia," says M. Schnitzler,[1] "at 402,100,552 dessaitines, 156,000,000 of this number are occupied by forests; 178,000,000 by uncultivated land, water, houses, and roads; 61,500,000 dessaitines by arable, and a little more than 6,000,000 by meadow-land. On this general view of the surface, we may compute that a dessaitine of wood occurs for every two and five-ninth dessaitines without it. The forests, indeed, constitute a source of riches which may long continue inexhaustible, and which might be indefinitely increased by strict regulations for their economy and management. Seventy-six millions of dessaitines are still completely covered with pines, firs, and other cone-bearing trees, without counting the oaks, maples, beeches, poplars, and elms, which are by no means rare in the latitudes within the 52d degree, and the birch, which grows in still more northern districts.... The governments of Novgorod and Tver, in particular, are studded with forests; that of Volkonskoï, which extends to the Valdaï Hills, is one of the largest known. In the government of Perm, out of 18,000,000 of dessaitines, 17,000,000 are forest. These immense tracts, covered with wood, are a great blessing in so inclement a climate, as they form a shelter against the winds from the icy seas. The provinces to the south have not the same necessity for them, and are so destitute of wood as to occasion the burning of grass and dung for fuel." The trees furnish the inhabitants with fir-timber of the finest and most durable quality, for building, household furniture, and utensils; and for these purposes it is largely used in the interior. The same tree supplies the peasantry with torches, which they use instead of candles. The brushwood, which covers a vast extent of forest country, consists almost entirely of the hazel, dwarf birch, alder, willow, and juniper. In other places the surface of the earth is covered with wild bilberry, and the cranberry, which is extensively exported.

Grain, hemp, a flax.

Russia is as yet chiefly an agricultural country. It is so extensive, and in many parts yields such abundant crops of grain, that enough is produced not only for home consumption, but for exportation in considerable quantities. On an average of five years, the annual production of grain amounts to 180,965,000 chetwerts, or about 134,818,920 English quarters, of which quantity 50,335,864 chetwerts were reserved for seed, leaving 119,498,213 chetwerts for home consumption or exportation. The price of grain varies exceedingly in different governments. Rye-meal in 1818 was, in Revel and Mittau, twenty-six and twenty-seven roubles per chetwert, while in Viatka and Simperopol it was only about the one half. St Petersburg, Moscow, Archangel, Vologda, and Perm are the only governments that consume more than they raise; all the others produce more than they require. The grains most commonly cultivated are rye and oats. The best wheat is produced in Southern Russia, where also, along with millet, a little rice

---

S istics.

is raised. Hemp and flax are very largely cultivated, and yield not only material for the manufactures of the country, but a large surplus for exportation.

V , mul- b , su- g ane, a indigo.

Whilst corn and cattle constitute the riches of the central districts, the southern abound in productions of a more precious or delicate nature. The peninsula of Crimea is adapted, by climate and soil, for all the productions of Italy and Greece, and here, indeed, many of them are indigenous. Government has taken a most lively interest in developing the resources of each district of the empire; and in consequence of this the cultivation of the vine, an indigenous plant, and the mulberry tree and sugar-cane, has been carried to a considerable extent. In 1835 there were planted in Crimea 1,454,000 feet of vines, the annual produce of which, in a few years, will be at least 75,000 vedros, or 250,000 gallons. The vine cultivation is extending with great success in the south, in the governments of Astracan, Kherson, Podolia, the country of the Don Cossacks, and especially in the Taurida. In 1837, 1,150,000 vedros of wine were produced, and 1,300,000 to be distilled; while in 1836 the whole quantity was not more than 800,000 vedros. The mulberry tree has been as carefully attended to as the vine, and the result has been, upon the whole, favourable. Vast plantations of mulberries have been formed near all the principal towns of the southern districts. Every encouragement is held out to planters by the government. In Crimea and the countries of the Caucasus, the rearing of the silk-worm is likewise rapidly advancing. Experiments have also been made to cultivate sugar-cane and indigo; but it is doubtful if they will succeed. The cork-tree was transplanted from Portugal to the Crimea in 1817, but we see no notice of it in recent works.

F s and flo rs.

In Southern Russia, a region whose climate differs little from that of Asia Minor, we find a similar abundance and variety of fruits and vegetables. The flora of Russia is very abundant in the south. As Pallas informs us, the country presents the most enchanting aspect. On the mountain side, in the valley, in the forest, everywhere, the earth is clothed with a profusion of the loveliest flowers, and aromatic herbs, whose delicate odours embalm all the surrounding atmosphere.

Ga en-stu , me-di l pla , and dy oods.

Russia further produces hops (not sufficient for home consumption), and tobacco, the *Nicotiana paniculata*, of which the young leaves are gradually removed, dried in the shade, and buried beneath hay-ricks, where they become of a brownish-yellow colour. Of garden vegetables there are the usual varieties found in Europe. Spanish pepper is raised on the Samara and Lower Volga; poppy in Charkov, where it yields a return of a hundred and sixty fold; rhubarb, which grows wild in Taurida; rhapontick, which grows wild in the Urals; and *polygonum minus*, which in the Ukraine engenders worms that yield a beautiful crimson dye used as paint by the Cossack women. Genuine turpentine might be collected to a great extent. Many plants useful for dyeing are produced in a wild state; and for tanning there are several valuable plants. In short, the Crimea presents great facilities for rendering this a lucrative branch of manufacture. It only remains to be stated with regard to the vegetation of Russia, that in the south there is abundance of excellent food for cattle, consisting not only of a great variety of grasses, but also of the best vegetables recommended for artificial meadows.

An als. Ca , she , &c.

The quadrupeds of Russia are numerous. Some appear to be peculiar to the country, but our business is chiefly with the domesticated animals. Cattle of every description are bred in vast numbers in the steppes, and they have increased with the improvement of agriculture. Black cattle and oxen are raised as far north as the sixty-fourth parallel, especially in Podolia and the Ukraine. Some of the calves of the latter territory weigh from 480 to 600 lbs. Sheep are reared to a great extent, there being supposed to be between sixty and seventy millions of these useful animals in different parts of the country. In Taurida a poor Tartar may have in his possession 1000, and a rich Tartar 50,000. The Merino breed of sheep has been naturalized in Little Russia, in the governments comprised under the name of New Russia on the south and east, and in those of the shores of the Baltic Sea. These different regions, so remote from one another, are too dissimilar to enjoy precisely the same advantages; nevertheless, the perseverance and judicious management of the cultivators have been crowned with success. Even in those districts least favoured by nature rapid improvement has been made. In 1826 the exports of wool from Odessa were only 18,000 poods, valued at ten roubles each; in 1835 they were 116,000 poods, the price being advanced to thirty roubles per pood. At Taganrog the exports have increased in the same proportion; and in Little Russia this branch of commerce is acquiring fresh activity. The wool trade is now also cultivated in Siberia, where a wool-company was established in 1832. In fine, Russia, lately so poor in this species of produce that even in 1824 her exports did not exceed annually 35,000 poods, valued at only 600,000 roubles, in 1834 sold 281,450 poods, the value of which amounted to 1,557,066 roubles. This is of course independently of the demands for the cloth manufactories in the interior, which have increased to a very great extent. The report of the minister of the interior for 1837 states the extensive advancement made in agricultural industry, and the improvement of the breeds of cattle and sheep, especially the great increase in the number of Merino sheep in New Russia, as well as in Esthonia, Livonia, and Courland. Amongst the animals are horses of very different races, to improve the breed of which, races have been instituted; goats, from the silken hair of some of which animals the celebrated Cashmere shawls are woven; camels in the warm and saline steppes of Taurida and Kherson; asses, which are especially domesticated in Taurida; swine; rein-deer, so valuable in the north; the buffalo, and others. Amongst useful insects there are bees, which yield an abundance of honey and wax for exportation. There are many wild animals, the skins or furs of which constitute important items of trade in the northern parts of Russia; and abundance of others, whose flesh is useful as food. Birds are very numerous, including field and water game of various kinds. Fish abound in the seas, lakes, and rivers; and the fisheries constitute an important branch of productive industry, as will be afterwards shown.

Statistics.

Divisions and population of the empire.

European Russia consists of a variety of countries, viz. that part improperly termed Muscovy, which is Russia strictly so called, and forms the nucleus of the empire; the country of the Cossacks of the Don and of the Black Sea; the kingdoms of Kazan and Astracan, wrested from the Tartars; Biarmia; the greater part of Lapland; Ingria, Karelia, Finland, Astrobothnia, Esthonia, Livonia, the archipelagos of Abo and Aland, and the islands of Dago, Oesel, &c., countries formerly appendages of the Swedish crown; the largest portion of the once independent kingdom of Poland, comprising the governments of Vitebsk, Moghilev, Minsk, Volhynia, Grodno, Vilna, Podolia, the province of Bialystok, and the new kingdom of Poland; the former khanate of the Crimea, with Little Tartary, Bessarabia, and part of Moldavia, territories conquered from the Ottoman empire; and the region beyond the Caucasus, wrested from the natives, Turks, and Persians. "The Russian government," says Balbi, "does not recognise the distinction made by geographers betwixt Russia in Europe, Russia in Asia, and Russia in America. The first two are blended in several governments. For instance, Perm and Orenburg, being traversed by the Urals, have one part of their territory in Europe and another in Asia. However, having determined the boundaries of Europe by the crest of the Urals and that of Caucasus, I have admitted into my table the whole of the two governments of Perm and Orenburg, although great part of their territory, lying east of the Urals, belongs in reality to Asia; and I have rejected the general government of Caucasus, although its northern portion is situated within the limits assigned by me to Europe. This was the only course I could pursue in order not to divide what the Russian government has willed to be united, and to preserve the great natural divisions which are the base of all geography." The following table is taken from M. Huot's edition of Malte-Brun's great work. Whilst its divisions correspond with those of the able geographer just named, it contains important materials which are not to be found in his work.

Governments.	Actual Population at the beginning of 1827.	Chief Towns.	Population.	Distance in Versts.		Capital declared by the Merchants.	Number of Manufactories.	Annual Harvest, in chetwerts.	Natives of each Government.

istics.

The governments, provinces, cities, and principal towns, being described in this work under their respective names, we shall not in this article enter into details regarding them.

Statistics.

The preceding table relates solely to European Russia; but the following, which is a much more recent census, embraces the whole empire.

Census of the Russian Empire, taken in the year 1836.

Russian priests	52,331		
Deacons and sacristans	63,178		
Male children of priests, deacons, and sacristans	138,548		
Total	254,057	Wives and daughters of priests, &c.	249,748
Priests of the united Greek and Roman Church	7,823	Ditto	7,318
Catholic priests	2,497		
Armenian priests	474	Ditto	343
Lutheran priests	1,003	Ditto	955
Reformed Church	51	Ditto	37
Mahommedan mollahs	7,850	Ditto	6,071
Lamas (Tartar)	150		
Nobles:—			
Hereditary ... males	284,731	Females	253,429
By virtue of service, &c. with their sons	78,922	Wives, &c.	74,273
Petty officers who have left the army and are employed in the civil service, &c.	187,047	Ditto	237,443
Foreigners of all classes	22,114	Ditto	15,215
Military colonies	950,698	Ditto	981,467
Inhabitants of towns:—			
Merchants	131,347	Ditto	120,714
Shopkeepers, artisans, &c.	1,339,434	Ditto	1,433,982
Citizens in the eastern provinces	7,535	Ditto	6,966
Greeks of Nishnei, gunmakers of Toula, &c.	10,882	Ditto	10,940
Citizens of Bessarabia	57,905	Ditto	56,176
Inhabitants of villages:—			
Peasants (that is, slaves) the private property of the emperor and the imperial family, peasants annexed to the crown, &c.	10,441,339	Ditto	11,022,594
Peasants the property of nobles	11,403,722	Ditto	11,958,873
Wandering tribes:—			
Kalmuks, Circassians, and Mahommedans of the Caucasus	245,715	Ditto	261,982
Territory beyond the Caucasus:—			
Georgia, Armenia, Mingrelia, &c. ... nearly	689,147	Ditto ... nearly	689,150
Poland	2,077,311	Ditto	2,110,911
Finland	663,658	Ditto	708,484
Russian colonies in America	30,761	Ditto	30,292
Total of population	28,896,223		30,237,343

Grand total of both sexes .... 59,133,566.

In this number, however, the private soldiers of the army and navy, with their wives and children, are not included, so that the sum total, in round numbers, may be estimated at sixty-one millions. In addition to this must be reckoned the inhabitants of the mountains between the Black Sea and the Caspian, 1,445,000 souls. There are also wandering tribes of Circassians and others, whom it is impossible to number. In short, the population of Russia may be stated in round numbers as about sixty-three millions.

This vast population consists of a number of distinct nations, tribes, and tongues, which have been classed and calculated by different writers. The last and most complete classification is as under.

1. *Slavonians.*—These consist of six races, and comprehend the inhabitants of Russia, Poland, and Courland. They are estimated in round numbers at 44,000,000.

2. *Fins.*—These consist of twenty-two races, and comprehend the chief residents of Finland, Livonia, Lapland, and some other places. They are estimated at 2,950,000.

3. *Lithuanians* or *Lettish.*—There are three races of this people, their chief residences being the governments of Moghilev, Vitebsk, Wilna, Minsk, and Grodno. Their number is estimated at 2,000,000.

4. *Tartars* or *Tatars.*—There are no less than twenty-six or twenty-seven races of Tartars seattered over the empire. The Tartars proper are divided into fourteen branches; the Noggiers into six; besides which there are the Kirghises, Aralians, Chewensens, Bukharians, Baschkirs, Teleutes, and Jakutes, whose aggregate number amounts to 2,190,000.

5. *Caucasians.*—There are eleven races of Caucasians, comprehending amongst others the Ischerkessens, the Awcheses, Lesghies, Ossetts, and Kistenses, estimated at 1,400,000.

6. *Germans.*—One only race, which is estimated at about 450,000.

7. *Jews.*—There are 550,000 of this indestructible people in the Russian empire.

8. *Mongols.*—Under this head are comprehended the Mongols proper, the Kalmuks, Buritens, and Kuriles, supposed to amount to 330,000.

9. *Mandshurs.*—These are divided into three branches or races, viz. Mandshurs proper, Tunguses, and Lamutes, whose number may be about 40,000.

10. *Samoiedes.*—There are twelve races of this polar people, comprehending 70,000 souls in all.

11. *Kamschats.*—This is another polar people, consisting of six races and 48,000 souls.

12. *Esquimaux.*—This northern race is estimated at 20,000.

13. *Indians.*—There are three races of Indians, estimated at 30,000 souls in all.

There are, besides, in the Russian empire, 25,000 Greeks, 10,000 gypsies, 15,000 Persians, and 6000 Arabians on the river Kama. There are likewise in the empire Hindus, Osman Turks, and in the cities and towns mercantile people belonging to England, France, Italy, and other countries.

Medical statistics.

It appears from the researches of De Jonnes in the *Révue Encyclopédique* for August 1833, that the mortality of Russia and Poland has remained stationary for a great number of years. The ratio of deaths to the population is one in forty-four, the annual mortality in each million of the inhabitants being 22,700. This differs somewhat from the statements of Herrmann, from whose elaborate researches concerning the progress of population in Russia the following conclusions have been drawn, viz. 1. The proportion of births to the number of inhabitants is one to twenty-five for the whole empire. 2. The proportion of deaths to the total population is one in forty.[1] 3. The general proportion of births to deaths in the whole empire is sixteen to ten. 4. The proportion of male to female births is forty-four to forty. The following table is of a more recent date than the researches of Herrmann. It is formed from the reports published by the synod (which, however, includes only the members of the orthodox Greek church), and shows the rate of the progressive increase of the population, as far as relates to that most numerous body of the people.

	1806.	1810.	1816.	1820.
Marriages	299,057	320,389	329,683	317,805[2]
Births	1,361,286	1,374,926	1,457,606	1,570,399[3]
Deaths	818,585	903,380	820,383	917,680[4]
Deaths of persons above a hundred years old	293	350	689	807

The increase of population in Russia appears to be equal to that of any European country. It is indeed not a little remarkable, that in places where neither nature nor fortune have been lavish of their bounties, the inhabitants live one half longer than those who enjoy the sunny skies and lovely landscapes of Italy, and exactly twice as long as those who people the capital of Austria; yet very recent and elaborate investigations have proved this to be the fact. The instances of longevity in Russia are astonishing. In 1821 the deaths were reckoned at 945,088; and of these, 221 were above 105 years of age, 120 above 110 ditto, seventy-eight above 115 ditto, forty-nine above 120 ditto, sixteen above 125 ditto, five above 130 ditto; one obtained to the great age of between 145 and 150 ditto; and another had tenaciously adhered to life till he had reached the almost antediluvian term of existence, 155 years.

Government.

The government of Russia is that of an absolute hereditary monarchy, where the will of the sovereign is the supreme law of the empire. No restraint can be imposed on it; but the emperors themselves have endeavoured in some degree to qualify this unlimited power, which is likewise somwehat moderated by the rights and privileges enjoyed through long-established usage by many bodies of people in different provinces, and which claims it would be dangerous to the monarch to infringe. The emperors of the house of Holstein have more than once declared that they would wish to follow fixed laws in whatever appertains to the rights of individuals and corporations. Arbitrary enactments are partly abolished; indeed they are only enforced against the great, or courtiers less solicitous about liberty than personal aggrandisement. The highest department of government is the council of the empire, which was established in 1810, to render the laws and the administration less liable to change. In 1811 it was completely organized, and consisted of thirty-five members and four presidents. It is divided into four departments, viz. law or legislation, the supreme court of judicature in spiritual and civil affairs; war; civil and church affairs; and internal political economy, or administration of the public revenue. The emperor himself is president, and, in his absence, one of the members whom he formally appoints president every year takes his place. Each department has its president, and the whole together have a common secretary, who is principal director of chancery, and the organ through which the council of the empire makes known its decisions to the monarch. He is also the person who bears the commands of the sovereign to the directing council of the empire, or makes them known to individual departments; he expedites all the orders of the above council to the respective authorities who are to execute them; and he receives all petitions, and the like, directed to the emperor in person. Each department has its state secretary. The ministers are members of the council of the empire, but they are disqualified from being presidents of the departments. The introduction of the members to the departments takes place half yearly. The original outline, or sketch of every law, ordinance, or regulation, is laid before the council of the empire, who examine it; but the sovereign power alone can give it efficiency. There are three commissions in connection with the council of the empire; these are, commissions of law, petitions, and the chancery of the empire. Alexander gave new activity to the law commission, by which about 70,000 ukases relative to civil rights were rescued from oblivion, and arranged in proper order. The archives of the chancery of the empire contain a collection of accurate accounts of state affairs of former years; complete accounts of the present situation of the government, the protocols of the council of the empire, and the imperial decisions. Each commission has a director, and is divided into several sections, over which a head presides. Such is the constitution of the Russian council of the empire.

The directing senate is one over which the emperor also presides. It is the supreme tribunal in all affairs of a home or internal description, as distinguished from those of a foreign nature. As guardian of the law, the sovereign watches over the administration of justice, superintends the management of the income and expenditure of the state, as well as looks after the means of national instruction, the preservation of public security, and the abolition of every illegal proceeding. The minister of justice is at the same time general procurator; but the remaining members are undefined, partly consisting of the ministers, who have likewise seats in the council of the empire. The directing senate is divided into eight departments, five of which have their constant seat at St Petersburg, and three at Moscow. These two bodies being composed of individuals either directly or indirectly appointed by the emperor, and, besides, not having power to act independently, cannot be looked upon as much better than mere agents for promulgating his decrees.

---

[1] The annual mortality has diminished in some localities since Herrmann drew up his tables, which in some measure accounts for the discrepancy here observable.

[2] It appears that the marriages in 1820 were fewer by 22,470 than in the year 1819.

[3] The births of 1820 exceeded those of 1819 by 48,265.

[4] The deaths of 1820 were fewer than those of 1819 by 1429.

The holy directing synod has for its object the management of ecclesiastical affairs. It watches over the interests of the established church, but its decrees are issued in the name of the emperor.

The ministries of state, whose members officiate in their several departments independently of each other, but sit in the council of the empire and the senate, and to the latter annually render an account of their stewardship, are distributed into three sections. The first section consists of the minister of foreign affairs, whose ministry comprises a vice-chancellor, vice-president of the imperial cabinet, director of the Asiatic department for the study of the oriental languages, and a superintendent of the archives of the empire; the minister of war, who takes cognizance of the departments of artillery, engineering, inspection, auditory, commissariat, provision, and medicine; the minister of marine; the minister of the interior, under whom are the departments of the administration of the public revenue, police, and medicine, the minister of spiritual matters, of public instruction; and, lastly, the minister of finance, who has supreme direction over the revenues, and yearly lays before the emperor a balance-sheet of the income and expenditure. He is also the highest authority in matters relative to the departments of trade, manufactures, the customs, mines, and the demesnes of the empire. The second section forms the treasury of the empire, into which all the revenues flow, and from which all payments are made according to the direct orders of the emperor. And to the third section belong the business of state accounts, the general direction of land and water communication, and the ministry of justice. There are likewise ministers of control, the post-office, and of the imperial household. There is, besides, a special minister of state, or secretary, for Poland, and a secretary of state for Finland.

To all the various ministers the necessary information is weekly sent from the different governments; the whole intelligence being annually laid before the monarch in a definite form. The governors and other authorities in the provinces hold their command through the ministers. Each government has a head director or civil governor, who usually has conjoined with him a military governor. Of course, there is under these the usual train of functionaries, who assist in administering justice, and protecting the peace of the country and the rights of the subject. How justice is administered it is difficult to say with certainty, for corruption prevails to a great extent. Alexander did much to put an end to it, and his successor has imitated his example with the most laudable zeal, but equivocal success.[1] Conjointly with the judges are appointed assessors, who must be of the same rank as the person tried, which is a plan somewhat similar to that of our jury. In the cities, two burgomasters and four councillors, and in the country, one justice and two plebeian proprietors, form tribunals of the first instance. From these, appeals may be made to higher courts established in the several provinces; and from them again to the supreme tribunals at St Petersburg and Moscow. A kind of court of conscience exists in most places, which hears verbal complaints, acts as arbiter in differences about smaller matters, and exercises power in behalf of minors and imbeciles. Great deviations from the general system exist in some of the less civilized provinces, that of the Cossacks, for instance, which has a sort of military administration. Siberia is also under a different system, as we shall see when we come to describe that country.

Laws.

The civil and criminal codes of Russia are very imperfect, notwithstanding the efforts which several successive sovereigns have made to introduce order and certainty. The institutions and pandects of the Russian law were published in 1819–1823, by order of the emperor, in twenty-two volumes. The Russian government has also made public a collection of all the ukases, rules, ordinances, &c. in vigour in Russia, which amounted in 1830 to forty-five volumes, systematically arranged, with copious indexes, and forming a single body of laws, divided into several codes. This measure, according to the imperial manifesto of the 31st of January 1833, guarantees the execution of the laws for the present, at the same time that it establishes a solid basis for their progressive improvement. This body of laws became the standard code of the empire in the beginning of the year 1835. Amongst the particular laws, the ukase of 1822, abolishing the practice of branding after the administration of the knout, deserves particular mention. With regard to the punishment of crime, capital punishment was nominally abolished by the licentious Empress Elizabeth; but in reality it was often inflicted. That horrible instrument the knout may be so administered as to produce death, which often happened. However, it is no longer allowed to extend so far as to take away life. Banishment to Siberia is the other extreme punishment to which the Russian is liable for such crimes as murder and robbery. The police of Russia is a political body, and all travellers complain of its regulations, as being formal and minute beyond any thing known in other European countries. A very recent traveller thus speaks of it. "The Russian police, whose business it is to perform the various essential duties of the civil government, are not, I think, more numerous than in other kingdoms on the Continent, where the system of form and routine is kept up; while the officials with whom you are brought in contact, as far as my experience goes, although grossly venal, and taking bribes without the smallest attempt at concealment, are always disposed to treat a stranger with the utmost courtesy. But, in addition to these acknowledged servants of the state, there is a body of secret police, who are everywhere, and most certainly spy out all the ways of the stranger."[2] Not only are passports necessary to any one who wishes to enter the country, but every person resident there, whether a native or a foreigner, must have one, which is regularly renewed at stated intervals at the police-office for the district in which the party resides. A fine is the consequence of neglect of this periodical renewal. Every servant applying for a place must produce a regular passport; and there are other annoying minutiæ connected with this branch of the civil service. The police of Russia is strong in numbers, and distinguished for its searching system of espionage.

Revenues and currency.

The revenues of the Russian government arise chiefly from a capitation tax of two roubles on each peasant, and five on each burgher; a tax on merchants' capital, of about $1\frac{3}{4}$ per cent.; the leases of the crown-lands, and *obrok* or rent of the crown-peasants, the customs, stamps, patents, various leases, &c.; the monopoly of spirituous liquors and salt; the mines; the purchase of exemption from military service; fines on smugglers and other delinquents; the crown-fisheries, mills, manufactories, baths, &c.; the profits of the coinage and the post-office; and the *iassac* or tribute in furs of the nomade races. But in estimating the receipts and expenditure of government, allowance must be made for numerous and large sums never carried to the account of either income or expenditure, because they are either appropriated to local purposes, or are discharged in kind by various portions of the population. This is the case with the rent of the fisheries on the Ural, which either serves as pay for specific services, or is assigned in perpetuity to certain classes of the community, so that it makes no appearance amongst the public receipts. In some districts the capitation tax is commuted, either wholly or in part, for labour or military service. According to Schubert's reckoning, the income of the Russian empire for 1836 amounted to 354,268,000 paper roubles, or about L.14,200,000 sterling. To the above may be added six millions of roubles as the produce of the gold and platina mines. The national debt, which in many other countries swallows up so much of the revenue, here absorbs but a comparatively small part of it. On the 1st of January 1834, the debt of the Russian government amounted to 933,871,673 roubles, a sum which two years and a half of revenue would pay up. It has been materially reduced since the above date, and, it is believed, will in a few years be altogether extinguished. Every year a large sum is appropriated to this purpose. In the course of 1835, there were consigned to the commission for the extinction of the national debt no less than 66,529,080 roubles 96 kopecks. For a long period the currency of the country was in a very equivocal state, from government having issued paper roubles or assignats at a gradually increasing depreciation. The assignats, or bank-notes, of Russia were established by an imperial ukase in 1768, and issued in the following year. Of course they were at first equivalent in value to silver roubles, or very nearly so, and were issued to the amount of 40,000, in notes of the value of a hundred, seventy-five, fifty, and twenty-five roubles a piece. In 1786 these assignats were exchanged for new ones, and their quantity increased to the sum of 60,000,000 roubles. Their number went on augmenting till the death of Catherine II., when the sum in circulation amounted to 157,000,000 roubles. A natural consequence of the increased issue was their proportional fall; so that, at the above-mentioned epoch, the value of a hundred roubles in assignats was equal to seventy in silver. During the reign of the Emperor Paul I. the quantity of assignats was increased by 55,000,000 more; and during the reign of Alexander the issues were carried to such an extent, that in 1817 their whole quantity amounted to 836,000,000, and their value fell in proportion to their over-issue. The Russian treasury then adopted measures for diminishing the number of its assignats; and from that year till 1822, assignats to the amount of 236,077,650 roubles were withdrawn from circulation and destroyed. In 1819 the old assignats were exchanged for new ones, issued in a much improved shape, and in notes of two hundred, one hundred, fifty, twenty-five, ten, and five. According to the report of the minister of finance on the 20th of August 1835, the whole amount of assignats in circulation was 595,776,310 roubles, and their relative value to the metallic money was as a hundred to twenty-seven. There is little gold to be seen; and the only silver coin is the rouble,[1] and its aliquot parts of halves, quarters, tenths, and twentieths. There is an immense copper circulation of kopecks, one hundred of which equal a paper rouble. Indeed the only true metallic currency may be said to be copper. A coinage of platina was made at the mint, but it is more rarely seen than even gold.

---

[1] Mr Bremner, whilst he does justice to Nicholas for his strenuous efforts to reform the bribing system, says, "In spite of all his efforts, however, bribery in public offices still prevails to a degree unheard of in other countries. Even in Austria, where they understand such things very well, they are mere tyros in the science, compared with the Russians. It grinds the poor and impoverishes the rich; it is practised in every branch of the administration, from the lowest clerk to the highest minister; it paralyses industry, enterprise, and merit, in every corner of the empire."

[2] Hand-Book for Travellers in Denmark, Norway, Sweden, and Russia. London, 1839.

Army.

The amount of the Russian army in time of peace is nominally 612,332 men, of which the imperial guard contains 41,200. The most correct enumeration of the various corps of this enormous force appears to be that of Marshal Marmont. He says that "the imperial guard are six divisions, three of infantry and three of cavalry, making sixteen battalions in all. The grenadier corps has three divisions of infantry, made up of twelve regiments, and a division of light cavalry, made up of four regiments; also two batteries of horse artillery and fifteen of foot. The regiments of guards consist of three battalions of infantry and seven squadrons of cavalry. The six corps of the line are composed each of a division of light cavalry (made up of four regiments), and three divisions of infantry, each of four regiments; in all twelve regiments; besides two battalions of foot and two of horse artillery. The total six corps of the line are seventy-two regiments of infantry and twenty-four of cavalry, twelve batteries of horse and ninety of foot artillery. The corps of cavalry reserve has two divisions, each of four regiments, making a total of twenty-four regiments, and twelve batteries of artillery. The reserve of the line are three divisions, composed of twenty-four battalions. There is, in addition, the corps of the Caucasus, Siberia, and Finland; the troops of the interior, fifty battalions of horse militia, and one hundred and forty-six regiments of Cossacks." The expense of this vast force is very small; the articles for their equipment, provisioning, and arming, being of the cheapest and coarsest kind, and the pay of both officers and men being low.[2] See the article ARMY.

Navy.

The naval force of Russia, for a long time inferior both in point of numbers and character, is now placed upon a highly respectable footing. The present emperor, when he ascended the throne, resolving to render Russia a first-rate naval as well as military power, made great exertions to realize his wishes. The Baltic fleet, in 1838, consisted of the following vessels; one three-decker of a hundred and twenty guns, three three-deckers of a hundred and ten guns, seven ships of eighty-four guns, and nineteen ships of seventy-four guns; thus making in all thirty heavy line-of-battle ships. To these must be added one razee of fifty-six guns, three frigates of fifty-two guns, and eighteen frigates of forty-four guns, besides corvettes and small craft. The whole is manned by a force of 33,000 men. The fleet in the Black Sea consists of sixteen heavy ships of the line, besides a number of frigates, smaller vessels, gun-boats, &c. On the Caspian Sea there are also several ships of very considerable size, and more are in rapid progress at the building-yards recently established at favourable points. Russia possesses at least sixty steam-boats of one kind or another. This is a formidable armament, and it is admitted by unprejudiced individuals, that the navy of Russia was never in such high condition as it is at the present time. But it is quite preposterous to look upon it in the light of a rival to that of

---

[1] Whenever the word rouble is used in any work relative to Russia, as well as throughout this article, the paper rouble (10½d.) is meant. The silver rouble is never made the basis of calculations of any kind, nor have the Russians any higher denomination corresponding to our pound sterling. Kopecks and roubles constitute the only practical elements of the currency throughout the whole empire, with the exception of Poland.

[2] "The military conscription in Russia," says the British and Foreign Review, October 1838, "is the most horrible thing that can be imagined. The levy of recruits is ordered almost every year, and each community is compelled to furnish one, two, three, or more recruits from every five hundred males, or, as they are officially called, *souls*. The choice of recruits is entirely left amongst peasants to their masters, and amongst the burghers to the elders of the community; and it may be easily imagined to how many abuses such a mode of levying is liable. We shall not enter into the disgusting details by which the levy of recruits is accompanied in Russia; we shall only add, that the condition of a Russian soldier is considered so wretched and so hopeless, that there are many instances of individuals, who have not only mutilated, but even destroyed themselves, in order to escape military service."

Great Britain. The expense of the navy, like that of the army, is comparatively small. "Indeed," says Mr Bremner, "it is one of the points which should never be forgotten in considering this question" [viz. the maintenance of such a large fleet], "that Russia can not only build ships cheaper than any other European power, but can also man them for less. The pay both of officers and men is so small, that the annual outlay on twenty Russian line-of-battle ships would not defray the expense of ten of ours." The Russian sailor is brave, well-trained, somewhat after a military fashion, and submissive; but he wants the activity and enthusiasm of the English seaman. To remedy a great defect under which the Russian navy has long laboured, a want of good native officers, colleges of naval cadets have been formed, where young Russians are carefully trained for the higher branches of the service.

oductive ustry. Ten or fifteen years ago the agricultural operations of the Russians were conducted in a very clumsy manner. Rotation of crops was little understood or practised, and husbandry in general was carried on in a very ignorant and unprofitable manner. In the Ukraine, so famous for its fertility, the mode of farming is very simple. They take as many crops out of the ground as it will yield, and then let it lie fallow for a year or two. But this branch of productive industry has made considerable progress within these few years; partly through the exertions of government, and partly through those of the landed proprietors, who find it for their advantage to approximate to those improved methods of cultivating the soil which are practised in most other parts of Europe. Amongst other means employed by government for encouraging agriculture, it has ordered what are called model-gardens to be formed in a number of governments. Native manufactures have likewise been greatly extended and improved.

State of the Manufactures of Russia in 1831.

Value of the Produce (estimated in roubles) of		Increase since 1821.
Cotton manufacture	104,170,481	230 per cent.
Silk ditto	16,131,373	25 ...
Woollen ditto	50,000,000	30 ...
Flax and hemp	22,615,940	45 ...
Leather	97,213,710	12 ...
Paper	6,468,968	10 ...
Hats	3,801,900	63 ...
Dyes and colours	3,000,000	55 ...
Tobacco and snuff	19,623,494	150 ...
Refined sugar	23,007,004	34 ...
Soap	6,591,690	131 ...
Tallow candles	8,095,584	62 ...
Snuff-boxes, and different kinds of japanned goods	2,000,000	0 ...
Chemical preparations	3,000,000	11 ...
China and earthenware	4,000,000	0 ...
Glass and crystal	9,000,000	11 ...
Potash	6,000,000	32 ...
Metallic Produce.		
Gold	25,905,680	5 ...
Silver		3 ...
Copper	9,620,736	13 ...
Wrought iron and steel	38,828,000	9 ...
Cast iron		26 ...
Sundry minerals	500,000	94 ...

The whole amount of the above produce is 509,574,379 roubles.[1] Russia, which formerly imported nothing but manufactured goods, now imports immense quantities of raw material for the use of her manufactures, as will be seen from our table of the imports; and the amount is yearly on the increase. In 1815 the total number of manufacturing establishments throughout the empire was estimated at 3250, at which 150,000 workmen were employed. In 1836 the number of manufacturing establishments in activity was 6045, which gave employment to 279,673 workmen. The financial agents of Russia residing at Paris, Vienna, and Berlin, as well as the consuls at the chief commercial towns of Europe, have instructions to contribute to the progress and improvement of national industry, by communicating to Russian manufacturers every information respecting new inventions made in foreign countries, forwarding to them patterns of new manufactures, models of machines, and the like, and by engaging expert workmen for them. Government holds out the greatest encouragement to persons engaging in new commercial enterprises. By a ukase dated 1827, such parties are relieved from certain taxes imposed upon them as members of one of the three city guilds, and in 1835 the land-tax and municipal imposts were also remitted in their favour. A further evidence of the advance which Russia has made in commercial enterprise is furnished by the fact, that the number of persons engaged in such pursuits is rapidly increasing, and that every year many acquire the means of passing from the inferior to the upper guilds. The following statement will make this clear.

	1835.	More than in 1834.
Merchants of the first guild	695	50
Ditto of the second	1,547	56
Ditto of the third	30,099	1,147
Peasants having permission to trade	4,992	388
Clerks	7,976	831

In 1836 thirty-five applications were made for patents for new inventions connected with manufactures, of which eleven were granted.

Brandy. The distillation of brandy is the most extensive and lucrative branch of the productive industry of Russia. This article is produced to the amount of 270,000,000 roubles annually, for which government receives an excise duty of 90,000,000 roubles. The brandy monopoly of government is productive of great mischief, as by the universal system of bribery the cost to the consumer is greatly increased. The farmer-general bribes the governor of the province, whose duty it is to see that the article is not adulterated; the farmer-general, and his secretary who grants licenses, are bribed by the retailer, so that by the time the spirit has reached the tables of the peasantry, amongst whom the use of it is universal, one gallon has multiplied itself to three or even four. A kind of beer called *braga* is likewise made to a great extent, and largely consumed.

Mines. The mines, particularly those on the Ural Mountains, were worked at a very ancient period; but it is only in modern times that the Russians have applied themselves to that branch of industry. Gold, platina, silver, and copper, are most abundant in the Asiatic governments, or along the last declivities of what is called the great central ridge. The quantities of gold and platina produced will be seen from a table at the end of the exports and imports.

Silver mines. The silver mines yield annually about 43,200 lbs., besides 1,440,000 lbs. of lead. The aggregate produce of copper from the government and private mines is 7,596,000 lbs. English. By a document published in the Russian Mining Journal for 1830, we find that there were in the Ural districts alone fifty-eight smelting works (seven belonging to the crown and fifty-one to individuals), which in 1827 produced 9,731,147 poods of cast iron. The forges, which amounted to 105 (only eight of them being crown property), sent into the markets in the same year 5,578,474 poods of wrought iron. We learn, from the same source, that the steel manufactured in all the empire in 1829 amounted only to 80,000 poods.

---

[1] The above official returns are taken from a work of M. Prelezynski, on the State of the Manufacturing Powers of Russia, published in Russian at St Petersburg in 1833.

Precious stones.

Another branch of industry to which the attention of the Russian government has been for some time directed, has originated in the discovery of precious stones in the Ural Mountains. Stones of great value have from time to time been detected in that range, and scientific individuals have been employed to make researches for the purpose of obtaining extensive and accurate knowledge of these hidden treasures. Diamonds have likewise been found in the auriferous sands of the Ural. But to what amount annually any of these precious stones may be collected is still uncertain.

Iron.

The mines of Finland, particularly those of iron, are also an important branch of productive industry. Some of the hills of that country contain veins of an ore fit for the manufacture of wrought iron, while layers of a fusible ore are found buried at a small depth, in marshes and along the borders of lakes. For a long time the mines of the first description were neglected; but there are thirteen now at work. The richest ore, produced from the mines of the Gamnholm and Oïama, contains from fifty-three to fifty-four per cent. of metal; the poorest yields about thirty per cent. of cast iron. The smelting of these ores is performed in eight different furnaces, which consume more ore than Finland can at present furnish; and the deficit is supplied by Sweden. Almost the whole of the cast iron produced by them is distributed among the forges established in different parts of the country. There are sixteen of these forges, which manufacture annually about 121,350 poods of wrought iron. Those immense beds of iron ore which extend throughout the country, along the shores of lakes, and at the bottom of marshes, have been wrought from time immemorial. The number of forges and smelting-houses for working up this product is considerable; and as experience has proved that the marsh ore is preferable to any other, several other establishments of forges have recently been erected, and more are in the course of being added to the number. Next to iron, copper is the most important mineral which Finland produces. Until very lately, however, only one mine was wrought, that of Ovi-Yervi, discovered in 1758. But a patent was a short time ago obtained for the working of copper and tin mines found near Nitkaranda. Iron of the best quality is likewise found in the district of Toula, the seat of the iron manufactures. Russia possesses another treasure in the numerous salt-lakes and marshes in the Siberian steppes, and in the country to the north of the Caspian Sea. The quantity of this article obtained throughout the empire amounts to 22,000,000 poods annually. Alum is also produced to the yearly extent of 16,000 poods.

Fisheries and the chase.

“A prodigious quantity of fish,” says M. Schnitzler, “is supplied by the rivers and lakes, constituting almost the sole food of the population of extensive districts, and during the long Lents replacing the use of meat. The fisheries of the Volga and the Oka are particularly productive. Without speaking of the carp, the pike, the trout, the herring, especially that species of herring termed *reipouchki*, and of the pilchard, I shall cite the sturgeon, beluga, and salmon fisheries, and the pickled lampreys and mackerel of the Crimea. The sterlet of the Volga is a variety of the sturgeon. Caviare, the consumption of which is so great in Russia, is made from the eggs of this fish, and from those of the beluga. A single sterlet will give from ten to thirty pounds weight; and from a single beluga there may at times, it is said, be taken as much as 120 pounds. The best caviare comes from the Cossacks of the Ural. The sturgeon fishery is usually of considerable value; 1,850,500 fish of this species, caught in the year 1793 in the Volga, near Astracan, yielded 124,970 poods of caviare, 3575 poods of isinglass. The coasts, which are visited by the cachalot, the whale, and other cetaceous fish, and on which are collected a quantity of pearl-oysters and mussels, likewise furnish cod and herrings. The largest fishery of the latter is in the Sea of Kamtschatka. The net annual value of the Russian fisheries amounts to more than 10,000,000 roubles.” The chase in the Russo-North American colonies, and elsewhere, has long been a profitable branch of national enterprise. Great quantities of furs and skins, of the otter, beaver, and fox, are annually brought to market by the traders.

Internal commerce. Fairs.

The internal traffic carried on in Russia is very considerable, and yearly upon the increase. The exchange of agricultural produce, as well as of manufactures, is immense. Nineteen fairs have been established for the benefit of trade in several principal towns of the empire, and thirteen in lesser ones. A great number of bazaars have likewise been erected for the accommodation of traders. The great centre of the inland commerce of Russia is Niznei-Novgorod, the annual fair at which place is entitled, both from the amount and variety of its articles, to be considered as the first in Europe, perhaps in the world. The trade consists chiefly of three branches; namely, that of goods brought from Asia, Russian manufactures, and merchandise from Europe and America. The Asiatic trade consists principally of tea from China, of which article immense quantities are annually brought to this great emporium. Russian manufactures form the most important branch of the trade of Niznei-Novgorod, and consist chiefly of cotton, silk, and woollen goods brought from the central provinces of the empire. The merchants of Kiakhta carry back large quantities of cotton and skins; those of Bukharia and of Khiva purchase nankeens, calicoes, cambrics, cloth, and sugar; the Armenians and the Persians buy cotton and woollen stuffs. Russian and Polish cloths are sent to this market in considerable quantities, part of which are sold to the Transcaucasian provinces, and some are even exported to China.

The produce of the Russian mines and founderies forms also a considerable item of trade, consisting of iron, copper, and steel articles from Toula, and which are bought for the use of the inhabitants of the interior. Sugar is sent from St Petersburg and Archangel. Much country produce is sold for the purpose of exportation; such as wax, wool, cotton, camel-hair, hemp, feathers, and Russian leather. The superb furs of Siberia and the coast of the White Sea form also most important objects of commerce. There is likewise a smaller trade in earthenware, glass, and soap. The third branch of the commerce of Niznei-Novgorod is the produce of Western Europe and its colonies; but the amount of goods imported from these countries is scarcely one tenth of the merchandise sold at the fair. It consists of indigo, cochineal, and madder, used for the purpose of dyeing manufactures. Foreign wines form also an important article of trade. Coffee and rum are imported from the West Indies; coral is also imported and sold, chiefly to Kiakhta merchants for the Chinese markets. Foreign manufactures, consisting of silks, cotton, and woollen stuffs, are likewise sold in very considerable quantities. The value of the goods which change hands at this fair, according to Klaproth, amounts to ninety-four millions of roubles annually. Dr Lyall and Captain Cochrane raise it to double this sum; but the statement of Lord Londonderry is more to be relied upon. He says that the value of goods actually sold amounted in 1831 to 98,329,525, in 1833 to 117,210,676, and in 1835 to 117,743,300 roubles. A great deal more merchandise than is sold is always brought to market. It is supposed that this fair is visited by about 150,000 strangers. The confluence of traders from such remote countries as those mentioned is one of the most striking and picturesque spectacles that can be witnessed. The fair lasts during the months of August and September. By the official account of the minister of the interior, the value of merchandise sold at the different fairs in 1836 was 284,949,191 roubles, and in 1837 it was 277,108,436 roubles, or L.10,500,000.

The internal commerce of Russia is greatly facilitated by the vast system of inland navigation, which forms so striking a feature of that country. All the great rivers, lakes, and seas have been connected with one another by means of canals, so that a water-communication exists between the most remote parts of the empire. The Black Sea and the Baltic communicate by means of three canals; the Baltic and the Caspian Seas are united by means of the Volga and artificial cuts; and the same great river is connected with the White Sea and other lakes. Important undertakings are in progress to perfect the junction of such rivers as the Markta and the Volga, the Oka and the Don, the Priepetz, the Niemen, the Bug, and others. In 1817 the Emperor Alexander created an office of "director-general of the ways of communication," including canals, roads, and bridges. From that period the works of this description have been vigorously prosecuted. The roads of Russia are in general bad, but a number of new high roads are in progress. That from St Petersburg to Moscow, which has long been in existence, is a remarkable work. It is an elevated causeway of timber, running in one long, level, unvarying, straight line, over marsh and bog, through forest and thicket. Many other important public works have been undertaken, of which number is the construction of quays along the Oka, and from the Volga to Niznei-Novgorod, and the works upon the river Seyn. Steam-boats have been established upon some of the principal rivers, for towing barges as well as for conveying passengers and goods. (See Navigation, Inland.)

Colonies.

The colonies of Russia, that is, those southern parts of the empire in particular which have been settled by foreigners, constitute a distinct feature of the country. At the period when Catherine II. ascended the throne, that vast tract of country which now forms the government of Saratof was almost without cultivation; and in order to bring it under proper culture, the empress issued a decree, inviting colonists from European countries, where agriculture was in the most advanced state. Great numbers of German and Swiss, French and Swedish families, accordingly, flocked to the banks of the Volga, and to these foreigners Russia is indebted for what advancement she has made in the manufacture of wine and the cultivation of the silk-worm. The German colonists who have settled in New Russia, Bessarabia, and the governments of Saratof, Georgia, &c., but principally in Southern Russia, are located in four hundred and twenty villages. Their population in 1837 amounted to 270,085; the number of sheep was 1,364,840; seed sown, 289,290 chetwerts; produce, 1,736,316 chetwerts; fruit trees, 1,666,599 chetwerts; vine roots, 18,447,902 chetwerts; lands assigned to them, 5,836,771 English acres. After the peace of Adrianople, about 60,000 Bulgarians and Rumelians came to settle in Russia. Since the days of Peter the Great, the Russian government has held out great encouragement to foreigners of all professions to settle in the empire, and to such persons Russia is in no small degree indebted for her present greatness and prosperity. There is scarcely an institution, an art, a manufacture, or a department of war or peace, that has attained to excellence in the country, which is not indebted to some foreigner for its efficiency.

The foreign commerce of Russia is very considerable, as the following tables will show.

Statement of the Quantities and Value of Merchandise imported into Russia from Countries in Europe, and from America, in the year 1835.

Description.	Quantities.	Value.

---

[1] The trade with China being one exclusively of barter, the exports ought to balance the imports, which is not the case here. The difference, however, is not very material; and we preserve the table as given in the Parliamentary Papers.

The foregoing tables have been obtained from parliamentary papers. In the last one, no mention is made of the silver and copper mines of the Urals, which, however, are less important than those of gold and platina. The quantities which they produce have already been stated. In 1832, the latest year for which we have complete returns, the number of vessels which arrived in the different ports of Russia was as follows :—

Ports on the Baltic Sea	3601
Ditto on the White Sea	472
Ditto on the Black Sea	1446
Ditto on the Caspian Sea	201
Total	5720

It may be mentioned, that there is little difference between the commercial returns of 1834 and those of 1835. Still, taking a series of years, Russia will be found to be steadily and widely extending her commercial relations. The receipts of the custom-house in 1835 amounted to 46,763,444 roubles, and in 1836 to 48,968,790 roubles, or L.2,142,384, which is an increase of 2,205,346 roubles in one year. By far the most important of the commercial relations of Russia are those which she has with Great Britain. The interests of the two greatest empires in the world are thus pretty closely united; and there appears to us to be little cause for dreading aggressive hostility on the part of a power which draws half its custom-house revenue from British imports, and sends to Britain one half of all the raw produce which it can raise for exportation. After all, the commerce of Russia is not one third of that of France, and not one seventh of that of Great Britain.

Di rent ra or cla s. N es.

The nobles in Russia, though distinguished by the several titles of prince, count, or baron, are all upon an equal footing, and enjoy equal privileges. Their persons and lands are freed from taxation; they are exempted from the recruiting ballot; and they are not subject to bodily penalties. These exemptions are, however, more apparent than real; for though their lands and persons are not taxable, yet a capitation tax, at the will of the government, may be imposed on their slaves, who form the most valuable part of their possessions. Though not in person compelled to serve in the army, yet they are bound to furnish from their slaves a number of recruits, in proportion to the demands of the service. In some of the more recently-acquired provinces, such as Livonia, Esthonia, and in Poland, the nobles have, or rather exercise, other privileges, extending even to the power of life and death, over their vassals; but these powers arise from custom and general acquiescence much more than from the existing law. The classes of the nobility are very numerous, being fourteen in all; but, singularly enough, some of them have no members. Thus, of the eleventh and thirteenth none are alive. Although titles are hereditary, there is no rank except what the emperor confers. Most of the public employments are filled by the nobles; but no one whatever is eligible to such appointments unless he belongs to one of the fourteen classes of rank into which the civil and military services, and the clergy, are correspondingly arranged. A fixed term of service, and a prescribed form of examination, are undergone previously to acquiring rank. The right of conferring nobility rests with the emperor, and, as with us, it is hereditary.

Cl y.

The clergy are exempt from taxation, and from corporal punishment; which privileges are extended to each eldest son, who must, however, though his father is excused, take the risk of being called upon for military service.

Ci ens.

The citizens form the second grand division of the Russian nation. Every inhabitant of a town, who is neither noble, nor the property of another, is a citizen. The notables constitute the highest class amongst them, and possess privileges similar to those of the nobles. Next to these come the merchants of the three guilds. The first or highest guild corresponds with the eighth class of rank, and enjoys most of the immunities of the notables. In fact, whoever has belonged ten years to the first guild, or twenty to the second, without incurring any visitation of the law, becomes a notable. For an account of the merchants of these guilds, see the article Petersburg.

Peasants.

The next class is that of the peasants, or free inhabitants of the country. In this rank are included, first, the ancient race of proprietors, who cultivate their own lands, but do not enjoy the right of possessing slaves; second, the Tartars, the Baschkirs, and several other races, less numerous, to the south of Siberia, who are all proprietors of the lands they cultivate; and, third, the peasants of Finland. Since the acquisition of New Finland, the privileges enjoyed by the peasants of that country under the Swedish government have been continued and confirmed to them, and the same rights granted to those of Old Finland, where all are now either proprietors or renters. There is a considerable number of rent peasants, who, by paying an annual sum to their proprietors, purchase the right of carrying on trade or business on their own account. Some of these have been known to amass considerable property; but they still remain slaves. In the fourth are included the colonists, consisting of foreign families of agriculturists, who are proprietors of the lands they cultivate, and whose number is about 65,000. The fifth embraces the military colonists. These are soldiers, who, after having served a prescribed period, have had land given to them, and a capital sufficient to cultivate it, in the southern provinces. And, lastly, the free cultivators, who enjoy immunity from taxes, on condition of keeping post-horses for the public service, which they furnish at a charge regulated by government.

Serfs.

The class next below these is that of the serfs. They are chiefly peasants on the crown-lands, or of the province of Livonia. The first of these, the crown-peasants, amount to about 12,000,000, some of whom labour in the fields, and the others in the mines and manufactories. The lot of this class seems to be placed on the confines between liberty and slavery. They may rise to the rank of citizens, they may acquire property, they may enjoy the protection of the laws, and, under some restrictions, may quit their residences to obtain employment for a limited time; but they are liable to be hired to the service of the mines, or to be sold. The peasants of Livonia, amounting to about 560,000, were slaves until the year 1804, when they first obtained the rights of serfs. They are now subject to some peculiar claims; but those claims are fixed, and they cannot be removed from the soil without their own consent.

Slaves.

The last and most numerous class is that of the slaves. These amounted in 1782 to 6,678,000 males, and at present are estimated to include 23,000,000 persons. They are in law considered as *things*, not as persons; they are attached to the soil, and incapable of possessing any property in land; they may be bought, sold, or exchanged, with little more restrictions than are enacted in dealing for cattle; and they have no other protection against their masters than what is created by a regard to their pecuniary interest. They belong to the nobles, or to such civil or military officers as have acquired the right of possessing them. They are divided into agricultural, mining, manufacturing, or domestic slaves, and have their condition only improved when drawn for military service.

"A Russian proprietor," says a recent traveller, "reckons the value of his property, not by the annual income of his estate, but by the number of souls, that is, of male peasants upon it. An estate is said to be worth so many souls instead of so many roubles per annum. The footing on which the agricultural serf practically stands towards his master, is in most respects that of a small tenant; the principal difference being, that he cannot change his employment or

Statistics.

Employment of the population.

move from home without his master's leave, which is sometimes obtained for a certain annual sum, called *obrok*, in lieu of service. As a general rule, he has a house and a portion of land, for which he pays rent in labour instead of money. He works three days in the week for his master, and has the remainder of his time at his own disposal. A day's labour of a man includes that of his wife and his horse when requisite. These peasants, who are for the most part in a state of the grossest ignorance, are perfect predestinarians, or fatalists; and this doctrine serves as an excuse on all occasions for their habitual improvidence and want of forethought. Yet, though ignorant, superstitious, and a slave, the serf seems in general happy and contented, and bears about him no signs of oppression; his desires are few and easily satisfied; though his fare is coarse and poor, he seldom suffers from cold or hunger, and he is naturally gay, good-humoured, and light-hearted." The situation of domestic servants is much worse than that of the peasant, whose great dread is the conscription, and a serious evil it is when it visits him. The peasant cannot legally be sold or transferred from one master to another, excepting with the whole of his family; but this law is often broken or evaded. "There are few landed proprietors who do not carry on a manufactory of some kind or other. The riches of the Russian gentleman lie in the labour of his serfs, which it is his study to turn to good account; and he is the more urged to this, since the law which compels the peasant to work for him, requires him to maintain the peasant; if the latter is found begging, the former is liable to a fine. He is therefore a master who must always keep a certain number of workmen, whether they are useful to him or not; and as every kind of agricultural and out-doors employment is at a stand during the winter, he naturally turns to the establishment of a manufactory as a means of employing his peasants, and as a source of profit to himself. In some cases the manufactory is at work only during the winter, and the people are employed in the summer in agriculture. The alternate employment of the same man in the field and in the factory, which would be attempted in most countries with little success, is here rendered practicable and easy by the versatile genius of the Russian peasant, one of whose leading national characteristics is a general capability of turning his hand to any kind of work which he may be required to undertake." Not only are the Russian nobles manufacturers, but they carry on the business in every branch; and from the privileges which they enjoy, they have great advantages over the other classes who are not allowed to possess serfs. In almost every house some art is carried on, useful or ornamental; and women are employed in spinning, weaving, knitting, carpet-making, and the like. Mr Bremner informs us that seven shillings and sixpence a week is the general pay of a labourer in the field, and that the best hands in the manufactories can only earn nine shillings and sixpence a week. Hence no people in Europe are so plainly or coarsely fed as the Russians. Their daily fare consists of pickled cucumbers, cabbages, and mushrooms, with a piece of black bread. Fish and butcher-meat are great rarities amongst the poor; they live upon the wretched articles which we have specified.

Religion.

The established religion of Russia is that of the Greek Church, to which the great bulk of the population belongs, although all others are tolerated, no civil or political disabilities attaching to those who profess other creeds. In regard to the doctrines of this church, it may be briefly stated, that they differ in several essential particulars from those of the Roman Catholics, although there is a general accordance. The first of these particulars is, that it holds the necessity of complete submersion of the whole body at baptism; the second, that whilst it admits the doctrine of transubstantiation in regard to the eucharist, it affirms that the bread must be leavened and the wine mixed with water, and they allow both elements to be distributed to every communicant, even to children before they have any correct idea of sin; and a third important distinction relates to the marriage of the clergy, all secular or parish priests being bound to marry. The Greek Church further differs from the Roman Catholic by rejecting purgatory, predestination, works of supererogation, indulgences, and dispensations. Catechising and preaching are scarcely practised; and mass forms the chief part of the public worship. No instrumental music is allowed, but vocal music is much cultivated. Fast days are numerous, and they are kept with great strictness. In addition to the Wednesday and Friday of every week, there are four principal fasts in the year, and several festivals which are celebrated with eastern pomp and splendour. This church rejects all round or solid images of the Saviour, or of saints, as idolatrous; but pictures, mosaics, bas-reliefs, in short, whatever is represented on a flat surface, they do not consider as violations of the law which says, "Thou shalt not make unto thee any graven image." The state of religion amongst the lower orders is in general deplorable. The most important parts of public worship are, first, to pronounce distinctly and fluently the two words *Gospodi pomilui*, which mean, "God be merciful;" secondly, to make the sign of the cross on the breast a countless number of times; and, thirdly, to bow the head to the ground repeatedly. The common people have a firm belief in good and bad angels. Evil spirits are the tempters and betrayers of men, and they believe that the sign of the cross, which they are very fond of making, will not only drive them away, but avert every kind of misfortune. There are comparatively few sectarians in Russia. The following is as near an approximation as can be arrived at, of the religious diversities of the Russian empire.

Members of the Russo-Greek Church	45,000,000
Dissenters from the church, called *Razkolniks*, or Heretics	350,000
Roman Catholics, including the united Greeks and the united Armenians	3,500,000
Armenians not united	250,000
Members of the Confession of Augsburg (Protestants	2,000,000
Members of the Reformed Church	54,000
Moravians 10,000, and Mennonites 6000	16,000
Mahommedans	2,500,000
Jews	600,000
Worshippers of the Grand Lama	300,000
Indians, devotees of Fetichism	600,000
Idolaters	170,000

Greek Church.

The whole spirituality of the Greek Church is divided into priests belonging to some religious order, and secular priests. For the management of church affairs there are at present thirty-six eparchies of three different classes, only four being of the highest class, those of St Petersburg, Moscow, Novgorod, and Kief. There are nine metropolitans, thirteen archbishops, and twenty-nine bishops. All aspiring to these dignities must be members of some monastery, and unmarried. By a statement published a short time since, the number of monasteries throughout the empire would appear to be 350, with 5330 monks. There are ninety-eight nunneries, containing 4162 nuns; all of them belong to the strict order of St Basil. There are 483 cathedrals, and 28,200 parish churches (of which 853 are situated in Bessarabia), with 218,418 ecclesiastics of the orthodox Greek ritual, and 7311 ecclesiastics of the united Greek ritual. The Russian clergy may be divided into three classes; those who are in full orders, including "protopapi," or inferior priests, and "papi," or common priests; those who are only in what may be called half orders, such as deacons and readers, who are not allowed to administer the sacrament; and those who have received no ordination

St stics. at all, such as choristers and sacristans, who, strictly speaking, do not belong to the clerical order, but merely discharge the duties of attendants.

It has been justly remarked, that the members of the religious fraternities are here of more importance, compared with the other clergy, than in the west of Europe, since from them alone are the highest functionaries of the church selected. They are divided into ecclesiastical functionaries of the highest class, such as metropolitans, archbishops, and bishops; heads of religious bodies, such as archimandrites (abbots), and igumen (priors); and monks. Whoever aims at the honour of being a bishop, &c. must of necessity become a monk. On account of their higher learning and more correct life, the monks are held in much greater estimation than the secular clergy. They live a life of abstinence and strict self-denial. Many of them are men of profound learning and undoubted piety; but it is to be feared that the greater bulk of the lower orders of ecclesiastics are among the most degraded that ever assumed the priestly habit in Europe. Many of them are as ignorant as the boors with whom they associate, drinking, playing, and going to market with them like unsophisticated serfs. The general state of morals in the Greek Church, compared with those of Protestants in Russia, may be inferred from the tables of births in St Petersburg, published by the holy synod. From these it appears, that out of 8663 births, the number which took place in the year 1834, in families of the Greek Church not fewer than 1589 were illegitimate; whilst in the Protestant congregations, of 1031 infants who were baptized, only seventy-six were illegitimate.[1]

Ca olic Ch ch.

The Catholic Church comprehends eighteen different orders, who possess 113 cloisters, in which there are 2200 monks. They support sixteen circuit and thirty-one parochial schools, at which 3012 scholars receive instruction. There are 666 nuns, belonging to ten different orders, and inhabiting fifty-two nunneries. They support thirty-three female schools, fifteen hospitals for the sick, and twelve poorhouses for the aged and infirm. These educational and benevolent institutions are attached to the cloisters. The Catholic secular priesthood, comprising about two thousand individuals, superintend a number of such establishments. There are in all thirteen seminaries of a higher order, 201 parochial schools, with 7688 pupils, and 566 poor-houses, with 4449 inmates. This enumeration is exclusive of Poland, in which, in 1830, there were 1917 clergymen, 309 chapels of ease, 2369 secular priests, 156 monasteries with 1783 monks, and twenty-nine nunneries with 354 nuns. At the head of the clergy were one archbishop, eight bishops, with a chapter of 276 dignitaries, canons, and the like. The collective number of Catholic ecclesiastics in Russia and Poland is estimated at 10,772.

Pro st- ant and Lu erans.

The Protestants, consisting of Lutherans and some other sects, are divided into two synods and eight consistories, to which belong 865 places of devotion. Each of the consistories has a bishop as its president. The Razkolniks or Apostates, that is, dissenters from the Greek Church, do not compose a distinct ecclesiastical body, but exist in separate congregations, independently of one another, and each having some distinctive shade of difference from all the rest. They have a consecrated clergy, but of course no common synod or consistory. Another sect, called the Duchoborzy, differing still more widely from the Greek Church than the former, have taken refuge in the steppes beyond the Don, where they still profess their creed, but without the aid of either churches or a priesthood.

Statistics.

Mahommedans.

The Mahommedans have 4785 mosques in Russia, of which 2466 are head mosques. They have colleges, mullahs, and muftis, who regulate the religious affairs of the sect.

Worshippers of the Grand Lama.

The worshippers of the Grand Lama have their principal religious establishment at Darsan, in the province of Udinsk. They have a numerous priesthood, who are said to be very successful in making converts amongst the wandering tribes.

Bible societies.

The principal institution for the dissemination of the Holy Scriptures amongst the various tribes of the empire, in their native languages, is established at St Petersburg, and is in connection with the British and Foreign Bible Society of London. It consists of fifty-eight sections and 289 auxiliary societies, situated in Moscow, Jaroslav, Dorpat, Mittau, Revel, Riga, Orenburg, Tobolsk, Irkutsk, and other places. From the period of its institution in 1813 until June 1823, it had issued 184,851 complete Bibles, 315,928 New Testaments, and 204,052 Old Testaments, in forty-one different languages and dialects. Its further usefulness was greatly promoted by an arrangement made in 1826, by which the sale of Bibles was for the future permitted. There is always a large supply of Bibles at Moscow, where those condemned to exile in Siberia may have a copy, if they desire one, as they pass through this city on their way to their place of banishment. It is well known that all the exiles, in whatever part of the country they may have received sentence, must take Moscow in their route to Siberia.

Education.

As early as the eleventh century, public schools were founded at several places in Russia; but Peter the Great, to whom Russia is indebted for her civilization and present standing, was the first to plan a regular system of public education. Elementary schools were established throughout the country; a naval and engineering school at St Petersburg; mathematical and navigation schools at Moscow and other places; ecclesiastical schools in the bishoprics; and Latin and Greek schools were also founded in different towns of the empire. Shortly after the demise of Peter, the St Petersburg Academy of Sciences was opened; but the military schools were those which throve best under the Empresses Anne and Elizabeth.[2] This last sovereign, however, founded in 1755 an university at Moscow, and two years afterwards an academy of the fine arts at St Petersburg. Inferior public schools were not regularly organized until the year 1786, under the reign of the Empress Catherine II. Boarding schools were established by her authority in all the different governments of the empire. But a more important measure was the institution of a central authority, intrusted with the care of disseminating education. This organization underwent a complete reform under the Emperor Alexander, who substituted, for the special commission of the former reign, a minister of public instruction with more extensive powers. This sovereign re-organized the university of Wilna, and founded those of Dorpat, St Petersburg, Kazan, and Kharkov. He also established a gymnasium in the capital of every government, and district schools in every district. But on the accession of Nicholas the system underwent a total change. A few immaterial forms were preserved, but the spirit had departed. His object was to render the system of instruction religious, monarchical, and national; but as the two first terms are evidently auxiliaries of the last, we must fuse the whole into two words, *strictly national*, a term of profound import, as we shall presently see. Until the year 1835, all the civil schools of the empire throughout the se-

Statistics.

veral circuits were dependent, in relation to superintendence and administration, upon the universities situated in each of these circuits. By the ukase of the 25th of June 1835, they are placed under the ministry of public instruction, represented in the different circuits by sub-delegates called curators, by which education is placed under the direct and immediate control of government. The different branches of the administration also take special cognizance of the schools analogous to them. Thus, the military schools are presided over by the war-office, the ecclesiastical schools by the holy synod, and so on of the others. The whole system is divided into four distinct parts: I. The ministry of public instruction; II. Military schools: III. Ecclesiastical schools: and, IV. Special and other schools.

I. *Ministry of Public Instruction.* This department comprehends, 1. Education in public schools; 2. Education in private institutions; 3. Domestic education; 4. Establishments destined for forming professors and masters; 5. The Academy of Sciences, the Russian Academy, the other learned societies, the censorship, public libraries, museums, and collections of every description. The public schools are thus discriminated into, 1. Parish schools, intended for the lower orders, and allowed to teach only the catechism, reading, writing, and the first four rules of arithmetic; 2. District schools, having three classes intended for the children of shopkeepers, and restricted in their course of instruction to the catechism, caligraphy, drawing, the first rudiments of grammar, arithmetic, geometry, geography, and history; 3. Gymnasiums distributed by government, divided into seven classes, authorized to embrace more elevated studies, but only accessible to the children of the nobility; 4. Universities of three faculties, those of philosophy, of jurisprudence, and of medicine (the university of Dorpat has a fourth, the faculty of theology), and of which the courses last five years. The following is a table of the state of the schools in 1835 throughout the ten circuits of the Russian empire, exclusive of Poland, which has a separate administration. It may be mentioned, that another university has recently been established at Vladimir, in Volhynia; so that, including the university of Warsaw, there will be nine institutions of this description throughout the Russian empire.

According to an official report lately issued by the minister of public instruction, the number of pupils amounted in 1837 to 95,560. The progress which the universities have made, and also their present condition, will be seen from the following table.

	1808.		1824.		1835.		Libraries. Vols. MSS.	Zoology. Specimens.	Medals.	Botany. Specimens.	Mineralogy. Specimens.

The number of schools under the minister of public instruction has likewise increased; and, viewing the general table of the march of education in Russia, there appears to be a progressive increase of the number of pupils. But, examined in detail, some parts of the empire exhibit a striking falling off. This is especially the case in some of the provinces formerly Polish, where schools were suppressed as a measure of policy.

The minister of public instruction has another important duty besides those mentioned. He exercises a jealous scrutiny of education in private and in boarding schools, as well as domestic education; no one being permitted to follow the profession of a teacher unless he has at least undergone an examination at one of the universities. Private institutions of instruction are usually conducted by foreigners, who, lest they should propagate forbidden truths, are placed under the inspection of the local authorities, and cannot make use of any books but those appointed by government. Other means are taken to shackle these private schools, and deter foreigners from settling in Russia as teachers of the people. But private or domestic tuition even by natives is discouraged. No father has the power of selecting the instructors of his children at his own pleasure; he must take them from amongst the individuals licensed by government, or furnished with an authority which gives them the character of public functionaries. No Russian subject is permitted to be educated in a foreign country under eighteen years of age; and even after that age it is the emperor alone who can grant the necessary permission. In 1829 there was founded at St Petersburg what is called an Upper Teacher's Institution, a sort of normal school, its object being the preparation of tutors for the gymnasia and lyceums of the empire. It stands next in order after the universities, and the number of pupils in 1835 was 146.

Military schools.

II. *Military Schools.* These institutions especially engage the solicitude of government; they multiply with amazing rapidity, and absorb far too much of the funds allotted to national education. The numerous establishments of this class have been arranged under the categories of, 1. Schools placed under the direction of his Imperial Highness the Grand Duke Michael; 2. Schools under the direction of the navy board; and, 3. Military schools, especially reserved for soldiers' children, and which are under the control of the minister of war. The first are pretty widely distributed throughout the empire; the second class, designated navy, battalion of pilots, and instruction for workmen, are established only at St Petersburg, Cronstadt, Nicolaief, and Sebastopol; and the third are planted in the military colonies. Their actual condition in 1835 was,

	Pupils.	Annual Budget. Roubles.
Schools under the first head...	8,733	6,255,000
Ditto under the second do.....	2,224	632,194
Ditto under the third do......	169,024	1,800,000
Total........	179,981	8,687,194

Of these, 179,500 are supported by government.

III. *Ecclesiastical Schools.* There are numerous establishments of this nature in Russia, which, as relates to their management, are divided into two heads. The first comprehends the schools of the Greek Church, under the control of the holy synod, and directed by a special commission; the second, the ecclesiastical schools belonging to other forms of worship, which schools are under the superintendence of the minister of the interior. All these schools are divided into three circuits or departments, viz. those of St Petersburg, Moscow, and Kief. Each district has a superior school, called the ecclesiastical academy; with a certain number of intermediary schools or seminaries, for the most part established in the chief provincial towns, and of inferior schools, divided into district and parochial ones. These establishments are exclusively reserved for the children of the clergy, an arrangement exactly of a piece with the system practised in the common schools. In 1835 the ecclesiastical institutions stood thus:—

	Schools.	Pupils.
Greek Church...........................	384	58,586
United or pure Greek Church.......	23	1,274
Roman Catholic Church..............	275	7,073
Catholic Armenian Church	5	137
Gregorian Armenian Church.........	14	319
Total................	701	67,389

Of this number of pupils, 41,586 pay their own expenses, 10,517 receive pecuniary aid from government, and 15,408 are educated wholly at the expense of the state.

IV. *Various Schools.* The numerous establishments which are comprehended under this head are classified according to the different ministers, or members of the imperial family, who especially superintend them. 1. Under the minister of finance. These consist of mining schools, distributed into inferior, middle, and superior seminaries, where the art of mining is taught. They are situated at St Petersburg, and in the principal manufacturing and mining districts. They are organized on the same vicious principle as the others, being confined to the children of miners, as if talents for particular arts were hereditary in families. The total number of pupils in the mining schools is 4613, who are allowed for their support by government 647,911 roubles annually. Private individuals support similar establishments, at which there may be a thousand pupils more. There are ten other various kinds of schools under the minister of finance. The Practical Institution of Technology was founded in 1828, and intended to form master manufacturers. Two mercantile-marine schools, for forming pilots, were both established in 1829 at St Petersburg and Kherson. There are, besides, the Forest Institute, the Academy of Commerce at Moscow, the Agricultural School at Gorygoretsk, schools of land-surveying and design at Tchernigov, and two schools for forest sciences, all as yet in their infancy. They are attended by 608 pupils, which, added to those attending the mine-schools, makes the number of pupils in the schools of this class amount to 6221. The annual budget is 1,032,191 roubles. 2. Schools under the minister of the interior. These are schools of medicine, surgery, and pharmacy, all independent of the university faculties; rural schools for the cultivation of the vine, and for agriculture in general; schools for the sons of persons employed in subaltern situations in public offices, who are supported by the state on condition of serving it eight years; and schools for orphans and poor children. The establishments under the minister of the interior contain 13,340 pupils, of whom 10,500 are in the hospitals. 3. Under the minister of the emperor's household are the Moscow Academy of the Fine Arts, Moscow School of Architecture, the Theatrical School of St Petersburg, and the Court School of Singers.[1] These contain in all only about 345 pupils. 4. The minister of appanages has under him some schools of agriculture, and primary schools for the peasants, but containing only 1070 pupils. 5. Under the general direction of roads and communications is a school of civil engineers and conductors, containing 665 pupils. 6. Under the minister of justice are a school of jurisprudence, and another of land-surveying, to train youth for the exclusive service of government. These two establishments contain 350 pupils. 7. Under the foreign office is an oriental institution for qualifying individuals to act as diplomatic interpreters in the Asiatic tongues. 8. Institutions under the reigning empress, comprehending the foundling hospitals of Moscow and St Petersburg, the boarding-schools for young ladies at St Petersburg, Moscow, and Odessa, which contain 52,912 pupils. The empress has further under her control several patriotic establishments, mostly appropriated to the education of children of indigent or invalid officers. In all they contain 1122 pupils. There are also a number of benevolent institutions, such as houses of industry, establishments for the deaf and dumb, the blind, and others. 9. The Archduchess Helena superintends a number of educational institutions, established in different provincial towns, and managed by the local authorities. 10. There remain to be added to the above a number of schools which are supported without any assistance from government. All the foregoing derive considerable pecuniary aid from that source. There are four German schools at St Petersburg, and 750 in the German colonies, having in all 35,746. In the same provinces are 561 Tartar schools, with 14,000 pupils; and there are two Jewish schools, with 500 pupils. At Orusk, Cossack and Asiatic schools have been instituted. The latter are intended to supply interpreters to all the frontier line of Siberia.

The following is M. de Krusenstern's estimate of the establishments of education throughout the Russian empire:

	Pupils.	Money supplied by Government. Roubles.
The ministry of public instruction	85,707	7,450,000
Military schools......................	179,981	8,687,194
Ecclesiastical schools...............	67,024	3,000,000
Divers schools.........................	127,864	9,596,947
Total......	460,576	28,734,141

This upon a population of 48,000,000, exclusively of the Asiatic population, gives about one pupil for every 104 of the inhabitants. He estimates the number of children receiving a home education at 597,424 individuals, which would give to Russia one pupil enjoying education for every fifty of the inhabitants. According to M. Ouvaroff's last report, this proportion had in 1837 become one in forty-five. The data upon which both the minister and Krusenstern make their calculations are very problematical. We greatly doubt if the proportion is so high as it is here given. Mr Bremner states[1] that "popular education is advancing but slowly; for in many of the governments of the interior, out of every four or five hundred of the population, there is not more than *one* young person attending school. The educational schemes of the government have hitherto been unsuccessful in the provinces, because the people, being ignorant of the value of instruction, seldom think of sending their children to school. In the large cities, however, public seminaries are most successfully conducted and numerously attended." With regard to the provinces, considering the character both of the country and of the peasantry, we think that there may be some truth in Mr Bremner's statement; but it cannot be of very extensive application, the discrepancy being so great between it and those of the individuals mentioned.

---

[1] Travellers have remarked, that the Russians possess a singular aptitude for music; and Reicha, a very eminent musician, particularly notices the admirable accuracy with which the vocal music is performed in the churches, without the aid of any instrumental accompaniment. But in Russia the music of the church, the theatre, the concert-room, and the chamber, has been chiefly indebted for its progress to Italian and German musicians, though the native music and musical instruments of Russia are sufficiently interesting to deserve much more consideration than has hitherto been bestowed upon them. The occurrence of popular airs in Finland in the unusual measure of $\frac{5}{4}$ is vouched by continental writers. In the interior of Russia, there appear to be many native airs of an uncommon character in respect of melody and tonality. The celebrated Russian horn-music, though very remarkable in its kind,

Science and learned societies.

Independently of the institutions occupied directly in the education of youth, Russia has further her academies of science, her learned societies, her public libraries, and her museums. The number of scientific establishments in St Petersburg is very great; and the merits of the Imperial Academy of Sciences, in relation to its mathematical, astronomical, mineralogical, and geographical labours, are incontestable. The universities of Moscow and Dorpat are also highly celebrated. The institution last named would appear to be the most prosperous of all the universities in Russia, many of its professors, such as Struve the astronomer, Parrot the traveller, and others, being men of great eminence in the scientific world. Of the Russian libraries, that of St Petersburg is the richest and most considerable, containing 413,000 volumes. After it rank the Hermitage Library, consisting of 100,000 volumes; the library of the Academy of Sciences, 90,000 volumes; and those belonging to the universities of Dorpat, Moscow, Kief, Kazan, Kharkov, and St Petersburg, each being highly respectable, as will be seen from a table already given. In 1837, the total amount of books in the public libraries of Russia amounted to 858,635 volumes. It ought to be mentioned, however, that about two thirds of the scientific and literary treasure of Russia have been plundered from unhappy Poland. The number of literary and scientific institutions throughout the empire, including several purely philanthropic associations, may be estimated at fifty, of which twenty belong to St Petersburg alone.

Poor-laws.

In Russia proper, the owners of estates are under obligations to provide their peasantry with the means of support, and in times of distress to relieve them. On the estates belonging to the crown, a methodical system of parochial relief is established, each parish being compelled to supply its destitute poor, in poor-houses, with fuel, food, and clothing. In Courland, Esthonia, and Livonia, a similar compulsory system is established, the landowners and farmers contributing in proportion to their occupations or rental, and the overseers being elected by the rate-payers. Public begging is forbidden, and vagrants set to work by the overseers. Even in Siberia the authorities are under legal obligation to prevent any individual of the people committed to their charge from suffering want, or remaining without assistance when in distress. In the Russo-Polish provinces a similar system prevails as in Russia proper.

Literature and the press.

The productions of the Russian press are no index to the national cultivation. Amongst the great body of the people there is little or no taste for literature. It is only amongst the higher classes that any thing like a reading public is to be found; so that it may well be believed native authors, or translators of foreign literature, have little encouragement held out to them, at least of a public nature. It redounds, however, to the credit of the late sovereigns of Russia, and the more wealthy of the nobles, that they have done much to foster Russian literature, by the munificent favours which they have bestowed on native writers. But that ready market, a large and intelligent reading community, is alone calculated to draw forth to any great extent the talents and the genius of native writers, and to promote the interests of literature. Thus, although many eminent men have appeared in Russia as authors, such as Lomonoscoff, Muravieff, Karamzin, Pouschkin (a celebrated poet, who perished in a duel in the flower of his age, February 1837), and some others, its literature is yet in an infant or imitative state. The greater number of the books that are published are translations from the German and French, and their circulation is limited. Karamzin's History of Russia, the most popular work ever published in that country, and said to be the one most widely circulated, sold only to the extent of 1500 copies in two editions. In the Russian empire are published eighty papers and minor periodicals, and about twelve scientific and literary journals. Of course, nothing like the liberty of the press is known in Russia. Indeed there cannot be said to exist a press at all in the common acceptation of the term, as the newspapers are published by the government, and no periodical literature of a political character exists in the Russian language. In 1837, the printing establishments in the empire were 171, of which ninety-four were maintained by government, and seventy-seven by private persons. There were seventy-four lithographic establishments, nine of which were supported by government. A strict censorship of the press has been instituted, and its jealous vigilance is particularly directed to English newspapers, all but the *Morning Post* being absolutely prohibited from entering the capital. The censorships of the press are conducted according to the precepts of a new regulation, which is due to the solicitude of the Emperor Nicholas, and was issued in 1828. In university towns it is intrusted to committees, and everywhere else committed to censors appointed *ad hoc*. The censorship of works relating to religion rests with the ecclesiastical authorities. Every book hostile to the creed of the Greek church, to monarchical or autocratical authority, to decency, to morality, to the honour of individuals, is prohibited. The first duty of the censors in examining a book, is "to consider what is the object that the author has proposed to himself." These rules apply alike to national and to foreign works. Literary property is a vested interest during the life of the author, and for twenty-five years after his death. Literary piracy is punished by a fine equivalent to double the cost of an edition of twelve hundred copies. In 1835, seven hundred and eight works were printed in Russia, and three thousand foreign volumes were imported. Mr Bremner informs us, that in spite of all restrictions, "Russian literature is advancing with great rapidity."

Russian language.

Under this head two languages are to be distinguished: 1. The Russian language, originally the dialect of the Sclavi,

---

must be considered as of foreign introduction, and as the result of great musical aptitude, and of most careful and laborious training. About the middle of the eighteenth century, J. A. Maresch, a Bohemian, and a very skilful horn-player, who was settled at St Petersburg, invented there the famous Russian horn-music. For a brief account of it, see the Appendix to Graham's Essay on Musical Composition; and for minute details regarding the notation and the mode of performance of this kind of music, consult J. C. Heinrich's work, *Entstehung, Fortgang und jetzige Beschaffenheit der Russischen Jagdmusik*, published at St Petersburg in 1796.

[1] Excursions in the Interior of Russia, in two vols. 8vo, 1839.

who founded the empire. It underwent various changes along with the empire itself, the Scandinavian, Mongolian, Tartar, and German, also the Polish and French languages, being all by degrees incorporated with it to a greater or less extent. This improvement is continually advancing by means of the national literature. 2. The Sclavonian language, or that of the Sclavonian Bible. It was fixed by the translation of the Holy Scriptures, and so settled that it has since experienced but few alterations. From the combination of these two a mixed language arose, which was used in sermons, rhetorical prose, and the higher species of poetry. The following extract presents a concise view of the way in which the Russian language began to assume its present form. "From the thirteenth to the fourteenth century," says the celebrated Karamsin, "our language generally became more pure and more correct. Our scrupulous authors gave up the use of the Russian language, as yet too rude, in order to attach themselves more strongly to that which had been employed in composing the books of our church, namely, the ancient Servian, in which our Bible is written. They followed its rules, not only in the declensions and conjugations, but even in the pronunciation and orthography; nevertheless, as may be seen in Nestor, the force of habit made them often recur to their natural idioms, a circumstance which has introduced into our literature a mixture consecrated by antiquity, and so deeply rooted amongst us, that often in the same book, and in the same page, we write *zláto* and *zoloto* (gold), *glad* and *golod* (hunger), *mladost* and *molodost* (youth). The time had not yet arrived for giving to the Russian language that energy, that flexibility, that grace and delicacy, which in the days of peace and prosperity are coupled with the rapid progress of the intellectual faculties, with richness of ideas, and variety of knowledge, as well as with the formation of taste and the sense of the beautiful. We see, however, that our ancestors endeavoured to express their thoughts with more distinctness; that they sought to soften the still too rude sound of words, and to give less stiffness to their style. In short, putting aside all national pride, we may say that though, compared with other Europeans, the Russians might appear very ignorant, they were nevertheless far from having lost all the fruits of civilization; they proved how much force it has to resist the rudest assaults of barbarism."[1] The study of the Russian language is extremely difficult; and from the fact of its not yet being in a state which would entitle it to be called fixed, it is an arduous study, even for the natives.

Cha cter of t Russian

The accounts of the Russian character in the works of those who have resided or travelled in the country, are extremely conflicting. He who impartially weighs the evidence of Coxe, Tooke, Clarke, Porter, Wilson, Cochrane, Holman, Londonderry, Bremner, and others, will arrive at the conclusion, which might have been suspected before the investigation began, that whilst there are not a few dark stains on the national character, many of them are attributable to the peculiar political system under which the people live, to their general ignorance hitherto, and to the low character and unclerical behaviour of the secular clergy; and that under a proper system of government, instruction, and religious discipline, the Russians would not be far behind some of their continental neighbours who hold a much higher place in the scale of civilization and morals. The opinion which generally prevails in this country regarding the Russians as a people does them injustice. If, as Dr Lyall asserts, they are "insinuating and cunning, deceitful and perfidious, sensual and immoral," it must not be forgotten, that any natural tendency to these vices not only remains unchecked by proper secular and religious instruction, but is fostered, as in a hot-bed, by a state of slavery, or semi-vassalage, which is little better. Amongst all the nations of Europe, in Russia alone is one half of the population a marketable commodity, or something not very far removed from it. But we question much if the natural bias to the crimes and vices mentioned by Dr Lyall and others be very strong. From circumstances, however, they have received a powerful development; and from the statements of more recent travellers, it would seem that they are gradually becoming less conspicuous. They are fond of novelties, amusements, and gambling, particularly of card-playing. They are extremely partial to singing, and their talents for imitation and the acquisition of languages are universally allowed to be remarkable. With regard to the former, Dr Clarke observes, "their surprising powers of imitation exceed all that has been hitherto known."

The foregoing observations apply to the bulk of the community. With regard to the Russian nobles, it may be briefly stated, that the style of living of the wealthy greatly resembles that of the higher ranks in other parts of Europe. With the exception of a few traits of a national cast, there is little distinction between the majority of the Russian nobility and those who move in the polite circles in Paris or in London. French and German are spoken with as much facility as the Russian language. French is the court language, and in spite of the invasion of 1812, and the loss of Moscow, the manners and literature of France are held in universal esteem. The wealthy nobles expend enormous sums on their entertainments, and many a goodly estate is mortgaged to gratify this passion for display.

Dress, &c.

The national dress of Russia consists of a long coat reaching to the calves of the legs, with numerous tucks at the bottom of the waist; a waistcoat of coloured linen, having the neck bare; and thin boots and shoes of the bark of the linden tree. In winter a sheep-skin pelisse is substituted for the coat. The dress of the higher ranks is now formed studiously on the European model, though no other part of Europe can rival the gorgeous robes worn by the nobles and bishops on public occasions, or the profusion of diamonds which emblazon their persons. The national amusements are chiefly those afforded by the ice. A favourite diversion is the ice-hill, or mountain, as the Russians call it, on whose sides are formed steep inclined planes, down which the adventurer throws himself, seated on a machine, which he guides with surprising skill. Swinging is another Russian diversion; to which may be added the common ones of dancing, and of a national music, which, with the songs and ballads to which it is sung, is very plaintive and pleasing.

Miscellaneous.

There are ten orders of knighthood or of merit in this empire, three of which were established by Peter the Great, the parent of Russian civilization. They are both of a civil and military description; and many of them are divided into several classes, some having five, others three and four. But the indiscriminate manner in which these marks of distinction are bestowed greatly lessens their value. Even private soldiers have frequently half a dozen bits of ribbon strung in a line across the breast, and common policemen are sometimes bedecked in the same manner. A general officer in the Russian service is usually covered with orders of one kind or another. It is a fact worthy of remark, that the calendar has not yet been reformed in Russia. The reason assigned by the Russians for thus remaining twelve days in arrear of all other nations, is partly the fear which the emperor has of any serious innovations giving offence to his nobles, and partly the unwillingness of the clergy to accede to any change which would so materially disarrange the present order of their numerous feasts or saints' days. Without the sanction of the priesthood, such an important reform could not be completely carried into effect.

---

[1] *Histoire de l'Empire de Russie*, par M Karamsin, traduite par MM. St Thomas et Jauffret, tome v. Paris, 1819–1826.

Asiatic Russia.

Russia in Asia comprehends the whole northern portion of it, extending from latitude 38° 40′ to 78° north, and from longitude 37° 14′ to 190° 22′ east from Greenwich. It is bounded on the west by European Russia and the Black Sea; on the south by Asiatic Turkey, Persia, the Caspian and Aral Seas, the territories of the Turkomans and Kirghises,[1] and China; on the east by the Pacific Ocean and Behring's Straits; and the Frozen Ocean extends along the whole of its northern limits. Its greatest extent from west to east is about 4142 miles, and its greatest breadth from north to south is about 1933 miles. This vast dominion is calculated to be spread over twenty-seven ninetieths of the land of the globe.

General aspect.

The Ural Mountains, already described, run along the western limits of Asiatic Russia. On the south-west extends the Caucasus, and on the west the Altai range. The eastern division of the Russian territory, from the river Yenisei or Ienessi, has on its southern and eastern parts vast mountain ranges; and on its interior there are several chains that run to the Arctic Ocean in gigantic masses. This portion of Siberia is covered with woods, large lakes, or extensive and elevated plains, and terminates towards the shores of the Frozen Ocean, in vast fields of eternal ice. The western division, with the exception of the mountain ranges mentioned, taken as a whole, may be described as a vast level plain, partially watered, but by its climate and soil ill adapted for the increase or the comfort of human beings.

Rivers.

The rivers of Asiatic Russia that empty themselves into the Arctic Sea are amongst the most considerable of the ancient world. The most remarkable of these are, 1st, the Obe, whose course is 2170 miles in length, during which it receives the great rivers the Tom, the Kek, the Irtysh, the Tyda, and all their tributary streams. 2d, The Yenisei, which has a course of 3115 miles, with fewer sinuosities than are usually observed in other great rivers. It receives the waters of fourteen large streams, and all their tributary collections. 3d, The Piasana, whose course is 300 miles. 4th, The Taimurskoe, a short stream issuing from a lake of the same name. 5th, The Khatanga, which empties itself into the Bay of Khatangaskoi, on the Frozen Ocean. 6th, The Anabara, an arctic stream. 7th, The Olenk, whose waters only become considerable after entering the arctic circle. 8th, The Lena, one of the largest of the Asiatic Russian rivers. It rises in the Baikal Mountains, to the north of China, in latitude 52° 30′, and empties itself into the ocean in latitude 70° 40′, and longitude 164° 26′, after receiving the waters of fourteen large rivers and their numerous tributary streams. 9th, The Omoloi; 10th, the Jana; 11th, the Indigirka; 12th, the Alazeja; 13th, the Kolyma; 14th, the Tchauna; and, 15th, the Amgonia. The streams whose courses have been traced to fall into the sea of Kamtschatka, between Asia and America, are the Anadyr, the Katirka, the Kamtschatka, the Penshena, the Tilcha, the Ischiga, the Tauna, the Okhota, the Uda, the Argun, and the Shilka. The rivers which descend from the Asiatic side into the Black Sea and Caspian have already been noticed.

Lakes.

The lakes in Russian Asia are very numerous, and some of them very extensive. One of the largest is the Baikal, in Siberia, between latitude 52° and 55°, and longitude 104° 26′ and 109° 56′, extending over 11,180 square miles. Its water is clear and bright, and the depth varies from eighteen to five hundred feet. It is covered with ice from the middle of December till April. The river Angara, which runs to the Yenisei, issues from it. It contains a great number of rocky islands, the largest of which is called Olchon. The lakes next in extent are the Tchani and the Piasenskoe, both in the government of Tomsk. Every province has one or more lakes, several of which are of salt water, and on whose banks a natural crystallization prepares culinary salt for the use of the inhabitants.

Steppes.

There are several plains or steppes of great extent in Asiatic Russia, the most remarkable being the Kirghis Steppe, between the Irtysh and Orenburg boundary line. It is a very dry and barren district, with some lakes whose water is saline. The few rivers have copious streams in the spring from the melted snows, but in summer become dried up. There is also the Steppe of Bolschei; of Jettish, to the eastward of the Ural; of Ischim, on both sides of the river of that name, between Tobol and the Irtysh; and the Baraba or Barbinska, between the Irtysh and the Ob or Obe. It is about two hundred miles in breadth, and its surface is by no means dry and arid, as is commonly thought, but, on the contrary, rather suffers from an abundance of water, being chiefly covered with large and small lakes and extensive swamps, and also traversed by several small rivers, which partly fall into the Om, an eastern tributary of the Irtysh, and partly into the Irtysh and Obe. Some portions of it present a perfect level, like the ocean in a calm; others are slightly undulating, and covered with grass, some birch, and poplar. Some lakes are salt, and occasionally the surface of the ground is covered with saline efflorescence. In this steppe a peculiar disease is prevalent, called the Siberian plague. To these may be added the Arctic Plain, between the 67th degree of latitude and the Frozen Ocean, whose whole surface is little more than morasses, mixed with rocks, and bound up by frost between ten and eleven months in the year. These extensive plains are sometimes passed by the wandering tribes, who find subsistence on the less sterile spots which are to be met with on the banks of the rivers that bound them. The southern districts, however, possess a great deal of land equally adapted for tillage and for pasture. The forests abound with game; and the rivers are well stocked with fish.

Climate and productions.

The climate differs little from that of European Russia. The principal productions are wheat, rye, barley, oats, and buck-wheat, which grows wild in the middle of Siberia. The return is small, but the crops have increased with the introduction of more improved methods of cultivating the soil. The southern territory along the upper part of the Irtysh, as well as along the Tobol, the Izet, and others of its tributaries, which are covered with luxuriant pastures, might be made to yield very rich crops, if the inhabitants would change their taste for a pastoral life, and till the ground. For some time past indeed the Kirghises have shown indications of commencing agriculture, especially the poorer classes, who cultivate, upon the borders of the lakes and rivers, fields of corn, rye, barley, and millet. But notwithstanding the general neglect of agriculture, the produce is in some parts extremely plentiful. Immense crops are raised without the aid of manure, so that living is very cheap. In many parts the goats and sheep, and in some the oxen, furnish food for the inhabitants; whilst in others they derive subsistence from the fish with which the seas, lakes, and rivers abound. The rearing of sheep for wool is a branch of industry lately introduced into Siberia, and is likely to thrive.

---

[1] This part of the Russian frontier, known by the name of "the line of the Cossacks of Siberia," traverses the extensive plains which separate Ural from Altai. The direction of this line, from the redoubts of Siberia to the village of Finalka, situated at the foot of the Altai, is in length 1707 versts, and is marked by four towns, eleven fortresses, fifteen fortified advanced posts, and eighty-four redoubts.

Fr iers.

The territory which stretches along the Asiatic frontier deserves particular mention, as the most favoured district of Siberia. This vast space is chiefly inhabited by Cossacks, colonised warriors, divided into several regiments; and although other colonists, as peasants, shopkeepers, &c. have established themselves there, the population does not at present exceed 45,000. The Cossacks are privileged to trade with the Kirghises, without paying the taxes of either of the three guilds; in their military capacity they mount guard in turn at the different posts; their leisure time is employed in the rearing of cattle, gardening, hunting, and fishing. The territory they occupy is for the most part very fertile, especially between the forty-ninth and fifty-first degrees of latitude, where the soil spontaneously produces fruit-trees, melons, tobacco, &c.; whilst in the most eastern part, the solitary but picturesque and fruitful valleys of Altai, rich in every description of odoriferous flowers and aromatic herbs, enable the inhabitants to rear innumerable swarms of bees, and to furnish the greatest part of Siberian honey. Several manufactories, especially that of leather, have been established in the towns; but trade is yet in its infancy, and scarcely developed. Its progress and improvement will doubtless hereafter enhance the value of the natural productions of these regions, amongst which must be reckoned the lakes of salt water so numerous in the steppes. Important as they are in relation to trade and commerce, these lakes likewise present to the naturalist a series of interesting phenomena. Their waters hold so great a quantity of salt in solution, that the action of the summer heat is of itself sufficient to convert it into crystals, which, carried towards the banks by the action of the waves, form there shoals of salt of an immense extent. Magazines have been formed upon the borders of Lake Koriak, the only one situated on the right bank of the Irtysh, and the salt therein preserved generally amounts to several millions of poods. Large quantities of this article are annually carried across the Irtysh to Tobolsk. But however rich this lake may be, it is less so than three others, the Karashack, the Kalkaman, and the Djémantons, situated in the steppes on the right bank of the Irtysh. Each of these basins is from twenty to twenty-five versts in circumference; and the action of the solar rays produces in them, during the summer season, crystals of salt so numerous, that by mutual contact they at length form thick and solid arches, which, like winter ice, cover the surface of the lakes. These masses are frequently nine inches thick; the action of the air whitens the upper layers; the lower ones preserve a bluish tint, which in some places assumes a beautiful violet hue; and the solidity of these crystal fields is such that horses, chariots, and even camels, pass over them with the greatest safety. Ten other lakes are also found between the Irtysh and Redoubt of Siberia.

Mine

The mines of Russian Asia are by far more productive than those of any other portion of the empire, as from them is extracted the whole of the gold, silver, platina, and lead, nine tenths of the copper, and eleven twelfths of the iron which is brought into use. Zinc, arsenic, and bismuth, together with precious stones, are also found. These mines are situated in the Uralian and Altaian ranges of mountains. It is in those parts of these chains which face Siberia, that is, the eastern slope of the Ural, and the northern declivities of the Altai, with its secondary branches, that are found the veins of precious metal. The best account of these mines is that contained in a recent book of travels by Gustav Rose.[1] "The sand containing small particles of gold occurs along the eastern declivity of the Uralian range, in numerous places north of 56° north latitude, and extends beyond 60° north latitude. It occurs in the western declivity likewise, but only in a few places, and contains less gold. On the Siberian side of the range, the sand from which the gold is extracted contains about one and a half or two solotnik of gold in a pood, or from $\frac{1}{2280}$ to $\frac{1}{1920}$; that which contains less is at present not worked." But Mr Rose says that even sand containing only $\frac{1}{7080}$ of gold can still be washed with profit. "The expenses in washing sand containing between $\frac{1}{2280}$ and $\frac{1}{1920}$ of gold amount commonly to two fifths of its net produce. Sometimes sand is found of which $\frac{1}{600}$ and even $\frac{1}{300}$ is gold. A small quantity of silver is always mixed with the gold; it amounts to between two and eleven parts in one hundred. Near the Altai Mountains, likewise, gold sand has been discovered in some places, and they have begun working it. The first establishment for working this sand in the Ural was made in 1814, at Beresowsk, near Ikaterineburg, and since that time they have been increasing in number and extent. Last year (1836) the produce of all the Russian mines gave 27,885 marcs of gold, of which more than two thirds were derived from the washing of the sand." The platina mines are situated on the western declivity of the Ural, about the parallel of 57° 40′ north. They are six in number, and lie at a short distance from one another. "In the most northern, called Sukhowissimokoi, the discovery of the sand containing platina was made in 1825, and at the other places it was found soon afterwards. The proportion of platina is much larger than that of gold, as it amounts on an average to $\frac{1}{142}$ of the whole mass. Sometimes pieces are found weighing some ounces, and even half a pound and upwards. A small quantity of gold is united with platina. In 1834 platina was discovered in layers of serpentine. The produce of platina in 1836 amounted to 8270 marcs."[2]

The field opened for researches is so vast, that years of methodical and persevering examination have not yet been sufficient to explore all the valleys and summits of these immense chains, a vast extent not having yet been visited by the officers of the Mining Board. The examination of these parts, as yet almost unknown, is pursued with the greatest regularity. The two chains, the Ural and the Altai, are divided into several mining districts. In each of them the officers to whom is confided the direction of the works, send out every summer detachments of discovery, whose duty it is to examine in detail the mountains assigned to them, the point at which the expedition stopped the preceding year being generally that of departure for the new one. We have already stated the quantities of metal which these mines produce annually. With regard to the diamonds, Mr Rose states that only small stones are found, their number up to July 1833 amounting only to thirty-three.

Manufactures and commerce.

The manufactures are few and unimportant, with the exception of spirits and leather, which are made to a considerable extent at Tobolsk, and the towns in the neighbourhood. There are here 114 tanneries, besides a number of establishments for soap-boiling and the melting of tallow. Cotton and woollen are begun to be manufactured into coarse stuffs in one or two parts. The breweries, but especially the distilleries, are more numerous than any other manufacturing objects. Making corn-spirits is a royal monopoly, but in some of the Asiatic cities it is let to farm by the government. The chief commerce is internal, between the several provinces whose productions are most different from each other. Trade is carried on to a great extent at Tobolsk, the capital of the country. With the exception of the clergy and persons employed in the service of government, almost all are engaged in it, exchanging the produce of European Russia, corn, meal, and iron, tools and utensils, for the skins, cattle, caviare, fish salted and fresh, and game brought to them from the interior by the Ostiaks or Tartars. Every year the merchants of Tobolsk, Tumene, and the other towns, send boats laden with flour up the Irtysh and the Obe to Berezoff, and the other small towns situated farther to the north; and these boats return freighted with fish. The clerks and agents belonging to these merchants, and who are established in the small towns upon the banks of the Obe, purchase of the Ostiaks valuable furs, which, together with soap, tallow, and leather, they afterwards export, partly to the fair of Niznei-Novgorod, and partly to the Kirghises of the steppes, who pay them in horses, cattle, and cotton stuffs, purchased by themselves of the Bukharians; the remaining produce of the government of Tobolsk is exported by the way of Kiakhta into China, whence are brought in exchange silks and tea. Kiakhta is the solitary point of commercial intercourse between the two great empires of Russia and China. Almost all the principal houses in Russia have an agent at Kiakhta; while the Chinese traffickers consist chiefly of temporary visiters without their families. The Russians here receive the staples of China, for which they give the productions of their own country in return. The nature and extent of the commerce of Kiakhta will be seen from the following statement.

---

[1] *Reise nach dem Ural, dem Altai, und dem Kaspischen Meere*, von Augustav Rose, vol. i. Berlin, 1837.

[2] Journal of the Royal Geographical Society, vol. vii. p. 399.

Exportation of Russian Merchandise in 1835.

	Roubles.
Skins to the amount of	2,229,377
Leather	742,481
Linen	203,115
Cottons	933,876
Cloths 718,221 archines	1,799,691
Corn, iron, steel, copper, glass, and other articles	1,446,148
Polish cloths, 206,301 archines	466,950
Transit merchandises	545,731
Total	7,427,369

Importation of Chinese Merchandises during the same year.

	Roubles.
Tea, 199,233 poods, to the amount of	6,909,149
Silks	208,599
Cottons	122,726
Drugs, &c	186,895
Total	7,427,369

Or L.324,947.

In 1825 the total exports amounted to 5,501,815 roubles, or L.239,697, so that in ten years there has been an increase in the commercial intercourse between Russia and China to the extent of nearly two millions roubles. The Russians chiefly transport by water the merchandise which they send in summer, or oftener in spring, from Kiakhta to Europe.[1]

Another great commercial line is that which branches from Irkutsk down the Lena, into the heart of the frozen regions and the shores of the Arctic Ocean. Yakoutsk, situated about eight hundred miles down the Lena, is the emporium where the furs and other products of these desolate regions are collected. They are brought from the remotest extremities of the land which borders Behring's Straits, from Kamtschatka, and from the American territory, as well as from the northern wastes. A considerable proportion consists of the tribute which is paid to government; and the wandering traffickers exchange tobacco, spirits, cutlery, beads, and toys, for the remainder.

Governments. Asiatic Russia, like the European portion of the empire, is divided into governments or provinces, which are further partitioned into circles, all being under the same species of civil government which we have described as characterising the rest of the empire. The names of the governments of Siberia, with the number of the inhabitants, are as follow.

Yenisei	193,486
Irkutsk	505,118
Tobolsk	662,650
Tomsk	394,136
Province of Omsk	72,545
Total	1,827,935

There can be little doubt that in this census, which has been recently taken, the wandering tribes have been merely estimated, and that it is only an approximation to the truth. The population consists of two very distinct portions, the foreign rulers and the native tribes. The Russian inhabitants consist chiefly of the unfortunate persons who have been banished to these remote regions for various crimes, more especially those of a political nature. A basis was formed by the Swedish officers who fell into the hands of Peter the Great on “ sad Pultawa's day,” and a regular succession of recruits has subsequently been furnished by the empire itself. Amongst those who have been thus expatriated by a jealous and absolute government, were of course many individuals belonging to the higher ranks of society, men of polished manners and accomplished minds, so that at Tobolsk, where they were chiefly stationed, there is a far higher degree of refinement and intelligence to be found than might have been expected in a settlement of convicts. This great capital of Western Siberia has to a considerable extent acquired the polish of a European city. In 1835 it contained 15,379 inhabitants, two ecclesiastical schools, about twenty churches, and a monastery. The lowest class of exiles are condemned to the mines, where, being closely watched, and with hard work and harder fare, they drag out a miserable existence. A class whose offences are of a milder character are distributed amongst the distilleries. A third class receive grants of land, for which a trifle is paid to government. The individuals composing this class are formed into villages, under the superintendence of a strict police. The native races have been enumerated in our general statement of the various tribes who inhabit the Russian empire. Siberia is under the same system of national education as European Russia, and has its schools, gymnasia, and other institutions of the kind. Public instruction is making some progress at Tobolsk, notwithstanding the many obvious difficulties which obstruct it. There are in this government eleven ecclesiastical schools, with thirty-four masters, and 686 pupils.

Transcaucasian Provinces.

The Transcaucasian territory of Russia is a vast tract of country situated between the Black and Caspian Seas, and bounded by Turkey and Persia on the south. It has been entirely incorporated with the empire since the commencement of this century. Relations had been established with Georgia a long time previously, but it was not till 1801 that it was declared a Russian province. The district of Elizabethpol was seized in 1803; Imeretia in 1805; Persia ceded the Khanats of Sheki, Shirvan, Karabagh, Talish, Bacoo, Cooba, and Derbend, in 1813; the treaty of Turkmanschay, concluded with Persia in 1828, gave to Russia the Armenian provinces of Erivan, Nanhischevan, and Ordubat, and fixed as its frontier the course of the Araxes; and, lastly, by the treaty of Adrianople Turkey surrendered istics.

---

[1] Tour in the North of Europe, vol. ii. p. 215.

to her great enemy the pashalik of Akhalzik. These acquisitions altogether comprehend a superficies of 154,000 square versts, which is about twice the size of England without Wales. The whole is considered an integral part of the empire, and as such is administered by Russian authorities. But besides these provinces, Russia claims a protectorate over Mingrelia, Abassa or Abhasia, the Lesghian tribes, and several principalities of Daghestan. Some of these countries are entirely under Russian influence; but in Abhasia, even according to Russian writers, it is merely nominal. The following statistical table is from a work composed and published in St Petersburg in 1836 by supreme authority.

	Houses.	Male Inhabitants.
1. Grusia or Georgia proper contains	63,801	225,395
2. The military district of nominal provinces	71,565	202,951

Small as this territory is compared with the vast extent of Russia, it is of no trifling importance to her in a commercial, financial, and political point of view. Its geographical position appears to us the happiest possible for such a power, prosecuting gigantic schemes of commercial intercourse or territorial aggrandisement. Climate, soil, natural capabilities, situation, and political relations, all prove that, whatever it has cost Russia to acquire and maintain her Transcaucasian dominions, their value, which as yet is only developed to a small extent, justifies her policy. A commission was appointed in 1828 to draw up a statistical account of these provinces, the labours of which body terminated in 1835. The following is a brief abstract of the results of their investigations, derived from the official sources.

1. *Silk.* The cultivation of mulberry trees is in a very backward state, although the tax levied upon them was abolished in 1830. The whole annual export does not exceed 15,530 poods.

2. *Cotton.* The natural capabilities of the country offer a possibility of increasing the production of this valuable commodity to an immense extent; but its cultivation has greatly decreased since the district where it is chiefly raised passed from the hands of Persia to those of Russia. The whole export amounts annually only to 36,000 poods, of very inferior quality.

3. *Wine.* The vine is indigenous to these regions, and presents a great variety of kinds. The vineyards are numerous and rich, the country being well adapted for the cultivation of the plant. There are produced annually about 3,888,000 vedros of wine, and 140,000 vedros of brandy. The district of Telav alone furnishes to this quota 2,000,000 vedros of wine, and 140 vedros of brandy. Imeretia is not included in this estimate. This quantity of wine and brandy is entirely absorbed by the internal consumption, which is immense. The production of wine of various kinds and most excellent quality might be prosecuted to an extent which might render Russia independent of foreign importations of the article.

4. *Rice.* The cultivation of this plant has not improved since the establishment of the Russians in the country. There is an annual produce, however, of about 130,000 chetwerts.

5. *Saffron.* The province of Bacoo alone produces yearly 1000 poods of saffron, which shows to what an extent this valuable branch of agricultural industry might be carried. The article has hitherto been very ill prepared, but efforts are making to improve the management of it.

Statistics.

6. *Madder.* This article is produced in great quantities at Derbend, and other places along the shores of the Caspian Sea.

7. *Cochineal.* The Armenian or southern parts of the Transcaucasian provinces produce a kind of cochineal, which is said to yield a dye equal to that of Mexico. The Russian government is doing every thing in her power to extend this new and profitable branch of productive industry.

8. *Live Stock.* Extensive herds might be reared in these provinces, which afford great facilities for their maintenance. Great numbers of sheep and cattle are indeed raised, but the wool of the one is bad, and the breed of the other is inferior. But there can be little doubt that Merino sheep will be successfully introduced into this quarter. There is a fine race of horses, and an abundance of camels, asses, mules, and swine.

The natural capabilities of these provinces are very great, affording facilities for the production of the most valuable commodities, which are exclusively furnished by southern climates. These have only been developed to a partial extent; but the Russian government is displaying such laudable zeal to encourage such branches of industry as are peculiarly adapted for the various districts of her vast possessions, that by and by she will be independent of what are called colonial goods, silk, cotton, and the like. The provinces, however, are greatly depressed by a system of most vexatious and unequally levied imposts. These have not been laid on by Russia; they owe their origin to the rapacity of the various petty tyrants who formerly ruled the different parts of this region. Free commerce was permitted to the provinces in 1821, and they soon began to reap great advantages from this liberal system. But it was abolished in 1832, probably because the additional revenue which accrued from it was not a sufficient compensation for such an interference with the general system of Russian policy.

This is not the place to enter into the great and important question relative to the influence which Russia is likely to exercise over the East, by thus firmly establishing her dominion beyond the Caucasus. Although the maintenance of the provinces costs her yearly L.16,000, the revenue being about L.216,000 and the expenditure about L.232,000, yet, by placing the resources of the country under proper management, the former might be increased to a vast extent. But this is of comparatively little moment compared with two other objects of her far-sighted policy, which will be promoted by rendering the Caucasian isthmus a commercial country, securely incorporated with the rest of the empire. These are the creation of a manufacturing industry, which will make her independent of other countries, particularly of England, and the establishment of her power in Asia, whence great advantages are not unreasonably expected. Now these provinces will at once supply the raw material necessary for manufactures, and at the same time open a market for them in the east. It is true, that the Caucasian Mountains almost totally sever this limb from the great body of the empire, the passes of Mozdac being difficult, and the country at the same time infested with predatory hordes. But there are other and much more eligible means of communication, viz. the Caspian Sea on the east, and the Black Sea on the west. Over the former Russia reigns paramount, no other vessels of war but her own being allowed to navigate its waters. Into this vast reservoir the Volga, which is the great artery of Russia, pours its waters, collected during a navigable course of two thousand miles, through some of the most fertile regions of the empire, and, including its tributaries, those most distinguished for manufacturing industry, which is the main object. There is also a communication between this noble stream and the

Baltic Sea. Thus, then, there is an easy transport of goods insured from the remotest governments of the empire to the Caspian Sea, and thence to the Transcaucasian territory. There is also on the other side a communication by the Black Sea, but it does not present so many advantages as that by the Caspian. Our space, however, will not allow us to pursue the subject further.

Islands in the Polar and Eastern Oceans.

In the Polar Ocean are the groups of New Siberia and of the Bear's Island. The first consists of four large and many smaller islands. They are covered with snow during the greater part of the year; their surface is generally rocky, and on some of them there are marks of volcanoes. They are chiefly remarkable for the bones and teeth of the mammoth, rhinoceros, buffalo, and other animals, which are found upon and beneath the surface of the ground. It was the search for this ivory which originally induced the Russians to visit these islands; and their first expedition for exploring them was equipped in 1820. These islands do not appear to be inhabited, though traces of human beings have been occasionally discovered by the Russians engaged in the fisheries. The Bear's Island group consists of six small islands, with several kinds of plants and shrubs on them, but no trees, although their shores are found to be covered with large drift-wood. The southernmost point of these islands is in latitude 69° 5′, and they extend to latitude 76° 20′. Their longitude is between 154° and 183° 50′ east from Greenwich.

In the Eastern Ocean the islands are thus classed:

1*st*, The islands of Gevosbewy and Nelken, in Behring's Straits, in latitude 65° 4′, with about 400 people.

2*d*, St Lawrence, latitude 63° 40′, and longitude 190° 26′, and three smaller islands on the south-east of it.

3*d*, St Mathew's, in latitude 60°, in the Sea of Kamtschatka, consisting of three islands, one of which was named by some early British navigators Pinnacle Island.

4*th*, The Prebelow Islands, in latitude 57°. Two of them have been named St Paul and St George. The former is about twenty-eight miles long and twenty broad, and both are well stocked with animals whose furs are valuable.

5*th*, The Aleutian Islands. This is a chain of islands extending from the peninsula of Kamtschatka to the American peninsula of Alaschka, between 51° and 55° 10′ north latitude, and 167° and 197° east longitude. (See ALEUTIAN ISLANDS.)

6*th*, The Kurile Islands. This chain extends from north latitude 43° 48′ to 50° 56′, and from longitude 145° 5′ to 156° 30′ east. They are evidently of volcanic origin. In some of them good water is found, but others are utterly destitute of it. The few inhabitants are of Japanese origin. Many of these islands have hitherto obtained no European names; but nineteen of the most considerable have been named by the Russians.

American Russia.

Russian America comprehends the north-west angle of the North American continent, as far as the 141st degree of longitude west from London, with a narrow stripe of coast reaching as far south as 55½° of north latitude. It occupies a surface of about 500,000 square miles, of which the useful soil forms but a very small proportion. Thick fogs continually brood over these shores. Some parts of the country, bristling with mountains of difficult access, present at every step impenetrable forests and extensive morasses; others, wholly without vegetation, offer to the eye nothing but sterile rocks. In short, the nature of the climate, and that of the soil itself, equally oppose prodigious obstacles to agriculture. The Russians have therefore been obliged to imitate the aborigines, in renouncing all attempts to form permanent establishments in the interior, and in fixing their abode upon the borders of the sea; it being there only that the chase, fishing, and trade, could furnish them with the means of subsistence.

The Russians who inhabit this remote part of the empire consist either of officers in the imperial navy or civil *employés*, who again quit these shores after a service of five years; or else of mechanics and workmen sent by the American Company. These latter, whose engagement is for seven years, also return home upon that term having expired; and even during the time of their sojourn in the colonies their names still remain upon the registers of their district, and the class to which they originally belonged. Exempted only from the conscription, they still continue to pay taxes; in short, the place of their birth is still regarded as their legal abode. The aborigines of the continent, with the exception of three tribes, are exempted from taxes; but they show a great reluctance to come under the restraints of civilization. On several of the numerous islands, as well as along the shores of the mainland, the Russian Company have hunting and fishing stations. The otter chase is the chief occupation in summer, together with the pursuit of aquatic birds and sea-calves. In winter, snares are laid for the white foxes; and dogs regularly trained for the purpose track the zizel to its subterranean abodes.

Novo Arkhangelsk or New Archangel, situated in latitude 57° 3′ and longitude 135° 20′, is the head establishment. It has a fortress with a small garrison and forty pieces of cannon. Hospitals and schools are established at the company's expense, which also takes upon itself the maintenance of the orphans and children of those among the tribes whose family is numerous. In these schools the children are taught reading, writing, arithmetic, and the precepts of religion. The priests attached to the churches of these colonies occasionally traverse the remotest regions, for the purpose of making converts; but, as may well be believed, their success is not in proportion to their zeal. On the 1st of January 1836 there were in American Russia 711 Russians, 1110 Creoles, 9101 Aleutians, and 99 Kuriles, being 11,021 inhabitants in the various settlements.

(R. R. R.)

RUSSOOA, a village of Thibet, on the northern face of the Himalaya Mountains, which marks the frontier of the Nepaul dominions in this direction. Long. 85. 40. E. Lat. 28. 3. N.

RUSSOOLPOOR, a town of Hindustan, belonging to the nabob of Oude, in the province of Allahabad, forty miles north-west from the city and fortress of Allahabad. Long. 81. 25. E. Lat. 25. 57. N.

RUST, the calx or oxide of a metal, iron, for instance, formed by exposure to the air, or by corroding and dissolving its superficial parts by some menstruum. Water is the great instrument or agent in producing rust; and hence oils and other fatty bodies secure metals from rust, water being no menstruum for oil, and therefore not able to make its way through it. Almost all metals are liable to rust. The rust of iron is not merely an oxide of that metal; it contains, besides, a portion of carbonate.

RUSTIC, in *Architecture*, implies a manner of building in imitation of nature, rather than according to the rules of art.

RUSTIC GODS, or *dii rustici*, in *Antiquity*, were the gods of the country, or those who presided over agriculture. Varro invokes the twelve *dii consentes*, as the principal amongst the rustic gods, viz. Jupiter, Tellus, the Sun, Moon, Ceres, Bacchus, Rubigus, Flora, Minerva, Venus, Lympha, and Good Luck. Besides these twelve arch-rustic gods, there were an infinity of lesser ones; as Pales, Vertumnus, Tutelina, Fulgor, Sterculius, Mellona, Jugatinus, Collinus, Vallonia, Terminus, Sylvanus, and Priapus. Struvius adds the Satyrs, Fauns, Sileni, Nymphs, and even Tritons, and gives the empire over all the rustic gods to the god Pan.

Rustic Work, is where the stones in the face, &c. of a building, instead of being smooth, are hatched, or picked with the point of a hammer.

RUSTRE, in *Heraldry*, a bearing of a diamond shape, pierced through in the middle with a round hole.

RUTH, a canonical book of the Old Testament, being a kind of appendage to the book of Judges, and an introduction to those of Samuel, and having its title from the person whose story is there principally related. In this story are observable the ancient rights of kindred and redemption; and the manner of buying the inheritance of the deceased, with other particulars of great note and antiquity. The canonicalness of this book was never disputed; but the learned are not agreed about the epoch of the history which it relates. Ruth the Moabitess is found in the genealogy of our Saviour. (Matt. i. 5.)

RUTHERGLEN, or by contraction Ruglen, the head burgh of the nether ward of Lanarkshire, in Scotland, is situated about two miles south-east of Glasgow, and nine west of Hamilton. Few towns in Scotland can lay claim to greater antiquity than Rutherglen. It was erected into a royal burgh by King David I. about the year 1126.

The territory under the jurisdiction of the burgh was extensive, and the inhabitants enjoyed many distinguished privileges, which were, however, gradually wrested from them by political influence in favour of Glasgow, which in latter times rose into consequence by trade and manufactures. The ancient dimensions of the place are now unknown; but in the fields and gardens towards the east, the foundations of houses are occasionally discovered.

About a hundred and fifty yards to the south of the main street is a kind of lane, known by the name of *Dins-dykes*. This place has acquired an opprobrious celebrity, from the circumstance which befell the unfortunate Queen Mary when her forces were routed at the battle of Langside. Her majesty, who, during the battle, stood on a rising ground about a mile from Rutherglen, no sooner saw her army defeated, than she took her precipitate flight to the south. Dinsdykes unluckily lay in her way. Two rustics, who were at that instant cutting grass hard by, seeing her majesty flying in haste, rudely attempted to intercept her, and threatened to cut her in pieces with their scythes if she presumed to proceed a step further. Neither beauty nor royalty would have secured her escape, had not some of her followers come to her relief.

Adjoining to a lane called the *Back-row* stood the castle of Rutherglen, originally built at a period coeval, it is reported, with the foundation of the town. This ancient fortress underwent several sieges during the unhappy wars in the days of King Robert Bruce, and it remained a place of strength until the battle of Langside; soon after which it was destroyed by order of the regent, to revenge himself on the Hamilton family, in whose custody it then was. The foundations of the buildings are now erased, and the site converted into dwelling-houses and gardens.

Rutherglen, in conjunction with Renfrew, Dumbarton, Kilmarnock, and Port-Glasgow, sends a member to the British parliament. The fairs of this town are generally well attended, and have long been famous for a great show of horses, of the Lanarkshire breed, which are esteemed the best draught-horses in Britain. The inhabitants of this borough still retain some customs of a very remote antiquity. One of these is the making of *Rutherglen sour cakes*. The operation is attended with some peculiar rites, which lead us to conclude that the practice is of Pagan origin. In 1821 the population of Rutherglen was about 1800, and including the parish it was 4640; in 1831 that of the town and parish was 5503.

RUTHIN, a borough and market town of the county of Denbigh, within the parish of Ruabon. It was formerly surrounded with walls, which are dilapidated; but it now consists of only one long street. It has still a corporation, consisting of two aldermen; and has markets, which are held on Mondays and Saturdays. The population amounted in 1801 to 1115, in 1811 to 1292, in 1821 to 1294, and in 1831 to 3376. The apparent increase on the last census arises from the parish of Llanfurog being then, but not before, included in that of the town.

RUTLAMGUR, a town of Hindustan, in the Mahratta territories, and province of Malwah, forty-seven miles north-north-west from Oojain. Long. 75. 26. E. Lat. 28. 46. N.

RUTLANDSHIRE, an English county, nearly in the centre of the kingdom, and the smallest of all the divisions so denominated. It is bounded by Lincolnshire on the east and north-east, by Leicestershire on the north-west and west, and by Northamptonshire on the south. Its length from north to south is sixteen, and its breadth from east to west is twelve miles. The square contents are 149 square statute miles, or 95,360 acres. It is divided into five hundreds, and contains two market-towns, Uppingham and Okeham, and forty-nine parishes; being a greater number, in proportion to its extent, than any other county in the kingdom.

It gives only one title at present, that of duke, to the family of Manners; two former peerages, that of Ferrars of Okeham, and Noel of Exton, being extinct. Only two members are returned to the House of Commons from the county, and none from either of the towns. In judicial affairs it is on the midland circuit of the judges; and in ecclesiastical matters it has formed, since the year 1541, a portion of the bishopric of Peterborough.

The appearance of this small county is pleasing to the traveller. It is much diversified by ranges of moderate hills running from east to west, in some parts well timbered. Between these ranges of hills, the valleys, of about half a mile in breadth, are luxuriant and verdant. The principal vale, called Catmose, is in the centre of the county, having to the north a tract of table-land overlooking the well-wooded plains of Leicester, Lincoln, and Nottinghamshire. The eastern part is more diversified; the southern division of it consisting of a beautiful valley, stretching towards Northamptonshire, and the western, bordering on Leicestershire, being abundantly wooded.

The soil on the eastern and south-eastern parts is chiefly shallow, resting upon a basis of limestone, composed of clays and loams. The other parts consist principally of a tenacious but fertile loam; but the vale of Catmose enjoys a most fertile soil of good clay, or red loam, or a grateful mixture of both these earths. A peculiarity of the soil is a redness, which generally prevails, and which tinges all the waters of the country.

Mr Parkinson, surveyor for the Board of Agriculture, estimates the land of the county in the following manner, viz. pasture land, 34,861 acres; arable land, 42,536; wastes, 30; woods, 2815; meadows, 9356; commons, 693; plantations, 65; lakes and ponds, 44 acres.

The woods of this county were far more extensive in former ages than they are at present. The ancient forest of Leafield, and the chase of Beaumont, though now under the plough, once occupied a great portion of the surface. The climate is generally accounted peculiarly soft and healthy; and the elevation is of that medium kind which equally exempts it from the pernicious effects of moist exhalations and cold mountain fogs.

The agriculture, though it has partaken of some modern improvements, is not, upon the whole, conducted in the best manner. In some parts, the reprobated system of two corn crops succeeding a fallow is still continued. In other parts, after a fallow, barley is sown with clover; the clover is mowed in two years, or sometimes fed the second year, and then, after one ploughing, the land is sown with wheat. In some cases, on the lighter lands, the four-course system of turnips, barley, clover, and wheat, is followed. The wheat of Rutlandshire is highly valued for seed, and is much in request in even very distant counties. Nearly two thirds of the land are tithe free, and in all the late enclosures, provisions to that end have been inserted in the acts of parliament for effecting them. The cows of Rutlandshire are remarkable for the richness of their milk, though they yield but a small quantity. The rich cheese commonly known as Stilton is chiefly made in the dairies of this county. As many oxen are brought from the more northern countries, and fattened in Rutlandshire, as are bred within it, the annual number of each being from 2700 to 3000. The sheep are more numerous in proportion than horned cattle. Mr Parkinson calculated them to be about 80,000; consisting of old and new Leicesters, of Southdowns, and a few Lincolnshires. It has been remarked, that though the quality of the wool has increased in fineness, the diminution in the weight of the fleeces has of late years more than counterbalanced that advantage.

The small rivulets that water this district run into the two rivers, the Guash, or Wash, which passes through it, or the Walland, which forms its southern boundary. The latter river is navigable only to Stamford, on the confines of Rutlandshire; but is useful in opening a communication with the ocean. A canal has been constructed from Okeham to Melton-Mowbray, by which a supply of coals has been drawn from the mines of Leicestershire.

Rutlandshire is neither a manufacturing nor a mineral district, but depends exclusively on its agriculture. By the returns of 1801 the inhabitants were 16,356, viz. 7978 males, and 8378 females; in 1811 the numbers were 16,380, viz. 7931 males, and 8449 females; in 1821 they were 18,487, viz. 9223 males, and 9264 females; and in 1831 the numbers were 19,385, viz. 9721 males, and 9664 females. Of these there were 2299 families chiefly employed in agriculture; 1102 families chiefly employed in trade, manufactures, and handicraft; and 790 not comprised in any of these classes.

RUTNAGIRI, a town of Hindustan, in the territories of the Nagpoor Mahrattas, and province of Bejapoor, on the east coast of the Concan district. Long. 78. 3. E. Lat. 17. 1. N.

RUTTUNPORE, a town of Hindustan, the capital of a small district of the same name, in the province of Gundwana, and district of Choteesgur, of which it is the capital. It is only a straggling village of about a thousand huts, many of which are uninhabited. It is situated in a remarkably productive and fertile country compared with the rest of the province, which is desolate and barren. This place is said to have been in possession of a family of Rajpoot Hindus from time immemorial. Their last independent chief, Sindar Sing, was, after a severe contest, subdued by Ragogee Bounsla, the founder of the Nagpoor dynasty. It was here that a number of French troops, who were endeavouring to effect a retreat from Bahar through the country into the Deccan, halted, when they were entertained for a few days by Bombajee, the Mahratta sovereign, and at the end of that time treacherously murdered. The travelling distance from Calcutta by Chuta Nagpoor is 493 miles, from Nagpoor 220 miles, from Delhi 633, from Poonah 706 miles. Long. 82. 35. E. Lat. 22. 16. N.

RUYSCH, Frederick, one of the most eminent anatomists of which Holland can boast, was born at the Hague in 1638. After making great progress at home, he repaired to Leyden, and there prosecuted the study of anatomy and botany. He next studied at Franeker, where he obtained the degree of doctor of physic. He then returned to the Hague, and marrying in 1661, dedicated his whole time to the study of his profession. In 1665 he published a treatise entitled *Dilucidatio Valvularum de variis Lymphaticis et Lacteis*, which raised his reputation so high that he was chosen professor of anatomy at Amsterdam. This honour he accepted with the more pleasure, because his situation at Amsterdam would have given him easy access to every requisite help for cultivating anatomy and natural history. After he settled in Amsterdam, he was perpetually engaged in dissecting, and in examining with the most inquisitive eye, the various parts of the human body. He improved the science of anatomy by new discoveries; and, in particular, he found out a way to preserve dead bodies many years from putrefaction. His anatomical collection was curious and valuable. He had a series of fœtuses of all sizes, from the length of the little finger to that of a new-born infant. He had also bodies of full-grown persons of all ages, and a vast number of animals of almost every species on the globe, besides a great many other natural curiosities. Peter the Great of Russia, in his tour through Holland in the year 1698, visited Ruysch, and was so charmed with his conversation, that he passed whole days with him; and when the hour of departure came, he left him with regret. He set so high a value on Ruysch's cabinet of curiosities, that when he returned to Holland in 1717, he purchased it for thirty thousand florins, and sent it to St Petersburg.

In 1685 he was made professor of medicine, an office which he discharged with great ability. In 1728 he got his thigh-bone broken by a fall in his chamber. The year before this misfortune happened, he had been deprived of his son Henry, a youth of talents, and well skilled in anatomy and botany, who had been created a doctor of physic, and was supposed to have assisted his father in his discoveries and publications. Ruysch's family now consisted only of his youngest daughter. This lady had been early inspired with a passion for anatomy, the favourite science of her father and brother, and had studied it with success. She was therefore well qualified to assist her father in forming a second collection of curiosities in natural history and anatomy, which he began to make after the emperor of Russia had purchased the first. Ruysch is said to have been of so healthy a constitution, that though he lived to the age of ninety-three, yet during that long period he did not labour above a month under the infirmities of disease. From the time he broke his thigh he was indeed disabled from walking without a support; yet he retained his vigour both of body and mind without any sensible alteration, until in 1731 his strength at once deserted him. He died on the 22d of February the same year. His anatomical works are printed in four vols. 4to.

The style of his writings is simple and concise, but sometimes inaccurate. Instruction, and not ostentation, seems to be his only aim. In anatomy he undoubtedly made many discoveries; but from not being sufficiently conversant with the writings of other anatomists, he published as discoveries what had been known before. The Academy of Sciences at Paris in 1727 elected him an honorary member, in place of Sir Isaac Newton, who had lately deceased. He was also a member of the Royal Society of London.

RUYSSELEDE, a town of Belgium, in the province of West Flanders and circle of Bruges. It contains 5400 inhabitants, who are employed in making linen and some woollen goods.

RUYTER, Michael Adrian, a distinguished naval officer, was born at Flushing, a town of Zealand, in the year 1607. He entered on a seafaring life when he was only eleven years old, and was first a cabin-boy. Whilst he advanced successively to the rank of mate, master, and captain, he acquitted himself with ability and honour in all these employments. He repulsed the Irish, who attempted to take

Dublin out of the hands of the English; he made eight voyages to the West Indies, and ten to Brazil; he was then promoted to the rank of rear-admiral, and sent to assist the Portuguese against the Spaniards. When the enemy came in sight, he advanced boldly to meet them, and gave such unquestionable proofs of valour as drew from the Portuguese monarch the warmest applause. His gallantry was still more conspicuous before Salee, a town of Barbary. With a single vessel he sailed through the roads of that place, in defiance of five Algerine corsairs who came to attack him.

In 1653 a squadron of seventy vessels was despatched against the English, under the command of Admiral Van Tromp. Ruyter, who accompanied the admiral in this expedition, seconded him with great skill and bravery in the three battles which the English so gloriously won. He was afterwards stationed in the Mediterranean, where he captured several Turkish vessels. In 1659 he received a commission to join the king of Denmark in his war with the Swedes; and he not only maintained his former reputation, but even raised it higher. As a reward of his services, the king of Denmark ennobled him and gave him a pension. In 1661 he run ashore a vessel belonging to Tunis, released forty Christian slaves, made a treaty with the Tunisians, and reduced the Algerine corsairs to submission. His country, as a testimony of her gratitude for such illustrious services, raised him to the rank of vice-admiral and commander in chief. To the latter dignity, the highest that could be conferred upon him, he was well entitled by the signal victory which he obtained over the combined fleets of France and Spain. This battle was fought in 1672, about the time of the conquest of Holland. The battle was maintained between the English and Dutch with the obstinate bravery of nations which were accustomed to dispute the empire of the ocean. Ruyter having thus made himself master of the sea, conducted a fleet of Indiamen safely into the Texel; thus defending and enriching his country, whilst it had become the prey of hostile invaders. The next year he had three engagements with the fleets of France and England, in which, if possible, his bravery was still more distinguished than ever. D'Estrées, the French vice-admiral, wrote to Colbert, "I would purchase with my life the glory of De Ruyter." But he did not long enjoy the triumphs which he had so honourably won. In an engagement with the French fleet off the coast of Sicily, he was defeated and received a mortal wound, which in a few days put an end to his life. His corpse was carried to Amsterdam, and a magnificent monument to his memory was there erected by the command of the states-general. The Spanish council had bestowed on him the title of duke, and transmitted a patent investing him with that dignity; but he died before it arrived. When Louis XIV. was congratulated upon De Ruyter's death, he replied, "Every one must be sorry at the death of so great a man."

RYACOTTA, a town and celebrated fortress of the south of India, added to the Baramuhl district by the Marquis Cornwallis, in virtue of a treaty he concluded with Tippoo. The fort is very strong by nature, and it has been further fortified by art, as this place is the chief key to Karnata. The air is so temperate here, from the elevation of the ground, that even in the hot season the thermometer scarcely ever rises higher than 82° of Fahrenheit. Ryacotta was besieged in 1791 by Major Gowdie; and though it was of such strength, yet the garrison were intimidated by the spirited attacks of the besiegers, and surrendered, though amply supplied with guns, ammunition, and provision for its defence. It is ninety-eight miles east by north from Seringapatam. Long. 78. 1. E. Lat. 12. 33. N.

RYAGUDD, a town of Hindustan, possessed by independent zemindars, in the province of Orissa. It is sixty miles north-west from Cicacole. Long. 83. 27. E. Lat. 19. 1. N.

RYCHOOR, a town of Hindustan, in the nizam's territories, and the province of Bejapoor. It is the capital of a district of the same name, and is 130 miles south-west from Hyderabad. It is an irregularly-built town, being an old fort with some new works. It is commanded by a hill, and by some rising grounds near it. Long. 77. 17. E. Lat. 15. 59. N. The district extends along the north bank of the Toombuddra river, between the 15th and 16th degrees of north latitude.

RYDE, a hamlet within the parish of Newchurch, in the Isle of Wight. It has become a place of some importance, from having of late years been the resort of numerous families for the purpose of sea-bathing. It is opposite to Portsmouth, and from its vicinity to Spithead has some trade in supplying fresh stock and vegetables to the ships of war. It is finely situated, and the bathing is good. The population in 1801 amounted to 2039, in 1811 to 2847, in 1821 to 3945, and in 1831 to 4928.

RYDROOG, a town and district of Hindustan, in the Balaghaut ceded territories. The town is 170 miles north by east from Seringapatam. Long. 77. 2. E. Lat. 14. 49. N. The district is situated principally between the 14th and 15th degrees of north latitude. The Hoggry is the chief river, and the principal towns are Rydroog and Mulkamarroor. This district was ceded to the Company in 1800, and a pension allowed to the polygar's family, to whom it belonged.

RYE, a borough and seaport of the county of Sussex, in the hundred of Gostrow and rape of Hastings, 63 miles from London. It is a member of the Cinque Ports, but of a later date than the others. The harbour has been nearly choked up, partly by the recession of the sea, though it has been recently somewhat improved by a new cut. It was once fortified, but is ill built. It has a corporation, and returned two members to the House of Commons till 1832, since which it elects but one; and its corporation, by the late law, consists of four aldermen and twelve councillors, but no justice of the peace. It has markets, which are held on Wednesday and Friday. The population in 1801 amounted to 2187, in 1811 to 2681, in 1821 to 3599, and in 1831 to 3715.

RYEPOOR, a town of Hindustan, in the province of Gundwana, and district of Choteesgur. This town, from its population and commerce, may be ranked amongst the first in the Choteesgur district. It contains 3000 huts, and has a stone fort on the north-east side of the town. It is sixty-nine miles from Ruttunpoor. Long. 82. 26. E. Lat. 21. 17. N.

RYLST, a city of Russia, in the government of Kursk, and the capital of a circle of the same name. It is built at the junction of the river Ryla with the Gem, and contains four stone and fourteen wooden churches, 840 houses, with 6300 inhabitants, who have considerable trade. It is 847 miles from St Petersburg. Long. 35. 3. E. Lat. 51. 35. N.

RYMER, Thomas, the author of that well-known and important work the *Fœdera*, was born in the north of England, and educated at the grammar-school of Northallerton. He was admitted a scholar at Cambridge, then became a member of Gray's Inn, and at length was appointed historiographer to King William in place of Mr Shadwell. He wrote a View of the Tragedies of the last Age, and afterwards published a tragedy named Edgar. For a critic he was certainly not well qualified, for he wanted candour; nor is his judgment much to be relied on, who could condemn Shakspeare with such rigid severity. His tragedy will show that his talents for poetry were by no means equal to those whose poems he has publicly censured. But though he has no title to the appellation of poet or critic, as an antiquarian and historian his memory will long be preserved. His *Fœdera*, which is a collection of all public documents of the kings of England with foreign princes, is esteemed one of our most authentic and valuable records, and is oftener referred to by the best English historians than any other book in the language. It was published at London in the beginning of the eighteenth century, in seventeen volumes folio. Three volumes more were added by Sanderson after Rymer's death. The whole were reprinted at the Hague in ten vols., 1739. They were abridged by Rapin in French, and inserted in Le Clerc's *Bibliothèque*, a translation of which was made by Stephen Whatley, and printed in four vols. 8vo, 1731. Rymer died on the 14th of December 1713, and was buried in the parish church of St Clement Danes. Some specimens of his poetry are preserved in the first volume of Mr Nichol's Select Collection of Miscellaneous Poems, 1780.

RYNABAD, a small village of Hindustan, in the province of Bengal, and district of Jessore. For a long time rumours were circulated that extensive ruins existed in the Sunderbunds, and particularly in the vicinity of Rynabad. But though repeated investigations have been made, none have been discovered.

RYOTS, in the policy of Hindustan, the name by which the renters of land are distinguished. They hold their possessions by a lease, which may be considered as perpetual, and at a rate fixed by ancient surveys and valuations. This arrangement has been so long established, and accords so well with the ideas of the natives concerning the distinction of castes, and the functions allotted to each, that it has been invariably maintained in all the provinces subject either to Mahommedans or Europeans; and to both it serves as the basis on which their whole system of finance is founded. Respecting the precise mode, however, in which the ryots held their possessions, there are many different opinions, for which we refer to Robertson's Historical Disquisition concerning India.

RYSWICK, a village of the province of Holland, in the circle of the Hague, and near that city, which is pleasantly situated, and contains some good country-houses and pleasure-gardens, and 1820 inhabitants. Near to it is the palace of Niewmburg, where was signed the general treaty of peace in 1697, which bears this name.

RZESZOW, a city of the Austrian province of Gallicia, and the capital of a circle which extends over 1782 square miles. It comprehends four cities, thirteen market-towns, and three hundred and thirty-three villages, with 251,500 inhabitants. The city stands on the river Wisloch, and contains 388 houses, with 4850 inhabitants. It has some trade in making linen and woollen goods, and some goldsmiths' work.

S.

S, or s, the eighteenth letter and fourteenth consonant of our alphabet. The sound of it is formed by driving the breath through a narrow passage between the palate and the tongue elevated near it, together with a motion of the lower jaw and teeth towards the upper, the lips being a little way open, with such a configuration of every part of the mouth and larynx as renders the voice somewhat sibilous and hissing. Its sound, however, varies; being strong in some words, as *this, thus*, and soft in words which have a final *e*, as *muse, wise*. It is generally doubled at the end of words, by which they become hard and harsh, as in *kiss, loss*. In some words it is silent, as *isle, island, viscount.*

In abbreviation, S. stands for *societas* or *socius;* as R. S. S. for *regiæ societatis socius*, fellow of the royal society. In medicinal prescriptions, S. A. signifies *secundum artem*, according to the rules of art. And in the notes of the ancients, S. stands for *Sextus;* S. P. for *Spurius;* S. C. for *senatus consultum;* S. P. Q. R. for *senatus populusque Romanus;* S. S. S. for *stratum superstratum*, one layer above another alternately; S. V. B. E. E. Q. V. for *si vales bene est, ego quoque valeo*, a form used in Cicero's time in the beginning of letters. Used as a numeral, S. anciently denoted seven; in the Italian music, S. signifies *solo;* and in books of navigation, S. stands for south, S. E. for south-east, S. W. for south-west, S. S. E. for south-south-east, S. S. W. for south-south-west, &c.

SAADE, a town of the mountainous district of Yemen, in Arabia, and the most important in the district. It is the residence of an imam or chief, whose power is limited, and his territories small; and he is often so hard pressed by his highland neighbours that he finds it difficult to maintain his ground. He imposes a duty on all goods passing from Yemen into the interior of Arabia, and from this source his revenue chiefly arises. It is 368 miles north-north-east of Mocha.

SAARBRUCK, a city of the Prussian government of Treves, the capital of a circle of the same name, and 215 square miles in extent. It stands on the river Saar, over which is a bridge connecting it with the large suburb of St John's. It is old and strongly built, and the suburb contains 1070 houses, with 6740 inhabitants, who carry on some iron-works, and have barges navigating the river, which is navigable up to the bridge.

SAAR-LOUIS, a city of the Prussian government of Treves, and the capital of a circle of the same name, of 189 square miles in extent. It is situated on the river Saar, and celebrated for the strength of its fortifications, which were constructed by Vauban, under Louis XIV. It is well and regularly built, and contains three churches, 550 houses, and 5800 inhabitants, who are employed in iron-works, chiefly in making weapons. Long. 6. 43. E. Lat. 49. 14. N.

SAASA, a village of Palestine, in the district which is said, on the authority of tradition, to have been the burial-place of Nimrod. It is forty miles north-west of Sarchad.

SAATZ, a city of the Austrian kingdom of Bohemia, the capital of a circle of the same name, which extends over 921 square miles, and contains 126,500 inhabitants. The river Eger runs by the town. It has a collegiate church, a gymnasium, and 640 houses, with 4180 inhabitants. Long. 14. 10. E. Lat. 50. 18. 35. N.

SAAVEDRA, Michael de Cervantes, a celebrated Spanish writer, and the inimitable author of Don Quixote, was born at Madrid in the year 1541. From his infancy he was very fond of books; but he applied himself wholly to books of entertainment, such as novels and poetry of all kinds, especially Spanish and Italian authors. From Spain he went to Italy, either to serve Cardinal Aquaviva, to whom he was chamberlain at Rome, or else to follow the profession of a soldier, as he did for some years under the victorious banners of Marco Antonio Colonna. He was present at the battle of Lepanto, in the year 1571; in which he either lost his left hand by the shot of an harquebus, or had it so maimed that he lost the use of it. After this he was taken by the Moors, and carried to Algiers, where he continued a captive five years and a half. Then he returned to Spain, and applied himself to the writing of comedies and tragedies; and he composed several, all of which were well received by the public, and acted with great applause. In the year 1584 he published his Galatea, a novel in six books, which he presented to Ascanio Colonna, a man of high rank in the church, as the first fruits of his wit. But the work which has done him the greatest honour, and will immortalize his name, is the history of Don Quixote, the first part of which was printed at Madrid in the year 1605. This is a satire upon books of knight-errantry, and the principal if not the sole end of it was to destroy the reputation of those books which had so infatuated the greater part of mankind, and especially those of the Spanish nation. This work was universally read; and the most eminent painters, tapestry-workers, engravers, and sculptors, have been employed in representing the history of Don Quixote. Cervantes, even in his lifetime, obtained the glory of having his work receive a royal approbation. As Philip III. was standing in a balcony of his palace at Madrid, viewing the country, he observed a student on the banks of the river Manzanares reading in a book, and from time to time breaking off, and beating his forehead with extraordinary tokens of pleasure and delight; upon which the king remarked to those about him, "That scholar is either mad or is reading Don Quixote." The latter proved to be the case. But *virtus laudatur et alget.* Notwithstanding the vast applause his book everywhere met with, he had not interest enough to procure a small pension, for he could scarcely keep himself from starving. In the year 1615 he published a second part; to which he was partly moved by the presumption of some scribbler, who had the year before published a continuation of this work. He wrote also several novels, and amongst the rest the Troubles of Persiles and Sigismunda. He had employed many years in writing this novel, and finished it just before his death; for he did not live to see it published. His sickness was of such a nature that he himself was able to be, and actually was, his own historian. At the end of the preface to the Troubles of Persiles and Sigismunda, he represents himself on horseback upon the road, and a student, who had overtaken him, engaged in conversation with him. "And happening to talk of my illness," says he, "the student soon let me know my doom, by saying it was a dropsy I had got; the thirst attending which, all the water of the ocean, though it were not salt, would not suffice to quench. Therefore Señor Cervantes, says he, you must drink nothing at all, but do not forget to eat; for this alone will recover you without any other physic. I have been told the same by others, answered I; but I can no more forbear tippling, than if I were born to do nothing else. My life is drawing to an end; and from the daily journal of my pulse, I shall have finished my course by next Sunday at the farthest. But adieu, my merry friends all, for I am going to die; and I hope to see you ere long in the other world, as happy as heart can wish." His dropsy increased, and at last proved fatal to him; yet he continued to say and to write bon mots. He received the last sacrament on the 18th of April 1616; yet the day after, he wrote a dedication of the Troubles of Persiles and Sigismunda to the Conde de Lemos. The particular day of his death is not known.

SABAGAN ISLANDS, a group of small islands in the Red Sea. Long. 41. 54. E. Lat. 14. 55. N.

SABAZIA, in Greek antiquity, were nocturnal mysteries in honour of Jupiter Sabazius. All the initiated had a golden serpent put in at their breasts, and taken out at the lower part of their garments, in memory of Jupiter's ravishing Proserpina in the form of a serpent. There were also other feasts and sacrifices distinguished by this appellation, in honour of Mithras, the deity of the Persians, and of Bacchus, who was thus denominated by the Sabians, a people of Thrace.

SABBATARIANS, or SEVENTH-DAY BAPTISTS, a sect of Anabaptists, so called because they observed the Jewish or Saturday-Sabbath, from a persuasion that it was never abrogated in the New Testament by the institution of any other.

Definition.

SABBATH, in the Hebrew language, signifies *rest*. The seventh day was denominated the *Sabbath*, or *day of rest*, because in it God rested from all his works which he had created. From that time the seventh day seems to have been set apart for religious services; and, in consequence of a particular injunction, it was afterwards observed by the Hebrews as a holiday. They were commanded to set it apart for sacred purposes in honour of the creation, and likewise in memorial of their own redemption from Egyptian bondage.

Importance of the institution, and early ceremonies.

The importance of the institution may be gathered from the different laws respecting it. When the ten commandments were published from Mount Sinai in tremendous pomp, the law of the Sabbath held a place in what is commonly called the first table; and by subsequent statutes the violation of it was to be punished with death. Six days were allowed for the use and service of man; but the seventh day God reserved to himself, and appointed it to be observed as a stated time for holy offices, and to be spent in the duties of piety and devotion. On this day the ministers of the temple entered upon their week; and those who had attended on the temple service the preceding week went out at the same time. New loaves of shew-bread were placed upon the golden table, and the old ones were taken away. Two lambs were offered for a burnt-offering, together with a certain proportion of fine flour, mingled with oil, for a bread-offering, and wine for a libation. The Sabbath, like all other festivals, was celebrated from evening to evening. It began at six in the evening on Friday, and ended at the same time the next day.

Time of its institution.

Concerning the time at which the Sabbath was first instituted, different opinions have been held. Some have maintained, that the sanctification of the seventh day, mentioned in Genesis ii., is only there spoken of as *δια προλεψιν*, or by anticipation; and is to be understood of the Sabbath afterwards enjoined the children of Israel at the commencement of the Mosaic dispensation. But without entering into a particular examination of all the arguments produced in support of this opinion, a few observations, it is presumed, will be sufficient to show that it rests upon no solid foundation.

It cannot easily be supposed that the inspired penman would have mentioned the sanctification of the seventh day amongst the primeval transactions, if such sanctification had not taken place until 2500 years afterwards. Writers, ambitious of that artificial elegance which the rules of criticism have established, often bring together in their narrative events which were themselves far distant, for the sake of giving form to their discourse; but Moses appears to have despised all such flimsy refinements, and to have constructed his narrative in conformity to the series of events.

Religious service in the patriarchal age.

From the accounts we have of the religious service practised in the patriarchal age, it appears that, immediately after the fall, when Adam was restored to favour through a Mediator, a stated form of public worship was instituted, which man was required to observe, in testimony, not only of his dependence on the Creator, but also of his faith and hope in the promise made to our first parents, and seen by them afar off. Of an institution, then, so grand and important, no circumstance would be omitted that is necessary to preserve it, or that contributes to render the observance of it regular and solemn.

That determined times are necessary for the due celebra-

Necessity of stated days for the performance.

tion of divine service, cannot be denied. Such is the constitution of man, that he must have particular times set apart for particular services. He is doomed to toil and labour, to earn his bread with the sweat of his brow; and is capable of performing religious duties only in such a manner as is consistent with his situation in the world. If stated times for religious solemnities had not been enjoined, the consequence would have been, that such solemnities would have been altogether neglected; for experience shows, that if mankind were left at liberty when and how often they should perform religious offices, these offices would not be performed at all. It is the observation of holy times that preserves the practice of holy services; and without the frequent and regular returns of hallowed days, man would quickly forget the duty which he owes to God, and in a short time no vestige of religion would be found in the world.

Objections to the early institution of the Sabbath considered.

Among the ordinances which God vouchsafed his ancient people, we find that the pious observation of holidays was particularly insisted upon; and the Sabbath was enjoined to be kept holy, in the most solemn manner, and under the severest penalties. Can it then be supposed that He would suffer mankind, from the creation of the world to the era of Moses, to remain without an institution so expedient in itself, and as well fitted to answer the end proposed by it under the one dispensation, as ever it could be under the other? No. We have every imaginable reason to conclude, that when religious services were enjoined, religious times were appointed also; for the one necessarily implies the other.

It is not an objection to the early institution of the Sabbath that there is no mention of it in the patriarchal age. It would have swelled the Bible to a most enormous size had the sacred historian given a particular account of all the transactions of those times; and, besides, it would have answered no end. When Moses wrote the book of Genesis, it was unnecessary to relate minutely transactions and institutions already well known by tradition. Accordingly we see that his narrative is everywhere very concise, and calculated only to preserve the memory of the most important facts. However, if we take a view of the church-service of the patriarchal age, we shall find that what is called the legal dispensation, at least the liturgic part of it, was no new system, but a collection of institutions observed from the beginning, and republished in form by Moses. The Scriptures inform us that Cain and Abel offered sacrifices; and the account which is given of the acceptance of the one, and the rejection of the other, evidently shows that stated laws respecting the service had then taken place. "In process of time," at the end of the days, "Abel brought an offering." Here was priest, altar, matter of sacrifice, appointed time, motive to sacrifice, and atonement made, and accepted. The distinction of animals into clean and unclean before the Flood, and Noah's sacrifice immediately after his deliverance, without any new direction, is an unanswerable proof of the same truth. It is testified of Abraham, by God himself, that he kept his charge, his commandments, his statutes, and his laws. These expressions comprehend the various branches into which the law given at Sinai was divided. They contain the moral precepts, affirmative and negative, the matter of religious service, a body of laws to direct obedience, and to which man was to conform his conduct in every part of duty. Agreeably to this, we find that sacrifices were offered, altars and places of worship consecrated, and the Sabbath also mentioned as a well-known solemnity, before the promulgation of the law. It is expressly taken notice of at the fall of manna; and the incidental manner in which it is then mentioned is a convincing proof that the Israelites were no strangers to the institution. For had it been a new one, it must have been enjoined in a positive and particular manner, and the nature of it must have been laid open and explained, otherwise the term would have conveyed no meaning.

Argument from the general division of time into weeks.

The division of time into weeks, or periods of seven days, which obtained so early and almost universally, is a strong indication that one day in seven was always distinguished in a particular manner. *Week*,[1] and *seven days*, are in scripture language synonymous terms. God commanded Noah, seven days before he entered the ark, to introduce into it all sorts of living creatures. When the waters of the Flood began to abate, Noah sent forth a dove, which, finding no rest for the sole of her foot, returned to him. After seven days he sent forth the dove a second time, and again she returned to the ark. At the expiration of other seven days he let go the dove a third time; and a week is spoken of (Gen. xxix.) as a well-known period of time.

This septenary division of time has, from the earliest ages, been uniformly observed over all the eastern world. The Israelites, Assyrians, Egyptians, Indians, Arabians, and Persians, have always made use of a week, consisting of seven days. Many vain attempts have been made to account for this uniformity; but a practice so general and prevalent could never have taken place had not the septenary distribution of time been instituted from the beginning, and handed down by tradition.

From the same source also must the ancient heathens have derived their notions of the sacredness of the seventh day. That they had such notions of it is evident from several passages of the Greek poets quoted by Aristobulus, a learned Jew, by Clement of Alexandria, and Eusebius.

———ἑβδομη, ἱερον ἡμαρ.
The seventh, the *sacred* day.

Ἑβδοματη δ' ἐπειτα κατηλυθεν, ἱερον ἡμαρ.
Afterwards came the seventh, the *sacred* day.

Again:

Ἑβδομον ἡμαρ ἐην, και τω τετελετο παντα.
On the *seventh* day all things were *completed*.

Ἑβδοματη δυοι τετελησμενα παντα τετυκται.
All things were made *perfect* on the *seventh* day.

That they likewise held the number *seven* in very high estimation, has been shown by a learned, though sometimes fanciful author,[2] with such evidence as to enforce conviction. The Pythagoreans call it the venerable number, σεβασμου ἀξιος, worthy of veneration, and held it to be perfect and most proper to religion. They denominated it fortune, and also styled it voice, sound, muse, because, no doubt, seven distinct notes comprehend the whole scale of music, beyond which neither voice nor instrument can go, but must return from the seventh, and begin again anew. They likewise designed it τελεσφορος, leading to the end. Seven, in the Hebrew language, is expressed by a word that primarily signifies fulness, completion, sufficiency, and is applied to a week, or seven days, because that was the full time employed in the work of creation; to the Sabbath, because on it all things were completed; and to an oath, because it is sufficient to put an end to all strife. This opening of the Hebrew root will enable us to come at the meaning of those expressions of the heathens, and also let us see whence they derived their ideas and modes of speaking, and that the knowledge of the transactions at the creation, though much perverted, was never entirely lost by them.

It has been supposed by some, that the heathens borrowed the notion of the sacredness of the seventh day from the Jews. But this opinion will not readily be admitted, when it is considered that the Jews were held in the greatest contempt by the surrounding nations, who derided them no less for their sabbaths than for their circumcision. All sorts of writers ridiculed them on this account. Seneca charged them with spending the seventh part of their time in sloth. Tacitus said, that not only the seventh day, but also the seventh year, was unprofitably wasted. Juvenal brings forward the same charge; and Persius upbraided them with their *recutita sabbata*. Plutarch said that they kept it in honour of Bacchus; Tacitus affirmed that it was in honour of Saturn; but the most abominable assertion of all is that of Apion, who said that they observed the Sabbath in memory of their being cured on that day of a shameful disease, called by the Egyptians *sabbo*.

---

[1] שבע, *seven*.

[2] Holloway's Originals, vol. ii. p. 60.

Some, perceiving the force of this objection, have contended that time was divided into weeks of seven days, that each of the planetary gods, the Sun, Moon, Mercury, Venus, Mars, Jupiter, and Saturn, who were the *Dii majorum gentium*, might have a day appropriated to his service. But if such was the origin of weeks, how came the great and ancient goddess Tellus to be omitted? She was worshipped by the early idolaters as well as the other planets, and must surely have been deemed by them as worthy of a particular day set apart to her honour as the planet Saturn, who was long undiscovered, afterwards seen but occasionally, and at all times considered as of malign aspect.

Still manner in which the ancient Jews observed the sabbath.

Others have supposed, that as the year was divided into lunar months of something more than twenty-eight days, it was natural to divide the months into quarters from the different phases of the moon, which would produce as many weeks of seven days. But this supposition is less tenable than the former. The phases of the moon are not so precisely marked at the quarters as to attract to them any particular notice; nor are the quarterly appearances of one month commonly like those of another. We cannot, therefore, conceive what should have induced the earliest observers of the phases of the moon to divide the month into four parts rather than into three, or five, or seven. Had the ancient week consisted of fourteen days, it might have been inferred, with some degree of plausibility, that its length was regulated by the phases of the moon, because the shape of that luminary, at the end of the second quarter, is very precisely marked; but there is nothing which, in the present hypothesis, could have everywhere led mankind to make their weeks consist of seven days. This division of time, therefore, can be accounted for only by admitting the primeval institution of the Sabbath, as related by Moses in the book of Genesis. That institution was absolutely necessary to preserve among men a sense of religion; and it was renewed to the Jews at the giving of the law, and its observance enforced by the severest penalties. It was accordingly observed by them with more or less strictness in every part of their commonwealth; and there is none of the institutions of their divine lawgiver which, in their present state of dispersion, they more highly honour. They regard it, indeed, with a superstitious reverence, call it their spouse, their delight, and speak of it in the most magnificent terms. They have often varied in their opinions of the manner in which it ought to be kept. In the time of the Maccabees, they carried their respect for the sabbath so very high, that they would not on that day defend themselves from the attacks of their enemies. But afterwards they did not scruple to stand upon their necessary defence, although they would do nothing to prevent the enemy from carrying on their operations. When our Saviour was on earth, it was no sin to loose a beast from the stall and lead him to water; and if he had chanced to fall into a ditch, they pulled him out. But now it is absolutely unlawful to give a creature in that situation any other assistance than that of food; and if they lead an animal to water, they must take care not to let the bridle or halter hang loose, otherwise they are transgressors.

Mode of observing it among the modern Jews.

As the law enjoins rest on that day from all servile employments, in order to comply with the injunction, they undertake no kind of work on Friday but such as can easily be accomplished before evening. In the afternoon they put into proper places the meat that they have prepared to eat the day following. They afterwards set out a table covered with a clean cloth, and place bread upon it, which they also cover with another cloth; and during the sabbath the table is never moved out of its place. About an hour before sunset, the women light the sabbath lamps, which hang in the places where they eat. They then stretch forth their hands to the light, and pronounce the following benediction. "Blessed be thou, O God, king of the world, who hast enjoined us, that are sanctified by thy commandments, to light the sabbath lamp." These lamps are two or more in number, according to the size of the chamber in which they are suspended, and continue to burn during the greater part of the night. In order to begin the sabbath well, they wash their hands and faces, trim their hair, and pair their nails, beginning at the fourth finger, then going to the second, then the fifth, then the third, and ending with the thumb. If a Jew casts the parings of his nails to the ground, he is *rascah*, that is, a wicked man; for Satan has great power over those parings of nails; and it seems they are of great use to the wizards, who know how to employ them in their enchantments. If he buries them in the earth, he is *tzedic*, that is, a just man; if he burns them in the fire, he is *chesid*, that is, worthy of honour, or an holy man. When they have performed these preparatory ceremonies, they repair to the synagogue, and enter upon their devotions. As soon as prayers begin, the departed souls spring out of the purgatorial flames, and have liberty to cool themselves in water while the sabbath lasts, for which reason the Jews prolong the continuance of it as much as they can; and the rabbin have strictly commanded them not to exhaust all the water on the sabbath day, lest those miserable souls should by these means be deprived of the refreshing element. When they have ended their prayers, they return home, and salute one another, by wishing a good sabbath. They then sit down to table. The master of the family takes a cup full of wine, and lifting up his hand, says, "Blessed be thou, O God our Lord, king of the world, who hast created the fruit of the vine. Blessed be thou, O God our Lord, king of the world, who hast sanctified us by thy commandments, and given us thy holy sabbath; and of thy good will and pleasure hast left it to us an inheritance, the memorial of thy works of creation. For it is the beginning of the congregation of saints, and the memorial of the coming out of Egypt. And thou hast also chosen us from all other people, and sanctified us, and with love and pleasure hast left thy holy sabbath an inheritance. Blessed be thou, O God, who sanctifiest the sabbath." After this benediction is ended, he drinks, and gives the cup to all who are present. He then removes the cloth, and taking bread, says, "Blessed be thou, O God our Lord, king of the world, who bringest bread out of the earth." Then he breaks off a bit, and eats, and also gives a piece of it to every one of the company.

On the morning of the sabbath, the Jews do not rise so early as they do at other times, thinking, the greater pleasure they take on that day, the more devoutly they keep it. When they come into the synagogue, they pray as usual, only the devotions are somewhat longer, being intermingled with psalmody, in honour of the sabbath. The pentateuch is then produced, and seven sections of it are read in order by seven persons chosen for the purpose. Several lessons are likewise read out of the prophets, which have some relation to what was read out of the law. After morning prayers, they return to their houses, and eat the second sabbath-meal, showing every token of joy, in honour of the festival. But if one has seen any thing ominous in his sleep; if he has dreamed that he burned the book of the law, that a beam has come out of the walls of his house, or that his teeth have fallen out; then he fasts until very late at night, for all such dreams are bad ones. In the afternoon they go again to the synagogue, and perform the evening service, adding to the ordinary prayers some lessons that respect the sabbath. When the devotional duties are ended, they return home, and light a candle resembling a torch, and again sit down to eat. They remain eating until near six, and then the master of the family takes a cup, and pouring wine into it, rehearses some benedictions; after which he pours a little of the wine upon the ground, and says, "Blessed be thou, O Lord, King of the world, who hast created the fruit of the vine." Then holding the cup in his left hand, with the right he takes a box of sweet spices, and says, "Blessed be thou, O Lord God, who hast created various kinds of sweet spices." He smells the spices, and holds them out to the rest, that they may do the same. He then takes the cup in his right hand, and going to the candle views the left very narrowly, and pronounces a blessing. With the cup in the left hand, he examines the right in the same manner. Again, holding the cup in his right hand, he rehearses another benediction, and at the same time pours some of the wine on the ground. After this he drinks a little of it, and then hands it about to the rest of the family, who finish what remains. In this manner the sabbath is ended by the Jews, and they may return to their ordinary employments. Those who meet pay their compliments, by wishing one another a happy week.

Prohibitions observed.

The rabbin have reckoned up thirty-nine primary prohibitions, which ought to be observed on the sabbatical festival; but their circumstances and dependents, which are also obligatory, are almost innumerable. The thirty-nine articles are, not to till the ground, to sow, to reap, to make hay, to bind up sheaves of corn, to thrash, to winnow, to grind, to sift meal, to knead the dough, to bake, to shear, to whiten, to comb or card wool, to spin, to twine or twist, to warp, to dye, to tie, to untie, to sew, to tear or pull in pieces, to build, to pull down, to beat with a hammer, to hunt or fish, to kill a beast, to flay it, to dress it, to scrape the skin, to tan it, to cut leather, to write, to scratch out, to rule paper for writing, to kindle a fire, to extinguish it, to carry a thing from place to place, and to expose any thing to sale. These are the primary prohibitions, and each of them has its proper consequences, which amount to an incredible number; and the Jews themselves say, that if they could keep but two sabbaths as they ought, they would soon be belivered out of all their troubles.

If a Jew on a journey is overtaken by the sabbath in a wood or on the highway, no matter where, nor under what circumstances, he sits down, he will not stir out of the spot. If he falls down in the dirt, he lies there; he will not rise up. A fresh wound must not be bound up on the sabbath day. A plaster that had been formerly applied to a sore may remain on it; but if it falls off, it must not be put on anew. The lame may use a staff, but the blind must not. These particulars, and a great many more of the same nature, are observed by the Jews in the strictest manner. But if any one wishes to know more of the practice of that race, he may consult Buxtorf's *Judaica Synagoga* (chap. x. xi.), where he will find a complete detail of their customs and ceremonies on the sabbath, and likewise see the primary prohibitions branched out into their respective circumstances.

Institution of Sunday, or the Lord's day.

As the seventh day was observed by the Jewish church, in memory of the rest of God after the works of creation, and their own deliverance from Pharaoh's tyranny; so the first day of the week has always been observed by the Christian church, in memory of the resurrection of Jesus Christ, by which he completed the work of man's redemption upon earth, and rescued him from the dominion of him who has the power of death.

This day was denominated by the primitive Christians the Lord's day. It was also sometimes called Sunday, which was the name given to it by the heathens, who dedicated it to the sun. And, indeed, although it was originally called Sunday by the heathens, yet it may very properly retain that name among the Christians, because it is dedicated to the honour of the true light, which lighteth every man that cometh into the world; of Him who is styled by the prophet the Sun of righteousness, and who on this day arose from the dead. But although it was, in the primitive times, indifferently called the Lord's day or Sunday, yet it was never denominated the sabbath; a name constantly appropriated to Saturday, or the seventh day, both by sacred and ecclesiastical writers.

The mention of it in the New Testament accidental.

Of the change from the seventh to the first day of the week, or even of the institution of the Lord's day festival, there is no account in the New Testament. However, it may be fairly inferred from it, that the first day of the week was, in the apostolic age, a stated time for public worship. On this day the apostles were assembled, when the Holy Ghost came down so visibly upon them to qualify them for the conversion of the world. On this day we find St Paul preaching at Troas, when the disciples came to break bread; and the directions which the same apostle gives to the Corinthians concerning their contributions for the relief of their suffering brethren, plainly allude to their religious assemblies on the first day of the week.

Thus it would appear from several passages in the New Testament, that the religious observation of the first day of the week is of apostolical appointment; and may indeed be very reasonably supposed to be amongst those directions and instructions which our blessed Lord himself gave to his disciples during the forty days between his resurrection and ascension, in which he conversed with them, and spoke of the things pertaining to the kingdom of God. Still, however, it must be owned that those passages, although the plainest that occur, are not sufficient to prove the apostolical institution of the Lord's day, or even the actual observation of it. In order, therefore, to place the matter beyond all controversy, recourse must be had to ecclesiastical testimony.

It nevertheless appears to be of divine origin.

From the consentient evidence and uniform practice of the primitive church, and also from the attestation of Pliny, we find that the first day of the week was observed in the earliest ages as a holiday or festival, in honour of the resurrection of Christ. Now there are but two sources whence the custom could possibly have arisen. It must have been instituted either by human or divine authority. But by human authority it was not instituted; for there was no general council in those early times, and without the decree of a general council it was impossible that any ecclesiastical institution could have been universally established at once. It remains, therefore, that it must have been instituted by divine authority; and that it really was so, will further appear from the following considerations. It is certain that the apostles travelled over the greatest part of the world, and planted churches in the remotest parts of it. It is certain also that they were all led by the same spirit; and their desire was, that unity and uniformity should be observed in all the churches which they had founded. It is not therefore surprising that, in the primitive times, the same doctrine, the same worship, the same rites and customs, should prevail all over the Christian world; nay, it would have been unaccountable had the case been otherwise. For this reason we may conclude that every custom, universally observed in the early ages of the Christian church, and not instituted by a general council, was of original appointment.

As the Lord's day is sanctified, that is, set apart, to Christians for the worship and service of God, their Creator, Redeemer, and Sanctifier, a little consideration will easily discover how it ought to be observed. Although a day separated from worldly business, yet it is in no sense a day of idleness, but a season appropriated to the works of salvation and labours of charity.

Ho it was obs ved in th rimi- tiv imes.

In the primitive times this holy day was observed in the most solemn manner. From the monuments of those early ages we learn, that it was spent in a due and constant attendance on all the offices of divine worship. On it they held their religious assemblies, in which the writings of the apostles and prophets were read to the people, and the doctrines of Christianity further pressed upon them by the exhortations of the clergy. Solemn prayers and praises were offered up to God, and hymns sung in honour of Christ; the Lord's supper was constantly celebrated; and collections were made for the maintenance of the clergy and the relief of the poor. On this day they abstained as much as they could from bodily labour. They looked upon it as a day of joy and gladness; and therefore all fasting on it was prohibited, even during the season of Lent, their great annual fast. Such was the zeal of those times, that nothing, no not the severest persecutions, hindered them from celebrating the holy offices on this day. They were often beset and betrayed, and as often slaughtered in consequence of cruel edicts from emperors, those very emperors for whose happiness and prosperity they always offered up their fervent prayers. For this cause, when they could not meet in the day-time, they assembled in the morning before it was light; and when sick, in exile, or in prison, nothing troubled them more than that they could not attend the service of the church. No trivial pretences were then admitted for any one's absence from public worship; for severe censures were passed upon all who were absent without some urgent necessity. When the empire became Christian, Constantine and his successors made laws for the more solemn observation of the Lord's day. They prohibited all prosecutions and pleadings, and other juridical matters, to be transacted on it, and also all unnecessary labour; not that it was looked upon as a Jewish sabbath, but because these things were considered as inconsistent with the duties of the festival.

But although the primitive Christians did not indulge themselves in the practice of unnecessary labour or trifling amusements, yet they did not wholly abstain from working, if great necessity required it. The council of Laodicea enjoined that men should abstain from work on the Lord's day if possible; but if any were found to Judaize, they were to be censured as great transgressors. So circumspect were the primitive Christians about their conduct on this festival, that on the one hand they avoided all things which tended to profane it, whilst on the other they censured all those who insisted that it should be observed with Pharisaical rigour and devotion.

Adv ta- ges ult- ing f the er- vatio f it.

The primary duty of the Lord's day is public worship. The nature and design of the Christian religion sufficiently shows the necessity and importance of assembling for the duties of devotion. The whole scope of Christianity is to bring us to an union with God, which cannot be obtained or preserved without frequent communications with him; and the reasons which show religious intercourse to be the indispensable duty of Christians in a private capacity, will bind it with equal or more force on them considered as a community.

The advantages of public worship, when duly performed, are many and great. There are two, however, which deserve to be considered in a particular manner. It gives Christians an opportunity of openly professing their faith, and testifying their obedience to their Redeemer in the wisest and best manner; and in an age when infidelity has arisen to an alarming height, when the Son of God is crucified afresh, and put to open shame, every man, who has any regard for religion, will cheerfully embrace all opportunities of declaring his abhorrence of the vicious courses pursued by those apostates. He will lay hold with pleasure on every occasion to testify that he is neither afraid nor ashamed to confess the truth; and will think it his indispensable duty openly to disavow the sins of others, that he may not incur the guilt of partaking of them.

Public worship preserves in the minds of men a sense of religion, without which society cannot exist. Nothing can keep a body of men together, and unite them in promoting the public good, but such principles of action as may reach and govern the heart. But these can be derived only from a sense of religious duties, which can never be so strongly impressed upon the mind as by a constant attendance upon public worship. Nothing can be more weak than to neglect the public worship of God, under the pretence that we can employ ourselves as acceptably to our Maker at home in our closets. Both kinds of worship are indeed necessary; but one debt cannot be paid by the discharge of another. By public worship every man professes his belief in that God whom he adores, and appeals to Him for his sincerity, of which his neighbour cannot judge. By this appeal he endears himself more or less to others. It creates confidence; and it roots in the heart benevolence, and all other Christian virtues, which produce, in common life, the fruits of mutual love and general peace.

Sabbath-Breaking, or profanation of the Lord's day, is punishable by law. For besides the notorious indecency and scandal of permitting any secular business to be publicly transacted on that day, in a country professing Christianity, and the corruption of morals which usually follows its profanation, the keeping one day in seven holy, as a time of relaxation and refreshment, as well as for public worship, is of admirable service to a state, considered merely as a civil institution. It humanizes, by the help of conversation and society, the manners of the lower classes, which would otherwise degenerate into a sordid ferocity and selfishness of spirit; it enables the industrious workman to pursue his occupation in the ensuing week with health and cheerfulness; it imprints on the minds of the people that sense of their duty to God which is so necessary to make them good citizens, but which yet would be worn out and defaced by an unremitted continuance of labour, without any stated times of recalling them to the worship of their Maker.

SABBEA, a town of Yemen, in Arabia, in the mountainous district of Khaulan, eight miles north-east of Abu Arish.

SABEIA, a small island in the Red Sea. Lat. 18. 22. N.

SABELLIANS, a sect of Christians of the third century, that embraced the opinions of Sabellius, a philosopher of Egypt, who openly taught that there is but one person in the Godhead. The Sabellians maintained, that the Word and the Holy Spirit are only virtues, emanations, or functions of the Deity, and held, that he who is in heaven is the Father of all things; that he descended into the virgin, became a child, and was born of her as a son; and that having accomplished the mystery of our salvation, he diffused himself on the apostles in tongues of fire, and was then denominated the Holy Ghost. This they explained by comparing God to the sun, the illuminative virtue or quality of which was the Word, and its warming virtue the Holy Spirit. The Word, they taught, was darted, like a divine ray, to accomplish the work of redemption; and that being re-ascended to heaven, the influences of the Father were communicated after a like manner to the apostles.

SABIANS, an early sect of worshippers of the sun, moon, and stars. See POLYTHEISM.

SABINUS, GEORGE, a celebrated Latin poet, born in the electorate of Brandenburg in 1508. His poem *Res Gestæ Cæsarum Germanorum* spread his reputation all over Germany, and procured him the patronage of all the princes who had any regard for polite literature. He was made professor of the belles lettres at Frankfort on the Oder, rector of the new academy of Königsberg, and counsellor to the elector of Brandenburg. He married two wives, the first of whom was the eldest daughter of Melancthon, and died in 1560. His poems are well known, and have often been printed.

SABIONETTA, a city of the province of Mantua, in Austrian Lombardy, with a citadel, four churches, and 6320 inhabitants. Long. 10. 24. 45. E. Lat. 44. 59. 47. N.

SABLE, or *Sable Animal*, in *Zoology*, a creature of the weasel-kind, called by authors *mustela zibellina*. See Mammalia.

Sable, *Cape*, the most southerly province of Nova Scotia, in North America. Long. 65. 34. W. Lat. 43. 24. N.

Sable, in *Heraldry*, signifies black, and is borrowed from the French, as are most terms in this science. In engraving it is expressed by both horizontal and perpendicular lines crossing each other. Sable of itself signifies constancy, learning, and grief; and ancient heralds will have it, that when it is compounded with

Or,	it signifies	Honour.
Arg.		Fame.
Gul.		Respect.
Azu.		Application.
Ver.		Comfort.
Pur.		Austerity.

SABLES D'OLONNE, Les, an arrondissement of the department of Vendée, in France. It extends over seven hundred and thirty-two and a half square miles, and comprehends eleven cantons, divided into seventy-nine communes, with 98,508 inhabitants in 1836. The capital is the city of the same name, situated at the termination of a sandy plain on the sea-shore, and only connected by a strip of land with the continent. It has a small harbour fit for vessels of not more than a hundred and fifty tons. It consists of four long parallel streets, with 4778 inhabitants, who carry on the fisheries, and deal in corn, cattle, and salt, which last is made by the sun on the marshes. Long. 1. 53. 3. W. Lat. 46. 29. 50. N.

SABON, an island in the Eastern Seas, at the southern entrance of the Straits of Malacca, of a triangular form. It is separated from Sumatra by a navigable channel, the Straits of Sabon, and is twenty-four miles in circumference. Long. 103. 21. E. Lat. 0. 24. N.

SABOU, or Saivu, probably the same island as Savo, near Timor, to which the reader is referred.

SABRAO, an island in the Eastern Seas, separated from the island of Flores by the Straits of Flores. It is forty miles in length by eighteen in average breadth.

SABRE, a kind of sword or scimitar, with a very broad and heavy blade, thick at the back, and a little falcated or crooked towards the point. It is the ordinary weapon worn by the Turks, who are very expert in the use of it.

SA BULAGH, a town and district of Persia, in Azerbijan, situated on the lake Urumea, thirty miles from Maraga.

SACÆA, a feast which the ancient Babylonians and other orientals held annually in honour of the deity Anaitis. The Sacæa were in the East what the Saturnalia were at Rome, namely, a feast for the slaves. One of the ceremonies was to choose a prisoner condemned to death, and to allow him all the pleasures and gratifications he could wish, before he was carried to execution.

SACCHARUM, Sugar, or the *Sugar-Cane*. This plant is a native of Africa, the East Indies, and Brazil; whence it was introduced into our West India islands soon after they were settled. The sugar-cane is the glory and the pride of those islands. It amply rewards the industrious planter, enriches the British merchant, gives bread to thousands of manufacturers and seamen, and brings an immense revenue to the crown. See Sugar.

SACCHAROMETER, an instrument for ascertaining the value of worts, and the strength of different kinds of malt liquor. The name signifies a measure of sweetness.

SACHEVEREL, Dr Henry, a famous Tory clergyman in the reign of Queen Anne, who distinguished himself by indecent and scurrilous sermons and writings against the dissenters and revolution principles. He owed his consequence, however, to being indiscreetly prosecuted by the House of Lords for his assize-sermon at Derby, and his fifth of November sermon at St Paul's in 1709, in which he asserted the doctrine of non-resistance to government in its utmost extent, and reflected severely on the act of toleration. The high and low church parties were very violent at that time; and the trial of Sacheverel inflamed the high-church party to dangerous riots and excesses. He was, however, suspended for three years, and his sermons were burned by the common hangman. The Tories being in administration when Sacheverel's suspension expired, he was freed with every circumstance of honour and public rejoicing; was ordered to preach before the Commons on the 29th of May; had the thanks of the house for his discourse; and obtained the valuable rectory of St Andrews, Holborn. He died in 1724.

SACK, a wine used by our ancestors, which some have taken to be Rhenish and some Canary wine. Venner, in his *Via Recta ad Vitam Longam*, printed in 1628, says that sack is "completely not in the third degree, and that some affect to drink sack with sugar and some without; and upon no other ground, as I think, but as it is best pleasing to their palate." He goes on to say, "that sack, taken by itself, is very hot and very penetrative; being taken with sugar, the heat is both somewhat allayed, and the penetrative quality thereof also retarded." He adds further, that Rhenish declines after a twelvemonth, but sack and the other stronger wines are best after they are two or three years old. It appears to be highly probable that sack was not a sweet wine, from its being taken with sugar; and that it did not receive its name from having a saccharine flavour, but from its being originally stored in sacks or borachios. It does not appear to have been a French wine, but a strong wine, the production of a hot climate. Probably it was what is called dry mountain, or some Spanish wine of that kind. This conjecture is the more plausible, as Howell, in his French and English Dictionary, printed in the year 1650, translates sack by the words "vin d'Espagne, vin sec."

SACKBUT, a musical instrument of the wind kind, being a sort of trumpet, though different from the common trumpet both in form and size. It is fit to play a bass, and is contrived to be drawn out or shortened, according to the tone required, whether grave or acute. The Italians call it *trombone*, and the Latins *tuba ductilis*.

SACKVILLE, Thomas, Lord Buckhurst and Earl of Dorset, a statesman and poet, the son of Richard Sackville of Buckhurst, in the parish of Withian, in Sussex, was born in the year 1536. He was sent to Hart Hall, in Oxford, in the latter end of the reign of Edward VI. whence he removed to Cambridge, where he took a degree of master of arts, and thence to the Inner Temple. He now applied himself to the study of the law, and was called to the bar. We are told that he commenced poet whilst at the universities, and that these his juvenile productions were much admired, though none of them have been preserved. In the fourth and fifth years of Queen Mary we find him a member of the House of Commons, about which time, in 1557, he wrote a poetical piece, entitled the Induction, or the Mirror of Magistrates. This last was meant to comprehend all the unfortunate great from the beginning of our history; but the design being dropped, it was inserted in the body of the work. The Mirror of Magistrates is formed upon a dramatic plan, in which the persons are introduced speaking. The Induction is written much in the style of Spencer, who, with some probability, is supposed to have imitated this author.

In the year 1561, his tragedy of Gorboduc was acted before Queen Elizabeth by the gentlemen of the Inner Temple. This was the first tolerable tragedy in our language. The Companion to the Playhouse tells us that the first three acts were written by Mr Thomas Norton. Sir Philip Sidney, in his Apology for Poetry, says, "it is full of stately speeches and well-sounding phrases, climbing to the height of Seneca in his style." Rymer speaks highly in its commendation. Mr Spence, at the instigation of Pope, republished it in 1736, with a pompous preface. It is said to be our first dramatic piece written in verse. In the first parliament of this reign Mr Sackville was member for Sussex, and for Buckinghamshire in the second. In the mean time he made the tour of France and Italy, and in 1566 was imprisoned at Rome, when he was informed of his father's death, by which he became possessed of a very considerable fortune. Having now obtained his liberty, he returned to England, and being first knighted, was created Lord Buckhurst. In 1570 he was sent as ambassador to France. In 1586 he was one of the commissioners appointed to try the unfortunate Mary queen of Scots, and was the messenger employed to report the confirmation of her sentence, as well as to see it executed. The year following he went as ambassador to the states-general, in consequence of their complaint against the Earl of Leicester, who, disliking his impartiality, prevailed on the queen to recall him, and confine him to his house. In this state of confinement he continued about ten months, when Leicester dying, he was restored to favour, and in 1580 was installed knight of the garter. But the most incontrovertible proof of the queen's partiality for Lord Buckhurst appeared in the year 1591, when she caused him to be elected chancellor in the university of Oxford, in opposition to her favourite Essex. In 1598, on the death of the treasurer Burghley, Lord Buckhurst succeeded him, and by virtue of his office became in effect prime minister; and when, in 1601, the earls of Essex and Southampton were brought to trial, he sat as lord high steward on that awful occasion. On the accession of James I. he was graciously received, had the office of lord high treasurer confirmed to him for life, and was created Earl of Dorset. He continued high in favour with the king till the day of his death, which happened suddenly on the 19th day of April 1608, in the council-chamber at Whitehall. He was interred with great solemnity in Westminster Abbey.

SACKVILLE, *Charles*, Earl of Dorset, a celebrated wit and poet, descended from the foregoing, was born in 1637. He was, like Villiers, Rochester, and Sedley, one of the libertines of King Charles's court, and sometimes indulged himself in inexcusable excesses. He openly discountenanced the violent measures of James II., and engaged early for the prince of Orange, by whom he was made lord chamberlain of the household, and taken into the privy council. He died in 1706, and left several poetical pieces, which, though not considerable enough to make a volume by themselves, may be found amongst the works of the minor poets, published in 1749.

SACMARA, a considerable river of Asiatic Russia, in the government of Orenburg. It has its rise in the Ural Mountains, and, flowing southwards, falls into the river of the same name. Its banks are thinly inhabited, though they are rich in mines of copper.

SACRAMENT is derived from the Latin word *sacramentum*, which signifies an oath, particularly the oath taken by soldiers to be true to their country and their general. The words of this oath, according to Polybius, were, *obtemperaturus sum et facturus quicquid mandabitur ab imperatoribus juxta vires.* The word was adopted by the writers of the Latin church, and employed, perhaps with no great propriety, to denote those ordinances of religion by which Christians came under an obligation, equally sacred with that of an oath, to observe their part of the covenant of grace, and in which they had the assurance of Christ that he would fulfil his part of the same covenant.

Of sacraments, in this sense of the word, Protestant churches admit but of two; and it is not easy to conceive how a greater number can be made out from Scripture, if the definition of a sacrament be just which is given by the church of England. By that church the meaning of the word sacrament is declared to be "an outward and visible sign of an inward and spiritual grace given unto us, ordained by Christ himself as a means whereby we receive the same, and a pledge to assure us thereof." According to this definition, baptism and the Lord's Supper are certainly sacraments; for each consists of an outward and visible sign of what is believed to be an inward and spiritual grace; both were ordained by Christ himself; and by the reception of each does the Christian come under a solemn obligation to be true to his divine master, according to the terms of the covenant of grace. The Catholics, however, add to this number confirmation, penance, extreme unction, ordination, and marriage, holding in all seven sacraments; but two of those rites not being peculiar to the Christian church, cannot possibly be Christian sacraments, in contradistinction to the sacraments or obligations into which men of all religions enter. Marriage was instituted from the beginning, when God made man male and female, and commanded them to be fruitful, and multiply, and replenish the earth; and penance, as far as it is of the same import with repentance, has a place in all religions which teach that God is merciful and men fallible. The external severities imposed upon penitents by the church of Rome may indeed be in some respects peculiar to the discipline of that church, though the penances of the Hindus are certainly as rigid; but none of these severities were ordained by Christ himself as the pledge of an inward and spiritual grace; nor do they, like baptism and the Lord's Supper, bring men under obligations which are supposed to be analogous to the meaning of the word *sacramentum.* Confirmation has a better title to the appellation of a sacrament than any of the other five rites of that name, though it certainly was not considered as such by the earliest writers of the Christian church, nor does it appear to have been ordained by Christ himself. Ordination is by many churches considered as a very important rite; but as it is not administered to all men, nor has any particular form appropriated to it in the New Testament, it cannot be considered as a Christian sacrament conferring grace generally necessary to salvation. It is rather a form of authorizing certain persons to perform certain offices, which respect not themselves, but the whole church; and extreme unction is a rite which took its rise from the miraculous powers of the primitive church vainly claimed by the succeeding clergy. These considerations seem to have some weight with the Catholic clergy themselves; for they call the eucharist, by way of eminence, the holy sacrament. Thus to expose the holy sacrament, is to lay the consecrated host on the altar to be adored. The procession of the holy sacrament is that in which this host is carried about the church, or about a town.

Congregation of the Holy S*ACRAMENT*, a religious establishment formed in France, whose founder was Autherius, bishop of Bethlehem, and which, in 1644, received an order from Urban VIII. to have always a number of ecclesiastics ready to exercise their ministry among pagan nations, wherever the pope, or the congregation *de propaganda fide*, should appoint.

SACRAMENTARIANS, a general name given to all such as have published or held erroneous doctrines of the sacrament of the Lord's Supper. The term is chiefly applied among Roman Catholics, by way of reproach to the Lutherans, Calvinists, and other Protestants.

SACRAMENTARY, an ancient Catholic church-book, which contains all the prayers and ceremonies practised at the celebration of the sacraments. It was written by Pope Gelasius, and afterwards revised, corrected, and abridged, by St Gregory.

SACRED, something holy, or that is solemnly offered and consecrated to God, with benedictions, unctions, and the like. Kings, prelates, and priests, are reckoned sacred persons; abbots are only blessed. The deaconhood, subdeaconhood, and priesthood, are all sacred orders, and are said to impress an indelible character. The custom of consecrating kings with holy oil is derived, says Gutlingius, from the Hebrews, amongst whom, he agrees with Grotius, it was never used but to kings who had not an evident right by succession. He adds, that the Christian emperors never used it before Justin the younger.

SACRED is also applied to things belonging to God and the church. Church-lands and ornaments are held sacred. The sacred college is that of the cardinals.

SACRED *Majesty* is applied to the emperor, and to the king of England.

SACRIFICE, an offering made to God on an altar, by means of a regular minister, as an acknowledgment of his power, and a payment of homage. Sacrifices, though the term is sometimes used for all the offerings made to God, or in any way devoted to his service and honour, differ from mere oblations in this, that in a sacrifice there is a real destruction or change of the thing offered; whereas an oblation is only a simple offering or gift, without any such change at all. Thus, all sorts of tithes and first fruits, and whatever of men's worldly substance is consecrated to God, for the support of his worship and the maintenance of his ministers, are offerings or oblations; and these, under the Jewish law, were either of living creatures or other things; but sacrifices, in the more peculiar sense of the term, were either wholly or in part consumed by fire. They have by divines been divided into bloody and unbloody. Bloody sacrifices were made of living creatures; unbloody, of the fruits of the earth. They have also been divided into expiatory, impetratory, and eucharistical. The first kind were offered to obtain of God forgiveness of sins; the second to procure some favour; and the third to express thankfulness for favours already received. Under one or other of these heads may all sacrifices be arranged; though we are told that the Egyptians had six hundred and sixty-six different kinds, a number surpassing all credibility.

Concerning the origin of sacrifices very various opinions have been held. By many, the Phœnicians are supposed to have been the authors of them, though Porphyry attributes their invention to the Egyptians; and Ovid imagines, from the import of the terms *victim* and *hostia*, that no bloody sacrifices were offered until wars prevailed in the world, and nations obtained victories over their enemies. These are mere hypotheses, contradicted by the most authentic records of antiquity, and entitled to no regard.

By modern deists, sacrifices are said to have had their origin in superstition, which operates much in the same way in every country. It is therefore weak, according to these men, to derive this practice from any particular people, since the same mode of reasoning would lead various nations, without any intercourse with each other, to entertain the same opinions respecting the nature of their gods, and the proper means of appeasing their anger. Men of gross conceptions imagine their deities to be, like themselves, covetous and cruel. They are accustomed to appease an injured neighbour by a composition in money; and they endeavour to compound in the same manner with their gods, by rich offerings to their temples and to their priests. The most valuable property of a simple people is their cattle. These offered in sacrifice are supposed to be fed upon by the divinity, and are actually fed upon by his priests. If a crime is committed which requires the punishment of death, it is accounted perfectly fair to appease the deity by offering one life for another; because, by savages, punishment is considered as a debt, for which a man may compound in the best way that he can, and which one man may pay for another. Hence, it is said, arose the absurd notions of imputed guilt and vicarious atonement. Among the Egyptians a white bull was chosen as an expiatory sacrifice to their god Apis. After being killed at the altar, his head was cut off and cast into the river, with the following execration: "May all the evils impending over those who perform this sacrifice, or over the Egyptians in general, be averted on this head."[1]

Had sacrifice never prevailed in the world but among such gross idolaters as worshipped departed heroes, who were supposed to retain in their state of deification all the passions and appetites of their mortal state, this account of the origin of that mode of worship would have been to us perfectly satisfactory. We readily admit that such mean notions of their gods may have actually led far distant tribes, who could not derive any thing from each other through the channel of tradition, to imagine that beings of human passions and appetites might be appeased or bribed by costly offerings. But we know, from the most incontrovertible authority, that sacrifices of the three kinds that we have mentioned were in use among people who worshipped the true God, and who must have had very correct notions of his attributes. Now we think it impossible that such notions could have led any man to fancy that the taking away of the life of a harmless animal, or the burning of a cake or other fruits of the earth in the fire, would be acceptable to a Being self-existent, omnipotent, and omniscient, who can neither be injured by the crimes of his creatures, nor receive any accession of happiness from a thousand worlds.

Sensible of the force of such reasoning as this, some persons of great name, who admit the authenticity of the Jewish and Christian Scriptures, and firmly rely on the atonement made by Christ, are yet unwilling to allow that sacrifices were originally instituted by God. Of this way of thinking were St Chrysostom, Spencer, Grotius, and Warburton, as were likewise the Jews Maimonides, R. Levi, Ben Gerson, and Abarbanel. The greater part of these writers maintain that sacrifices were at first a human institution; and that God, in order to prevent their being offered to idols, introduced them into his service, though he did not approve of them as good in themselves, or as proper rites of worship. That the infinitely wise and good God should introduce into his service improper rites of worship, appears to us so extremely improbable, that we cannot but wonder how such an opinion should ever have found its way into the minds of such men as those who held it. Warburton's theory of sacrifice is much more plausible, and worthy of particular examination.

According to this ingenious prelate, sacrifices had their origin in the sentiments of the human heart, and in the ancient mode of conversing by action in aid of words. Gratitude to God for benefits received is natural to the mind of man, as well as his bounden duty. "This duty," says the bishop,[2] "was in the most early times discharged in expressive actions, the least equivocal of which was the offerer's bringing the first fruits of pasturage or agriculture to that sequestered place where the Deity used to be more solemnly invoked, at the stated times of public worship; and there presenting them in homage, with a demeanour which spoke to this purpose: 'I do hereby acknowledge thee, O my God, to be the author and giver of all good; and do now, with humble gratitude, return my warmest thanks for these thy blessings particularly bestowed upon me.'" Things thus devoted became thenceforth sacred; and to prevent their desecration, the readiest way was to send them to the table of the priest, or to consume them in the fire of the altar. Such, in the opinion of our author, was the origin of eucharistical sacrifices. Impetratory or precative sacrifices had, he thinks, the same origin, and were contrived to express by action an invocation for the continuance of God's favour. "Expiatory sacrifices," says the same learned prelate, "were in their own nature as intelligible, and in practice as rational, as either of the other two. Here, instead of presenting the first fruits of agriculture and pasturage, in corn, wine, oil, and wool, as in the eucharistical, or a portion of what was to be sown or otherwise propagated, as in the impetratory, some chosen animal, precious to the repenting criminal who deprecates, or supposed to be obnoxious to the Deity who is to be appeased, was offered up and slain at the altar, in an action which, in all languages, when translated into words, speaks to this purpose: 'I confess my transgressions at thy footstool, O my God, and with the deepest contrition implore thy pardon, confessing that I deserve death for those my offences.' The latter part of the confession was more forcibly expressed by the action of striking the devoted animal, and depriving it of life; which, when put into words, concluded in this manner: 'And I own that I myself deserve the death which I now inflict on this animal.'"

---

[1] Herodotus, lib. ii.

[2] Divine Legation of Moses demonstrated, b. ix. c. ii.

This system of sacrifice, which his lordship thinks so well supported by the most early movements of simple nature, we admit to be ingenious, but by no means satisfactory. That mankind in the earlier ages of the world were accustomed to supply the deficiencies of their language by expressive gesticulations, we are not inclined to controvert. The custom prevails among savage nations, or nations half civilized, at the present day. His lordship, however, is of opinion, and we heartily agree with him, that our first parents were instructed by God to make articulate sounds significant of ideas, notions, and things, and not left to fabricate a language for themselves. That this heaven-taught language could at first be copious, no man will suppose, who thinks of the paucity of ideas which those who spoke it had to express; but when we consider its origin, we cannot entertain a doubt but that it was precise and perspicuous, and admirably adapted to all the real purposes of life. Among these purposes must surely be included the worship of God as the most important of all. Every sentiment therefore which enters into worship, gratitude, invocation, confession, and deprecation, the progenitors of mankind were undoubtedly taught to clothe in words the most significant and unequivocal; but we know from Moses, whose divine legation the bishop surely admitted, that Cain and Abel, the eldest children of our first parents, worshipped God by the rites of sacrifice; and can we suppose that this practice occurred to them from their having so far forgotten the language taught them by their father, as to be under the necessity of denoting by action what they could not express by words? If this supposition be admitted, it will force upon us another still more extravagant. Even Adam himself must, in that case, have become dumb in consequence of his fall; for it is not conceivable, that as long as he was able to utter articulate sounds, and affix a meaning to them, he would cease, in the presence of his family, to confess his sins, implore forgiveness, and express his gratitude to God for all his mercies.

The author, as if aware of some such objection as this, contends, that if sacrifices had arisen from any other source than the light of reason, the Scripture would not have been silent concerning that source; "especially since we find Moses carefully recording what God immediately, and not nature, taught to Adam and his family." "Had the original of sacrifice," says he, "been prescribed and directly commanded by the Deity, the sacred historian could never have omitted the express mention of that circumstance. The two capital observances in the Jewish ritual were the Sabbath and sacrifices. To impress the highest reverence and veneration on the Sabbath, he is careful to record its divine original; and can we suppose that had sacrifices had the same original, he would have neglected to establish this truth at the time that he recorded the other, since it is of equal use and of equal importance? I should have said, indeed, of much greater; for the multifarious sacrifices of the law had not only a reference to the forfeiture of Adam, but likewise prefigured our redemption by Jesus Christ."

But all this reasoning was foreseen, and completely answered, before his lordship gave it to the public. It is probable, that though the distinction of weeks was well known over all the eastern world, the Hebrews, during their residence in Egypt, were very negligent in their observance of the Sabbath. To enforce a religious observance of that sacred day, it became necessary to inform them of the time and occasion of its first institution, that they might keep it holy in memory of the creation; but, in a country like Egypt, the people were in danger of holding sacrifices rather in too high than too low veneration, so that there was not the same necessity for mentioning explicitly the early institution of them. It was sufficient that they knew the divine institution of their own sacrifices, and the purposes for which they were offered. Besides this, there is reason to believe, that, in order to guard the Hebrews from the infections of the heathen, the rite of sacrificing was loaded with many additional ceremonies at its second institution under Moses. It might, therefore, be improper to relate its original simplicity to a rebellious people, who would think themselves ill used by any additional burdens of trouble or expense, however really necessary to their happiness. Bishop Warburton sees clearly the necessity of concealing from the Jews the spiritual and refined nature of the Christian dispensation, lest such a backsliding people should, from the contemplation of it, have held in contempt their own economy. This, he thinks, is the reason why the prophets, speaking of the reign of the Messiah, borrow their images from the Mosaic dispensation, that the people living under that dispensation might not despise it from perceiving its end; and we think the reason will hold equally good for their lawgiver concealing from them the simplicity of the first sacrifices, let they should be tempted to murmur at their own multifarious ritual.

But his lordship thinks that sacrifices had their origin from the light of natural reason. We should be glad to know what light natural reason can throw upon such a subject. That ignorant pagans, adoring as gods departed heroes, who still retained their sensual appetites, might naturally think of appeasing such beings with the fat of fed beasts, and the perfumes of the altar, we have already admitted; but that Cain and Abel, who knew that the God whom they adored has neither body, parts, nor passions; that he created and sustains the universe; and that from his very nature he must will the happiness of all his creatures, should be led by the light of natural reason to think of appeasing him, or obtaining favours from him, by putting to death harmless animals, is a position which no arguments of his lordship can ever compel us to admit. That Abel's sacrifice was in deed accepted, we know; but it was not accepted because it proceeded from the movements of the human mind, and the deficiency of the original language, but because it was offered through faith. The light of natural reason, however, does not generate faith, but science; and when it fails of that, its offspring is absurdity. "Faith is the substance of things hoped for, the evidence of things not seen," and comes not by reasoning, but by hearing. What things then were they of which Abel had heard, for which he hoped, and in the faith of which he offered sacrifice? Undoubtedly it was a restoration to that immortality which was forfeited by the transgression of his parents. Of such redemption an obscure intimation had been given to Adam, in the promise that the seed of the woman should bruise the head of the serpent; and it was doubtless to impress upon his mind in more striking colours the manner in which this was to be done, that bloody sacrifices were first instituted. As long as the import of such rites was thus understood, they constituted a perfectly rational worship, as they showed the people that the wages of sin is death; but when men sunk into idolatry, and lost all hopes of a resurrection from the dead, the slaughtering of animals to appease their deities was a practice grossly superstitious. It rested in itself without pointing to any further end, and the grovelling worshippers believed that by their sacrifices they purchased the favour of their deities. When once this notion was entertained, human sacrifices were soon introduced; for it naturally occurred to those who offered them, that what they most valued themselves, would be most acceptable to their offended gods. By the Jewish law, these abominable offerings were strictly forbidden, and the whole ritual of sacrifice restored to its original purity, though not simplicity.

All Christian churches, the Socinian, if it can be called a church, not excepted, for a long period of time agreed in believing that the Jewish sacrifices served, amongst other uses, for types of the death of Christ, and the Christian worship. In this belief all sober Christians agree still; whilst many are of opinion that they were likewise federal rites, as they certainly were considered by the ancient Romans.[1]

Of the various kinds of Jewish sacrifices, and the subordinate ends for which they were offered, a full account is given in the books of Moses. When an Israelite offered a loaf or a cake, the priest broke it in two parts, and, setting aside that half which he reserved for himself, broke the other into crumbs, poured oil, wine, incense, and salt upon it, and spread the whole upon the fire of the altar. If these offerings were accompanied with the sacrifice of an animal, they were thrown upon the victim to be consumed along with it. If the offerings were of the ears of new corn, they were parched at the fire, rubbed in the hand, and then offered to the priest in a vessel, over which he poured oil, incense, wine, and salt, and then burned it upon the altar, having first taken as much of it as of right belonged to himself.

The principal sacrifices amongst the Hebrews consisted of bullocks, sheep, and goats; but doves and turtles were accepted from those who were not able to bring the other. These beasts were to be perfect, and without blemish. The rites of sacrificing were various, all of which are minutely described in the books of Moses.

The manner of sacrificing amongst the Greeks and Romans was the following. In the choice of the victim, they took care that it was without blemish or imperfection; its tail was not to be too small at the end, the tongue not black, nor the ears cleft; and that the bull was one that had never been yoked. The victim being pitched upon, they gilt his forehead and horns, especially if a bull, heifer, or cow. The head they also adorned with a garland of flowers, a woollen infula or holy fillet, whence hung two rows of chaplets with twisted ribands; and on the middle of the body a kind of stole, pretty large, hung down on each side. The lesser victims were only adorned with garlands and bundles of flowers, together with white tufts or wreaths.

The victims thus prepared were brought before the altar, the lesser being driven to the place, and the greater led by an halter; when, if they made any struggle, or refused to go, the resistance was taken for an ill omen, and the sacrifice frequently set aside. The victim thus brought was carefully examined, to see that there was no defect in it; then the priest, clad in his sacerdotal habit, and accompanied with the sacrificers and other attendants, and being washed and purified according to the ceremonies prescribed, turned to the right hand, and went round the altar, sprinkling it with meal and holy water, and also besprinkling those who were present. Then the crier proclaimed with a loud voice, Who is here? To which the people replied, Many and good. The priest then having exhorted the people to join with him, by saying, Let us pray, confessed his own unworthiness, acknowledging that he had been guilty of different sins, for which he begged pardon of the gods, hoping that they would be pleased to grant his requests, accept the oblations offered them, and send them all health and happiness; and to this general form he added petitions for such particular favours as were then desired. Prayers being ended, the priest took a cup of wine, and having tasted it himself, caused his attendants to do the like, and then poured forth the remainder between the horns of the victim. Then the priest or the crier, or sometimes the most honourable person in the company, killed the beast, by knocking it down, or cutting its throat. If the sacrifice was in honour of the celestial gods, the throat was turned upwards towards heaven; but if they sacrificed to the heroes or infernal gods, the victim was killed with its throat towards the ground. If by accident the beast escaped the stroke, leaped after it, or expired with pain and difficulty, it was thought to be unacceptable to the gods. The beast being killed, the priest inspected its entrails, and made predictions from them. They then poured wine, together with frankincense, into the fire, to increase the flame, and laid the sacrifice upon the altar, which in the primitive times was burned whole to the gods, and thence called an holocaust; but in after times only part of the victim was consumed in the fire, and the remainder reserved for the sacrificers; the thighs, and sometimes the entrails, being burned to their honour, the company feasted upon the rest. During the sacrifice, the priest, and the person who gave the sacrifice, jointly prayed, laying their hand upon the altar. Sometimes they played upon musical instruments in the time of the sacrifice, and on some occasions they danced round the altar, singing sacred hymns in honour of the god.

Human SACRIFICES, an abominable practice, about the origin of which different opinions have been formed.

The true account seems to be that which we have given in the preceding article. When men had gone so far as to indulge the fancy of bribing their gods by sacrifice, it was natural for them to think of enhancing the value of so cheap an atonement by the cost and rarity of the offering; and, oppressed with their malady, they never rested till they had got that which they conceived to be the most precious of all, a human sacrifice. "It was customary," says Sanchoniathon, "in ancient times, in great and public calamities, before things became incurable, for princes and magistrates to offer up in sacrifice to the avenging dæmons the dearest of their offspring."[2] Sanchoniathon wrote of Phœnicia; but the practice prevailed in every nation under heaven of which we have received any ancient account. The Egyptians had it in the early part of their monarchy. The Cretans likewise had it, and retained it for a long time. The nations of Arabia did the same. The people of Dumah, in particular, sacrificed every year a child, and buried it underneath an altar, which they made use of instead of an idol; for they did not admit of images. The Persians buried people alive. Amestris, the wife of Xerxes, entombed twelve persons quick under ground for the good of her soul. It would be endless to enumerate every city, or every province, where these dire practices obtained. The Cyprians, the Rhodians, the Phoceans, the Ionians, those of Chios, Lesbos, Tenedos, all had human sacrifices. The natives of the Tauric Chersonese offered up to Diana every stranger whom chance threw upon their coast. Hence arose that just expostulation in Euripides upon the inconsistency of the proceeding. Iphigenia wonders, as the goddess delighted in the blood of men, that every villain and murderer should be privileged to escape, nay, to be driven from the threshold of the temple; whereas, if an honest and virtuous man chanced to stray thither, he only was seized upon and put to death. The Pelasgians, in a time of scarcity, vowed the tenth of all that should be born to them for a sacrifice, in order to procure plenty. Aristomenes the Messenian slew three hundred noble Lacedæmonians, among whom was Theopompus the king of Sparta, at the altar of Jupiter at Ithome. Without doubt the Lacedæmonians did not fail to make ample returns; for they were a severe and revengeful people, and offered similar victims to Mars. Their festival of the Diamastigosis is well known, when the Spartan boys were whipped in the sight of their parents with such severity before the altar of Diana Orthia, that they often expired under the torture. Phylarchus, as quoted by Porphyry, affirms that of old every Grecian state made it a rule, before they marched towards an enemy, to solicit a blessing on their undertakings by human victims.

---

[1] *Tit. Liv.* lib. xxi. cap. xlv.

[2] Eusebius, *Præp. Evang.* lib. iv.

The Romans were accustomed to the like sacrifices. They both devoted themselves to the infernal gods, and they constrained others to submit to the same horrid doom. Hence we read in Titus Livius, that, in the consulate of Æmilius Paulus and Terentius Varro, two Gauls, a man and a woman, and two in like manner of Greece, were buried alive at Rome in the ox-market, where was a place under ground walled round to receive them, and which had before been made use of for such cruel purposes. He says it was a sacrifice not properly Roman, that is, not originally of Roman institution; yet it was frequently practised there, and that too by public authority. Plutarch makes mention of a similar instance a few years before, in the consulship of Flaminius and Furius. There is reason to think that all the principal captives who graced the triumphs of the Romans were, at the close of that cruel pageantry, put to death at the altar of Jupiter Capitolinus. Caius Marius offered up his own daughter for a victim to the *Dii Averrunci*, to procure success in a battle against the Cimbri, as we are informed by Dorotheus, quoted by Clemens. It is likewise attested by Plutarch, who says that her name was Calpurnia. Marius was a man of a sour and bloody disposition, and had probably heard of such sacrifices being offered in the enemy's camp, among whom they were very common, or he might have beheld them exhibited at a distance, and therefore murdered what was nearest, and should have been dearest to him, to counteract their fearful spells, and outdo them in their wicked machinery. Cicero, making mention of this custom being common in Gaul, adds, that it prevailed among that people even at the time he was speaking; whence we may be led to infer that it was then discontinued among the Romans. And we are told by Pliny, that it had then, and not very long before, been discouraged. For there was a law enacted, when Lentulus and Crassus were consuls, so late as the 657th year of Rome, that there should be no more human sacrifices; for till that time those horrid rites had been celebrated in broad day, without any mask or control, which, had we not the best evidence for the fact, would appear scarcely credible. And however they may have been discontinued for a time, we find that they were again renewed, though they became not so public nor so general. For not very long after this, it is reported of Augustus Cæsar, when Perugia surrendered, in the time of the second triumvirate, that besides multitudes executed in a military manner, he offered up, upon the ides of March, three hundred chosen persons, both of the equestrian and the senatorial order, at an altar dedicated to the manes of his uncle Julius. Even at Rome itself this custom was revived; and Porphyry assures us, that in his time a man was every year sacrificed at the shrine of Jupiter Latialis. Heliogabalus offered similar victims to the Syrian deity which he introduced among the Romans. The same is said of Aurelian.

The Gauls and the Germans were so devoted to this shocking custom, that no business of any moment was transacted among them without being prefaced with the blood of men. They were offered up to various gods; but particularly to Hesus, Taranis, and Thautates. These deities are mentioned by Lucan, where he enumerates the various nations who followed the fortunes of Cæsar.

The altars of these gods were far removed from the common resort of men, being generally situated in the depth of woods, that the gloom might add to the horror of the operation, and give a reverence to the place and proceeding. The persons devoted were led thither by the Druids, who presided at the solemnity, and performed the cruel offices of the sacrifice. Tacitus takes notice of the cruelty of the Hermunduri, in a war with the Catti, in which they had greatly the advantage, and at the close of which they made one general sacrifice of all that was taken in battle. The poor remains of the legion under Varus suffered in some degree the same fate. There were many places destined for this purpose all over Gaul and Germany; but especially in the mighty woods of Arduenna, and the great Hercynian Forest, a wild that extended above thirty days' journey in length. The places set apart for this solemnity were held in the utmost reverence, and only approached at particular seasons. Lucan mentions a grove of this sort near Massilia, which even the Roman soldiers were afraid to violate, although commanded by Cæsar. It was one of those set apart for the sacrifices of the country.

Claudian compliments Stilicho, that, among other advantages accruing to the Roman armies through his conduct, they could now venture into the awful forest of Hercynia, and follow the chase in those so much dreaded woods, and otherwise make use of them.

These practices prevailed among all the people of the north, of whatever denomination. The Massagetæ, the Scythians, the Getes, the Sarmatians, all the various nations upon the Baltic, particularly the Suevi and Scandinavians, held it as a fixed principle, that their happiness and security could not be obtained but at the expense of the lives of others. Their chief gods were Thor and Woden, whom they thought they could never sufficiently glut with blood. They had many very celebrated places of worship, especially in the island Rugen near the mouth of the Oder, and in Zeeland; some, too, which were very famous among the Semnones and Naharvalli. But the most reverenced of all, and the most frequented, was at Upsal; where there was every year a grand celebrity, which continued for nine days. During this term they sacrificed animals of all sorts. But the most acceptable victims, and the most numerous, were men. Of these sacrifices none were esteemed so auspicious and salutary as a sacrifice of the prince of the country. When the lot fell for the king to die, it was received with universal acclamations and every expression of joy; as it once happened in the time of a famine, when they cast lots, and it fell to King Domalder to be the people's victim. And he was accordingly put to death. Olaus Tretelger, another prince, was burned alive to Woden. They did not spare their own children. Harald the son of Gunild, the first of that name, slew two of his children to obtain a storm of wind. "He did not hesitate," says Verstegan, "to sacrifice two of his sons unto his idols, to the end he might obtain of them such a tempest at sea as should break and disperse the shipping of Harald king of Denmark." Saxo-Grammaticus mentions a similar fact. He calls the king Haquin; and speaks of the persons put to death as two very hopeful young princes. Another king slew nine sons to prolong his own life, in hopes, perhaps, that what they were abridged of would in a great measure be added to himself. Such instances, however, occur not often; but the common victims were without end. Adam Bremensis, speaking of the awful grove at Upsal, where these horrid rites were celebrated, says that there was not a single tree but what was reverenced, as if it were gifted with some portion of divinity; and all this because they were stained with gore, and foul with human putrefaction. The same is observed by Scheiffer in his account of this place.

The manner in which the victims were slaughtered was different in different places. Some of the Gaulish nations chined them with a stroke of an axe. The Celtæ placed the man who was to be offered for a sacrifice upon a block or an altar, with his breast upwards, and with a sword struck him forcibly across the sternum; then tumbling him to the ground, from his agonies and convulsions, as well as from the effusion of blood, they formed a judgment of future events. The Cimbri ripped open the bowels, and from them they pretended to divine. In Norway they beat men's brains out with an ox-yoke. The same operation was performed in Iceland, by dashing them out against an altar of stone. In many places they transfixed them with arrows. After they were dead, they suspended them upon trees, and left them to putrefy. One of the writers above quoted mentions, that in his time seventy carcasses of this sort were found in a wood of the Suevi. Dithmar of Mersburg, an author of nearly the same age, speaks of a place called Ledur in Zeeland, where there were every year ninety-nine persons sacrificed to the god Swantowite. During these bloody festivals a general joy prevailed, and banquets were most royally served. They fed, caroused, and gave a loose to indulgence, which at other times was not permitted. They imagined that there was something mysterious in the number nine; for which reason these feasts were in some places celebrated every ninth year, in others every ninth month, and continued for nine days. When all was ended, they washed the image of the deity in a pool, and then dismissed the assembly. Their servants were numerous, who attended during the term of their feasting, and partook of the banquet. At the close of all, they were smothered in the same pool, or otherwise made away with. On this Tacitus remarks, how great an awe this circumstance must necessarily infuse into those who were not admitted to these mysteries.

These accounts are handed down from a variety of authors in different ages, many of whom were natives of the countries which they describe, and to which they seem strongly attached. They would not therefore have brought so foul an imputation on the part of the world in favour of which they were each writing, nor could there be that concurrence of testimony, were not the history in general true.

The sacrifices of which we have been treating, if we except some few instances, consisted of persons doomed by the chance of war, or assigned by lot, to be offered. But among the nations of Canaan the victims were peculiarly chosen. Their own children, and whatever was nearest and dearest to them, were deemed the most worthy offering to their god. The Carthaginians, who were a colony from Tyre, carried with them the religion of their mother-country, and instituted the same worship in the parts where they settled. It consisted in the adoration of several deities, but particularly of Kronus, to whom they offered human sacrifices, and especially the blood of children. If the parents were not at hand to make an immediate offer, the magistrates did not fail to make choice of what was most fair and promising, that the god might not be defrauded of his due. Upon a check being received in Sicily, and some other alarming circumstances happening, Hamilcar, without any hesitation, laid hold of a boy, and offered him on the spot to Kronus; and at the same time he drowned a number of priests, to appease the deity of the sea. The Carthaginians another time, upon a defeat of their army by Agathocles, imputed their miscarriages to the anger of this god, whose services had been neglected. Touched with this, and seeing the enemy at their gates, they seized at once three hundred children of the prime nobility, and offered them in public for a sacrifice. Three hundred more, being persons who were somehow obnoxious, yielded themselves voluntarily, and were put to death with the others. The neglect of which they accused themselves consisted in sacrificing children purchased of parents among the poorer sort, who reared them for the purpose, and not selecting the most promising and the most honourable, as had been the custom of old. In short, there were particular children brought up for the altar, as sheep are fattened for the shambles; and they were bought and butchered in the same manner. But this indiscriminate way of proceeding was thought to have given offence. It is remarkable, that the Egyptians looked out for the most specious and handsome person to be sacrificed. The Albanians pitched upon the best man of the community, and made him pay for the wickedness of the rest. The Carthaginians chose what they thought the most excellent and at the same time the most dear to them; which made the lot fall heavy upon their children. This is taken notice of by Silius Italicus in his fourth book. Kronus, to whom these sacrifices were exhibited, was an oriental deity, the god of light and fire; and therefore always worshipped with some reference to that element.

The Greeks, we find, called the deity to whom these offerings were made Agraulos; and feigned that she was a woman, the daughter of Cecrops. But how came Cecrops to have any connection with Cyprus? Agraulos is a corruption and transposition of the original name (which should have been rendered *Uk El Aur*, or *Uk El Aurus)*; but has, like many other oriental titles and names, been strangely sophisticated, and is here changed to Agraulos. It was in reality the god of light, who was always worshipped with fire. This deity was the Moloch of the Tyrians and Canaanites, and the Melech of the East; that is, the great and principal god, the god of light, of whom fire was esteemed a symbol, and at whose shrine, instead of viler victims, they offered the blood of men.

Such was the Kronus of the Greeks and the Moloch of the Phœnicians. And nothing can appear more shocking than the sacrifices of the Tyrians and Carthaginians, which they performed to this idol. In all emergencies of state, and times of general calamity, they devoted what was most necessary and valuable to them as an offering to the gods, and particularly to Moloch. But besides these undetermined times of bloodshed, they had particular and prescribed seasons every year, when children were chosen out of the most noble and reputable families, as before mentioned. If a person had an only child, it was the more liable to be put to death, as being esteemed more acceptable to the deity, and more efficacious for the general good. Those who were sacrificed to Kronus were thrown into the arms of a molten idol, which stood in the midst of a large fire, and was red with heat. The arms of it were stretched out, with the hands turned upwards, as it were to receive them; yet sloping downwards, so that they dropped from thence into a glowing furnace below. To other gods they were otherwise slaughtered, and, as it implied, by the very hands of their parents. What can be more horrid to the imagination, than to suppose a father leading the dearest of all his sons to such an infernal shrine; or a mother the most engaging and affectionate of her daughters, just rising to maturity, to be slaughtered at the altar of Ashtaroth or Baal? Justin describes this unnatural custom very pathetically: "Quippe homines, ut victimas, immolabant; et impuberes (quæ ætas hostium misericordiam provocat) aris admovebant, pacem sanguine eorum exposcentes, pro quorum vita Dii rogari maxime solent." Such was their blind zeal, that this was continually practised; and so much of natural affection still left unextinguished, as to render the scene ten times more shocking, from the tenderness which they seemed to express. They embraced their children with great fondness, and encouraged them in the gentlest terms, that they might not be appalled at the sight of the hellish process, begging of them to submit with cheerfulness to this fearful operation. If there was any appearance of a tear rising, or a cry unawares escaping, the mother smothered it with her kisses, that there might not be any show of backwardness or constraint, but the whole might be a free-will offering. These cruel endearments being over, they stabbed them to the heart, or otherwise opened the sluices of life; and with the blood warm as it ran, besmeared the altar and the grim visage of the idol. These were the customs which the Israelites learned of the people of Canaan, and for which they are upbraided by the Psalmist. "They did not destroy the nations, concerning whom the Lord commanded them; but were mingled among the heathen, and learned their works; yea, they sacrificed their sons and their daughters unto devils, and shed innocent blood, even the blood of their sons and of their daughters, whom they sacrificed unto the idols of Canaan; and the land was polluted with blood. Thus were they defiled with their own works, and went a-whoring with their own inventions."

These cruel rites, which were practised in so many nations, made Plutarch debate with himself, "Whether it would not have been better for the Galatæ, or for the Scythians, to have had no tradition or conception of any superior being, than to have formed to themselves notions of gods who delighted in the blood of men; of gods who esteemed human victims the most acceptable and perfect sacrifice? Would it not," says he, "have been more eligible for the Carthaginians to have had the atheist Critias, or Diagoras, their lawgiver, at the commencement of their polity, and to have been taught that there was neither god nor demon, than to have sacrificed, in the manner they were wont, to the god which they adored?" In this they acted, not as the person did whom Empedocles describes in some poetry, where he exposes this unnatural custom. The sire there, with many idle vows, offers up unwittingly his son for a sacrifice; but the youth was so changed in feature and in figure that his father did not know him. These people used knowingly and wilfully to go through this bloody work, and slaughter their own offspring. Even they who were childless would not be exempted from this cursed tribute; but purchased children of the poorer sort, and put them to death with as little remorse as one would kill a lamb or a chicken. The mother who sacrificed her child stood by, without any seeming sense of what she was losing, and without uttering a groan. If a sigh did by chance escape, she lost all the honour which she proposed to herself in the offering, and the child was notwithstanding slain. All the time of this ceremony, whilst the children were murdering, there was a noise of clarions and tabors sounding before the idol, that the cries and shrieks of the victims might not be heard. "Tell me now," says Plutarch, "if the monsters of old, the Typhons and the giants, were to expel the gods, and to rule the world in their stead, could they require a service more horrid than these infernal rites and sacrifices?"

SACRILEGE, Sacrilegium, the crime of profaning sacred things, or things devoted to God; or of alienating to laymen, for common purposes, what was given to religious persons and pious uses.

SACRISTAN, a church-officer, otherwise called sexton.

SACRISTY, in *Ecclesiastical History*, an apartment in a church where the sacred utensils were kept.

SADDUCEES were a famous sect among the ancient Jews, and consisted of persons of great quality and opulence. Respecting their origin there are various accounts and various opinions. Epiphanius, and after him many other writers, contend that they took their rise from Dositheus, a sectary of Samaria, and derived their name from the Hebrew word צדק, *just* or *justice*, from the great justice and equity which they showed in all their actions; a derivation which neither suits the word Sadducee nor the general character of the sect. They are thought by some, too, to have been Samaritans. But this is by no means probable, as they always attended the worship and sacrifices at Jerusalem, and never at Gerizim.

In the Jewish Talmud, we are told that the Sadducees derived their name from Sadoc, and that the sect arose about 260 years before Christ, in the time of Antigonus of Socho, president of the Sanhedrim at Jerusalem, and teacher of the law in the principal divinity school of that city. Antigonus had often in his lectures, it seems, taught his scholars that they ought not to serve God as slaves do their masters, from the hopes of a reward, but merely out of filial love for his own sake; and from this Sadoc and Baithus inferred that there were no rewards at all after this life. They therefore separated from their master, and taught that there was no resurrection nor future state. This new doctrine quickly spread, and gave rise to the sect of Sadducees, which in many respects resembled the Epicureans.

Dr Prideaux thinks that the Sadducees were at first no more than what the Caraites are now; that is, they would not receive the traditions of the elders, but acknowledged the written word only; and the Pharisees being great promoters of those traditions, these two sects hence became directly opposite to each other.

Afterwards the Sadducees imbibed other doctrines, which rendered them a sect truly impious. They denied the resurrection of the dead, and the existence of angels, and the spirits or souls of men departed. They held that there is no spiritual being but God only; and that as to man, this world is his all. They did not deny but that we had reasonable souls; but they maintained that this soul was mortal, and, by a necessary consequence, they denied the rewards and punishments of another life. They pretended also, that what is said of the existence of angels and of a future resurrection is nothing but illusions. St Epiphanius, and after him St Augustin, have advanced, that the Sadducees denied the Holy Ghost. But neither Josephus nor the evangelists accuse them of any error like this. It has been also imputed to them, that they thought God corporeal, and that they received none of the prophecies.

It is difficult to apprehend how they could deny the being of angels, and yet receive the books of Moses, where such frequent mention is made of angels and of their appearances. Grotius and Le Clerc observe, that it is very likely they looked upon angels, not as particular beings, subsisting of themselves, but as powers, emanations, or qualities, inseparable from the Deity, as the sunbeams are inseparable from the sun. Or, perhaps, they held angels not to be spiritual, but mortal, just as they thought that substance to be which animates us and thinks in us. The ancients do not tell us how they solved this difficulty, that might be urged against them from so many passages of the Pentateuch, where mention is made of angels.

As the Sadducees acknowledged neither punishments nor recompenses in another life, so they were inexorable in chastising the wicked. They observed the law themselves, and caused it to be observed with the utmost rigour by others. They admitted none of the traditions, explications, or modifications, of the Pharisees; they kept to the text of the law, and maintained that only what was written was to be observed.

The Sadducees are accused of rejecting all the books of Scripture except those of Moses; and to support this opinion, it is observed, that our Saviour makes use of no Scripture against them, but passages taken out of the Pentateuch. But Scaliger produces good proofs to vindicate them from this reproach. He observes, that they did not appear in Israel till after the number of the holy books was fixed; and that if they had been to choose out of the canonical Scriptures, the Pentateuch was less favourable to them than any other book, since it often makes mention of angels and their apparition. Besides, the Sadducees were present in the temple, and at other religious assemblies, where the books of the prophets were read indifferently, as well as those of Moses. They were in the chief employments of the nation; many of them even were priests. Would the Jews have suffered in these employments persons that rejected the greater part of their Scriptures? Menasse ben-Israel says expressly, that they did not indeed reject the prophets, but that they explained them in a sense very different from that of the other Jews.

Josephus assures us that they denied destiny or fate; alleging that these were only sounds void of sense, and that all the good or evil that happens to us is in consequence of the good or evil side we have taken, by the free choice of our will. They said, also, that God was far removed from doing or knowing evil, and that man was the absolute master of his own actions. This was roundly to deny a providence; and upon this footing I know not, says Calmet, what could be the religion of the Sadducees, or what influence they could ascribe to God in things here below. However, it is certain that they were not only tolerated among the Jews, but that they were admitted to the high priesthood itself. John Hircanus, high priest of the nation, separated himself in a signal manner from the sect of the Pharisees, and went over to that of Sadoc. It is said, also, that he gave strict command to all the Jews, on pain of death, to receive the maxims of this sect. Aristobulus, and Alexander Jannæus, son of Hircanus, continued to favour the Sadducees; and Maimonides assures us, that under the reign of Alexander Jannæus, they had in possession all the offices of the Sanhedrim, there only remaining of the party of the Pharisees Simon the son of Secra. Caiaphas, who condemned Jesus Christ to death, was a Sadducee; as was also Ananus the younger, who put to death St James the brother of our Lord. At this day the Jews hold as heretics the small number of Sadducees which are to be found among them.[1]

The sect of the Sadducees was much reduced by the destruction of Jerusalem, and by the dispersion of the Jews; but it afterwards revived. At the beginning of the third century it was so formidable in Egypt, that Ammonim, Origen's master, when he saw them propagate their opinions in that country, thought himself obliged to write against them, or rather against the Jews, who tolerated the Sadducees, though they denied the fundamental points of their religion. The Emperor Justinian mentions the Sadducees in one of his novels; banishes them out of all places of his dominions; and condemns them to the severest punishments, as people that maintained atheistical and impious tenets, denying the resurrection and the last judgment. Annus, or Ananus, a disciple of Juda, son of Nachman, a famous rabbi of the eighth century, declared himself, as it is said, in favour of the Sadducees, and strenuously protected them against their adversaries. They had also a celebrated defender in the twelfth century, in the person of Alpharagius, a Spanish rabbi. This doctor wrote against the Pharisees, the declared enemies of the Sadducees, and maintained by his public writings, that the purity of Judaism was only to be found among the Sadducees; that the traditions avowed by the Pharisees were useless; and that the ceremonies, which they had multiplied without end, were an insupportable yoke. The rabbi Abraham ben David Italleri replied to Alpharagius, and supported the sect of the Pharisees by two great arguments; that of their universality, and that of their antiquity. He proved their antiquity by a continued succession from Adam down to the year 1167; and their universality, because the Pharisees are spread all the world over, and are found in all the synagogues. There are still Sadducees in Africa and in several other places. They deny the immortality of the soul and the resurrection of the body; but they are rarely found, at least there are but few who declare themselves friendly to these opinions.

SADLER, John, descended from an ancient family in Shropshire, was born in 1615, and educated at Cambridge, where he became eminent for his great knowledge in the oriental languages. He removed to Lincoln's Inn, where he made great progress in the study of the law; and in 1644 he was admitted one of the masters in chancery, as also one of the two masters of requests. In 1649 he was chosen town-clerk of London, and the same year he published his Rights of the Kingdom. He was greatly esteemed by Oliver Cromwell, by whose special warrant he was continued a master in chancery, when their number was reduced to six. By his interest it was that the Jews obtained the privilege of building for themselves a synagogue in London. In 1658 he was made member of parliament for Yarmouth, and next year was appointed first commissioner under the great seal with Mr Taylor, Mr Whitelocke, and others, for the probate of wills. In 1660 he published his *Olbia;* and soon after the Restoration he lost all his employments. In the fire of London in 1666 he was a great sufferer, which obliged him to retire to his seat of Warmwell in Dorsetshire, where he lived in a private manner until 1674, when he died.

SADLER, *Michael Thomas*, was born at Snelstone, a village in Derbyshire, in January 1780. He was descended, on the father's side, from Sir Ralph Sadler, one of Queen Elizabeth's ministers; and his mother's family had been French refugees at the revocation of the edict of Nantes. He was educated principally at home, his father having intended him for one of the learned professions; but, when about eighteen years old, he was induced to join his brother in business at Leeds, where he continued until called into public life by the ministerial proposal of the Catholic Relief Bill. On a vacancy occurring for the borough of Newark, in March 1829, Mr Sadler, being invited to become a candidate, immediately complied, and triumphantly carried his election, though opposed by Mr Sergeant Wilde, one of the most able and energetic members of the bar. Mr Sadler distinguished himself by a long and eloquent speech delivered against the Roman Catholic claims on the 17th of the same month; and during the continuance of the discussion he was the great champion of the Protestant cause. At the general election of 1830, he was again chosen for Newark, and in 1831 he took his seat for Aldborough in Yorkshire. At the first general election under the Reform Bill, Aldborough having been disfranchised, he became a candidate for the new borough of Leeds; but, though highly esteemed by a large number of his townsmen, his reputation as an anti-reformer preponderated over his less equivocal merits, and he lost his election.

---

[1] See upon this matter *Menasse ben-Israel de Resurrectione Mortuorum;* Basnage's History of the Jews; and Calmet's Dissertation upon the Sects of the Jews, before the Commentary of St Mark.

In his public career Mr Sadler was generally associated with the old constitutional Tories. We have already mentioned his strenuous opposition to the Roman Catholic Relief Bill. To the policy of free trade he was also most decidedly hostile; nor was he less unfriendly to the settlement of the currency question, which he considered should have been effected upon a more equitable adjustment. Mr Sadler was likewise very hostile to the Reform Bill, to which he recorded his objections in a speech when seconding General Gascoigne's motion, the effect of carrying which was the dissolution of parliament. For Ireland he always expressed the deepest interest, and twice introduced a poor-law bill for that country into parliament. During the last session he sat in parliament, he was almost constantly occupied in prosecuting the bill he had brought before the legislature for the protection of children employed in the manufactories, and which is familiarly called the Ten Hours Bill. This measure was referred to a select committee, of which Mr Sadler was appointed chairman; and it is believed that the fatigue and responsibility thus imposed on him, of collecting the mass of evidence contained in the report, laid the foundation of his long and fatal illness. Neither, after all, were his efforts successful in passing this measure.

Mr Sadler was some years a member of the Royal Society, and author of several works, the most important of which are, 1. Ireland, its Evils, and their Remedies; and, 2. An Essay on the Law of Population, in two volumes, written principally to controvert the opinions of Mr Malthus. A third volume, intended to complete this treatise, the author was engaged upon at the time of his death, which took place at New Lodge, near Belfast, on the 29th of July 1835. Mr Sadler's disease appears to have been an incurable affection of the heart, brought on by severe study and intense anxiety. At the time of his death, he was the leading partner of the firm of Sadler, Fenton, and Company, of Belfast. (A.)

SADO, an island of Japan, about ninety miles in circumference, on the northern coast of the island of Niphon, in a large bay. Long. 138. 54. E. Lat. 37. 40. N.

SADOC, a famous Jewish rabbi, and founder of the sect of the Sadducees.

SADOLET, James, a learned cardinal, was born at Modena in 1477. Leo X. made him and Peter Bembo his secretaries, an office for which they were both well qualified; and Sadolet was soon afterwards made bishop of Carpentras, near Avignon. He was made a cardinal in 1536 by Paul III.; employed in several negotiations and embassies; and died in 1547, not without the suspicion of poison, for corresponding too familiarly with the Protestants, and testifying too much regard for some of their doctors. His works, which are all in Latin, were collected in 1607 at Mentz, in one volume 8vo. All his contemporaries spoke of him in the highest terms.

SADRAS, a town of Southern India, in the Carnatic, on the sea-coast. It was formerly a small village, which was purchased by the Dutch about the middle of the seventeenth century; and under their protection it grew up into a populous place, the seat of a flourishing manufacture of ginghams of a superior quality. It was surrounded by them with a brick wall fifteen feet in height, and close to the sea. The fort was seized by the French general Lally in the year 1759, while the French were besieging Madras, though the Dutch were neutral in the war. It was afterwards restored to Holland, and was finally taken possession of by the British in 1795. The town has now fallen into a state of decay. At a short distance are some hills, on which are situated seven Hindu temples, held in great estimation. Long. 80. 16. E. Lat. 12. 27. N.

SAFAD, or Saphet, a village of Palestine, in an elevated situation, which overlooks the western coast of the Lake of Tiberias, and was of some consideration in the time of the crusades; but in 1759, being destroyed by an earthquake, and since regarded with an evil eye by the Turks, it has now dwindled into a poor village. Pococke found in it the ruins of a very strong old castle, which appeared to have commanded the whole surrounding district, which takes its name from the place. It is sixty-five miles south-west from Damascus.

SAFFRON is formed of the stigmata of the *crocus officinalis*, dried upon a kiln, and pressed together into cakes. There are two kinds of saffron, the English and Spanish; but the latter is by far the most esteemed. Saffron is principally cultivated in Cambridgeshire. This drug has been reckoned a very elegant and useful aromatic. Besides the virtues it has in common with other substances of the same class, it has been accounted one of the highest cordial.

SAFFRON-WALDEN, a town in the hundred of Uttlesford, in the county of Essex, forty-two miles from London. It has a good market for corn, which is held on Saturday. It is a borough, whose charter was granted by Edward VI., and is governed by a mayor and aldermen; but it does not return a member to the House of Commons. The chief trade is preparing malt for the great breweries in London. The church is a fine Gothic building of great extent, and adorned by the monuments of many eminent persons who have been buried in it. Adjoining to the town is the magnificent house of Audley End, belonging to Lord Howard of Walden. The town has the benefit of water-communication with London. The population amounted in 1801 to 3181, in 1811 to 3403, in 1821 to 4154, and in 1831 to 4762.

SAFFY, Saffee, Safi, Azafi, or Asfee, is a seaport town of Morocco, capital of the province of Abda. It is situated between two hills, and at the foot of a steep and high mountain, a part of Atlas. Its position renders it extremely hot, and in winter very disagreeable, as the waters from the neighbouring mountains, occasioned by the rains, discharge themselves through the main street into the ocean, deluging the lower apartments of the houses. The walls of Saffy are extremely thick and high. It is a very ancient town, and was the chief seat of European commerce till the monopolizing predilections of the Emperor Sidi Mahommed transferred it to Mogadore. The roadstead is safe in summer; but in winter, when the winds blow from the south or south-west, vessels are obliged to run to sea, sometimes more than once whilst taking in their cargoes. The surrounding country abounds in corn, and two falls of rain a year are sufficient to bring the crops to maturity. There are many sanctuaries in the environs, on which account the Jews are obliged to enter the town barefooted, taking off their sandals when they approach these consecrated places; and if riding, they must descend from their mules and enter the town on foot. There is here a neat palace, and a fort stands at a little distance north of the town. Saffy is still supposed to retain a population of 12,000. Long. 9. 5. W. Lat. 32. 20. N.

SAFIA, a small river of Arabia, which falls into the Red Sea two miles north of Tor.

SAFRA, a town of Hedjaz, in Arabia, forty miles south-south-west of Medina.

SAGAING, a town in the Burmese dominions, situated on the Irrawaddy, opposite to Ava, the capital. It is a large, straggling place, where the houses are of a mean description, and thinly scattered among groves of fruit-trees, with temples and monasteries innumerable. A considerable portion of the inhabitants are Cassay captives or their descendants. On the river face it has a brick-wall, which extends for about half a mile; it is not above ten feet in height, but has a parapet and embrasures. To each flank of the brick-wall there is a stockade of a paltry description." Inland it is quite defenceless. The town extends along the Irrawaddy about a mile and a half, but its breadth is inconsiderable. Over the site of the town and its environs are innumerable temples, many of them ruinous and old, and also modern.

SAGAN, in scripture history, the suffragan or deputy of the Jewish high priest. According to some writers, he was only employed to officiate for him when he was rendered incapable of attending the service through sickness or legal uncleanness on the day of expiation; or, according to others, he was destined to assist the high priest in the care of the affairs of the temple and the service of the priests.

Sagan, a city of Prussian Silesia, in the government of Liegnitz, the capital of a circle of its own name, which extends over 484 square miles, and contains 41,600 inhabitants. It stands on the river Bober, and is strongly fortified. It was a principality, but has been mediatized; and it still retains a fine palace of the prince, besides 540 houses, with 4920 inhabitants. It contains manufactures of linen, lace, paper, glass-ware, and hosiery, and carries on a considerable trade in corn and in corn-spirits.

SAGANAK, a town of Independent Tartary, situated on the Sihon or Jaxartes. It was taken by Ghengis Khan, and the greater part of the inhabitants put to death.

SAGANEER, a Rajpoot town of Hindustan, in the province of Ajmeer, and district of Jyenagur, eight miles south-east from the city of Jyenagur. Long. 75. 50. E. Lat. 26. 49. N. This is also the name of a town of the province of Gundwana, belonging to the rajah of Nagpoor. Long. 79. 18. E. Lat. 21. 34. N.

SAGARA Nacken Bay, a bay on the east coast of the island of Java. Long. 109. 21. E. Lat. 8. 15. S.

SAGARAWIDA Bay, on the south coast of the island of Java. Long. 113. E. Lat. 8. 15. S.

SAGE, Alain Rene, an ingenious French romance-writer, was born at Ruys, in Bretagne, in the year 1667. He had a fine flow of imagination, was a complete master of the French and Spanish languages, and wrote several admired romances in imitation of the Spanish authors. These were, 1. The Bachelor of Salamanca, two vols. 12mo; 2. New Adventures of Don Quixote, two vols. 12mo; 3. The Devil on Two Sticks, two vols. 12mo; and, 4. Gil Blas, four vols. 12mo. He produced also some comedies, and other humorous pieces. This ingenious author died in the year 1747, in the vicinity of Paris.

Sage, *John*, so justly admired by all who knew him for his classical learning and reasoning powers, was born in 1652, in the parish of Creich and county of Fife, where his ancestors had lived for seven generations with great respect, though with little property. His father was a captain in Lord Duffus's regiment, and fought for his king and country when Monk stormed Dundee on the 30th of August 1651.

The issue of the civil wars, and the loyalty of Captain Sage, left him nothing to bestow upon his son but a liberal education and his own principles of piety and virtue. In those days the Latin language was taught in the parochial schools of Scotland with great ability and at a trifling expense; and after young Sage had acquired a competent knowledge of that language at one of those useful seminaries, his father, without receiving from an ungrateful court any recompense for what he had lost in the cause of royalty, was still able to send him to the university of St Andrews. Having remained in college the usual number of terms or sessions, and performed the exercises required by the statutes, he was admitted to the degree of master of arts, the highest honour which it appears he ever received from any university.

During his residence in St Andrews he studied the Greek and Roman authors with great diligence, and was likewise instructed in logic, metaphysics, and such other branches of philosophy as then obtained in the schools. When Mr Sage had taken his master's degree, the narrowness of his fortune compelled him to accept of the first literary employment which was offered to him; and that happened to be nothing better than the office of schoolmaster in the parish of Bingry in Fifeshire, whence he was soon removed to Tippermuir, in the county of Perth. In these humble stations, though he wanted many of the necessaries and almost all the comforts of life, he prosecuted his studies with great success; but in doing so, he unhappily imbibed the seeds of several diseases, which afflicted him through life, and, notwithstanding the native vigour of his constitution, impaired his health and shortened his days. From the miserable drudgery of a parish-schoolmaster he was relieved by Mr Drummond of Cultmalundie, who invited him to superintend the education of his sons, whom he accompanied first to the public school at Perth, and afterwards to the university of St Andrews. This was still an employment by no means adequate to his merit, but it was not wholly without advantages. At Perth, he gained the friendship and esteem of Dr Rose, afterwards bishop of Edinburgh, and at St Andrews that of every man capable of properly estimating genius and learning.

The education of his pupils terminated in 1684, when he was left with no determinate object of pursuit. In this moment of indecision, his friend Dr Rose, who had been promoted from the parsonage of Perth to the professorship of divinity in the university which he was leaving, recommended him so effectually to his uncle, then archbishop of Glasgow, that he was by that prelate admitted into orders, and presented to one of the churches in the city. He was then about thirty-four years of age, and had studied the Scriptures with great assiduity; he was no stranger to ecclesiastical history, or the apologies and other writings of the ancient fathers, and had examined with great accuracy the modern controversies, especially those between the Romish and Reformed churches. A man so far advanced in life, and so thoroughly accomplished as a scholar, would naturally be looked up to by the greater part of the clergy as soon as he became one of their body. This was in fact the case. Mr Sage was, immediately on his admission into orders, appointed clerk to the synod or presbytery of Glasgow; an office of great trust and respectability, to which we know nothing similar in the church of England. During the establishment of episcopacy in Scotland, the authority of the bishops, though they possessed the sole power of ordination, was very limited in the government of the church. They did every thing with the consent of the presbyters over whom they presided. Diocesan synods were held at stated times for purposes of the same kind with those which employ the meetings of presbyteries at present; and the only prerogative which the bishop seems to have enjoyed was to be permanent president, with a negative voice over the deliberations of the assembly. The acts of each synod, and sometimes the charge delivered by the bishop at the opening of it, were registered in a book kept by the clerk, who was always one of the most eminent of the diocesan clergy.

Mr Sage continued in this office, discharging in Glasgow all the duties of a clergyman, in such a manner as endeared him to his flock, and gained him the esteem even of those who were dissenters from the establishment. Many of his brethren were trimmers in ecclesiastical as well as in civil politics. They had been republicans and presbyterians in the days of the covenant; and, with that ferocious zeal which too often characterizes interested converts, had concurred in the severities which, during the reign of Charles II. were exercised against the party whom they had forsaken at the Restoration. When that party again raised its head during the reign of James, and every thing indicated an approaching change of the establishment, those whose zeal for the church had so lately incited them to persecute the dissenters, suddenly became all gentleness and condescension, and advanced towards the presbyterians as to their old friends.

The conduct of Mr Sage was the reverse of this. He was an episcopalian and a royalist from conviction; and in all his discourses, public and private, he laboured to instil into the minds of others the principles which to himself appeared to have their foundation in truth. To persecution he was at all times an enemy, whilst he never tamely betrayed through fear what he thought it his duty to maintain. The consequence was, that in the end of the year 1688, he was treated by the rabble, which in the western counties of Scotland rose against the established church, with greater lenity than his more complying brethren.

Mr Sage retired to the metropolis, and carried with him the synodical book, which was afterwards demanded by the presbytery of Glasgow, but not recovered till, on the death of a nephew of Dr Rose, the last established bishop of Edinburgh, it was found in his possession, and restored to the presbytery to which it belonged. Mr Sage had detained it and given it to his friend, in the fond hope that episcopacy would soon be re-established in Scotland; and it was doubtless with a view to contribute what he could to the realizing of that hope, that, immediately on his being obliged to leave Glasgow, he commenced as a polemical writer. At Edinburgh he preached for a time, till, refusing to take the oaths of allegiance when required by the government, he was obliged to retire. Returning to Edinburgh in 1695, he was observed, and obliged to abscond. Yet he returned in 1696, when his friend Sir William Bruce was imprisoned as a suspected person.

After a time Mr Sage found a safe retreat with the Countess of Callendar, who employed him to instruct her family as chaplain, and her sons as tutor. These occupations did not wholly engage his active mind; for he employed his pen in defending his order or in exposing his oppressors. When the Countess of Callendar had no longer sons to instruct, Sage accepted the invitation of Sir John Stewart of Grandtully, who wanted the help of a chaplain and the conversation of a scholar. With Sir John he continued till the decency of his manners and the extensiveness of his learning recommended him to a higher station; and, on the 25th of January 1705, he was consecrated a bishop by Paterson the archbishop of Glasgow, Rose the bishop of Edinburgh, and Douglas the bishop of Dumblane. But this promotion did not prevent him from falling into sickness in November 1706. After lingering for many months in Scotland, he tried the effect of the waters of Bath in 1709, without success. At Bath and at London he remained twelve months, recognised by the great and caressed by the learned. Yet though he was invited to stay, he returned in 1710 to his native country, and died at Edinburgh on the 7th of June 1711.

His works are, 1st, Two Letters concerning the Persecution of the Episcopal Clergy in Scotland, London, 1689; 2. An Account of the late Establishment of Presbyterian Government by the Parliament of Scotland in 1690, London, 1693; 3. The Fundamental Charter of Presbytery, London, 1695; 4. The Principles of the Cyprianick Age with regard to Episcopal Power and Jurisdiction, London, 1695; 5. A Vindication of the Principles of the Cyprianick Age, London, 1701; 6. Some Remarks on the Letter from a Gentleman in the City to a Minister in the Country, on Mr David Williamson's Sermon before the General Assembly, Edinburgh, 1703; 7. A Brief Examination of some Things in Mr Meldrum's Sermon, preached on the 16th of May 1703, against a Toleration to those of the Episcopal Persuasion, Edinburgh, 1703; 8. The Reasonableness of a Toleration of those of the Episcopal Persuasion inquired into purely on Church Principles, Edinburgh, 1704; 9. The Life of Gawin Douglas, in 1710; and 10. An Introduction to Drummond's History of the Five Jameses, Edinburgh, 1711.

SAGHALIEN, a large island or peninsula, situated at the eastern extremity of Asia, immediately to the north of the large island of Jesso or Matsmai. It is called also Oku Jesso, or Upper Jesso, and by the natives Tchoka. It is separated from the continent by a narrow channel called the channel of Tartary; and it is not certainly known whether this channel extends along the whole western coast and forms Saghalien into an island, or whether it is connected with Tartary by an isthmus, thus making it a peninsula. The channel was entered by Pérouse with the idea of determining this question; but he was obliged, by adverse winds and other circumstances, to quit it before examining its whole extent. The inhabitants assured him that it was an island separated from the continent only by a narrow strait. The people of Tartary, on the other hand, asserted that it was a peninsula connected with the continent by a narrow isthmus of sand, and covered with marine plants. In confirmation of the latter theory, Pérouse observed the depth of the water constantly to diminish, without any current being felt; and he concluded that it was a strait, though so obstructed by sand and sea-weed as to be scarcely passable. Broughton, who penetrated twenty miles farther, and Krusenstern, observed that in the strait to the north of the river Saghalien the water is rendered almost fresh by the influx of the stream. The territory of Saghalien is mountainous, especially towards the centre. In the lower parts are wooded valleys and hills, and behind lofty mountains covered with snow; towards the south the country becomes more level, and exhibits only hills of sand. Krusenstern, who sailed along the eastern coast, remarked that it was nearly destitute of inhabitants. The southern and western coasts are occupied by rude tribes, of whose dispositions, however, Pérouse gives a favourable account. They are chiefly employed in hunting and in fishing. The north-east coast, opposite to the mouth of the Saghalien, is occupied by a colony of Mantchou Tartars. The Japanese had formed a colony in the Bay of Aniwa, at the southern extremity of the island; but it has been destroyed by the Russians, who, it is supposed, intend to form establishments for themselves in those countries.

SAGITTA, in *Astronomy*, the Arrow, a constellation of the northern hemisphere, near the Eagle, and one of the forty-eight old asterisms. According to the fabulous ideas of the Greeks, this constellation owes its origin to one of the arrows of Hercules, with which he killed the eagle or vulture that gnawed the liver of Prometheus. In the catalogues of Ptolemy, Tycho, and Hevelius, the stars of this constellation are only five in number, while Flamsteed made them amount to eighteen.

SAGITTA, in *Geometry*, a term used by some writers for the absciss of a curve.

SAGITTA, in *Trigonometry*, the same as the versed sine of an arch, being so denominated because it is like a dart or arrow, standing on the chord of the arch.

SAGITTARIA, an island in the Southern Pacific Ocean, discovered by Quiros in 1606, and supposed to be the same as Otaheite.

SAGITTARIUS, in *Astronomy*, the name of one of the twelve signs of the zodiac.

SAGO, a nutritive substance brought from the East Indies, and of considerable use in diet as a restorative. It is produced from a species of palm-tree (*Cycas Circinalis*, Linn.), growing spontaneously in the East Indies without any culture.

SAGOR, or GANGA SAGOR, an island belonging to the province of Bengal, situated at the entrance and eastern side of the Hooghly, or Bhagurutty river, which here separates it from another island formed by the numerous outlets of the Ganges. It is eight miles in length by four in breadth, and is detached from the mainland by a creek, the north end of which is dry at low water. The spring-tides rise here to the height of four fathoms. This station is found more healthy for ships than those farther up the Hooghly. This is owing to the great expansion of the river, in consequence of which, ships have the advantage of lying at a greater distance from the shore, and of enjoying a refreshing circulation of sea-air; and they also escape the offensive exhalations from the mud banks at Culpee and Diamond Harbour.

Sagor island has been from time immemorial a celebrated place of pilgrimage among the Hindus, being situated at the junction of the Bhagurutty river, or most sacred branch of the Ganges, with the ocean. Many of the pilgrims formerly made voluntary sacrifices of themselves, and sometimes of their children, to the sacred sharks and alligators inhabiting the surrounding waters. But in 1812 the practice was abolished under the administration of the Marquis Wellesley. The jungles of this island swarm with tigers of the largest and most ferocious sort. The island is not inhabited; but the Brahmins repair at the appointed season to the temple, and are followed by pilgrims. Its south point is in long. 88. 20. E. and lat. 21. 34. N.

SAGRES, a town of Portugal, in the province of Algarve, and in the corregimiento of Lagos. It is situated on a steep and rocky tongue of land which projects into a deep bay near to Cape St Vincent. It has a good roadstead, with a safe anchorage, and it is defended by a fort, but is chiefly inhabited by fishermen. It is celebrated as having been the favourite residence of the children of one of their princes, Henry the Sailor.

SAGUM, in Roman antiquity, a military habit, open from top to bottom, and usually fastened on the right shoulder with a buckle or clasp. It was not different in shape from the *chlamys* of the Greeks, and the *paludamentum* of the generals. The only difference between them was, that the *paludamentum* was made of a richer stuff, and was generally of a purple colour, and both longer and fuller than the *sagum*.

SAGUNTUM. See MURVIEDRO.

SAHABAD, a Rajpoot town of Hindustan, in the province of Ajmeer, tributary to the Mahrattas. It is eighty-five miles east by north from Kotah. Long. 77. 10. E. Lat. 25. 26. N.

SAHARA, or the GREAT DESERT, an immense tract of territory in Northern and Central Africa, the most desolate and terrible on the face of the globe. It is bounded on the north by the Barbary States; on the south by Soudan, or the countries watered by the upper course of the Niger, and by the Lower Senegal; and on the east it commences near the left bank of the Nile, and stretches westward to the shores of the North Atlantic Ocean, being nearly the whole breadth of Africa. Its actual extent may be stated as from the fifteenth to the thirtieth parallels of north latitude, and from the thirtieth of east to the fifteenth of west longitude. Its length is thus about three thousand miles, and its breadth is in some parts above a thousand miles. It is by many degrees the largest desert to be found in any part of the world, and it occupies about one fifth of the surface of this part of the globe. Sahara seems to be a table-land little raised above the level of the sea, covered with moving sands, and here and there containing some rocky heights, and valleys, or oases, where the water collects and nourishes thorny shrubs, ferns, and grass. From the defective cultivation of the surrounding countries, and the influence of the prevailing winds, the desert has always been gaining ground, so that in the east some of the Egyptian monuments of antiquity, which at the time of their erection were no doubt unencumbered by the sand, even at their bases, are now covered with it. In the south, likewise, it has encroached on the banks of the Niger and the Senegal; and on the north and north-west the southern provinces of Morocco have been partly usurped by it, so that the streams descending from the Atlas Mountains are either drunk up, or have their courses diverted so as to be rendered comparatively useless; while in the west it has, in some parts, extended a hundred miles into the sea, forming immense sand-banks, destructive to the formation of landing-places. The mountains along the Atlantic Ocean are in no continued chain, but rise up in isolated peaks, and through the open spaces between them the sand is drifted by the winds. Towards the interior they again lose themselves in a plain covered with white and sharp pebbles. From being frequently shifted by winds, the sand extends over the vast plain in a billowy or undulating manner, like the sea when agitated. In its nature it is quartzy and calcareous. The solid fixed rocks which occasionally rise above this mobile surface are sometimes extensive enough to form tracts of country. In the eastern part of the Sahara, the rocks are principally secondary, and for the most part limestone, sandstone, gypsum, and rock-salt, which occasionally appear to be traversed by trap-rocks. At Tegazza, and some other places, a sal-gem, whiter than the purest marble, lies in extensive strata under a bed of rock. Golberry informs us, that on its southern margin he found masses of native iron. The waters of the lakes which here and there occur in the desert are in some instances impregnated with carbonate of soda, in others with muriate of soda or common salt, forming the natron and salt lakes of travellers. The rocks on the sea-coast of the Sahara, and the islands that lie along it, are said to be principally composed of igneous rock, and chiefly basalt.

The principal production of Sahara is mineral salt, which, in many places, covers the surface in white glittering crystals, so that at a distance they appear to be rugged fields of snow or ice. This salt constitutes the staple article of the trade of Soudan, and Timbuctoo is indebted to this product of the waste for its existence as well as its prosperity.

The most remarkable feature of this desolate ocean of sand consists in the oases or verdant islands which, at distant and dreary intervals, agreeably break its appaling uniformity. These are formed by springs, which, fed by distant mountains, burst forth amidst the desert solitudes, and, diffusing a partial verdure and fertility, form a strikingly beautiful contrast with the surrounding desolation. They are embellished with flowering shrubs of peculiar beauty. An aromatic plant resembling thyme, the same which bears the grains of zahara, acacias and other thorny shrubs, nettles, and brambles, constitute the ordinary vegetation of these places. Whole tracts are covered with forests of acacia, from which rich gums distil their odours; and groves of the date and lotus also occur, but more rarely. The fruits and berries which they yield constitute the food of whole tribes of men, while the verdure affords a support for animals chiefly of the antelope species. But lions, panthers, and serpents of enormous size, sometimes augment the horrors of these frightful solitudes. Ravens and other birds of prey are likewise often seen hovering over the track of the caravan, ready to dispute with the Moorish dogs for the carcasses of those who have perished in the desert. These oases are frequented by numerous flocks of ostriches, which feed on snails, lizards, and some coarse plants. For a great part of the year the dry and heated air has the appearance of a reddish vapour, and the horizon looks like the fire of a series of volcanoes. The rain, which descends from July to October or November, does not extend its precarious and momentary blessing to all the districts. In some of them rain does not fall for years together, on which occasions the springs also dry up, and a frightful want of water ensues, which drives men and animals to despair. The air during the day is oppressively hot, without a cloud to mitigate the glowing sunshine; and during the night it is disproportionally cool. The natural magic of the *Fata Morgana*, here often exhibited to the eye of the parched traveller, is provokingly deceptive. Sometimes he sees in the distance what appears almost beyond question to be a sheet of water glittering in the sunbeams. He hastens forward, in hopes of soon allaying his thirst at the welcome lake; but his efforts to reach it are as vain as those of the child to clasp the rainbow. Still his fainting steps pursue, for still the imaginary lake lies before him as lovely and alluring, but as distant, as ever.

It is of course only on the borders of the Sahara that oases on a great scale occur. In the eastern part they are extensive enough to form small kingdoms, generally dependent on some more powerful neighbour. In other parts, particularly the western, they consist merely of one or more detached villages, serving as emporia for the trade carried on by the caravans. And sometimes, especially as we penetrate into the interior of the desert, the oases are merely springs which nourish too scanty a vegetation to admit of inhabitants settling there, but affording supplies of water to the caravans, whose route is determined by the situation of these fountains. Dreary and encompassed with dangers as such abodes must be, every spot on which inhabitants can subsist is occupied; and notwithstanding the perils and sufferings of such travelling, regular journeys are performed across the whole breadth of this desolate region, from Morocco on the north to Timbuctoo on the south. The only animal fitted for traversing these solitudes as a beast of burden is the camel, which with equal truth and beauty has been designated the ship of the desert. By its patience of hunger and fatigue, by the provision which has been made for its carrying a large supply of water, and by the structure of its hoof, so formed as to glide smoothly over the level sand, it seems expressly designed by nature as a means of communication across these immense wastes. The merchandise which they convey is firmly secured on their backs by means of creels and otherwise; and for the sake of mutual aid and defence, as well as to relieve the tedium of the route, they proceed in large bodies, occasionally amounting to the number of two thousand. The trade is carried on by merchants inured from their infancy to the hardships which attend such journeys. Their food consists of the milk of the camel, with barley-meal or Indian corn, and a few dates, although the more opulent carry dried flesh and coffee. Water is conveyed in goat-skins, covered with tar for the purpose of preventing evaporation. The caravans, or akkabahs, as the Moors call them, do not proceed in a straight line to their journey's end, but turn in various directions according to the position of the different oases. At each of these the travellers rest and refresh themselves for a day or two, and take in supplies of water. Two great evils are encountered in crossing the desert. The first and most terrible is, when from a peculiarly dry season one or more of the springs happens to fail; and the second is the burning wind, called the samoom, shoom, or simoom. Less than half a century ago a caravan consisting of two thousand persons and eighteen hundred camels, not finding water at the usual places, perished utterly, both men and animals. The vehemence of the wind, which is more like the breath of a furnace than the natural commotion of the atmosphere, raises and rolls before it the waves of red sand, causing the desert so much to resemble a stormy sea, that the Arabs have given it the name of "Bahar billa-maia," or waterless sea.

Major Denham relates an instance of the terrible effects of the simoom. "The overpowering effect of a sudden sand-wind, when nearly at the close of the desert, often destroys a whole kafila, already weakened with fatigue. The spot was pointed out to us, strewed with bones and dried carcasses, where, the year before, fifty sheep, two camels, and two men, perished from thirst and fatigue, when within eight hours' march of the well which we were anxiously looking for."

Captain Lyon thus describes the appearance of these dead bodies: "We observed many skeletons of animals which had died of fatigue on the desert, and occasionally the grave of some human being. All these bodies were so dried by the extreme heat of the sun, that putrefaction did not appear to have taken place after death. In recently dead animals I could not perceive the slightest offensive smell; and in those long dead, the skin, with the hair on it, remained unbroken and perfect, although so brittle as to break with a slight blow. The sand-winds never cause these carcasses to change their places, as in a short time a slight mound is formed round them, and they become stationary." The fact here noticed of the preservation of the dead bodies in the sand has been observed in other parts of the world, for instance in South America. It appears that the heat of the sun rapidly exhales the natural juices, which prevents the usual process of putrefaction from going on, and thus the carcass is parched into something resembling the well-known mummy of Egypt.

The merchants possess some knowledge of the heavenly bodies, and direct their course by the polar star, often preferring to travel during the clear nights of these climates rather than brave the scorching heat of a tropical sun. This nocturnal travelling, however, has its inconveniences, so that the most part of the journey is performed during the day. The camel-drivers sing as they go along; and as they approach houses, or when the camels seem in danger of dropping down with fatigue, their songs acquire additional spirit and expression, which is said to have the intended effect upon the animals. At four o'clock in the afternoon they pitch their tents and join in prayer. Supper follows this act of devotion, after which they sit down in a circle and converse or recite stories until sleep closes their eyes, and the perils of the desert are forgotten in its unconsciousness.

The coast of Sahara contains some harbours and roadsteads. Those of Rio-do-Ouro and of St Cyprian are formed by large creeks, resembling the mouths of rivers. The Gulf of Ardum, and the Portendic Road, have often been visited by Europeans. On the same line are Cape Bojadore and Cape Blanco, which latter is supposed to mark the limit of the discoveries of the Carthaginians. At Hoden, Tisheet or Tegazza, and Taudeny, in the western region of Sahara, are extensive mines of rock-salt, an article which is wanting in the populous regions of Central Africa, and is consequently in great demand in those quarters. One of the principal dépôts of salt is Walet, which, by this article, is rendered a place second in importance only to Timbuctoo. Aroun, also, in the very centre of the desert, has become a place of some importance, containing three thousand inhabitants, chiefly by this trade and the passage of caravans. In the heart of Sahara, between Gadamis and Timbuctoo, is the district of Suat or Tuat, inhabited by a mixture of Arabs and Tuaricks, in no respect superior to the rest of the desert tribes. Aghably and Ain-el-Salah, their chief towns, are frequented as caravan stations. (R. R. R.)

SAHARUNPORE, an extensive and valuable district of Hindustan, in the province of Delhi, situated principally between the rivers Jumna and Ganges, and about the thirty-first degree of northern latitude. It is bounded on the north by the Sewalic Mountains, and the province of Serinagur. The soil is fertile, and being well watered by innumerable streams from the hills, produces all kinds of grain, sugar, indigo, cotton, and tobacco. It has a fine and temperate climate for the greater part of the year; but during the months of April and May the hot winds blow with great violence, while some of the winter months are excessively cold. This district, though it is placed between the Ganges and the Jumna, which here run parallel at the distance of about fifty-five miles, is not subject to the periodical inundation which prevails in Bengal and the southern provinces. The country is flat to the bottom of the hills, which rise abruptly, being the northern boundary of the immense valley through which the Ganges flows in its progress to the sea. The whole district was, about the middle of the last century, made over to Nijeeb Khan, an Afghan chief, who brought it into a high state of cultivation, and was succeeded by his son, Zabita Khan, who, dying in 1785, was succeeded by his son Ghoolam Kadir, a cruel tyrant. He rebelled against the unfortunate emperor Shah Alum, and put out his eyes, and tortured and starved to death many of the royal family; in retaliation for which he was himself put to death by the Mahratta chief Mahdajee Sindia, who took possession of the district. In 1803, this country, with all the other Mahratta possessions between the Ganges and the Jumna, was acquired by the British government, and in 1804 was separated into two divisions, the northern and the southern, and placed under the superintendence of a civil establishment of a judge, collector, &c. and has since been divided into two collectorships. From the death of Aurungzebe, until its acquisition by the British in 1803, it was one continued scene of intestine commotion. The capital is of the same name, and is an open town, a hundred and five miles north by east from Delhi. Long. 77. 23. E. Lat. 30. 15. N.

SAHLAYDUN, a town of the Birman empire, in the province of Pegu, and situated on the Irrawaddy river. It carries on a considerable trade in teak-timber with Rangoon, and has also a land-communication with the seacoast of Arracan. Long. 94. 40. E. Lat. 18. 35. N.

SAHWOTTY, a town of the Birman empire, situated on the western bank of the Irrawaddy. Long. 94. 50. E. Lat. 19. 41. N.

SAIBGUNGE, a town of Hindustan, in the province of Bengal and district of Rungpore. Long. 88. 48. E. Lat. 26. 15. N.

SAIDA, or SEIDA, a seaport of Syria, celebrated as one of the most ancient Phœnician cities, and supposed to be built on the site of the ancient Sidon. In sacred writ it is often mentioned along with Tyre, and always as a flourishing commercial city. It was occupied by the French during the middle ages, who repaired and strengthened the fortifications. Although decayed from its ancient splendour, it is still of importance as the port of Damascus. It is situated in a plain extending only two miles inward from the sea, when it rises into steep mountains, barren and unproductive; and hence its prosperity must always have been derived from commerce. The town extends six hundred paces along the sea. It is, like all Turkish towns, dirty, ill built, and filled with ruins. It formerly had a magnificent harbour, composed of vast moles stretching out into the sea, but it is now entirely destroyed. The huge stones of which it was built may be still seen, some twelve feet long by eleven broad, and five deep. It is said to be the work of Louis IX. but contains on the top work of an older date. The harbour is said to have been ruined by Feckerdine, emir of the Druses, when he established an independent power with a view of preventing the grand seignior from effecting a landing with a maritime force. On the opposite side of the town is a modern fort, consisting merely of a large tower, but incapable of resisting any serious attack. The road is formed by a shoal running opposite the castle, and leaving a space between, where vessels may ride, though not in perfect safety. The surrounding country is laid out in gardens and orchards, which appear very beautiful at a distance. It carries on a considerable trade, and is the emporium, not only of Damascus, but of the surrounding country. The exports consist of corn, silk, raw and spun cotton, the last article forming the principal trade of the inhabitants. It is now included in the pashalik of Damascus. The population is from 7000 to 8000. Long. 35. 14. E. Lat. 33. 25. N.

SAIL, in *Navigation*, an assemblage of several breadths of canvass, sewed together by the lists, and edged round with cord, fastened to the yards of a ship, to make it drive before the wind.

The edges of the cloths or pieces of which a sail is composed, are generally sewed together with a double seam; and the whole is skirted round at the edges with a cord, called the bolt-rope. Although the form of sails is extremely different, they are all nevertheless triangular or quadrilateral figures; or, in other words, their surfaces are contained either between three or four sides.

The former of these are sometimes spread by a yard, as lateen-sails, and otherwise by a stay, as stay-sails, or by a mast, as shoulder-of-mutton sails; in all which cases the foremost leech or edge is attached to the said yard, mast, or stay, throughout its whole length. The latter, or those which are four-sided, are either extended by yards, as the principal yards of a ship; or by yards and booms, as the studding-sails, drivers, ring-tails, and all those sails which are set occasionally; or by gaffs and booms, as the mainsails of sloops and brigantines. See SHIP and SHIP-BUILDING.

SAIL is also a name applied to any vessel seen at a distance under sail, and is equivalent to ship.

To set SAIL, is to unfurl and expand the sails upon their respective yards and stays, in order to begin the action of sailing.

To make SAIL, is to spread an additional quantity of sail, so as to increase the ship's velocity.

To shorten SAIL, is to reduce or take in part of the sails, with an intention to diminish the ship's velocity.

To strike SAIL, is to lower it suddenly. This is particularly used in saluting or doing homage to a superior force, or to one whom the law of nations acknowledges as superior in certain regions. Thus all foreign vessels strike to a British man-of-war in the British seas.

SAILING, the movement by which a vessel is wafted along the surface of the water, by the action of the wind upon her sails.

When a ship changes her state of rest into that of motion, as in advancing out of a harbour, or from her station at anchor, she acquires motion very gradually, as a body which arrives not at a certain velocity till after an infinite repetition of the action of its weight.

The first impression of the wind greatly affects the velocity, because the resistance of the water might destroy it; since the velocity being but small at first, the resistance of the water which depends upon it will be very feeble. But as the ship increases her motion, the force of the wind on the sails will be diminished; and, on the contrary, the resistance of the water on the bow will accumulate in proportion to the velocity with which the vessel advances. Thus the repetition of the degrees of force, which the action of the sail adds to the motion of the ship, is perpetually decreasing; while the new degrees added to the effort of resistance on the bow are always augmenting. The velocity is then accelerated in proportion as the quantity added is greater than that which is subtracted; but when the two powers become equal, when the impression of the wind on the sails has lost so much of its force as only to act in proportion to the opposite impulse of resistance on the bow, the ship will then acquire no additional velocity, but continue to sail with a constant uniform motion. The great weight of the ship may indeed prevent her from acquiring the greatest velocity; but when she has attained it, she will advance by her own intrinsic motion, without gaining any new degree of velocity, or lessening what she has acquired. She moves then by her own proper force *in vacuo*, without being afterwards subject either to the effort of the wind on the sails, or to the resistance of the water on the bow. If at any time the impulsion of the water on the bow should destroy any part of the velocity, the effort of the wind on the sails will revive it, so that the motion will continue the same. It must, however, be observed, that this state will only subsist when these two powers act upon each other in direct opposition, otherwise they will mutually destroy one another. The whole theory of working ships depends on this counter action, and the perfect equality which should subsist between the effort of the wind and the impulsion of the water.

The effect of sailing is produced by a judicious arrangement of the sails to the direction of the wind. Accordingly the various modes of sailing are derived from the different degrees and situations of the wind with regard to the course of the vessel. See SEAMANSHIP.

SAILING also implies a particular mode of navigation, which is formed on the principles and regulated by the laws of trigonometry. Hence we say, Plain Sailing, Mercator's, Middle-latitude, Parallel, and Great-circle Sailing.

SAINT means a person eminent for piety and virtue, and is generally applied to the apostles and other holy persons mentioned in Scripture. But the Roman Catholics give it an application much more extensive. The canonization of saints, they tell us, is the enrolment of any person in the *canon* or catalogue of those who are called saints; or it is a judgment and sentence of the church, by which it is declared that a deceased person was eminent for sanctity during his lifetime, and especially towards the end of it, and that consequently he must now be in glory with God, and deserves to be honoured by the church on earth with that veneration which she is wont to pay to the blessed in heaven.

The discipline with regard to this matter has varied. It would seem that in the first ages every bishop in his own diocese was wont to declare what persons were to be honoured as saints by his people. Hence St Cyprian, about the middle of the third century, requires that he be informed of those who should die in prison for the faith, that so he might make mention of them in the holy sacrifice with the martyrs, and might honour them afterwards on the anniversary day of their happy death. This veneration continued sometimes to be confined to one country; but sometimes it extended to distant provinces, and even became universal all over the church. It was thus that St Laurence, St Ambrose, St Augustin, St Basil, and many others, appear to have been canonized by custom and universal persuasion. In those ages none were reckoned saints but the apostles, the martyrs, and very eminent confessors, whose sanctity was everywhere notorious. Afterwards it appears that canonizations were wont to be performed in provincial synods, under the direction of the metropolitan. It was thus that St Isidore of Seville was canonized in the seventh century, by the eighth council of Toledo, fourteen years after his death. This manner of canonization continued occasionally down to the twelfth century. The last instance of a saint canonized in this way, is that of St Walter, abbot of Pontoise, who was declared a saint by the archbishop of Rouen in the year 1153. In the twelfth century, in order to prevent mistakes in so delicate a matter, Pope Alexander III. judged it proper to reserve this declaration to the Holy See of Rome exclusively; and decreed that no one should for the future be honoured by the church as a saint without the express approbation of the pope.

Several authors have written on canonization, particularly Prosper Lambertini, afterwards pope under the name of Benedict XIV., who had held the office of Promoter of the Faith for many years. He published on it a large work in several volumes, in folio, of which there is an abridgment in French. In this learned performance there is a full history of the canonization of saints in general, and of all the particular processes of that kind that are on record.

ST ANDREWS. See ANDREWS, ST.

ST ANTONIO, one of the Cape de Verd islands. See VERD CAPE, ISLANDS OF.

ST BARBES ISLE, a small island in the Eastern Seas, situated under the equinoctial line. It is about three miles in circumference. Long. 107. 40. E.

ST BERNARDINO, straits that separate the islands of Luzon and Samar, in the Philippines.

ST GEORGE, one of the Azores. See AZORES.

ST IAGO, one of the Cape de Verd islands. See VERD CAPE, ISLANDS OF.

ST MICHAELS, one of the Azores. See AZORES.

ST NICHOLAS, one of the Cape de Verd islands. See VERD CAPE, ISLANDS OF.

ST PETER AND ST PAUL, a seaport village of Asia, on the south-eastern coast of Kamtschatka, in the bay of Awatska, which, though small, is described by Captain King as most commodious. Long. 158. 43. E. Lat. 54. N.

ST SERVAN, a city of France, in the department of the Ille-Vilaine, and arrondissement of St Malo. It stands on the bay of St Malo, where the river Rance falls into it, and is separated from the city of that name by an arm of it. It has an enclosed harbour and a good roadstead, in which ships of the line can ride in security. It is only fortified towards the sea. There is an establishment for building ships, where some frigates have been constructed. It has manufactories of sail-cloth, ropes, and ship-biscuits, and, in the year 1836, contained 9975 inhabitants, who depend mostly on the shipping.

ST SEVER, an arrondissement of the department of the Landes, in France, containing 170,746 hectares, equal to $600\frac{1}{3}$ square miles in extent. It is divided into eight cantons, and these into 114 communes, with 90,500 inhabitants in 1836. The capital is the city of the same name situated on the left bank of the river Adour, and contains 5863 inhabitants. Long. 0. 55. W. Lat. 43. 45. N.

ST THOME, a town of the south of India, in the province of the Carnatic, situated close to the sea-side, which here forms a small bay. It stands in a fine plain abounding in cocoa-nut trees, which retain their verdure throughout the year. Except the church, it is now nearly a heap of ruins, inhabited chiefly by Indians, Portuguese, and Hindu weavers, who consist of Hindus, Mahommedans, and Roman Catholic Christians, the latter being a mixture of the Portuguese and natives, and of a very dark complexion. This town arose on the ruins of the ancient Hindu city of Maliapurum, which the Portuguese took possession of about the year 1545, and made it the capital of all their settlements on the Coromandel coast. They changed the name to St Thome, in honour of the apostle. In 1672 it was taken by the French, who in 1674 were compelled to surrender it to the Dutch, who gave it up to the king of Golconda. In 1749 it was taken by a British fleet under Admiral Boscawen; and in the Carnatic wars between the British and the French it was occupied by the Madras presidency, under whose authority it has ever since remained. Long. 80. 22. E. Lat. 13. 1. N.

ST TROPES, a city of France, in the department of the Var and the arrondissement of Draguignan. It is a seaport on the bay of Grimaud, in a fruitful district, has a haven defended by a castle, is well built, and enjoys a great trade in cork and in ship-building, and a considerable tunny fishing. In 1836 it contained 3736 inhabitants. Long. 6. 33. 25. E. Lat. 43. 16. 8. N.

SAINTES, an arrondissement of the department of the Lower Charente, in France. It is 536 square miles in extent, and comprehends eight cantons, divided into 109 communes, with 104,871 inhabitants in 1836. The capital is the city of the same name situated at the foot of a hill on the navigable river Charente. It is an ill-built place, but, with the suburb, contains 1800 houses, with 9559 inhabitants, carrying on some woollen manufactories, and considerable distilleries of brandy and spirits of wine. Near to it are some Roman antiquities, especially the remains of an amphitheatre, an aqueduct, and a triumphal arch. Long. 0. 43. 58. W. Lat. 45. 44. 43. N.

Saintes, *Des*, a group of small islands in the West Indies, adjacent to Guadaloupe, of which government they form a part.

SAIPOOR, a town of Hindustan, in the province of Gundwana, possessed by independent zemindars. It is situated on the north-west side of the Rhair river, fifteen miles from the southern frontier of the Rhotas district, in Bahar. Long. 82. 50. E. Lat. 24. 2. N.

SAJENE, a Russian measure of length, equal to about seven English feet.

SAKERTOL, a town and fortress of Hindustan, in the province of Delhi, and district of Saharunpore. It was taken by the Mahrattas in 1772. It is situated on the western bank of the Ganges. Long. 77. 0. E. Lat. 29. 25. N.

SAKKAR, a district of Hindustan, in the province of Bejapoor, belonging to the nizam, and situated about the seventeenth degree of north latitude. It is well watered, being situated between the rivers Beemah and Krishna, and is extremely fertile. To the north of the Beemah it is somewhat hilly. The principal towns are Nusseritabad and Sakkar; and the latter is the capital. It is situated on the north side of the Beemah river, sixty-five miles east from the city of Bejapoor. Long. 76. 38. E. Lat. 17. 4. N.

SAL si Puedes, is the name of some islands in the Gulf of California. They lie in the interior of the gulf, and form a chain, leaving only some very narrow channels, of difficult entrance for vessels. They are of various sizes, the largest bearing the names of Las Animas, San Lorenzo, San Estevan, and San Augustin.

SALA, a city of Italy, in the province of Principato Citra, of the kingdom of Naples, situated on a small river of the same name. It is an inland place, situated on an elevated spot, and has a castle, five parish churches, and 6100 inhabitants. Another place of the same name in Italy is in the duchy of Parma, being situated on the river Baganza. It was the favourite residence of the last duchess, and now belongs to her successor, who keeps on the land belonging to it a large flock of merino sheep, with the view of extending that race throughout the country. There is another place in Sicily of the name, in the intendancy of Trapani, which is described as containing 9800 inhabitants, but ill built and disgustingly filthy.

SALAD, or Sallad, a dish of eatable herbs, seasoned with salt, oil, and vinegar. Ménage derives the word from the Latin *salata*, from *sal*, salt; but others from *salcedo*. Ducange derives it from *salgama*, which is used in Ausonius and Columella in the same sense. Some add mustard, hard eggs, and sugar. The principal salad herbs, and those which ordinarily make the basis of our English salads, are lettuce, celery, endive, cresses, radish, and rape.

SALADIN, a famous sultan of Egypt, equally renowned as a warrior and a legislator. He supported himself by his valour, and the influence of his amiable character, against the united efforts of the chief Christian potentates of Europe, who carried on wars against him, under the appellation of *Holy Wars*.

SALAIBSKOIE, a fortress of Asiatic Russia, situated at the confluence of the small river Salaiba with the Bia, and surrounded with immense forests.

SALAMANCA, one of the departments into which the kingdom or province of Leon, in Spain, is divided. It is situated between lat. 40° and 41° 38′ north. The river Duero forms its limit to the north and north-west, except where it comes in contact with Portugal. Estremadura is on its southern side, and the province of Segovia to the eastward. It extends over 471 square leagues, and its population amounts to 272,982 souls. It generally consists of an open country with extensive plains, and for the most part destitute of trees. The soil is more fruitful than its appearance would suggest. It yields excellent corn, and in moist summers the harvests are abundant; but it is subject to that want which the greater part of Spain feels from the scarcity of water; for although there are several rivers in the department, the influence of their moisture extends but a small distance from their banks. The principal of these rivers is the Duero, into which the Alba, the Tormes, and the Agueda run, whilst the Alagon, taking a southern course, runs into the Tagus. From the nature of the soil through which these rivers pass, they have worn very deep channels, and therefore cannot be used for the purposes of irrigation, without a portion of labour and expenditure which the inhabitants are neither willing nor able to bestow upon them. Though generally the department is destitute of wood, yet in some parts there are extensive forests of evergreen oak trees, without any brushwood under them; and the oaks themselves are without those spreading branches and lofty tops with which our forests exhibit these trees. They are, however, of considerable benefit to the inhabitants by their copious produce of acorns, on which large droves of pigs are fed. The peasants who attend to these animals precede the drove, and proceeding from tree to tree, beat them with a kind of flail, causing the acorns to fall, which the swine most greedily devour. They thus proceed daily from tree to tree till the food they supply is exhausted. The hams of the pigs fattened in this way are most highly esteemed. In this department large flocks of the merino kind of sheep are fed; and many of the stationary kind are bred here, whose wool is of a very inferior degree of fineness. In the early part of the late war the plains of Salamanca were very favourable to the operations of the French armies, who being superior in cavalry, could act on them with the most powerful effect. The cattle of this province are reckoned to be 9363 horses, 6163 mules, 22,002 asses, 107,800 oxen, 103,401 goats, and 107,200 pigs. Of fruits it yields 9500 fanegas of chestnuts, 502,000 of nuts, and 12,000 of raisins.

Salamanca, a city of Spain, head of the department of the same name, in the province or kingdom of Leon. It is situated on the river Tormes, over which there is a bridge standing, the piers of which were built by the Romans, and there remain twelve of the arches constructed by them, and thirteen of more recent date, probably erected since the expulsion of the Moors. At a short distance Salamanca has a most imposing effect. Its lofty towers and cupolas, the magnificent Gothic cathedral, the numerous convents and colleges, and the lengthened bridge which leads to them, present a landscape of the first order.

The immediate vicinity of the city is fruitful, being on a plain surrounded by mountains of no great elevation, though the Sierra de Guadarrama is visible in the distance, towering above them. It is well supplied from its fields with wine, corn, fruits, and edible vegetables. It grows some flax and oil, but procures a part of the latter from Estremadura and Andalusia.

The principal fame of Salamanca has arisen from its university, which is one of the largest establishments for education in Spain, if not in Europe. The professors are not generally distinguished for their learning or activity, and principally exercise their faculties in keeping the minds of the pupils down to that level of inquiry and pursuit which is best calculated to secure their attachment to the existing civil and religious institutions of their country. Every inquiry which may have a tendency to lead them from this beaten track is most carefully checked; and even books of science, if composed by foreigners, are viewed with a suspicion that there may be in them some latent heretical tenets. Under such restraints, it is not wonderful that the orthodoxy of the university of Salamanca is unimpeached. The spirit of loyalty was, in fact, so great, that at the commencement of the invasion a regiment was formed from the students, which was soon disciplined and effective, but the whole of which was almost destroyed at the fatal battle of Medellin.

No establishment of the kind in Spain enjoys revenues equal to this university, and none under proper regulations could be more beneficial to this or any country; but science and knowledge are so checked by the tendency towards the preservation of the religion of the state, and the apprehension that knowledge may give a bias contrary to the interests of the church, that a vast deal of time, which might be usefully employed, is devoted, both by pupils and tutors, to a course of studies which, to say the least, neither tends to enlarge the boundaries of knowledge nor to strengthen the minds of the students. Besides the candidates for holy orders, great numbers of the sons of good families from all parts of Spain are sent to this seminary to pass a few years; and hence the number of the members of the university has at some periods amounted to more than four thousand. The regular inhabitants of the city, exclusive of the university, amount to 13,500 persons.

The cathedral is a fine object of the Gothic kind, though of no earlier erection than the reign of Charles I. of Spain, in the beginning of the sixteenth century; and as at that period Gothic architecture was on the decline in Spain, it will not bear very rigid criticism. It is, however, a magnificent mass of building, and is adorned with paintings from the pencil of Titian, Spagnoletti, and some other great masters. The college formerly belonging to the order of Jesuits is a very large pile of building, now occupied by regular canons. The church, dedicated to St Mark, within it, has some of the best productions of the Spanish painter Mengs, but being a representation of the various parts of the life of Loyola, the founder of the order of Jesuits, whatever merit they may have as paintings, they have now none as historical pieces.

The principal square of Salamanca, in the centre of the city, is a fine object. The buildings that surround it are handsome and lofty, and supported by piazzas, under which is the principal public walk for the inhabitants. It is situated in latitude 41. 21. N.

SALAME, a small island at the entrance of the Persian Gulf, near Cape Mussendoon. Long. 56. 48. E. Lat. 26. 20. N.

SALAMIS, an island of the Archipelago, situated in long. 34. 0. E. and lat. 37. 32. N. It was famous in antiquity for a battle fought there between the Greek and Persian fleets. In this engagement, which was one of the most memorable actions we find recorded in history, the Grecians lost forty ships, and the Persians two hundred, besides a great many more which were taken, with all the men and ammunition on board.

The island of Salamis is of a very irregular shape; it was reckoned eight or ten miles in length, reaching westward as far as the mountains called *Kerata* or *The Horns*. Pausanias informs us that on one side of this island stood in his time a temple of Diana, and on the other a trophy for a victory obtained by Themistocles, together with the temple of Cychreus, the site of which is now thought to be occupied by the church of St Nicholas.

The city of Salamis was demolished by the Athenians, because in the war with Cassander it surrendered, from disaffection, to the Macedonians. In the second century, when it was visited by Pausanias, some ruins of the Agora or market-place remained.

SALAYR ISLE, an island in the Eastern Seas, situated off the southern extremity of Celebes, about the sixth degree of south latitude. This island is about forty miles in length by eight in average breadth; and there are many smaller isles around it, two of which only are inhabited, namely, Bonarutte and Calawe. It is mountainous and woody, yet better cultivated and peopled than most of the eastern isles. The principal produce is millet, which is the chief subsistence of the natives, and cotton, which is raised in a coarse manner. From this raw material coarse blue and white stripped cloths are manufactured, for internal consumption and for exportation. The inhabitants, according to the estimate of Captain Forrest, amount to about 60,000. They have good houses; and the richer classes, in travelling, are carried in bamboo chairs over the hills, while horses are used in the level country. The island was ceded by the Macassars, who had obtained possession of it, to the king of Ternate, from whom it was taken by the Dutch East India Company. The Dutch had a junior resident here as merchant, who dwelt in a pallisadoed fort.

SALE is the exchange of a commodity for money; barter, or permutation, is the exchange of one commodity for another.

SALEMI, a city of the island of Sicily, in the province of Mazzara. It stands on a healthy spot on the summit of a hill, which is the ancient Alicia or Halycus. It is surrounded with walls in a dilapidated state. It is on the decline, but still contains 9200 inhabitants, who are chiefly employed in agriculture, especially in producing the best oil, and in making excellent wire.

SALENGORE, a district in the Malay peninsula, extending along the Straits of Malacca, and governed by a Mahommedan chief, who bears the title of rajah. It is situated at no great distance from Prince of Wales' Island, in which the trade of the place chiefly centres. Pepper, cloves, wild nutmegs, wax, nutmeg-oil, rattans, dammer, wood, oil, &c., are imported in the Buggess prows; and from a large river near to Salengore great quantities of long rattans are brought. The prince is the chief merchant, as in the other Malay principalities, monopolizing all the trade. Ships lying in the river are secure from pirates; but in the road it is necessary to be on the alert against straggling prows, which are always ready to take advantage of unguarded ships. The Buggesses have still a small settlement here, and profess the Mahommedan religion.

SALEP, in the *Materia Medica*, the dried root of a species of orchis. "The restorative, mucilaginous, and demulcent qualities of the orchis root, render it of considerable use in various diseases. In the sea-scurvy it powerfully obtunds the acrimony of the fluids, and at the same time is easily assimilated into a mild and nutritious chyle. In diarrhœas and the dysentery it is highly serviceable, by sheathing the internal coat of the intestines, by abating irritation, and gently correcting putrefaction. In the symptomatic fever which arises from the absorption of pus from ulcers in the lungs, from wounds, or from amputation, salep used plentifully is an admirable demulcent, and well adapted to resist the dissolution of the crasis of the blood, which is so evident in these cases. And by the same mucilaginous quality it is equally efficacious in the strangury and dysury, especially in the latter when arising from a venereal cause, because the discharge of urine is then attended with the most exquisite pain, from the ulceration about the neck of the bladder and through the course of the urethra. I have found it also an useful aliment for patients who labour under the stone or gravel." (Dr Percival's Essays, Medical and Experimental.) The ancient chemists appear to have entertained a very high opinion of the orchis root, as appears from the *Secreta Secretorum* of Raymund Lully, a work dated 1565.

SALERNO, a city of Italy, the capital of the Neapolitan province Principato Citeriore. It stands on the sea-shore, in the bay of that name, between mountains and the two small rivers called Sele and Larino. It is surrounded with walls, and defended by a castle. An archbishop is situated here, with a fine cathedral, under which are the graves of the ancient kings of Lombardy, as well as of Pope Gregory VII. It contains seventeen parish and nineteen conventual churches, a lyceum, which was formerly a university, and the remains of the celebrated medical school. The houses, though old, are large and grand, and the inhabitants are 10,650. A fair of the greatest trade in Italy was formerly held here; but it has gradually fallen into decay of late years, owing to the insecurity of the roadstead, where ships must anchor, there being no harbour.

SALFORD, a township of the parish of Manchester, and a kind of suburb to that place, being separated from it only by a small bridge. It is chiefly inhabited by operatives in the cotton trade. It was created a borough by the law of 1832, for the purpose of returning one member to the House of Commons. The population amounted in 1801 to 13,611, in 1811 to 19,114, in 1821 to 25,772, and in 1831 to 40,786.

SALIANT, in *Fortification*, denotes projecting. There are two kinds of angles; the one saliant, which have their points outwards; the other re-entering, which have their points inwards.

Saliant, Salient, or Saillant, in *Heraldry*, is applied to a lion, or other beast, when its fore-legs are raised in a leaping posture.

SALIBABO Isles, a group of islands in the Eastern Seas, situated about the fourth degree of north latitude, and between 126 and 127 of east longitude. The island of Salibabo is about fifteen miles in circumference, and is situated to the southward of Tulour, from which it is divided by a narrow strait, about one mile across. The names of the principal islands are Tulour or Kercolang, Salibabo, and Kabruang. Salibabo contains twelve villages, the united population of which amounts to 3000. All these islands are well cultivated and populous, abounding in potatoes, rice, goats, hogs, &c. The inhabitants are of the Malay colour, with long hair; and have for arms lances, swords, targets, and daggers. They manufacture a coarse kind of cloth from the wild plantain tree. They are much oppressed by their chiefs, and sold as slaves for trifling offences. They barter provisions with such ships as pass, for coarse calicoes, red handkerchiefs, coarse cutlery, &c. There is a good harbour on the east coast of the island of Salibabo.

SALIC or Salique Law (*Lex Salica*), an ancient and fundamental law of the kingdom of France, usually supposed to have been made by Pharamond, or at least by Clovis, in virtue of which males only are to inherit.

Some, as Postellus, would have it to have been called *Salic*, as if *Gallic*, because peculiar to the Gauls. Montanus insists that it was so named because Pharamond was at first called *Salicus*. Others will have it to be so named as having been made for the Salic lands. These were noble fiefs which the first kings used to bestow on the Sallians, that is, the great lords of their *salle* or court, without any other tenure than military service; and for this reason such fiefs were not to descend to women, as being by nature unfit for such a tenure. Some, again, derive the origin of this word from the Salians, a tribe of Franks that settled in Gaul in the reign of Julian, who is said to have given them lands upon condition of their personal service in war. He even passed the conditions into a law, which the new conquerors acquiesced in, and called it *salic*, from the name of their former countrymen.

SALII, in Roman antiquity, priests of Mars, of which there were twelve, instituted by Numa, and wearing painted, parti-coloured garments, and high bonnets, with a steel cuirass on the breast. They were called *salii*, from *saltare*, to dance; because, after assisting at sacrifices, they went dancing about the streets, with bucklers in their left hand, and a rod in their right, striking musically with their rods on one another's bucklers, and singing hymns in honour of the gods.

SALIM, a river of Asiatic Russia, which falls into the Obi, sixty miles from Sourgout.

SALINA, an island in the Mediterranean, belonging to the kingdom of the Two Sicilies. It is divided by a channel three miles across from Lipari to the north-west of that island. It is about fourteen miles in circuit. A valley between two mountains, called Fossa Felice, is extremely fertile, and produces a great revenue from the exportation of grain, fruit, pulse, capers, salt, alum, and wine, the last of which, known by the name Malvasia, is highly valued. It is evidently of volcanic origin, having vestiges of ancient craters and several thermal springs. It was known to the ancients by the name of Didyme, or twins, from the two conical mountains, which are prominent objects when seen from the sea. The population consists of 4000 persons. The chief town is Amalfi, near to which is good anchorage. Long. 14. 47. 35. E. Lat. of Amalfi church, 38. 35. 40. N.

SALINES, a city of France, in the department of the Jura, and arrondissement of Poligny. It is situated in a narrow valley on the river Furieuse, and is defended by two forts. In it are some strong brine springs, from which culinary salt is prepared; but much of the brine is conducted to Arp and Senans to be granulated. Near to it some excellent wine is produced, as well as much honey and bees-wax. In 1836 it contained 6554 inhabitants.

SALISBURY, or New Sarum, a city in the county of Wilts, and in the hundred of Underditch. It is the shire town of the county, where the assizes and the elections are held, and where, but in the village of Fisherton adjoining, is the county jail. It stands in a narrow valley, in which the small rivers Willy and Nadder unite with the Avon. These streams are, by means of small channels, conducted through most parts of the city, forming clear running brooks in several of the streets. By means of a canal the city communicates with the sea through Southampton. Among the public edifices for secular purposes, the most distinguished is the council-house, erected about forty-five years ago. It is a square building with a grand Doric portico, which forms on one side the entrance to the law-courts, and on the other to a large public room used for county meetings and other purposes. But the public building which most distinguishes this city is the magnificent cathedral, which is the most uniform structure, as well as being the most perfect and original example, of all the edifices dedicated to the choral service of the Church of England. The erection of it at the commencement of the reign of Henry III. marks a decided epoch in English architecture, the very beautiful pointed style having then been brought to its utmost perfection. A very experienced critic has given it as his opinion, that this very interesting church, so remarkable in its design for purity, simplicity, and grandeur, holds the same rank in English architecture which the Parthenon bears in the Grecian.

This edifice was founded in the year 1220, the fifth year of the reign of Henry III., the see having been then removed from Old Sarum, to which place it had been translated from Sherborn, in Dorsetshire, in 706, when the episcopal jurisdiction of it extended over what have since become the dioceses of Salisbury, Bristol, Wells, and Exeter. The extreme length of the cathedral outside from west to east is 480 feet. The length of the grand transept from south to north is 232 feet, and the extreme length of the eastern transept is 172 feet.

This church has an important advantage over many other edifices of a similar character, in not being so closely surrounded by other buildings. It is easy of access, and it affords a most delightful view from almost every point. As to outline and dimensions, a more splendid building can scarcely be imagined; while the lofty proportions of the spire, which rises to the height of four hundred feet, become the more striking upon a near approach. The spire is a most interesting object from every part of the surrounding country. A slight settlement was observed to have taken place on the western sides of the tower, which on examination was found in 1681 to be twenty-two inches out of the perpendicular, but no variation has taken place since that time.

By a recent act of parliament the see of Salisbury has been increased by the county of Dorset, which before was within the diocese of Bristol, having been added to it. The establishment of the church, besides the bishop, comprises the dean, the precentor, the chancellor, three archdeacons, the sub-dean, the sub-chanter, and forty-five prebendaries (six of whom being residentiary, are called canons), four vicars, six singing men, eight choristers, and other inferior officers. The palace of the bishop and the houses of the several dignitaries surround the cathedral, in what is called the Close, being all encircled with an ancient and lofty wall.

The civil government of the city was in a body corporate, consisting of a mayor, high steward, recorder, deputy-recorder, and twenty-four aldermen; but by the late law it has been divided into three wards, having six aldermen and eighteen councillors, who elect the mayor. It has also a recorder appointed by the crown. The city elects two members to the House of Commons, and gives the title of marquis to the family of Cecil. Salisbury was formerly celebrated for its manufactories of cutlery, which have of late years declined, in consequence of the powerful competition of Sheffield and Birmingham; but still some of the best knives, scissors, and razors are made there, and some of the most beautiful and costly ornaments in steel. There was till recently a considerable trade in making flannels, especially one kind, almost wholly appropriated to the market of Spain, from whence the goods were despatched to Buenos Ayres and other parts of South America.

Salisbury being on the high road to Exeter and to Plymouth, is a great thoroughfare, and well provided with good inns, carriages, and horses. It is well supplied with provisions at moderate prices, and has good markets, which are held on Tuesdays and Fridays. It has a great number of charitable establishments, both for the purposes of education and for the solace of old age, or of infirmities of body or mind. It contains three parish churches, and an appropriate number of places of worship for the various sects of dissenters. It is eighty-one miles from London, and ninety from Exeter. The population appears at the decennial enumerations to have amounted in 1801 to 7668, in 1811 to 8243, in 1821 to 8763, and in 1831 to 9876.

SALIVA is that fluid by which the mouth and tongue are continually moistened in their natural state, and is supplied by glands which form it, and are called salivary glands.

SALIVATION, in *Medicine*, a promoting of the flux of saliva by means of medicines, chiefly by mercury.

SALIX, the Willow. Willow trees have been frequently the theme of poetical description, both in ancient and modern times. In Virgil, in Horace, and in Ovid, we have many exquisite allusions to them and their several properties. The *Babylonica*, Babylonian pendulous salix, commonly called weeping willow, grows to a large size, having numerous long, slender, pendulous branches, hanging down loosely all round in a curious manner, and long, narrow, spear-shaped, serrated, smooth leaves. This curious willow is a native of the East, and is retained in our hardy plantations for ornament; it exhibits a most agreeable variety, particularly when disposed singly by the verges of any piece of water, or in spacious openings of grass ground. All the species of salix are of the tree kind, very hardy, remarkably fast growers, and several of them attaining a considerable stature when permitted to run up to standards. They are mostly of the aquatic tribe, being generally the most abundant and of most prosperous growth in watery situations. They, however, will grow freely almost anywhere, in any common soil and exposure; but they spring considerably faster and stronger in low moist land, particularly in marshy situations, by the verges of rivers, brooks, and other waters, which places often lying waste, may be employed to good advantage in plantations of willows for different purposes.

SALLAWATTY, one of the Papuan or Oriental Negro Isles, separated from the island of Papua or New Guinea by a narrow strait. It is thirty miles in length by twenty-five in average breadth, and produces abundance of sago of an excellent quality. It is situated about the 131st degree of east longitude.

SALLEE, an ancient and considerable town of Africa, in the kingdom of Fez, with a harbour and several forts; but the river, which formerly admitted large vessels, is now choked up with sand. It was formerly the stronghold of Moorish piracy, from which great depredations were committed upon Europeans; and there may still be seen an immense and dreary dungeon formed under ground for the detention of the unfortunate captives. On the opposite side of the river stands Rabat, or New Sallee, which is chiefly frequented by Europeans, and where they once possessed numerous factories; but the trade is now nearly annihilated. Long. 6. 40. W. Lat. 34. 3. N.

Sallee, a town of Hindustan, in the province of Gujerat, situated on the north side of the Mahy river, and thirty-eight miles east by north from Cambay. Long. 73. 20. E. Lat. 22. 27. N.

SALLEEOLAKIT, a small island in the Eastern Seas, near the south-west coast of Mindanao. Long. 121. 25. E. Lat. 6. 42. N.

SALLIAN, a city of Persia, situated on the Caspian, at the mouth of the Kur. It is chiefly inhabited by Russians, who carry on here an extensive fishery of sturgeon, which abounds in the neighbouring seas. It is ninety miles south of Schamachi.

SALLO, Denis de, a French writer, famous for being the projector of a certain class of literary journals, was born at Paris in 1626. He studied the law, and was admitted a counsellor in the parliament of Paris in 1652. It was in 1664 that he formed the plan of the *Journal des Savans;* and the year following he began to publish it under the name of Sieur de Héronville, which was that of his valet de chambre. But he played the critic so severely, that authors, surprised at the novelty of such attacks, retorted so powerfully, that M. de Sallo, unable to weather the storm, after he had published his third journal, declined the undertaking, which he handed over to the Abbé Gallois, who, without presuming to criticise, contented himself merely with giving titles and making extracts. M. de Sallo died in 1669.

SALLUNA, a town of Northern Hindustan, tributary to the Ghoorkhali rajah of Nepaul. Long. 81. 37. E. Lat. 29. 2. N.

SALLUSTIUS, C. Crispus, a celebrated Latin historian, was born of a plebeian family of Amiternum, a city of the Sabines, B. C. 86, the same year that Marius died. We can have no doubt that the cultivation of his mental powers must have been carefully attended to, though this does not seem to have prevented him from falling into all the extravagances and dissipation of a profligate age. His intrigue with Fausta, daughter of Sulla, and wife of Milo, became known to her husband, and was punished in a way which made the two parties irreconcileable enemies. Sallust became quæstor at the age of twenty-seven, and tribune of the people in the year B. C. 52. His profligacy, however, became so notorious, that the censors, Appius Claudius and L. Piso, B. C. 50, found it necessary to remove him from the senate, though his removal has been ascribed by others to political reasons, as he was a warm supporter of Cæsar. It is supposed that he at this time wrote his account of the conspiracy of Catiline. His absence from public affairs continued only for a short time, as we find him prætor, B. C. 47, when he accompanied Cæsar to Africa; and after the battle of Thepsa, he was appointed to the province of Numidia, where he enriched himself by the most nefarious means. He returned to Rome with immense wealth; and after the murder of Cæsar abstained from taking any part in public affairs. He again devoted himself to a life of pleasure, and constructed a magnificent palace on the Quirinal, in the midst of gardens which were afterwards known as the Horti Sallustiani. This palace was subsequently occupied by Vespasian, Nerva, and many other emperors, and was destroyed by fire when Rome was plundered by Alaric. According to Eusebius, Sallust was married to Terentia, wife of Cicero, and died B. C. 35, in the fifty-first year of his age, being not less distinguished for his talents than for his profligacy. Of his historical works the following remain: 1. Bellum Catilinarium, a history of the conspiracy of Catiline, B. C. 63, with a very beautiful introduction, in which he laments, with much apparent feeling, the corruption of the age, and the profligacy of his contemporaries; 2. Bellum Jugurthinum, a history of the wars carried on against Jugurtha, king of Numidia, which he was probably induced to write from his residence in that country; 3. Historiarum Libri Quinque, a work on the history of Rome, from the consulship of M. Æmilius Lepidus and Q. Lutatius Catulus, B. C. 78, to that of M. Æmilius Lepidus and L. Volcatius Tullus, B. C. 66, with an introduction on the manners and government of Rome, and a short summary of the wars of Marius and Sulla. Of this work only a few fragments have been preserved. Some other works, however, have come down to us, which are ascribed to Sallust, though without sufficient reason: 1. Duæ Orationes de Republica Ordinanda, addressed to Julius Cæsar when he was proceeding against Petreius and Afranius, in Spain; and, 2. Declamatio in Ciceronem, which is alluded to by Quintilian. The character of Sallust as a historian stood high among the ancients, who regarded him as the rival of Thucydides, and in many points he was certainly the imitator of that writer. Like Thucydides, he endeavours to give the causes of the various events which he is narrating; and if he more frequently ascribes them to unworthy motives, we may readily discover the reason of this in the corruption of the age in which he lived. But they both show themselves profound thinkers, and intimately acquainted with the springs of human action. The first edition of the works of Sallust was published in Rome in 1470, and in Venice the same year; but since that time a variety of editions have appeared. The best is that of C. H. Frotscher, giving the notes and emendations of Cortius, three vols. Lips. 1380, 8vo. C. Sallustii Histor. iii. fragmenta e cod. Vatic. edita ab. Angelo Maio, editio auctior et emendatior, curante J. Th. Kreissig, Misen. 1830.

SALLUZZO, a city of the kingdom of Sardinia, in the province of Turin, and the capital of the division of that name. It stands on an elevation not far from the river Po. It is surrounded with walls, is the see of a bishop, and has a cathedral, several churches and monasteries, and 10,150 inhabitants, who carry on much trade in wine and in corn, and make silk goods and ironmongery. Long. 16. 55. E. Lat. 25. 3. N.

SALLY-PORTS, in *Fortification*, are those underground passages which lead from the inner to the outward works; such as from the higher flank to the lower, or to the tenailles, or the communication from the middle of the curtain to the ravelin.

SALMASIUS, CLAUDIUS, a French writer of uncommon abilities and erudition, descended from an ancient and noble family, and born at or near Samur in the year 1596. His mother, who was a Protestant, infused her notions of religion into him, and he at length converted his father. He settled at Leyden; and in 1650 he paid a visit to Christina queen of Sweden, who is reported to have shown him extraordinary marks of regard. Upon the violent death of Charles I. of England, he was prevailed on by the royal family, then in exile, to write a defence of that king; which was answered by our Milton in 1651, in a work entitled *Defensio pro Populo Anglicano contra Claudii Salmasii Defensionem Regiam.* This book was read over all Europe, and conveyed such a proof of the writer's abilities, that he was respected even by those who hated his principles. Salmasius died in 1653; and some did not scruple to say that Milton killed him by the acuteness of his reply. His works are numerous, and of various kinds; but the greatest monuments of his learning are, his *Notæ in Historiæ Augustæ Scriptores*, and his *Exercitationes Plinianæ in Solinum.*

SALMO, the SALMON. See ICHTHYOLOGY.

SALMON FISHERY. See FISHERY.

SALO, a market-town of Italy, in the Austrian kingdom of Venetian Lombardy, and in the delegation of Brescia. It is most delightfully situated on a bay in the lake of Garda, and behind it rises the Alpine mountain Pennino. It is the seat of a judicial tribunal, has three churches, an orphan-house, a hospital, and many well-built houses, and about 6500 inhabitants. The finest silk in Italy is produced in the vicinity; and within the town there are manufactories of hats, leather, glass, and linen threads.

SALO BAY, on the north coast of the island of Java. Long. 112. 36. E. Lat. 6. 58. S.

SALOMBO, a cluster of small islands in the Eastern Seas. Long. 113. 13. E. Lat. 5. 30. S.

SALON, a city of France, in the department of the Mouths of the Rhone, and the arrondissement of Aix. It stands partly on the side of a hill and partly on the plain below, through which the canal of Craponne connects it with the river Crau. In 1836 it contained 5987 inhabitants, who cultivate great numbers of olive trees, in extracting the oil from which consists the chief occupation. Salon was the birthplace of the celebrated astrologer Nostradamus. Long. 5. 5. E. Lat. 43. 40. N.

SALONA, a seaport town of Dalmatia, situated on a bay of the Gulf of Venice. It was formerly a very considerable place, and its ruins show that it was twelve miles in circumference. In a valuable manuscript relation of Dalmatia, written by the senator Giambattista Giustiniani, about the middle of the sixteenth century, there is a sketch of what existed at the time. "The nobility, grandeur, and magnificence of the city of Salona, may be imagined from the vaults and arches of the wonderful theatre, which are seen at this day; from the vast stones of the finest marble, which lie scattered on and buried in the fields; from the beautiful column of three pieces of marble, which is still standing in the place where they say the arsenal was, towards the sea-shore; and from the many arches of surprising beauty, supported by very high marble columns. The height of the arches is a stone-throw, and above them there was an aqueduct, which reached from Salona to Spalatro. There are to be seen many ruins and vestiges of large palaces, and many ancient epitaphs may be read on fine marble stones; but the earth, which is increased, has buried the most ancient stones and the most valuable things." Long. 17. 29. E. Lat. 24. 10. N.

SALONICA, a large city of Turkey in Europe, the capital of a province of the same name, and anciently Thessalonica. It is situated on a bay formed by the two capes of the Great and Little Burnu. It is of a triangular shape, the base of which is on the sea-shore. The walls of brick, on a stone foundation, are of an unusual thickness, and defended by bastions at the appropriate points. The appearance of the city from without is magnificent, from the number of minarets, cupolas, and lofty buildings; but the interior is found with narrow and crooked streets, disgusting public squares, and low, ill-built houses, resembling barracks; but still a considerable degree of cleanliness is observable everywhere. The quays are covered with sheds; and the numerous buyers and sellers who are congregated near them, and near the ships, present a striking picture of animation and bustle, and seem to confirm what is asserted by the natives, that Salonica is the first trading city of the Levant. The inhabitants are calculated, for they are not ascertained, to be between sixty and seventy thousand, of whom one half are Turks, one quarter Greeks, one fifth Jews, and the remainder Franks of all the several European nations, each of which have resident consuls. The manufactures are extensive, yielding cotton and silk goods, turkey leather, carpets, tobacco, and snuff, and the small articles of gold, silver, copper, steel, and iron; these, and many raw materials, such as raw silk, cotton, wool, corn, oil, honey, wax, with opium and other drugs, form the exports. Although the excellence and security of the haven naturally creates great maritime commerce, yet that by land with Austria and Germany is very extensive, and at one period conveyed vast quantities of colonial wares to great distances in the interior of Europe, as long as Bonaparte's continental system was in force, and is still a valuable branch of the trade of this city. This place has institutions for education, and especially the Jews have an institution in which it is said there are more than a hundred tutors and a thousand pupils. The Greeks have several elementary schools, but none for the higher branches of learning. There are few remains of antiquity except the Hippodrome, which is of marble, and highly ornamented with most valuable sculpture. There is also a rotunda built in resemblance of that in Rome, and the remains of two triumphal arches built by Augustus and Constantine. In 1313 this city was ceded for a valuable consideration by the Greek emperors to the Venetians, who retained it ten years, and it fell under the Turks with Constantinople. Long. 22. 25. 25. E. Lat. 40. 40. N.

SALOON, a town of Hindustan, in the nabob's territories, in the province of Oude, sixty-five miles south-south-east from Lucknow. Long. 81. 24. E. Lat. 26. 2. N.

SALOOR, a town of Hindustan, in the Northern Circars, fifty-three miles north-west from Vizagapatam. Long. 83. 19. E. Lat. 18. 26. N.

SALOP, or SHROPSHIRE, an inland county of England. It is bounded on the north by Cheshire and the Welsh counties of Flint and Denbigh; on the west by the Welsh counties of Denbigh, Montgomery, and Radnor; on the south by Herefordshire and Worcestershire; and on the east by Staffordshire. It is of an oblong figure, extending from north to south, and contains a variety of projections and indentations. Its greatest length is about forty-six, and its greatest breadth thirty-seven miles. Its superficial contents are 1341 square miles, or 854,240 statute acres.

This county is divided into fifteen districts or hundreds, of which five are on the north-east side of the river Severn, three extend to both banks of that river, and the remainder are on its south-west side. The ecclesiastical divisions of the county are into the diocese of Lichfield and Coventry, extending over 114 churches; of Hereford, over 127; of Worcester, over three; and of St Asaph, over twelve; besides which there are six in the peculiar jurisdiction of Bridgenorth, making in the whole 262 churches, of which 229 are parochial.

The population of this county at the four decennial periods of enumeration has been found to be as follows: In 1801, 167,639; in 1811, 194,298; in 1821, 206,153; and in 1831, 222,800.

The occupiers of land employing labourers, were	3,832
Occupiers of land not employing labourers	2,139
Labourers employed in agriculture	17,296
Ditto employed in manufactures	1,353
Ditto employed in retail trade or handicraft	14,461
Capitalists, bankers, &c	1,948
Labourers not agricultural	11,585
Other males under twenty years of age	2,800
Males above twenty years of age	56,474
Male servants	1,560
Female servants	11,371

In the year 1831, the number of families chiefly employed in agriculture was found to be 17,096; of those chiefly employed in trade, manufactures, and handicraft, 16,210; and of those not comprised in the two preceding classes, 13,121. The annual value of the real property of the county, as assessed in 1813, was L.1,037,988. The number of houses in 1831 was thus estimated: Inhabited, 42,633, occupied by 46,267 families; uninhabited, 1415; and building, 253.

The towns whose population exceeded 1500 persons in 1831 are,

Shrewsbury	21,297
Hales Owen	9,765
Wellington	9,671
Ellesmere	6,540
Whitchurch	5,736
Bridgenorth	5,298
Ludlow	5,253
Shiffnal	4,779
Oswestry	4,478
Drayton	3,882
Wenlock town, 3,481; but in the borough are included several parishes, of which Broseley contained 4,299, and Madeley 5,822, or in the whole	17,435
Newport	2,745
Bishop's Castle	2,007
Wem	1,932
Hodnel	1,767
Cleobury Mortimer	1,716

The face of the county is very much diversified. On the western side it has the wild appearance of the adjoining principality of Wales. Throughout the rest of the county the land is rather undulating, tolerably wooded, and with many beautiful rivulets meandering along the different valleys. The whole tract of country, from Wellington to the termination of the county between Oswestry and Chirk, exhibits the mild beauties of a fertile and cultivated district, enclosed by well-formed hedges into fields, of dimensions well calculated for advantageous husbandry, and ornamented with several domains of noblemen and gentlemen, which present a most pleasing succession of pictures to the traveller.

That singular insulated mountain, the Wrekin, rising from a plain to the height of eleven hundred feet, exhibits its sugar-loaf form over the tops of the smaller elevations in its vicinity, and increases the interest of the scenery. In the southern division of the county, the Brown Clee Hill and the Titterson Clee Hill rise to greater elevations than the Wrekin, and produce much picturesque variety.

In a county of such extent the soil must be very varied. On the eastern side, the valleys are flat and warm, and the soil generally of a sandy nature. In the middle part, the soil is most tenacious, and the bottoms of the wider valleys have frequently a stiff but rich clay. On the most western parts, the soil is very shallow, resting upon rocks of varied descriptions; and is better calculated for sheep-pasture than for producing grain. There are some moorlands, but enclosures and drainage have considerably diminished their extent. A very great portion of the soil rests on a limestone subsoil; and almost the whole of the plains are easy to work with light ploughs and two or three horses. The easterly wind generally prevails in the spring, and the westerly in autumn; but the former is more remarkable for regularity than the latter. The whole of the county enjoys a salubrious air; but on the hills, on the western side, the cold of winter is most intensely felt.

The chief river is the Severn, which runs through the whole extent of the county from north-west to south-east. It is navigable at all seasons to the Bristol Channel downwards, and in wet seasons upwards to Welshpool in Montgomeryshire. The navigation is, however, at all times impeded by many obstructions. In dry weather, the fords

Salop.

are only passable with difficulty, and in very wet weather the floods cover the banks, and extend so far over the level land on both sides, that the barges cannot be drawn up, from wanting a path on which the men who draw them can securely walk. It is one of the singularities of this navigation, that men are employed instead of horses, as on other rivers, to draw the vessels against the stream. Imperfect as this navigation is, it is, however, the chief source of the wealth of the county, as affording the means of conveying to good markets the various heavy productions which it yields. The fish found in the Severn, in its course through Shropshire, are salmon, pike, flounders, grayling, and eels. There are also some lampreys in the Shropshire part of the Severn, but they are less abundant than in the lower parts of the river. The principal tributary rivers are the Camlet, the Vyrnwey, the Tern, the Clun, the Ony, and the Teme. There are, besides, innumerable rivulets and streams, which adorn and fertilize the country. The lakes of Shropshire, though neither numerous nor extensive, form a variety in its landscapes rarely to be seen in the midland counties of England. Adjoining the town of Ellesmere is a beautiful lake of a hundred and sixteen acres, with some others smaller near it. On the western side of the county is Marton Pool, of forty-five acres. On the north of the Severn are Fennymere, Llynclyspool, and Ancot; and at Shrawardine is a fine lake of forty acres. That side of the county which most abounds in running streams has few or no lakes. The canals of this county, if not equal in extent to those in some others, yield to none in their construction, or in the obstacles they have surmounted, or in the beneficial consequences by which they have been followed. The first canal was a private undertaking by a Mr Reynolds, completed in the year 1788, for the conveyance of his ironstone and coals. It was a short canal, but a descent of seventy-three feet was conducted by a well-contrived inclined plane and double railroad, by means of which the loaded boat passing down drew up another with a load nearly equal to one third of its own weight. This contrivance was found to be applicable to similar purposes upon a larger scale, and was speedily adopted by a company who, under the power of an act of parliament, soon constructed the Shropshire Canal, which passes through the most considerable iron and coal works, till it reaches the Severn. The Ellesmere Canal is a most important undertaking, as by it a communication is opened between the Severn and all the great canals and rivers in the north of England. Bristol and Liverpool are thus become connected by inland navigation; and the rivers Severn, Dee, Mersey, Trent, and Humber, are united for the purposes of conveyance. In districts where the inequalities of the surface would not admit of canals, iron railways have been constructed, on which heavy goods are conveyed, in appropriate waggons, with a great saving in the expense of carriage.

There are few counties in which the agricultural business is, on the whole, better conducted than Shropshire. The land is very well adapted for the turnip cultivation, and the large flocks of sheep which are commonly fed on that valuable root a great part of the year, supply abundance of manure for the due cultivation of the different kinds of grain. The most prevailing breed of sheep are the Southdown, but many of the New Leicesters are to be seen, and in the hilly parts of the county are many of the fine-woolled Welsh sheep. The meadows on the banks of the Severn, and on the flat lands contiguous to the smaller streams, afford pasturage for numerous cows, whose milk, when converted into cheese, is commonly sold under the denomination of Cheshire. The corn generally cultivated is either wheat, barley, oats, or pease, and the crops on an average equal in productiveness those of the best districts of the kingdom. Hops are grown in small quantities upon that part of the county which adjoins to Herefordshire.

Salop.

Some small portions of land are appropriated to the growth of hemp and flax. The cultivation of potatoes has been very much extended of late years, and now furnishes a large proportion of the aliment of the labouring part of the population. The growth of hay, and the cultivation of artificial grasses, are more neglected than any other branch of rural economy. On the flat lands, the deposits from the overflowing of the streams sufficiently enrich them without any artificial manure; but from the embankments being neglected, the hay produced on such situations is liable to be much injured by the floods that frequently occur in summer.

A great portion of the wealth of this county consists in the mineral productions, which are most profusely found beneath its surface. The chief of these are lead, iron, limestone, freestone, pipe-clay, and coals. The lead is procured in considerable quantities, chiefly from the mines of the Hope and Snailbeach. The matrix of the ore is crystallized quartz, sulphate and carbonate of barytes, and carbonate of lime. The iron ore is found contiguous to the coal, and frequently close to it. This is especially the case about Colebrook Dale, a division peculiarly rich in those minerals. This district is about eight miles long and two broad, on the banks of the Severn, on the western side of the Wrekin, and running parallel with it, from north-east to south-west. The whole, but especially the southern part, of the coal district, is considerably above the plain of Shropshire, so that at one part the height is five hundred feet above the Severn. The works of the dale supply both ore and coal, as well as limestone, in great quantities; and every part of the process, from digging the ore to the completion of the manufacture, including the conversion of the coal into coke, is performed on the spot. Arthur Young, describing this part of the county, says, "Colebrook Dale is a winding glen, between two immense hills, which break into various forms, being all thickly covered, and forming most beautiful sheets of hanging woods. The noise of the forges, mills, furnaces, &c., with all their vast machinery, the flames bursting from the furnaces, with the burning coal, and the smoke of the limekilns, are altogether horribly sublime." A bridge of cast iron, the first, we believe, constructed in this kingdom, thrown over the Severn, gives to the whole scenery a most romantic appearance. Soon after it was ascertained that iron might be made with coals reduced to the state of coke, as well as from wood, the operation of coking was begun here by Lord Dundonald, with a view to obtain the fossil tar in the course of the process. This operation led to the discovery of that gas, extracted from coal, whose brilliant light now serves to illuminate so many of our streets and public buildings. In this dale was discovered, in opening a coal-mine, a copious spring of fossil tar. It yielded, at first, very plenteously, but the quantity diminished in a few years, and although it still runs, its produce is but of small amount. Though the iron-works in this dale were the first begun, on a large scale, they are by no means confined to it; for in many other parts of the county they are carried on to an extent that is unequalled in any other country but Great Britain.

Besides the process of separating the iron from its ore, and bringing it into the state of bar-iron and pig-iron, the other steps in the application of that mineral to general purposes are made within this county. The larger kind of iron goods, whether cast or wrought, are prepared, and most of the iron bridges which have been erected in different parts of the kingdom have been formed here into such a state as only to require to be put together in the places where they were destined to be ultimately fixed. Some of the largest establishments for making porcelain have been formed here, especially that for iron-stone china in Colebrook Dale, which has lowered the price of that beautiful commodity so as to bring it within the reach of a greater number of consumers than could formerly afford it. Manufactures of a coarser kind of earthenware, and of tobacco-pipes, are carried on at Broseley and other places. The raw materials of which these articles are formed are almost all found near the spots where they are converted to these useful and profitable purposes. The preparation of iron for the forge is in fact the principal manufacture of Shropshire; at Hales Owen, nearly five hundred males of twenty years of age and upwards are so employed; and at Madeley half as many. At Dowley and other places in its vicinity, many men are employed in the blast-furnaces; and at and near Shrewsbury seventy-four men are employed in iron-castings and at forges, in preparing the weighty apparatus of powerful machinery. Nails are largely made at Wellington. The finer kinds of earthenware employ two hundred men at Broseley and Madeley; carpeting employs ninety men at Bridgenorth; glass is made at Wrockwordine; flannels are made at Oswestry, Church Stretton, and Worthen. There is a small manufacture of hair-seating carried on at Drayton. The trade in Welsh flannels centres in a great degree in Shrewsbury. The merchants of that town repair to the markets of Welshpool and Oswestry, and make their purchases of the small country weavers, who bring their goods in an unfinished state; and the pieces are rendered fit for the markets to which they are destined by the Shrewsbury traders.

Shrewsbury, the county town of Shropshire, from its vicinity to Wales, in which the towns are few, and from its distance from any other large town, has ever been considered as a kind of provincial capital. It is situated on a circular peninsula of considerable elevation, formed by the curvatures of the Severn. It presents at every approach a pleasing variety of views; and the noble sweep of the river, which seems to embrace it, heightens at every turn the charm of the scenery. The exterior ranges of houses command the rich and beautiful landscapes of the surrounding country. The stately spires of two venerable churches, and the massive towers of the castle, give that imposing grandeur to the whole which is commonly felt in contemplating the works of antiquity. The walks between the river and the town are finely shaded by an avenue of lofty trees, and furnish an agreeable promenade to the inhabitants. The interior of the town by no means corresponds with its external beauty. The streets are intricately dispersed, many of them steep and narrow, and all badly paved. They exhibit a strange contrast of ancient and modern buildings, and are as uncouth in their names as in their appearance. This town, as well as many other parts of the county, exhibits many interesting remains of antiquity. Among these is the castle, placed on the narrow neck of land by which the only entrance to the town can be gained without passing a bridge. The remains consist of the keep, a square building of a hundred feet, connected with two towers; the walls of the inner court; and the great arch of the interior gate. The keep is the most perfect of the whole mass of building. The walls of this building are ten feet in thickness, and its beams of very large dimensions. It is stated to have been built by Roger de Montgomery the Norman, as a feudal hold; but being forfeited to the crown in the reign of Henry I., was used as a royal fortress in subsequent periods, to check the incursions of the less civilized Welsh. The remains of the abbey, erected by the same founder as the castle, rewards the lover of antiquities for the inspection of them. The most perfect remains of this edifice is an octagonal structure six feet in diameter, usually called the Stone Pulpit, standing upon a portion of the ruined wall. It is crowned by an obtuse dome of stone-work at about eight feet from the base, supported on six narrow-pointed arches rising on pillars. The ancient church of St Chad, which fell down in 1788, presents an interesting group of ruins. That of St Mary, founded by Edgar, as well as St Alkmunds, founded by Queen Elfleda, daughter of Offa king of Mercia, have received such alterations in more recent periods that they exhibit the architectural taste of several successive ages. The charitable institutions of Shrewsbury, consisting of hospitals, infirmary, schools, and other establishments, rather exceed the proportion to be found in other places of equal population, and do much credit to the liberality of the natives.

Our limits do not admit of lengthened descriptions of the numerous remains of ancient architecture which are still existing in this county. The most remarkable are Haugmond Abbey, about four miles from Shrewsbury; the walls of Wroxeter, of British and Roman construction; the Abbey of Buildwas, founded in 1135 by Roger bishop of Chester, for monks of the Cistercian order; the Monastery of Wenlock, founded in 680, destroyed by the Danes, and afterwards re-established; the Roman camp, called the Walls, at Quatford; the castle of Ludlow, celebrated for its splendour in the reigns of Henry VIII. and of Elizabeth, during the latter period the residence of the Sidneys, and in the reign of Charles I. immortalized as the place where Milton composed some of his works; Wannington Castle, near Oswestry, a house of strength before the Norman conquest; Lilleshall Abbey, near Newport, with one of the most highly adorned Norman arches in the kingdom; and Boscobel House, with the oak in the grounds near it which served as a shelter to Charles II. when, after the battle of Worcester, he was closely pursued by the victorious party.

By the parliamentary reform bill, this county has been formed into two separate divisions, distinguished as the northern and southern, each of which is empowered to elect two members to the House of Commons. The polling places for the northern division are Shrewsbury, Oswestry, Whitchurch, and Wellington; and for the southern division, Church Stretton, Bridgenorth, Ludlow, Bishop's Castle, and Wenlock. By the same law, the borough of Bishop's Castle has been disfranchised. The borough of Shrewsbury, as before, returns two members, as well as Ludlow, Bridgenorth, and Wenlock.

The titles of peers derived from the county are, Earl of Shrewsbury, and Barons Hill and Forrester, and the Irish title of Earl of Ludlow. As there are fewer titles derived from this county, so the seats of peers are much fewer than in any other of the same extent. The most remarkable residences of noblemen and gentlemen are the following: Walcot Hall, Earl Powis; Hardwicke, Lord Hill; Ross Hall and Willey Park, Lord Forrester; Apley Park, Thomas Whitmore, M. P.; Dudmaston, William Whitmore; Pitchford, Honourable C. C. C. Jenkinson, M. P.; Hodnett, the late Mr Heber; Hawkstone, Sir Richard Hill, Bart., M. P.; Kinlet Hall, W. C. Childe, Esq. M. P.; Stanley Hall, Sir T. Tyrwhit Jones, Bart.; Altingham, Lord Berwick; Manor House, Lord Stafford; Pradoe, Honourable Thomas Kenyon; Pentrepant Hall, Honourable F. West; Orlaton Hall, William Cludde, Esq.; Downton Castle, Richard Payne Knight, Esq.; Oakley Park, Honourable Robert Clive; Plowden Hall, Edward Plowden, Esq.; Audlim, Lady Cotton.

SALOPAR, a town of the island of Ceylon, belonging to the British, eighteen miles north-north-west of Trincomalee.

SALPINX, σαλπιγξ, the name of an ancient Greek trumpet.

SALSETTE, an island on the western coast of Hindustan, in the province of Aurungabad, about eighteen miles in length by fourteen in average breadth. It was formerly separated from Bombay by a narrow strait about two hundred yards across, opposite to the fort of Tannah, across which, in 1805, a causeway was carried, which, although it is said to have had a prejudicial effect on the harbour, has been of much advantage to the island. The soil is well adapted for the cultivation of sugar, cotton, hemp, indigo, and the like; but it has been hitherto kept in a state of nature, and almost wholly covered with jungle, for the purpose of supplying Bombay with wood, charcoal, and sea-salt, of which there is a considerable manufactory in this island. It is more unhealthy than Bombay, the jungle being thicker and more shut in. In its present uncultivated state, it scarcely produces the hundredth part of what it might supply. Notwithstanding its present desolate state, Salsette contains numerous mythological antiquities, and the remains of reservoirs with flights of steps round them, and the ruins of temples, which indicate that it was formerly in a greater state of prosperity, and had a more numerous population. Among the most remarkable curiosities, are the caverns at Kennere, which are very extraordinary excavations. The largest resembles that at Carli, but is not equal to it in size and elegance. It contains two gigantic figures of Boodh, nearly twenty feet in height, and each filling one side of the vestibule. They are exactly alike, and in complete preservation, the Portuguese having adopted them and painted them red, and converted the temple into a Christian church. The manufacture of salt is carried on at the sea-shore, where extensive enclosures are levelled and divided into partitions of about twenty feet square, which are filled by the overflowing of the sea, and contain six or eight inches of water. The moisture is exhaled by the heat of the sun before the next tide, and the salt is gathered from the bottom of the enclosure. The first account we have of this island is dated in 1330, and was written by a friar named Oderic. It was taken possession of by the Portuguese in the sixteenth century, and from them by the Mahrattas in 1750. In 1773, during a rupture with that nation, the Company's troops obtained possession of it; and it was formally ceded by the Mahrattas, at the treaty of Poorbunder, in 1776, and subsequently confirmed at the peace of 1782–83, when all the small islands in the gulf formed by Bombay and Salsette were also ceded.

SALT, one of the great divisions of natural bodies. The characteristic marks of salt have usually been reckoned its power of affecting the organs of taste, and its being soluble in water. But this will not distinguish salt from quicklime, which also affects the sense of taste, and dissolves in water; yet quicklime has been universally reckoned an earth, and not a salt. The only distinguishing property of salts, therefore, is their crystallization in water. But this does not belong to all salts; for the nitrous and marine acids, though allowed on all hands to be salts, are yet incapable of crystallization, at least by any method hitherto known. Several of the imperfect neutral salts, such as combinations of the nitrous, muriatic, and vegetable acids, with some kinds of earths, also crystallize with very great difficulty. However, by the addition of spirit of wine, or some other substances which absorb part of the water, and keeping the liquor in a warm place, all of them may be reduced to crystals of one kind or other. Salt, therefore, may be defined a substance affecting the organs of taste, soluble in water, and capable of crystallization, either by itself or in conjunction with some other body; and, universally, every salt capable of being reduced into a solid form is also capable of crystallization *per se*. Thus the class of saline bodies will be sufficiently distinguished from all others; for quicklime, though soluble in water, cannot be crystallized without addition either of fixed air or of some other acid; yet it is most commonly found in a solid state. The precious stones, though supposed to be formed by crystallization, are nevertheless distinguished from salts by their insipidity and insolubility in water.

But acids and alkalis, and combinations of both, when in a concrete form, are salts, and of the purest form. Hence we conclude, that the bodies to which the name of salts more properly belongs are the concretions of those substances, which are accordingly called acid salts, alkaline salts, and neutral salts. These last are combinations of acid and alkaline salts, in such proportion as to render the compounds neither sour nor alkaline to the taste. This proportional combination is called saturation. Thus common kitchen salt is a neutral salt, composed of muriatic acid and soda combined together to the point of saturation. The appellation of neutral salts is also extended to denote all those combinations of acids, and any other substance with which they can unite, so as to lose, wholly or in a great measure, their acid properties.

But although this general definition of salts is commonly received, yet there are many writers, especially mineralogists, who confine the denomination of salts in the manner we first mentioned, viz. to those substances only which, besides the general properties of salts, have the power of crystallizing, that is, of arranging their particles so as to form regularly-shaped bodies, called crystals, when the water superfluous to their concrete existence has been evaporated.

Common SALT, or *Sea-Salt*, the name of that salt extracted from the waters of the ocean, which is used in greater quantities for preserving provisions, and other domestic purposes.

It is a perfect neutral salt, composed of marine or muriatic acid, saturated with mineral alkali. It has a saline but agreeable flavour. It requires about four times its weight of cold water to be dissolved, and nearly the same quantity of boiling water, according to Macquer; but according to Kirwan, it only requires 2·5 its weight of water to be dissolved in the temperature of sixty degrees of Fahrenheit. This salt always contains some part formed with a calcareous base; and, in order to have it pure, it must be dissolved in distilled water. Then a solution of mineral alkali is to be poured into it until no white precipitation appears; and by filtrating and evaporating the solution, a pure common salt is produced. Its figure is perfectly cubic, and those hollow pyramids, as well as the parallelopipeds formed sometimes in its crystallization, consist all of a quantity of small cubes, disposed in those forms. Its decrepitation on the fire, which has been reckoned by some as a characteristic of this salt, although the vitriolated tartar, nitrous lead, and other salts, have the same property, is owing chiefly to the water, and perhaps also to the air of its crystallization.

Its specific gravity is 2·120 according to Kirwan. The acid of tartar precipitates nothing from it. One hundred parts of common salt contain thirty-three of real acid, fifty of mineral alkali, and seventeen of water. It is commonly found in salt water and salt springs, in the proportion of even thirty-six per cent. It is found also in coals, and in beds of gypsum. This salt is unalterable by fire, though it fuses and becomes more opaque. Nevertheless a violent fire, with the free access of air, causes it to evaporate in white flowers, which adhere to the neighbouring bodies. It is only decomposed, as Macquer affirms, by the sulphuric and nitric acids, and also by the boracic or sedative salt. But although nitre is very easily decomposed by arsenic, this neutral marine salt is nowise decomposed by it. According to Monge, the fixed vegetable alkali, when caustic, decomposes all this marine salt. It preserves from corruption almost all sorts of animal food much better for use than any other salt, as it does so without destroying their taste and qualities; but when applied in too small a quantity, it then promotes putrefaction.

Of this most useful commodity there are ample stores on land as well as in the ocean. There are few countries indeed which do not afford vast quantities of rock or fossil salt. Mines of it have long been discovered and wrought in England, Spain, Italy, Germany, Hungary, Poland, and other countries of Europe. In several parts of the world there are huge mountains which wholly consist of fossil salt. Of this kind are two mountains in Russia, near Astracan; several in the kingdoms of Tunis and Algiers, in Africa; some also in Asia; and the whole island of Ormus, in the

Persian Gulf, almost entirely consists of fossil salt. The new world is likewise stored with treasures of this useful mineral, as well as with all other kinds of subterranean productions. Moreover, the sea affords such abundance of common salt, that all mankind might thence be supplied with quantities sufficient for their occasions. There are also innumerable springs, ponds, lakes, and rivers, impregnated with common salt, from which the inhabitants of many countries are plentifully supplied. In some countries which are remote from the sea, and have little commerce, and which are not blessed with mines of salt or salt-waters, the necessities of the inhabitants have forced them to invent a method of extracting common salt from the ashes of vegetables. The muriatic salt of vegetables was described by Dr Grew under the title of lixiviated marine salt. Leeuwenhoeck obtained cubical crystals of this salt from a lixivium of soda or kelp, and also from a solution of the lixivial salt of *carduus benedictus*; of which he gave an account in a letter to the Royal Society, published in their Transactions.

The muriatic salt which Mr Boyle extracted from sandiver, and supposed to be produced from the materials used in making glass, was doubtless separated from the kelp made use of in that process. Kunckel also informs us, that he took an alkaline salt, and after calcining it with a moderate fire, dissolved it in pure water, and placing the solution in a cool cellar, obtained from it many crystals of a neutral salt. He supposes that the alkaline salt was by the process converted into this neutral salt. But it is more reasonable to believe that the alkaline salt which he applied was not pure, but mixed with the muriatic salt of vegetables, which by this process was only separated from it.

Naturalists, observing the great variety of forms under which this salt appears, have thought fit to rank the several kinds of it under certain general classes; distinguishing it most usually into rock or fossil salt, sea-salt, and brine or fountain salt. To these classes others might be added, particularly those muriatic salts which are found in vegetable and animal substances. These several kinds of common salt often differ from each other in their outward form and appearance, or in such accidental properties as they derive from the heterogeneous substances with which they are mixed. But when perfectly pure, they have all the same qualities; so that chemists have not been able to discover any essential difference between them. For this reason we shall distinguish common salt after a different manner, into the three following kinds, viz. into rock or native salt, bay-salt, and white salt. By *rock* or *native salt* is understood all salt dug out of the earth, which has not undergone any artificial preparation. Under the title of *bay-salt* may be ranked all kinds of common salt extracted from the water in which it is dissolved, by means of the sun's heat, and the operation of the air, whether the water from which it is extracted be sea-water or natural brine drawn from wells and springs, or salt water stagnating in ponds and lakes. Under the title of *white* or *boiled salt* may be included all kinds of common salt extracted by coction from the water in which it is dissolved.

The first of these kinds of salt is, in several countries, found so pure that it serves for most domestic uses, without any previous preparation, triture excepted; for, of all natural salts, rock-salt is the most abundantly furnished by nature in various parts of the world, being found in large masses occupying vast tracts of land.

The English fossil salt is unfit for the uses of the kitchen, until by solution and coction it is freed from several impurities, and reduced into white salt. The British white salt also is not so proper as several kinds of bay-salt for curing fish and such meats as are intended for nautical provisions, or for exportation into hot countries. For these purposes, therefore, we are obliged, either wholly or in part, to use bay-salt, which is purchased in France, Spain, and other foreign countries.

However, it does not appear that there is any other thing requisite in the formation of bay-salt than to evaporate the sea-water with an exceedingly gentle heat; and it is even very probable, that our common sea-salt, by a second solution and crystallization, might attain the requisite degree of purity. Without entering into any particular detail of the processes used for the preparation of bay-salt in different parts of the world, we shall content ourselves with giving a brief account of the best methods of preparing common salt.

At some convenient place near the sea-shore is erected the saltern. This is a long, low building, consisting of two parts; one of which is called the fore-house, and the other the pan-house or boiling-house. The fore-house serves to receive the fuel and cover the workmen, and in the boiling-house are placed the furnace, and pan in which the salt is made. Sometimes they have two pans, one at each end of the saltern; and the part appropriated for the fuel and workmen is in the middle.

The furnace opens into the fore-house by two mouths, beneath each of which is a mouth to the ash-pits. To the mouths of the furnace, doors are fitted; and over them a wall is carried up to the roof, which divides the fore-house from the boiling-house, and prevents the dust of the coal and the ashes and smoke of the furnace from falling into the salt-pan. The fore-house communicates with the boiling-house by a door placed in the wall which divides them.

The body of the furnace consists of two chambers, divided from each other by a brick partition called the mid-feather, which from a broad base terminates in a narrow edge near the top of the furnace, and, by means of short pillars of cast iron erected upon it, supports the bottom of the salt-pan. It also fills up a considerable part of the furnace, which otherwise would be too large, and would consume more coals than, by the help of this contrivance, are required. To each chamber of the furnace is fitted a grate, through which the ashes fall into the ash-pits. The grates are made of long bars of iron, supported underneath by strong cross bars of the same metal. They are not continued to the farthest part of the furnace, it being unnecessary to throw in the fuel so far. For the flame is driven from the fire on the grate to the farthest part of the furnace, and thence passes, together with the smoke, through two flues into the chimney; and thus the bottom of the salt-pan is everywhere equally heated.

The salt-pans are made of an oblong form, flat at the bottom, with the sides erected at right angles. The length of some of these pans is fifteen feet, the breadth twelve feet, and the depth sixteen inches; but at different works they are of different dimensions. They are commonly made of plates of iron, joined together with nails, and the joints are filled with a strong cement. Within the pan five or six strong beams of iron are fixed to its opposite sides, at equal distances, parallel to each other and to the bottom of the pan, from which they are distant about eight inches. From the beams hang down strong iron hooks, which are linked to other hooks or clasps of iron firmly nailed to the bottom of the pan; and thus the bottom of the pan is supported, and prevented from bending down or changing its figure. The plates most commonly used are of malleable iron, about four feet and a half long, a foot broad, and the third of an inch in thickness. The Scotch commonly prefer smaller plates fourteen or fifteen inches square. Several make the sides of the pan, where they are not exposed to the fire, of lead; those parts, when made of iron, being found to consume fast in rust from the steam of the pan. Some have used plates of cast iron five or six feet square, and an inch in thickness; but they are very subject to break when unequally heated, and shaken, as they frequently are, by the violent boiling of the liquor. The cement most commonly used to fill the joints is plaster made of lime.

The pan, thus formed, is placed over the furnace, being supported at the four corners by brick-work, but along the middle, and at the sides and ends, by round pillars of cast iron called taplins, which are placed at three feet distance from each other, being about eight inches in height, and at the top, where smallest, four inches in diameter. By means of these pillars the heat of the fire penetrates equally to all parts of the bottom of the pan, its four corners only excepted. Care is also taken to prevent the smoke of the furnace from passing into the boiling-house, by bricks and strong cement, which are closely applied to every part of the salt-pan. In some places, besides the common salt-pans here described, they have a preparing pan placed between two salt-pans, in the middle part of the building, which in other works is the fore-house. The sea-water being received into this preparing pan, is there heated and in part evaporated by the flame and heat conveyed under it through flues from the two furnaces of the salt-pans. And the hot water, as occasion requires, is conveyed through troughs from the preparing pan into the salt-pans. Various other contrivances have been invented to lessen the expense of fuel, and several patents have been obtained for that purpose; but the salt-boilers have found the old methods the most convenient.

Between the sides of the pan and walls of the boiling-house there runs a walk five or six feet broad, where the workmen stand when they draw the salt, or have any other business in the boiling-house. The same walk is continued at the end of the pan, next to the chimney; but the pan is placed close to the wall at the end adjoining to the fore-house.

The roof of the boiling-house is covered with boards fastened with nails of wood, iron nails quickly mouldering into rust. In the roofs are several openings, to convey off the watery vapours; and on each side of it a window or two, which the workmen open when they look into the pan whilst it is boiling.

Not far distant from the saltern, on the sea-shore, between full sea and low-water marks, they also make a little pond in the rocks, or with stones on the sand, which they call their *sump*. From this pond they lay a pipe, through which, when the tide is in, the sea-water runs into a well adjoining to the saltern; and from this well it is pumped into troughs, by which it is conveyed into the ship or cistern, where it is stored up until they have occasion to use it.

The cistern is built close to the saltern, and may be placed most conveniently between the two boiling-houses, on the back of the fore-house; it is made either of wood or of brick and clay. It sometimes wants a cover, but ought to be covered with a shed, that the salt water contained therein may not be weakened by rains, nor mixed with soot and other impurities. It should be placed so high that the water may conveniently run out of it, through a trough, into the salt-pans.

Besides the buildings already mentioned, several others are required; as storehouses for the salt, cisterns for the bittern, an office for his majesty's salt-officers, and a dwelling-house for the salt-boilers.

All things being thus prepared, and the sea-water having stood in the cistern till the mud and the sand are settled to the bottom, it is drawn off into the salt-pan. And at the four corners of the salt-pan, where the flame does not touch its bottom, are placed four small lead pans, called scratch-pans, which, for a salt-pan of the size above mentioned, are usually about a foot and a half long, a foot broad, and three inches deep, and have a bow or circular handle of iron, by which they may be drawn out with a hook when the liquor in the pan is boiling.

The salt-pan being filled with sea-water, a strong fire of pit-coal is lighted in the furnace; and then, for a pan which contains about four hundred gallons, the salt-boiler takes the whites of three eggs, and incorporates them well with two or three gallons of sea-water, which he pours into the salt-pan whilst the water contained therein is only lukewarm, and immediately stirs it about with a rake, that the whites of the eggs may everywhere be equally mixed with the salt water.

Instead of whites of eggs, at many salterns, as at most of those near Newcastle, they use blood from the butchers, either of sheep or black cattle, to clarify the sea-water; and at many of the Scotch salterns they do not give themselves the trouble of clarifying it. As the water grows hot, the whites of eggs separate from it a black frothy scum, which rises to the surface of the water, and covers it all over. As soon as the pan begins to boil, this scum is all risen, and it is then time to skim it off.

The most convenient instruments for this purpose are skimmers of thin ash boards, six or eight inches broad, and so long that they may reach above half way over the salt-pan. These skimmers have handles fitted to them; and the salt-boiler and his assistant, each holding one of them on the opposite sides of the pan, apply them so to each other that they overlap in the middle, and beginning at one end of the pan, carry them gently forward together, along the surface of the boiling liquor, to the other end; and thus, without breaking the scum, they collect it all to one end of the pan, whence they easily take it out.

After the water is skimmed, it appears perfectly clear and transparent; and they continue boiling it briskly till so much of the fresh or aqueous part is evaporated, that what remains in the pan is a strong brine almost fully saturated with salt, so that small saline crystals begin to form on its surface; and this operation, in a pan filled fifteen inches deep with water, is usually performed in five hours.

The pan is then filled up a second time with clear sea-water drawn from the cistern; and about the time when it is half filled, the scratch-pans are taken out, and being emptied of the scratch found in them, are again placed in the corners of the salt-pan. The scratch taken out of these pans is a fine white calcareous earth found in the form of powder, which separates from the sea-water during its coction, before the salt begins to form into grains. This subtile powder is violently agitated by the boiling liquor, until it is driven to the corners of the pan, where the motion of the liquor being more gentle, it subsides into the scratch-pans placed there to receive it; in them it remains undisturbed, and thus the greatest part of it is separated from the brine.

After the pan has again been filled up with sea-water, three whites of eggs are mixed with the liquor, by which it is clarified a second time, in the manner before described; and it is afterwards boiled down to a strong brine as at first, which second boiling may take up about four hours. The pan is then filled up a third time with clear sea-water; and after that a fourth time, the liquor being each time clarified and boiled down to a strong brine, as before related, and the scratch-pans being taken out and emptied every time that the pan is filled up. Then, at the fourth boiling, as soon as the crystals begin to form on the surface of the brine, they slacken the fire, and only suffer the brine to simmer, or boil very gently. In this heat they constantly endeavour to keep it all the time that the salt corns or granulates, which may be nine or ten hours. The salt is said to granulate when its minute crystals cohere together into little masses or gains, which sink down in the brine, and lie at the bottom of the salt-pan.

When most of the liquor is evaporated, and the salt thus lies in the pan almost dry on its surface, it is then time to draw it out. This part of the process is performed by raking the salt to one side of the pan into a long heap, where it drains a while from the brine, and is then filled out into barrows or other proper vessels, and carried into the storehouse, and delivered into the custody of his majesty's officers. And in this manner the whole process is performed in twenty-four hours, the salt being usually drawn every morning.

In the storehouse the salt is put hot into drabs, which are partitions like stalls for horses, lined on three sides and at the bottom with boards, and having a sliding-board on the foreside to put in or draw out as occasion requires. The bottoms are made shelving, being highest behind, and gradually inclining forwards, by which means the saline liquor, which remains mixed with the salt, easily drains from it; and the salt, in three or four days, becomes sufficiently dry, and is then taken out of the drabs, and laid up in large heaps, where it is ready for sale.

The saline liquor which drains from the salt is not a pure brine of common salt, but has a sharp and bitter taste, and is therefore called bittern. This liquor, at some works, is saved for particular uses, and at others is thrown away. A considerable quantity of this bittern is left at the bottom of the pan after the process is finished; and as it contains much salt, it is suffered to remain in the pan when it is filled up with sea-water. But at each process this liquor becomes sharper and more bitter, and also increases in quantity. Thus, after the third or fourth process is finished, they are obliged to take it out of the pan, otherwise it mixes in such quantities with the salt as to give it a bitter taste, disposes it to grow soft and run in the open air, and renders it unfit for domestic uses.

After each process there also adheres to the bottom and sides of the pan a white stony crust, of the same calcareous substance with that before collected from the boiling liquor. This the operators call stone-scratch, distinguishing the other found in the lead pans by the name of powder-scratch. Once in eight or ten days they separate the stone-scratch from their pans with iron picks, and in several places find it a quarter of an inch in thickness. If this stony crust be suffered to adhere to the pan much longer, it grows so thick that the pan is burned by the fire, and quickly wears away.

The consumption of salt in this country is immense. Neckar estimated the consumption, in those provinces of France which had purchased an exemption from the *gabelle*, at 19½ lbs. English for each individual. But we believe that the people in this country may be estimated a little higher, or at 22 lbs.; and, on this supposition, taking the population at 16,500,000, the entire consumption will amount to 363,000,000 lbs. or 161,000 tons. Exclusively of this immense home consumption, we annually export about 10,000,000 bushels, which, at 56 lbs. a bushel, are equivalent to 250,000 tons. The cheapness of this important necessary of life is therefore not less remarkable than its diffusion.

In this country duties upon salt were imposed in the reign of William III. In the year 1798, they amounted to five shillings a bushel, but were subsequently increased to fifteen shillings, or about forty times the cost of the salt. So exorbitant a duty was productive of the worst effects, and by its magnitude, as well as by the regulations allowing salt duty-free to the fisheries, occasioned a great deal of smuggling. For this reason, the opinion of the public and the House of Commons having been strongly expressed against the tax, it was finally repealed in the year 1823. (M'Culloch's Commercial Dictionary, art. *Salt.*)

SALT *Springs.* Of these there are great numbers in different parts of the world, which undoubtedly have their origin from some of the large collections of fossil salt mentioned under the article *Common* SALT.

SALT, *Valley of*, in Syria. It is a lake in winter; but in summer the moisture is evaporated by the heat of the sun, when the salt is left in beds of about half an inch thick, and is afterwards purified for use. It is about eighteen miles to the east of Aleppo.

SALTASH, a market-town of the county of Cornwall, in the hundred of East, and a part of the parish of St Stephen. It is 220 miles from London, on the banks of the river Tamar, three miles above Plymouth, with which place it is connected by the Crimble Ferry. It is a corporate town, with a charter granting jurisdiction on the river Tamar. It returned two members to parliament before 1832. It has a market, which is held on Saturday. The population amounted in 1801 to 1150, in 1811 to 1478, in 1821 to 1548, and in 1831 to 1637.

SALTCOATS, a seaport town in Ayrshire, on the Frith of Clyde, thirty miles distant from Glasgow. At the end of the seventeenth century it consisted only of four houses; but it is now a place of considerable trade, and exports large quantities of coals, which are procured from the extensive coal-fields in the neighbourhood. There are some hundreds of looms in the town employed in weaving for the Glasgow and Paisley manufacturers; and ship-building has been carried on successfully for some years. In 1821 the population of the town and parish was 3413, and in 1831 it was 3544.

SALTPETRE, or NITRE (*nitrate of potash*), a compound of nitric acid and potash. It is generally obtained in the form of six-sided prismatic crystals, terminated by six-sided pyramids, joined by their bases. Its specific gravity is 1·933. See CHEMISTRY.

It is used in the various arts, and is the principal ingredient in the manufacture of gunpowder. See GUNPOWDER.

SALTSKAMMER, a circle in the Austrian province of the Upper Ens, extending over 330 square miles, and containing three market-towns and seventy-two villages, with 15,600 inhabitants. It is a most picturesque district, five sixths of the surface being covered with Alpine mountains, and watered by the romantic river Traun, issuing from the beautiful lake of that name, which was a favourite retreat of the late Sir Humphry Davy to enjoy fishing. The capital is the town of Ischl, where a large quantity of salt is refined.

SALVADOR, ST, or BAHIA, a large and important province of Brazil, extending from the Belmonte, in latitude 15° 25′ south, to the Rio Real, which divides it from Seregipe d'el Rey, in latitude 11° 38′ south. The river St Francisco separates it from Pernambuco on the west and north-west, while on the south-west it touches on Minas Geraes. It is divided into three comarcas, Bahia, Ilheos, and Jacobina; the former two comprising the coast, and the latter the western part of the province. The eastern is divided from the western portion by a chain of mountains of considerable elevation, from the eastern side of which proceed the numerous streams flowing into the prolific district of Reconcave, or forming the rivers of Ilheos. A considerable portion of Jacobina is occupied with cattle-plains, which are not susceptible of cultivation. It was formerly rich in gold, and, according to Cazal, it still produces that metal, and also silver, copper, iron, saltpetre, and crystals. This comarca comprehends the country on which the Rio St Francisco enters when it leaves the province in which it originates. The inhabitants are scattered everywhere over its surface, and occupy themselves chiefly in breeding cattle. "The regular winter or wet season," says Southey, "extends only some thirty leagues from the coast; and what rain falls in the interior comes only in thunder-showers, which are of course irregular, in no part frequent, and occur seldomer in the northern part of the province than in the south. After rain, the ground is presently covered with rich verdure, and the cattle fatten; but when drought succeeds to this season of abundance, they are reduced to browse upon such shrubs as resist the burning sun. The streams fail, and if the tanks which the thunder-showers had filled are also dried, a dreadful mortality ensues. Because of the frequency of this evil, the province cannot depend upon its own pastures, but looks to Goyaz and Piauhy for a regular supply." Jacobina, the capital of the comarca, is still a town of some importance, although the mines have ceased to be productive, and its smelting-house is broken up. It is situated near the left bank of the southern branch of the Ilapicuru, three miles below a lake which communicates with the river. Its inhabitants cultivate wheat, which is not found farther north, and the fruits as well as the pulse and grain of Portugal flourish in this elevated district. They export in particular large quantities of quince marmalade. There are some other towns in the comarca, but few of any material importance. Rio de Contas, a town situated about a hundred and thirty miles south of Jacobina, lies on the high road from Bahia to Goyaz. It owed its origin to its gold mines, which were discovered in 1718. But these have failed, and the inhabitants have betaken themselves to the more advantageous occupation of agriculture. Fifty miles west-south-west of Contas is Villa Nova do Principe, formerly called Caytete, the inhabitants of which are employed in raising cotton and breeding cattle.

The comarca of the Ilheos begins at Belmonte, and extends northward to the river Jiquirica. The Rio Pardo, which, according to Prince Maximilian, is the limit between the province of Porto Seguro and this comarca, rises in Serro Frio, and falls into the sea by three branches.

The Bay of Bahia, or All-Saints, has been pronounced one of the finest harbours in the world. The entrance, which is nearly three leagues wide, is from the south, having the continent on the right hand, and the long island of Itaparica on the left. According to Mr Henderson, this island forms two entrances, the eastern or proper entrance being eight miles in width, and the western or false bar being less than two miles across. The bay is twelve leagues in diameter, and thirty-six leagues in circumference, without including the islands or remote parts. The anchorage is secure. Vessels are here sheltered from every wind, and there is accommodation for the united navies of the world. This little Mediterranean is spotted with above a hundred islands, many of which are cultivated and inhabited. The city of St Salvador, better known by the name of Bahia, is, with the exception of Rio, the largest and most flourishing city in Brazil. In ecclesiastical dignity it claims the precedency, being an archiepiscopal see. It has also a higher antiquity, and was long the capital of the empire. Notwithstanding the removal of the seat of government to Rio, the natural advantages of Bahia will enable it, under all changes, to preserve its rank as the second city in Brazil. It is situated on the right side of the bay, where the land, at a small distance from the shore, rises steeply to a high ridgy hill, on the summit of which the city is chiefly erected. From the inequality of the ground, and the plantations interspersed, it occupies a considerable space, its length from north to south being four miles. The buildings are chiefly of the seventeenth century, the churches being of course the most conspicuous edifices. The town has a magnificent appearance from the water, but when entered, its interior is found not to correspond with its imposing aspect at a distance. In the lower town, where the port is situated, the houses are high, and the streets confined and narrow, wretchedly paved, and kept in a very filthy state. The upper town, from its height, and from the slope of the streets, is much cleaner than the port, and although far from being well built, has a number of handsome private houses and public buildings. Here are the cathedral, the archiepiscopal palace, the governor's palace, the ex-Jesuits' church (built entirely of marble brought from Europe, but now degraded into barracks for soldiers), the misericordia with its hospital, and various other edifices. The cathedral, and several other churches, are handsome, and richly ornamented. The city is protected by a number of forts and batteries, some of which are garrisoned. Society is not considered so polished here as at Rio. Gaming, the resource of vacant minds, is eagerly followed by both sexes. Intellectual pursuits seem to be little cultivated; and a large library, containing some valuable manuscripts respecting the interior of America, is allowed to remain in a neglected state. Bahia contains thirty-six churches, a number of monasteries, has a university, a number of schools of instruction, a foundling hospital, the library already mentioned, a few printing-presses, and is the centre of a very considerable trade. There are about a hundred and twenty wholesale merchants, and amongst other manufactures carried on are those of cotton, glass, rum, and sugar. There are companies engaged in the whale-fishery, and in ship-building.

The best idea of the great importance of the trade of Bahia will be formed from the following statements of the exports and imports. A statement of the quantities of Brazilian produce exported from the port of Salvador or Bahia in the year ending the 1st of October 1835: Sugar, 47,428 cases of thirteen hundredweights, 474 half cases, and 3071 barrels; cotton, 40,320 bags of about 160 pounds; 148,752 hides; coffee, 12,601 sacks and 131 barrels; tobacco, 54,419 bales, 172 sacks, and 5739 barrels; rum, 6129 pipes; molasses, 315 pipes; besides many other smaller articles. The number of vessels which cleared from the port was 244.

A statement of the value of merchandise imported into the port of Bahia or Salvador in the year ending the 1st of July 1835: Cotton manufactures to the value of L.664,104, of which Great Britain furnished L.573,097; woollen goods to the value of L.67,517, of which Great Britain supplied L.64,740 worth; linen manufactures to the value of L.77,863, Great Britain supplying L.57,497 worth; silk L.42,086, of which Great Britain supplied L.5657 worth, and France L.25,053; and numerous other articles, of which a large proportion is furnished by Great Britain; the total value of the imports being L.1,412,521.

The population of this city is estimated at 150,000. The environs of Bahia are very beautiful; and being constantly refreshed by land and sea breezes, the climate is deemed very healthy. The Reconcave, as the country which extends round the whole sweep of this beautiful bay is denominated, is one of the richest and most populous parts of Brazil. It varies in breadth from twelve to forty miles. Upon the rivers which intersect it, and fall into the bay, are situated many flourishing towns, which carry on a considerable trade with the capital. One of the largest is Cachoeira, situated on the river Paraguassu, which divides it into two parts. Near this town was found a mass of native copper, weighing a ton and a half. Fifteen miles below Cachoeira, on the same river, is Maragogype, also a considerable town. The other chief towns are St Amaro, on the right bank of the Serigy or Serzipe, twelve miles from its mouth, and forty north-west of Bahia; and Jaguaripe, on the right bank of the river of the same name, seven miles from its mouth, the inhabitants of which are chiefly manufacturers of earthenware. On the island of Itaparica, which is twenty-three miles in length from north to south, and ten in breadth, is a considerable town, with 16,000 inhabitants, who engage in the whale-fishery. The population of the whole province of St Salvador is estimated at 600,000.

SALVATION means the safety or preservation of any thing which is or has been in danger, and is generally used in a religious sense, when it means preservation from eternal death, or reception to the happiness of heaven, which is now offered to all men by the Christian religion upon certain conditions. See THEOLOGY.

SALVIANUS, an ancient father of the Christian church, who flourished in the fifth century, and was well skilled in the sciences. He acquired such reputation for his piety and learning, that he was named the Master of the Bishops. He wrote a Treatise on Providence; another on Avarice; and some epistles, of which Baluze has given an excellent edition. That of Conrad Rittershusius, in two volumes 8vo, is also esteemed.

SALUTE, in military matters, a discharge of artillery, or small arms, or both, in honour of some person of extraordinary quality. The colours likewise salute royal persons, and generals commanding in chief, which is done by lowering the point to the ground. In the field, when a regiment is to be reviewed by the king or his general, the drums beat a march as he passes along the line, and the officers salute one another, bowing their half-pikes or swords to the ground, then recover and take off their hats. The ensigns salute all together, by lowering their colours.

SALUTE, in the navy, a testimony of deference or homage rendered by the ships of one nation to those of another, or by ships of the same nation to those of a superior or equal. This ceremony is variously performed, according to the circumstances, rank, or situation, of the parties. It consists in firing a certain number of cannon, or volleys of small arms; in striking the colours or top-sails; or in one or more general shouts of the whole ship's crew, mounted for that purpose on the masts or rigging.

SALWATTY, an island in the Pacific Ocean, near the north-west coast of New Guinea, from which it is separated by a narrow channel. It is about ninety miles in circumference. Long. 131. 15. E. Lat. 1. 6. S.

SALZBURG. At present this district forms a circle of the Austrian province of Upper Ens, extending over 2836 square miles. It was formerly one of the most valuable of the independent ecclesiastical states of Germany, in the circle of Bavaria, under its own archbishop, whose revenues and dignity were of the highest class. It then contained sixteen cities, twenty-three market-towns, and 250,000 inhabitants. Owing to a severe persecution of the Protestants, which the archbishop instituted between 1729 and 1733, many of that religious party emigrated, and established themselves in other parts of Germany, and thereby the population was more than one third reduced; and those who had abandoned it were the most active portion of the community. During the French revolution, the country was secularized, and by the treaty of 1802 was, with Eichstadt, Berchtolsgaden, and a part of Passau, given to the archduke of Austria, Ferdinand, as an indemnification for the loss of Tuscany. By the peace of Presburg in 1805, Salzburg was secured to the emperor of Austria, and Eichstadt, with Passau, ceded to Bavaria. The treaty of 1809 left Salzburg at the disposal of Napoleon, who, in 1810, transferred it to the kingdom of Bavaria; but by the general peace of 1815 it was again delivered over to the Austrian monarchy, of which it still forms a portion. It is a most romantically interesting country, very rich in the long valley through which the river Salza flows, and in the smaller valleys which proceed from it, especially on the southern side of that stream. On both sides of these valleys are lofty mountains, forming a part of the Noric Alps, whose tops, especially that of the Nokchorn, which is 10,380 feet in height, are covered with perpetual snow, and exhibit, like the Alps in Switzerland, the striking objects which attract such numerous visitors. There are various mines in the territory, the most prolific of which are those of rock-salt, which yield more than sufficient for the consumption of the inhabitants. Formerly, several mines of gold were worked, and some of silver; but of late years that employment has been diminished, and applied to other subterranean objects. These are iron, arsenic, rock-crystal, marble, serpentine, saltpetre, cobalt, and asbestos. The iron is made into cutlery and other hardwares for domestic use, but no raw iron is exported. The circle yields flax and hemp, which, with the wool of their sheep, is spun and woven by the peasantry during the winter months, and converted by themselves into the necessary articles of clothing. The whole number of the inhabitants at present is 152,000.

SALZBURG, a city, the capital of the Austrian circle of the same name. It stands on the beautiful valley of the Saltz, on both sides the river of that name, over which there is a beautiful bridge three hundred and seventy feet long and forty feet broad. The city is surrounded with walls, but the suburbs are more extensive and more elegant, and extend to a considerable distance, containing the best of the modern residences. The streets within the city are narrow and crooked, but there are several handsome open plazas or squares, and a great number of those large and striking buildings which are tokens of its former ecclesiastical sovereigns. On a hill overlooking the city, and six hundred feet above it, is the ancient fortress of Moncksberg, now dismantled of its artillery; but it is an object of curiosity from a road having been hewn out of the solid rock on which it stands, forming an archway a hundred and fifty yards in length and eight in breadth, which terminates in a most delightful prospect of the surrounding country. It contains, with the suburbs, 16,500 inhabitants, who have little trade except at two large fairs, which become entrepôts for exchanging the productions of Italy with those of Germany. The environs are highly enchanting from the scenery they exhibit. Long. 13. 54. 5. E. Lat. 47. 43. 10. N.

SALZWEDEL, a city of Prussian Saxony, in the government of Magdeburg, the capital of a circle of the same name, which extends over 454 square miles, and contains a population of 31,600 persons. It is situated on the river Jeeke, which is navigable thus far, is surrounded with walls, and contains 930 houses, with 6300 inhabitants, employed in linen, cotton, and woollen manufactures, and in making leather, shoes, gloves, and refining salt.

SAMADONG, a large town in the island of Java, situated in a country of luxuriant fertility, 144 miles south-east from Batavia.

SAMAK, an island in the south-western part of the Gulf of Persia, about twelve leagues in circumference.

SAMANA, a town of Hindustan, in the province of Delhi, possessed by native chiefs in alliance with the British, 122 miles north-west from Delhi. Long. 75. 48. E. Lat. 30. 2. N.

SAMANAP, a large and populous town on the south-eastern coast of the island of Madura, and the residence of a prince. It is situated on a fine bay, which, though rather shallow, will admit of large brigs or country prows lying close to the town. It carries on an extensive commerce, and the country abounds in rice, and teak-timber for building. Long. 114. E. Lat. 7. 5. S.

SAMAND, a town of Hindustan, in the province of Moultan, and district of Bahar, which is tributary to the Afghans. It is situated on the eastern side of the river Indus. Long. 19. 57. E. Lat. 28. 11. N.

SAMANEANS, in *Antiquity*, a kind of magicians or philosophers, who have been confounded by some with the Brahmins. They proceeded from Ariana, a province of Persia, and the neighbouring countries, spread themselves in India, and taught new doctrines.

The Brahmins, before their arrival, it is said, were in the highest period of their glory the only oracles of India; and their principal residence was on the banks of the Ganges and in the adjacent mountains, whilst the Samaneans were settled towards the Indus. Others say that the Brahmins acquired all their knowledge from the Samaneans, before whose arrival it would be difficult to prove that the Brahmins were the religious teachers of the Indians. The most celebrated and ancient of the Samanean doctors was Boutta, or Buddha, who was born 683 years before Christ. His scholars paid him divine honours; and his doctrine, which consisted chiefly in the transmigration of souls, and in the worship of cows, was adopted not only in India, but also in Japan, China, Siam, and Tartary. It was propagated, according to M. de Sainte Croix, in Thibet, in the eighth century, and succeeded there the ancient religion of Zamolxis. The Samaneans, or Buddhists, were entirely destroyed in India by the Brahmins; but several of their books were preserv-

Samar
||
Samarang.

ed, and still continue to be respected on the coasts of Malabar.

SAMAR, one of the Philippine Islands, 140 miles in length by sixty in average breadth. It is situated south-east from the large island of Luzon, from which it is separated by a strait five leagues in breadth. It is of an extremely fertile soil, which, besides other grain, produces abundance of rice, that is wholly appropriated to the use of the parochial clergy. The common food of the natives consists chiefly in a species of potato, yams, and a sort of root named gaby. The soil is favourable for the production of the sugar-cane, and fruits, such as lemons, melons, figs, of which there are about fourteen different species, the pumplemous, a species of orange, which is nearly five inches in diameter, and other vegetables besides, namely, cabbages, garlic, onions, and the like. Pepper, honey, and wax are found in the woods; and from the sap of the cocoa, nipe, and cabonegro trees, excellent materials are found for the manufacture of brandy. The woods afford an excellent cover for many animals, and monkeys abound; also a remarkably large deer, wild buffaloes, and other quadrupeds. They swarm also with every description of birds, particularly the common fowl. There are three species of the turtle-dove. The parroquet, cockatoo, and another pretty little bird of the same genus, and of the size of a linnet, are quite common. A diminutive bird, of the size of a wasp, is also seen, of the most vivid and beautiful colours, consisting of a shade of yellow mixed with red and blue. There is a curious production found in this island. It consists in numerous folds of the bark of a tree, which in a certain period of putrefaction are separable without art or difficulty. These pieced together afford a species of fine linen, harsh, indeed, and disagreeable to the skin, but which is softened by a preparation of lime. Besides serving as the materials of linen, it is likewise useful for the purposes of cordage. The iron-tree, ebony, and dyeing-wood, grow everywhere; and gold dust is found in small quantities in the interior.

The natives, especially those who reside upon the sea-coast, were formerly Mahommedans; but being converted by the missionary Jesuits, they embraced the religion and submitted to the authority of Spain. Their houses are constructed of bamboos, and being raised a few feet from the ground, they admit a circulation of air from beneath. The natives are extremely simple in their habits, and are clothed with very little trouble or expense. The priests exercise over them both spiritual and temporal authority. They give them advice and admonition, which is always accompanied with presents of wine and medicines, or food; and when punishment is necessary, it is promptly inflicted. Long. 124. 15. to 125. 52. E. Lat. 11. 15. to 12. 45. N.

SAMARA, a town of Irak Arabi, on the Tigris, revered by Mussulmen as containing the tomb of Mahommed al Mahudi, the twelfth imam. It was known in antiquity, and was in the ninth century the residence of several caliphs of the house of Abbas. It now only contains about four hundred houses. It is sixty miles north of Bagdad.

SAMARANG, a fortified town on the north-east coast of the island of Java, and the principal central station in the island, being the capital of a large district. It has a considerable European population, and ranks next in importance to Batavia. The town is defended by a stone parapet, with bastions and a wet ditch; but is in no condition to withstand a siege by European troops, being only calculated for defence against a native power. It has a good hospital, and a public school, chiefly for the teaching of mathematics, where numbers of Dutch and half-caste children were formerly educated for the military profession; and also a theatre, a fine large church, and a variety of other public buildings, both elegant and commodious, within and without the city. Between the town and the sea-coast is an impassable morass, through which the access to the town is by two fine roads east and west, both of which are raised, and communicate with each other. Owing to shoals, ships are obliged to lie at the distance of five or six miles from the shore, the anchorage being six fathoms, with a muddy bottom. The river is navigable for prows and coasting vessels as far as the town. In blowing weather the bar at the mouth is very dangerous. The surrounding country is remarkably fertile, and provisions in the town are consequently abundant and cheap. The climate is more healthy than that of Batavia, and the European inhabitants have more active habits. In the environs are numerous villas, which, from their elevated situation, command a view of the neat garden-houses and beautifully verdant fields below. There is here a numerous population of natives and Chinese, and crowded villages overspread the neighbourhood. Samarang was always the seat of a separate governor, who was called the governor of Java, his authority extending from Cheribon to the eastern extremity of the island. This government is one of the most lucrative in the gift of the Dutch East India Company, and is surpassed only by that of the governor-general. It is 343 miles east from Batavia. Long. 110. 38. E. Lat. 6. 54. S.

Samarcand
|

SAMARCAND. This city, which was once the capital of Independent Tartary, and the favourite residence of the great Timour, is now little better than a mass of ruins. Until the time of Shah Murad, the place was not only ruinous, but desert, the haunt of the wolf and the lion. That sovereign used all his efforts to restore and to repeople this place; and though it is still small, it is daily increasing. It formerly covered more ground than Bokhara; and although the original walls, which tradition declares, though this is no doubt an exaggeration, to have been forty-eight miles in circuit, have mouldered into dust, Clavijo, a Spanish ambassador, who visited it about the year 1400, estimates the population of the city at 150,000; and a considerable number besides, for want of habitations, were obliged to shelter themselves in the caves of the surrounding rocks. The surrounding country also had a flourishing and populous appearance, being entirely covered with large villages, gardens, and country-houses, the residence of Tartar chiefs. A great proportion of the inhabitants consisted of persons who had been collected by Timour from every part of Asia, whose policy it was to bring hither all who were famous for the exercise of any art not followed in Samarcand. It carried on, besides, a great inland commerce with Russia, Tartary, India, Turkey, and particularly China. The splendour of Timour's court is said to have surpassed description, and his palaces vied with each other in magnificence. They were adorned with the spoils of conquered countries, and were resplendent with hangings of silk, gold and silver embroidery, tables of solid gold, and a display of rubies and precious stones that formed a dazzling scene. The city is still protected with a mud-wall, and has a citadel of the same materials; but the principal buildings and most of the houses are constructed of stone. The mausoleum of Timour may still be seen here. It is a large building, with a very lofty dome, which was once covered with gold; but this covering has since been taken off by Shah Murad. Within this building is the tomb, covered by a large flag of green stone, adorned with jewels, and sculptured over with the genealogical tree of the great Timour. Here, too, was the observatory of Oolugh Beg, which was destroyed by one of the many barbarous invaders of this country, and it is now a heap of dust. There were here also the tombs of many other distinguished persons, but they are all going to decay. Samarcand was a seat of religion and learning as well as of an extensive commerce; and it contained many colleges, the finest of which was the Khanums, which is now all in ruins, and its extensive buildings laid waste. Some, however, are still inhabited.

There is still in the town a very large dome, having six sides, each side forming a bazaar; regular horse-markets are held here on Sundays and Wednesdays, and horses are cheaper than at Bokhara. It has the reputation of being a pleasant place, having a small stream running through it from the mountains, a fine country around it, and a fine climate. At a little distance flows the river Kohuk, which falls into the Zurusshan, the latter passing by Bokhara, and flowing into the Oxus. It is about 150 miles due east from Bokhara, and 180 miles south of Balkh. Long. 64. 9. E. Lat. 39. 37. 23. N.

SAMARIA, in *Ancient Geography*, one of the three larger Cisjordan districts, situated in the middle between Galilee to the north and Judæa to the south, beginning at the village Ginæa, in the Campus Magnus, and ending at the toparchy called Acrobatena. Its soil differs in nothing from that of Judæa, both being equally hilly and champaign, and both equally fertile in corn and fruit. It is called the *kingdom of Samaria in Ephraim*, comprehending the ten tribes, and consequently all the country to the north of Judæa and east and west of Jordan.

Samaria, the capital city of the kingdom of Samaria, or of the ten tribes. It was built by Omri king of Israel, who began to reign in the year of the world 3079, and died 3086.

SAMARITANS. The Samaritans are the people of the city of Samaria, and the inhabitants of the province of which Samaria was the capital city. In this sense, it should seem that we might give the name of Samaritans to the Israelites of the ten tribes, who lived in the city and territory of Samaria. However, the sacred authors commonly apply the name of Samaritans only to those strange people whom the kings of Assyria sent from beyond the Euphrates to inhabit the kingdom of Samaria, when they took captive the Israelites that were there before. Thus we may fix the epoch of the Samaritans at the taking of Samaria by Salmaneser, in the year of the world 3283. This prince carried away captive the Israelites that he found in the country, and assigned them dwellings beyond the Euphrates, and in Assyria. He sent other inhabitants in their stead, of which the most considerable were the Cuthites, a people descended from Cush, and who are probably of the number of those whom the ancients knew by the name of Scythians.

After Salmaneser, his successor Esarhaddon was informed that the people who had been sent to Samaria were infested by lions that devoured them. This he imputed to the ignorance of the people in the manner of worshipping the god of the country. Esarhaddon therefore sent a priest of the God of Israel, that he might teach them the religion of the Hebrews. But they thought they might blend this religion with that which they had previously professed; so they continued to worship their idols as before, in conjunction with the God of Israel, not perceiving how absurd and incompatible these two religions were.

It is not known how long they continued in this state; but at the return from the captivity of Babylon, it appears they had entirely quitted the worship of their idols; and when they asked permission of the Israelites that they might labour with them at the rebuilding of the temple of Jerusalem, they affirmed, that from the time when Esarhaddon had brought them into this country they had always worshipped the Lord. And indeed, after the return from the captivity, the Scripture does not anywhere reproach them with idolatrous worship, though it does not dissemble either their jealousy against the Jews, or the ill offices they had done them at the court of Persia by their slanders and calumnies, or the stratagems they contrived to hinder the repairing of the walls of Jerusalem.

It does not appear that there was any temple in Samaria, in common to all these people who came thither from beyond the Euphrates, before the arrival of Alexander the Great into Judæa. Before that time, every one was left to his own discretion, and worshipped the Lord wherever he thought fit. But they presently comprehended, from the books of Moses which they had in their hands, and from the example of the Jews their neighbours, that God was to be worshipped in that place only which he had chosen; so that since they could not go to the temple of Jerusalem, which the Jews would not allow of, they bethought themselves of building a temple of their own upon Mount Gerizim, near the city of Shechem, which was then their capital. Sanballat, governor of the Samaritans, therefore applied himself to Alexander, and told him he had a son-in-law, called Manasses, son of Jaddus the high priest of the Jews, who had retired to Samaria with a great number of other persons of his own nation; that he desired to build a temple in this province, where he might exercise the high priesthood; and that this undertaking would be to the advantage of the king's affairs, because in building a temple in the province of Samaria, the nation of the Jews would be divided, who are a turbulent and seditious people, and by such a division would be made weaker, and less in a condition to undertake new enterprises. Alexander readily consented to what Sanballat desired, and the Samaritans presently began building the temple of Gerizim, which from that time they have always frequented, and still frequent to this day, as the place where the Lord intended to receive the adoration of his people. It is of this mountain and of this temple that the Samaritan woman of Sychar spoke to our Saviour.

But the Samaritans did not long continue under the obedience of Alexander. They revolted from him the very next year, and Alexander drove them out of Samaria, put Macedonians in their place, and gave the province of Samaria to the Jews. This preference which Alexander gave to the Israelites contributed not a little to increase that hatred and animosity that had already obtained between these two people. When any Israelite had deserved punishment for the violation of some important point of the law, he presently took refuge in Samaria or Shechem, and embraced the method of worship according to the temple of Gerizim. When the Jews were in a prosperous condition, and affairs were favourable to them, the Samaritans did not fail to call themselves Hebrews, and pretended to be of the race of Abraham. But no sooner were the Jews fallen into discredit or persecution, than the Samaritans immediately disowned them, would have nothing in common with them, and acknowledged themselves to have been originally Phœnicians, or that they were descended from Joseph and Manasseh his son. This was their practice in the time of Antiochus Epiphanes.

The Samaritans, having received the Pentateuch, or the five books of Moses, from the priest that was sent by Esarhaddon, continued to preserve it in the old Hebrew or Phœnician character, which we now call the Samaritan, to distinguish it from the modern Hebrew character, which we find in the books of the Jews. These last, after their captivity, changed their old characters, and took up those of the Chaldaic, which they had been used to at Babylon, and which they continue still to use. It is wrong, says Calmet, to give this the name of the Hebrew character, for that can be said properly to belong to the Samaritan text. The critics have taken notice of some variations between the Pentateuch of the Jews and that of the Samaritans; but these varieties of reading chiefly regard the word Gerizim, which the Samaritans seem to have purposely introduced to favour their pretensions that Mount Gerizim was the place in which the Lord was to be adored. The other various readings are of little importance.

As to their belief, it is objected to them, that they receive only the Pentateuch, and reject all the other books of Scripture, chiefly the prophets, who have more expressly declared the coming of the Messiah. They have also been accused of believing God to be corporeal, and of denying the Holy Ghost, and the resurrection of the dead.

Joseph Scaliger, with the view of informing himself respecting their usages and opinions, wrote to the Samaritans of Egypt, and to the high priest of the whole sect, who resided at Neapolis in Syria. They returned two answers to Scaliger, dated in the year of the Hejira 998. These were preserved in the French king's library, translated into Latin by Father Morin, and printed in England in the collection of that father's letters, in 1682, under the title of *Antiquitates Ecclesiæ Orientalis.*

There are still some Samaritans at Shechem, which is otherwise called Naplous; and they have priests there, who say they are of the family of Aaron. They have a high priest, who resides at Shechem, or at Gerizim, who offers sacrifices there, and who declares the feast of the passover, and all the other feasts, to all the dispersed Samaritans. Some of them are to be found at Gaza, others at Damascus, and others at Grand Cairo.

SAMAVAT, a town of the Syrian desert, to the west of the Euphrates, once a considerable city, but now only containing 300 Arabs, who levy exorbitant contributions on all pilgrims who take this route to the holy city. It is ninety miles west of Meshed Ali.

SAMBACCA, a town of the island of Sicily, in the province of Mazzara, and fifty miles from Palermo. It is in a healthy situation on a hill, eight miles from the sea-shore, and contains 9600 inhabitants.

SAMBAH, a town of Hindustan, in the Sikh territories, and province of Lahore, situated on the eastern side of the small river Deeg, fifty-five miles north-north-east from the city of Lahore. Long. 74. 8. E. Lat. 32. 34. N.

SAMBAR POINT, the south-west point of the large island of Borneo.

SAMBASS, a town and river on the west coast of the island of Borneo. The town is about forty miles up the river. It is built, as the seaport towns in Borneo generally are, of timber and bamboos, and is raised on wooden stalks and piles, on low swampy morasses. The river is wide at its entrance, which is in long. 109. 5. E. and lat. 1. 12. N. The inhabitants here, as in other towns on the coast, were much addicted to piracy. They were in the practice of darting out on defenceless vessels, so that it became quite unsafe for the European trader to venture near so dangerous a coast. It was on account of these piracies that the place was attacked by the British in 1812, who were repulsed with loss, and suffered still more severely from the pestilential effects of the climate. In 1813, a second attack was made by a British armament, which proved completely successful.

SAMBAYA, a river on the north coast of the island of Java, which is navigable in the rainy season as far as the residence of the Emperor of Solo; and a recent survey, made by Captain Colebrooke, shows that the impediments to its further navigation might be easily removed.

SAMBELONG ISLANDS, two or three islands among the Nicobar Islands, a little to the north of the Great Nicobar. Long. 100. 36. E. Lat. 41. 20. N.

SAMBER, a Rajpoot town of Hindustan, in the province of Ajmeer, and district of Jyepoor. It is situated in the vicinity of a salt lake, from which the greater part of Hindustan is supplied with salt, which is a source of great prosperity to the town.

SAMBHAR CAPE, on the south-western coast of the island of Borneo. Long. 109. 50. E. Lat. 2. 52. S.

SAMBOANGAN, a Spanish fortress and settlement on the south-west extremity of the island of Magindanao. The town is situated on the banks of a small rivulet which flows into the sea, and contains a thousand inhabitants, including officers, soldiers, and their respective families. Here are erected, on posts twelve feet high, small look-out houses, in all of which a constant guard is kept by the Spaniards, against the inroads of the natives, with whom they are in a state of perpetual hostility. The military force consists of 150 to 200 soldiers, natives of Manilla, who have no discipline. To this place criminals are sent into banishment from the Philippines. The adjacent country is extremely fertile, and cattle have multiplied everywhere in the woods. Pirates swarm in the neighbourhood, and frequently plunder and cut off vessels richly laden, while lying in the harbour. They frequently make descents close to the fort, and carry off the inhabitants, whom they sell into slavery. Long. 122. 10. E. Lat. 6. 45. N.

SAMBOR, a circle of the Austrian kingdom of Gallicia, extending over 2050 square miles, comprising ten cities and towns, and 352 villages, with 250,700 inhabitants, about one fifth of whom are Jews. The capital is the city of the same name, which is situated on the river Dniester. It stands on a fine plain, is tolerably well built, and has a gymnasium, one Greek and three Catholic churches, 1170 houses, and 6950 inhabitants. Long. 23. 30. 31. E. Lat. 49. 31. 30. N.

SAMBUCA, σαμϐυκη, appears to have been an instrument of the harp kind, of a triangular form, and having strings of unequal length and thickness, said to have been invented by Ibycus of Messina, a lyric poet, contemporary with Anacreon; more probably, we think, an oriental instrument adopted by the ancient Greeks. (Consult Athenæus, l. 4 and l. 14.)

SAMGAUM, a town of Hindustan, in the province of the Carnatic, and district of Nelloor, situated on the north bank of the Pennar river. Long. 70. 44. E. Lat. 14. 33. N.

SAMMAN, a town in the interior of Lasha, in Arabia, fifty miles west-north-west of El Katif.

SAMOGITIA, a province of Poland, bounded on the north by Courland, on the east by Lithuania, on the west by the Baltic Sea, and on the south by Regal Prussia, being a hundred and seventy-five miles in length and a hundred and twenty-five in breadth.

SAMOIEDA, a country of the Russian empire, between Asiatic Tartary and Archangel, lying along the sea-coast as far as Siberia. The inhabitants are extremely rude and barbarous, travelling on the snow in sledges drawn by an animal like a rein-deer, but with the horns of a stag. Their chief employment consists in hunting and fishing.

SAMON, an island in the Eastern Seas, to the north-west of Timor. It is hilly, and covered with wood. The tides run very strong, and occasion ripplings, which have the appearance of breakers.

SAMOS, a Greek island on the shore of Asia Minor, from which it is separated by a very narrow and crooked channel called the Little Boghaz, near to which are the ruins of Ephesus and the celebrated Cape Mycale. It is celebrated as the birthplace of Pythagoras, and was the most powerful and important of the Ionian Islands, distinguished by the number and skill of its seamen, who, 566 years before the Christian era, navigated the Mediterranean to the pillars of Hercules, and are said to have ascended the river Guadalquivir in Spain. Some degree of independence was maintained until the reign of the Emperor Vespasian, about the year 70. Up to that time it had been celebrated for being a great school of statuary, and for preparing bronze images, in which art Rhoekos, and his two sons Theodoros and Telekles, were distinguished masters. In the middle ages the island was successively governed by Arabs, Venetians, Genoese, and Turks, and continued a portion of the empire of the latter till the recent Grecian revolution broke out. The islanders on that occasion took part with their countrymen as soon as the news reached them of the execution of their patriarch. Fortifications were erected towards the channel of the Boghaz, which rendered an invasion from the continent of Anatolia too hazardous for the Turks to attempt. Under the command of the archbishop, ten thousand men were instantly armed and formed into regiments, bearing the cross as their standard. Three vessels were equipped as ships of war, and well manned with the best of seamen, who carried on predatory excursions with great success on the neighbouring continental shores. The conduct of the Sameotes produced unbounded rage in the Turkish government, and a powerful fleet and a numerous body of armed men were collected to insure the subjugation in 1821; but it failed, principally owing to the Greek fleet having been posted in the channel between Cape Mycale, where the Turkish land force was assembled. In that contracted spot the heavy Turkish ships could not approach, and the active and brave Greek seamen attacked the crowded transports, some of which were sunk, and others of them burned by fire-ships. The Capitan Pasha withdrew with his fleet, followed by the Greeks with their fire-ships; and the land-forces returned as they could along the shore to Constantinople.

Though repulsed and disgraced, the Turks, having captured and desolated Scio, and the island of Ispara, near to Samos, resolved on another attempt on that island in the year 1824. It was arranged that the Turkish force should be joined by the fleet of the pasha of Egypt. When the junction was effected, the Turks sent a flag of truce, offering an amnesty and proposing to treat; but the Sameotes, warned by the atrocities committed at the Isle of Scio in spite of a treaty, resolved to defend their possessions, or to dedicate their lives to its defence. The females, and the children, with their provisions, were removed to the mountains, and the men stood armed on the shore. The Turks had placed their ships in the narrowest part of the Boghaz, where they formed a kind of bridge for the troops to pass over. Upon the bridge or line of shipping the small vessels of the Greeks opened a most destructive fire, some were sunk and others burned, while the larger ships of the Turks, drawing too much water, remained in a state of total inactivity. A retreat was commenced, at which time another Greek fleet, under Miaulis, reached the scene of contest. The unwieldy and ponderous ships of the Turks could not withstand the attacks of this new enemy, whose ships, from being small, and the men agile, gave them a great superiority. The Turks were driven out to sea, where, by means of their enemy's fire-ships, they lost one man-of-war of fifty-four guns, and a corvette, brig, and several gun-boats of the Egyptian fleet. After this attack the Sameotes were unmolested, and are now in alliance with the kingdom of Greece.

The island is twenty-seven miles in length, being of an irregular shape, and very various breadth. The chief town is Vathi, in latitude 37° 46′ and longitude 26° 58′. The island is represented by those who have visited it to have contained from 50,000 to 60,000 inhabitants, living in comfort, industry, and abundance, and all of them Greek Christians. The only town is Vathi, built on the descent of some mountains, sloping down to the port, and tolerably well built, but with narrow streets. The port is beautiful, being the segment of a long oval, stretching inland towards the south-east, covered with trees, and well cultivated. It is protected from all winds but the south-west. The most important production is the rich Muscato wine, known in Europe by the name of Malmsey. A great quantity of raisins are furnished for exportation, as well as much oil. In the preparation of the latter much pains are taken, and it equals that from Lucca. Though the apprehension of the horrors exhibited at Scio by the Turks caused many families to fly, yet some of them have returned, and the prosperity of the island is returning.

SAMOYEDES, one of those barbarous tribes who range over the vast and frozen deserts of Asia, which are bounded by the Northern Ocean. They cover a space along the shores of that ocean which extends east and west about two thousand miles, nearly as far as the river Mesen on the west, which falls into the White Sea; and eastward to the Olenek and almost to the Lena, comprising the space between the 40th and 120th degrees of east longitude. From north to south this territory extends from 300 to 600 miles; yet on this extensive area there are not more than 20,000 inhabitants. They are divided into three principal tribes, namely, the Vanoites, who inhabit the banks of the Petchora and the Obi; the European tribe, who are found on the Mesen and in the interior of the government of Archangel; and the Khirutches, who wander over the remoter wastes of Siberia. They bear the stamp of their ungenial climate in their small and stunted proportions, being in general not above four or five feet in height. Their features are extremely coarse, resembling those of the Tungouses, while their neighbours the Ostiaks bear the stamp of the Finnish race. The face is flat, round, and broad, the lips large and thick, the nose wide and open, and the beard small, with a small quantity of rough and black hair carefully arranged. The dress of the men differs little from that of the Ostiaks. But the females do not wear any veil; they keep the head and face uncovered, unless during their winter journeys. The Ostiaks are in regular subjection to the Russians, have adopted many of their customs, and are reckoned to have made greater advances in civilization than their neighbours. The Samoyedes, though included within the nominal limits of Russian authority, are left at liberty to roam at large over the desert, the vast extent and poverty of which would not maintain a military force. They live by hunting, and are continually moving about on their sledges from place to place. The animal they hunt is the wild deer, which is their chief subsistence; they eat the flesh, make clothes of the skin, and use the nerves as thread for sewing. They also hunt the white fox, and employ themselves in summer in fishing in the lakes. Like most savage nations, they are extremely superstitious, and have very rude ideas of the Supreme Being. They however acknowledge the Deity as the ruler of the universe, who cannot be represented by any image; and under him numerous inferior deities, spirits, and demi-gods, who are divided into celestial and terrestrial, and are the inferior agents who distribute good and evil among men. These are represented by little wooden idols, finely clothed and ornamented, placed in houses or in woods, to which sacrifices are offered. They have their magicians or shamans, who are general throughout Northern Asia, and are distinguished by their drums, and by a dress adorned with rings and pieces of iron. These persons have a terrific aspect, which frightens even the Russians; and their practice is to work themselves up into such an irritable state of nerves, that a sudden cry, a blow, or even a touch, raises them to a state of frenzy, and they seize the first deadly weapon they can lay hold of in order to massacre the person who is the cause of their agitation. On the subject of death they have many superstitions. They cover the deceased with all his clothes, put a caldron over his head, and, wrapping him in deer-skins, they drag him out by an opening made in the tent for the express purpose, lest, as they fear, he should drag out any one after him. In winter they place the body in a ditch, and cover it over with leaves and branches of trees. In winter a wooden cottage is constructed, in which they place the dead with his axe, knife, bow, arrows, tobacco, and pipe. Their dead bodies are consequently in most cases devoured by the wild beasts. They have a superstitious dread of ghosts, and have recourse in this case to magicians, who array themselves in charms, and exorcise the spirit, exhorting him not to revisit the earth and disturb his surviving friends, or envy them the possession of those hunting grounds which he has left. It is considered of evil omen to pronounce the name of the deceased; and this is viewed by the relatives as a deadly injury. They are in general a peaceable and harmless race, prone to intoxication, as most savages are, and immoderately fond of tobacco. Their favourite amusements are wrestling and dancing.

SAMPANMANGO Cape, the north-west point of the island of Borneo. Long. 116. 52. E. Lat. 7. 0. N.

SAMPIT, a town of the island of Borneo, on the south coast, near a river of the same name, 140 miles west of Banjar Massam.

SAMPOO, a small island in the Eastern Seas, near the south coast of Java. Long. 112. 26. E. Lat. 8. 23. S.

SAMRONGUR, a town of Hindustan, in the district of Nepaul. It has a large artificial reservoir in the vicinity, which shows the country to have been better cultivated than at present. Long. 85. 30. E. Lat. 26. 45. N.

SAMSOE, an island belonging to the kingdom of Denmark, in the Cattegat, between Zealand and Jutland. It is forty-five square miles, or 28,800 acres, in extent, and is divided into six parishes, containing 2400 inhabitants. It is of moderate fertility, producing both corn, butter, and cheese, and occupying a part of the people in the fisheries.

SAMSON, one of the judges of Israel, memorable for his supernatural strength, his victories over the Philistines, and his tragical end, as related in the book of Judges.

Samson's Post, a sort of pillar erected in a ship's hold, between the lower deck and the kelson, under the edge of a hatchway, and furnished with several notches that serve as steps to mount or descend, as occasion requires. This post being firmly driven into its place, not only serves to support the beam and fortify the vessel in that place, but also to prevent the cargo or materials contained in the hold from shifting to the opposite side, by the rolling of the ship in a heavy sea.

SAMSOON, a port on the southern shore of the Black Sea, to the westward of Trebisond. It contains many well-built houses, seven mosques, one Armenian church, and 500 Mahommedan and 200 Christian families. The vicinity has long been noted for silver and copper mines, two of which, lying between Samsoon and Kabback, and near the river Saraez Gourkhan, are deemed of great antiquity, and are called Malett and Jumbish. They have been recently opened anew. From the earliest times all these districts, to the very margin of the Euxine, have also been famous for workers in iron, and they bear the same reputation now as in ancient times.

SAMUEL, Books of, two canonical books of the Old Testament, being usually ascribed to the prophet Samuel. The books of Samuel and the books of Kings are a continued history of the reigns of the kings of Israel and Judah; for which reason the books of Samuel are likewise styled the first and second books of Kings. Since the first twenty-four chapters contain all that relates to the history of Samuel, and the latter part of the first book and all the second include the relation of events that happened after the death of that prophet, it has been supposed that Samuel was author only of the first twenty-four chapters, and that the prophets Gad and Nathan finished the work. The first book of Samuel comprehends the transactions under the government of Eli and Samuel, and under Saul, the first king, and also the acts of David whilst he lived under Saul; and is supposed to contain the space of a hundred and one years. The second book contains the history of about forty years, and is wholly spent in relating the transactions of David's reign.

SAMULCOTTA, a town of Hindustan, in the province of the Circars, and district of Rajamundry. Pepper grows wild on the neighbouring hills. It is situated on the north bank of a small river, a few miles from the sea. Long. 82. 30. E. Lat. 17. 5. N.

SAMUR, a river of Persia, in the province of Shirvan, which rises in the mountains of Lesghistan, and falls into the Caspian. At its mouth there is a small town of the same name, fifteen miles south of Derbend.

SAN, a river of China, which rises on the frontier of Tartary, and falls into the Gulf of Leatong. Long. 117. 28. E Lat. 39. 9. N.

SAN del Bose, an elevated island in the Eastern Seas. Long. 120. 31. E. Lat. 10. 27. S.

SAN Paloi, a small island near the west coast of Luzon. Long. 120. 10. E. Lat. 14. 45. N.

San Juan de Puerto Rico. See Porto Rico.

SAN Lucar de Barrameda, a city of Spain, in the province of Andalusia. It is a good port, at the entrance of the river Guadalquivir, and the city is built on its eastern bank. The trade of Seville in a great degree centres here, as the larger vessels belonging to that city cannot ascend higher up the river. It is well fortified towards the sea. The country around it is cultivated quite to the shore, and produces rich crops of grapes, olives, and the other fruits of the climate, but little or no corn. It contains 15,200 inhabitants.

San Sebastian, a city of Spain, in the province of Guipuscoa, at the mouth of the river Urumea, which runs from Navarre. Its harbour is excellent, and, as well as the city, is defended by the strong fortress La Mota, which overlooks both; and it has other powerful fortifications towards the land as well as the sea. It has considerable trade by means of ships of great burden. The mole is a magnificent and well-executed work, as is the lighthouse, which is visible at sea at nine leagues distance. San Sebastian has always been considered, for its extent, the most commercial city of Spain, and its trade is as ancient as its foundation. The city contains about seven hundred houses, mostly containing two or more families, and the population is 13,100 souls; but the country around it is thickly studded with country residences, and is well peopled. The land in its neighbourhood is not fertile, but the hills which surround it abound with iron, and are a great source of wealth to the inhabitants. It is in latitude 43. 19. 39. north, and longitude 1. 30. 35. west from London.

SANA, the capital of the province of Yemen, in Arabia, and the residence of the Imam. It is situated in a barren and stony valley amidst lofty hills, and is surrounded in its immediate vicinity with fine gardens and luxuriant woods. It contains many handsome stone houses, and others substantially built of brick, and is said by Sir Henry Middleton to be somewhat larger than Bristol, in space at least, if not in population. It is defended by a strong mud-wall. Fruits are plentiful in the neighbourhood. It is 128 miles north-north-east of Mocha. Long. 44. 9. E. Lat. 15. 21. N.

SANADON, Noel Etienne, a Jesuit, and a distinguished professor of humanity at Caen, was born at Rouen in 1676. He there became acquainted with Huet, bishop of Avranches, whose taste for literature and poetry was similar to his own. Sanadon afterwards taught rhetoric at the university of Paris, and upon the death of Du Morceau he was intrusted with the education of the prince of Conti. In 1728 he was made librarian to Louis XIV., an office which he retained to his death, which took place on the 21st of September 1733, in the fifty-eighth year of his age.

His works are, 1. Latin Poems, in 12mo, 1715, reprinted by Barbou, in 8vo, 1754. His style possesses the graces of the Augustan age. His language is pure and nervous, his verses are harmonious, and his thoughts are delicate and well chosen, but sometimes his imagination flags. His Latin poems consist of odes, elegies, epigrams, and others, on various subjects. 2. A translation of Horace, with remarks, in two vols. 4to, printed at Paris in 1727. The best edition of this work, however, was printed at Amsterdam in 1735, in eight vols. 12mo, in which are also inserted the versions and notes of M. Dacier. In general, his version is rather a paraphrase than a faithful translation. Learned men have justly censured him for the liberty which he has taken in making considerable changes in the order and structure of the odes; and he has also given offence by his uncouth orthography. 3. A Collection of Discourses delivered at different times, which afford strong proofs of his knowledge of oratory and poetry. 4. A book entitled *Prières et Instructions Chrêtiennes.*

SANASHYGOTTA, a flourishing town of Bengal, in the district of Purneah, on the Mahanuddy river, much frequented by Hindu pilgrims on their route to the places of ablution in the Northern Mountains, from which circumstance it takes its name. Long. 88. 32. E. Lat. 26. 35. N.

SANBALLAT, the chief or governor of the Cuthites or Samaritans, was always a great enemy to the Jews. He was a native of Horon, or Horonaim, a city beyond Jordan, in the country of the Moabites. He lived in the time of Nehemiah, who was his great opponent, and from whose book we learn his history. There is one circumstance related of him which has occasioned some dispute among the learned. When Alexander the Great came into Phœnicia, and sat down before the city of Tyre, Sanballat quitted the interests of Darius king of Persia, and went at the head of eight thousand men to offer his service to Alexander. This prince readily entertained him, and being much solicited by him, gave him leave to erect a temple upon Mount Gerizim, where he constituted his son-in-law Manasseh the high priest. But this story carries with it a flagrant anachronism. For a hundred and twenty years before this, that is, in the year of the world 3550, Sanballat was governor of Samaria; wherefore Dr Prideaux, in his Connexion of the Histories of the Old and New Testament, supposes two Sanballats, and endeavours to reconcile it to truth and probability by showing it to be a mistake of Josephus. This author makes Sanballat to flourish in the time of Darius Codomannus, and to build his temple upon Mount Gerizim by license from Alexander the Great; whereas it was performed by leave from Darius Nothus, in the fifteenth year of his reign. This takes away the difficulty arising from the great age of Sanballat, and brings him to be contemporary with Nehemiah, as the Scripture history requires.

SANCERRE, an arrondissement of the department of the Cher, in France, extending over 209,684 hectares, equal to 737 square miles. It comprehends eight cantons, and seventy-six communes, and in 1836 the inhabitants amounted to 70,907. The capital is the city of the same name, upon an elevation rising from the river Loire. In 1836 it contained 3482 inhabitants, who are chiefly employed in making hats and hosiery, and in working some marble quarries in the neighbourhood. Long. 2. 45. 15. E. Lat. 47. 16. 53. N.

SANCHEZ, François, called in Latin *Sanctius*, was a native of Las Brocas, in Spain, and has been dignified by his own countrymen with the pompous titles of father of the Latin language and doctor of all kinds of letters. He wrote, 1. An excellent treatise entitled Minerva, or *De Causis Linguæ Latinæ*, which was published at Amsterdam in 1714, in 8vo; 2. The Art of Speaking and the Method of translating Authors; 3. Several other learned pieces on grammar. He died in the year 1600, in his seventy-seventh year.

We must be careful to distinguish this author from another François Sanchez, who died at Toulouse in 1632. This last was a Portuguese physician, who settled at Toulouse, and, though a Christian, was born of Jewish parents. He is said to have been a man of genius, and a philosopher. His works have been collected under the title of *Opera Medica*. They were printed at Toulouse in 1636.

SANCHONIATHO, a Phœnician philosopher and historian, who is said to have flourished before the Trojan war, and about the time of Semiramis. Of this most ancient writer the only remains extant are various fragments of cosmogony, and of the history of the gods and first mortals, preserved by Eusebius and Theodoret, both of whom speak of Sanchoniatho as an accurate and faithful historian; and the former adds, that his work, which was translated by Philo-Byblius from the Phœnician into the Greek language, contains many things relating to the history of the Jews which deserve great credit, both because they agree with the Jewish writers, and because the author received these particulars from the annals of Hierombalus, a priest of the god Jao.

Several modern writers of great learning, however, have called in question the very existence of Sanchoniatho, and have contended, with much plausibility, that the fragments which Eusebius adopted as genuine upon the authority of Porphyry, were forged by that author or by the pretended translator Philo, from enmity to the Christians, and that the Pagans might have something to show of equal antiquity with the books of Moses. These opposite opinions have produced a controversy that has filled volumes, and of which our limits would hardly admit of an abstract. We shall therefore in few words state what appears to us to be the truth, and refer such of our readers as are desirous of fuller information to the works of the authors mentioned below.[1]

The controversy respecting Sanchoniatho resolves itself into two questions: First, was there in reality such a writer? and, second, was he of the very remote antiquity which his translator claims for him?

Now that there was really such a writer, and that the fragments preserved by Eusebius are indeed parts of his history, interpolated perhaps by the translator, we are compelled to believe by the following reasons.[2] Eusebius, who admitted them into his work as authentic, was one of the most learned men of his age, and a diligent searcher into antiquity. His conduct at the Nicene council shows, that on every subject he thought for himself, neither biassed by authority on the one side, nor carried over by the rage of innovation on the other. He had better means than any modern writer can have of satisfying himself with respect to the authenticity of a very extraordinary work, which had then but lately been translated into the Greek language, and made generally known; and there is nothing in the work itself, or at least in those parts of it which he has preserved, that could induce a wise and good man to obtrude it upon the public as genuine, had he himself suspected it to be spurious. Too many of the Christian fathers were indeed credulous, and ready to admit the authenticity of writings without duly weighing the merits of their claim; but then such writings were always believed to be favourable to the Christian cause, and inimical to the cause of Paganism. That no man of common sense could suppose the cosmogony of Sanchoniatho favourable to the cause of revealed religion, further proof cannot be requisite than what is furnished by the following extract.

"He supposes, or affirms, that the principles of the universe were a dark and windy air, or a wind made of dark air, and a turbulent evening chaos; and that these things were boundless, and for a long time had no bound or figure.

---

[1] Bochart, Scaliger, Vossius, Cumberland, Dodwell, Stillingfleet, Mosheim's Cudworth, and Warburton.

[2] Of these indeed there are several proofs. Philo makes Sanchoniatho speak of Byblus as the most ancient city of Phœnicia, which, in all probability, it was not. We read in the book of Judges of Berith or Berytus, the city where Sanchoniatho himself lived; but not of Byblus, which was the native city of Philo, and to which he is therefore partial. He makes him likewise talk of the Greeks at a period long before any of the Grecian states were known or probably peopled.

Sanchoniatho.

But when this wind fell in love with his own principles, and a mixture was made, that mixture was called desire or cupid (ποθος).

" This mixture completed, was the beginning of the (κτισεως) making of all things. But that wind did not know its own production; and of this with that wind was begotten *Mot*, which some call *Mua*, others the putrefaction of a watery mixture. And of this came all the seed of this building, and the generation of the universe.

" But there were certain animals which had no sense, out of which were begotten intelligent animals, and were called *Zophesemin*, that is, the spies or overseers of heaven; and were formed alike in the shape of an egg. Thus shone out *Mot*, the sun and the moon, the less and the greater stars.

" And the air shining thoroughly with light, by its fiery influence on the sea and earth, winds were begotten, and clouds and great defluxions of the heavenly waters. And, when all these things first were parted, and were separated from their proper place by the heat of the sun, then all met again in the air, and dashed against one another, and were broken to pieces, whence thunders and lightnings were made; and at the stroke of these thunders the fore-mentioned intelligent animals were awakened, and frighted with the sound, and male and female stirred in the earth and in the sea. This is the generation of animals."

After these things Sanchoniatho goes on to say, " These things are written in the Cosmogony of Taautus, and in his memoirs; and out of the conjectures and surer natural signs which his mind saw, and found out, and wherewith he has enlightened us."

Afterwards declaring the names of the winds north and south, and the rest, he makes this epilogue: " But these first men consecrated the plants shooting out of the earth, and judged them gods, and worshipped them; upon whom they themselves lived, and all their posterity and all before them; to these they made their meat and drink offerings." Then he concludes: " These were the devices of worship, agreeing with the weakness and want of boldness in their minds."

Let us suppose Eusebius to have been as weak and credulous as the darkest monk in the darkest age of Europe, a supposition which no man will make who knows any thing of the writings of that eminent historian, what could he see in this senseless jargon, which even a dreaming monk would think of employing in support of Christianity? Eusebius calls it, and calls it truly, direct atheism; but could he imagine that an ancient system of atheism would contribute so much to make the Pagans of his age admit as divine revelations the books of the Old and New Testaments, that he should be induced to adopt, without examination, an impudent forgery, not two hundred years old, as genuine remains of the most remote antiquity?

If this Phœnician cosmogony be a fabrication of Porphyry, or of the pretended translator, it must surely have been fabricated for some purpose; but it is impossible for us to conceive what purpose either of these writers could have intended to serve by forging a system so extravagantly absurd. Porphyry, though an enemy to the Christians, was not an atheist, and would never have thought of making an atheist of him whom he meant to obtrude upon the world as the rival of Moses. His own principles were those of the Alexandrian Platonists; and had he been the forger of the works which bear the name of Sanchoniatho, instead of the incomprehensible jargon about dark wind, evening chaos, Mot, the overseers of heaven in the shape of an egg, and animation proceeding from the sound of thunder, we should doubtless have been amused with refined speculations concerning the operations of the Demiurgus and the other persons in the Platonic Triad.

Father Simon of the oratory imagines,[1] that the purpose for which the history of Sanchoniatho was forged, was to support Paganism, by taking from it its mythology and allegories, which were perpetually objected to it by the Christian writers. But this learned man totally mistakes the matter. The primitive Christians were too much attached to allegories themselves to rest their objections to Paganism on such a foundation. What they objected to that system was, the immoral stories told of the priests. To this the pagan priests and philosophers replied, that these stories were only mythological allegories, which veiled all the great truths of theology, ethics, and physics. The Christians said this could not be; for that the stories of the gods had a substantial foundation in fact, these gods being only dead men deified, who in life had like passions and infirmities with other mortals. This, then, was the objection which the forger of the works of Sanchoniatho had to remove, if he really forged them in support of Paganism; but instead of doing so he gives the genealogy and history of all the greater gods, and shows that they were men deified after death for the exploits, some of them grossly immoral, which they had performed in this world. We have elsewhere (see POLYTHEISM) given his account of the deification of Chrysos, and Ouranos, and Gé, and Hypsistos, and Muth.; but our readers may not perhaps be ill pleased to accompany him through the history of Ouranos and Kronus, two of his greatest gods; whence it will appear how little his writings are calculated to support the tottering cause of Paganism against the objections which were then urged to it by the Christian apologists.

" Ouranos," says he, " taking the kingdom of his father, married Gé, his sister, and by her had four sons; Ilus, who is called Kronus; Betylus; Dagon, who is Siton, or the god of corn; and Atlas. But by other wives Ouranos had much issue, wherefore Gé, being grieved at it and jealous, reproached Ouranos, so as they parted from each other. But Ouranos, though he parted from her, yet by force invading her, and lying with her when he listed, went away again; and he also attempted to kill the children he had by her. Gé also often defended or avenged herself, gathering auxiliary powers unto her. But when Kronus came to man's age, using Hermes Trismegistus as his counsellor and assistant (for he was his secretary), he opposed his father Ouranos, avenging his mother. But Kronus had children, Persephone and Athena; the former died a virgin, but by the counsel of the latter Athena, and of Hermes, Kronus made of iron a scimitar and a spear. Then Hermes, speaking to the assistants of Kronus with enchanting words, wrought in them a keen desire to fight against Ouranos in the behalf of Gé; and thus Kronus, warring against Ouranos, drove him out of his kingdom, and succeeded him in the imperial power of office. In the fight was taken a well-beloved concubine of Ouranos, big with child. Kronus gave her in marriage to Dagon, and she brought forth at his house what she had in her womb by Ouranos, and called him Demaroon. After these things Kronus builds a wall round about his house, and founds Byblus, the first city in Phœnicia. Afterwards Kronus, suspecting his own brother Atlas, with the advice of Hermes, throwing him into a deep hole of the earth, there buried him, and having a son called Sadid, he despatched him with his own sword, having a suspicion of him, and deprived his own son of life with his own hand. He also cut off the head of his own daughter, so that all the gods were amazed at the mind of Kronus. But in process of time, Ouranos, being in flight, or banishment, sends his daughter Astarte, with two other sisters, Rhea and

---

[1] *Bib. Crit.* vol. i. p. 140.

Dione, to cut off Kronus by deceit, whom Kronus taking, made wives of these sisters. Ouranos, understanding this, sent Eimarmene and Hore, Fate and Beauty, with other auxiliaries, to war against him; but Kronus, having gained the affections of these also, kept them with himself. Moreover, the god Ouranos devised Bætulia, contriving stones that moved as having life. But Kronus begat on Astarte seven daughters called Titanides or Artemides; and he begat on Rhea seven sons, the youngest of whom, as soon as he was born, was consecrated a god. Also by Dione he had daughters, and by Astarte, moreover, two sons, Pothos and Eros, that is, Cupid and Love. But Dagon, after he had found out bread-corn, and the plough, was called Zeus Aratrius. To Sydyc, or the just, one of the Titanides bare Asclepius. Kronus had also in Peræa three sons, first, Kronus, his father's namesake; second, Zeus Belus; and, third, Apollo."

Is it conceivable, that a writer so acute as Porphyry, or indeed that any man of common sense, either in his age or in that of Philo, would forge a book filled with such stories as these, in order to remove the Christian objections to the immoral characters of the Pagan divinities? The very supposition is impossible to be made. Nor let any one imagine that Sanchoniatho is here writing allegorically, and by his tales of Ouranos, and Gé, and Kronus, is only personifying the heaven, the earth, and time. On the contrary, he assures us, that Ouranos, or Epigeus, or Autochthon (for he gives him all these names), was the son of one Eliaun or Hypsistos, who dwelt about Byblus, and that from him the element which is over us was called heaven, on account of its excellent beauty, as the earth was named Gé after his sister and wife. And his translator is very angry[1] with the Neotoric Greeks, as he calls them, because that, "by a great deal of force and straining, they laboured to turn all the stories of the gods into allegories and physical discourses." This proves unanswerably that the author of this book, whoever he was, did not mean to veil the great truths of religion under the cloak of mythological allegories; and therefore, if it was forged by Porphyry in support of Paganism, the forger so far mistook the state of the question between him and his adversaries, that he contrived a book, which, if admitted to be ancient, totally overthrew his own cause.

The next thing to be inquired into with respect to Sanchoniatho is his antiquity. Did he really live and write at so early a period as Porphyry and Philo pretend? We think he did not; and what contributes not a little to confirm us in our opinion, is that mark of national vanity and partiality, common to after-times, in making the sacred mysteries of his own country original, and conveyed from Phœnicia into Egypt. This, however, furnishes an additional proof that Porphyry was not the forger of the work; for he well knew that the mysteries had their origin in Egypt (see MYSTERIES), and would not have fallen into such a blunder. He is guilty, indeed, of a very great anachronism, when he makes Sanchoniatho contemporary with Semiramis, and yet pretends that what he writes of the Jews is compiled from the records of Hierombalus the priest of the god Jao; for Bochart has made it appear in the highest degree probable,[2] that Hierombalus or Jeromb-baal is the Jerub-baal or Gideon of Scripture.

Between the reign of Semiramis and the Trojan war a period elapsed of near eight hundred years, whereas Gideon flourished not above seventy years before the destruction of Troy. But supposing Sanchoniatho to have really consulted the records of Gideon, it by no means follows that he flourished at the same period with that judge of Israel. He speaks of the building of Tyre as an ancient thing, while our best chronologers[3] place it in the time of Gideon. Indeed, were we certain that any writings had been left by that holy man, we should be obliged to conclude, that a large tract of time had intervened between the death of their author and their falling into the hands of Sanchoniatho; for, surely, they could not, in a short period, have been so completely corrupted as to give any countenance to his impious absurdities. His atheistic cosmogony he does not indeed pretend to have got from the annals of the priest of Jao, but from records which were deposited in his own town of Berytus by Thoth, a Phœnician philosopher, who was afterwards made king of Egypt. But surely the annals of Gideon, if written by himself, and preserved pure to the days of Sanchoniatho, must have contained so many truths of the Mosaic religion, as must have prevented any man of sense from adopting so impossible a theory as Thoth's, although sanctioned by the greatest name of profane antiquity. Stillingfleet indeed thinks it most probable that Sanchoniatho became acquainted with the most remarkable passages of the life of Jerub-baal from annals written by a Phœnician pen. He observes, that immediately after the death of Gideon, the Israelites, with their usual proneness to idolatry, worshipped Baal-berith, or the idol of Berytus, the town in which Sanchoniatho lived; and from this circumstance he concludes, that there must have been such an intercourse between the Hebrews and Berytians, that in process of time the latter people might assume to themselves the Jerub-baal of the former, and hand down his actions to posterity as those of a priest instead of a great commander. All this may be true; but if so, it amounts to a demonstration that the antiquity of Sanchoniatho is not so high by many ages as that which is claimed for him by Philo and Porphyry; though he may still be more ancient, as we think Vossius has proved him to be, than any other profane historian whose writings have come down to us either entire or in fragments.

But granting the authenticity of Sanchoniatho's history, what, it may be asked, is the value of his fragments, that we should be at any trouble to ascertain whether they be genuine remains of high antiquity, or the forgeries of a modern impostor? We answer, with the illustrious Stillingfleet, that though these fragments contain such absurdities as it would be a disgrace to reason to suppose credible, though the whole cosmogony is the grossest sink of atheism, and though many persons make a figure in the history, whose very existence may well be doubted; yet we, who have in our hands the light of divine revelation, may in this dungeon discover many excellent relics of ancient tradition, which throw no feeble light upon many passages of holy scripture, as they give us the origin and progress of that idolatry which was so long the opprobrium of human nature. They furnish, too, a complete refutation of the extravagant chronology of the Chaldæans and Egyptians, and show, if they be genuine, that the world is indeed not older than it is said to be by Moses.

SANCOT, a town of Hindustan, in the province of Serinagur, situated in a well-cultivated and fertile country. It is tributary to the Ghoorkali rajah of Nepaul. Many of the inhabitants are affected with tumours in their neck.

SANCROFT, WILLIAM, archbishop of Canterbury, was born at Fresingfield in Suffolk in 1616, and admitted into Emanuel College, Cambridge, in 1633. In 1642 he was elected a fellow; but was ejected from his fellowship for refusing to take the covenant. In 1660 he was chosen one of the university preachers, and in 1663 was nominated to the deanery of York. In 1664 he was installed dean of St Paul's. In this situation he set himself with unwearied diligence to repair the cathedral, till the fire of London in 1666 employed his thoughts on the more noble undertaking of rebuilding it, to which he gave L.1400. He also rebuilt the deanery, and improved its revenue. In 1668 he was admitted archdeacon of Canterbury, upon the king's presentation. In 1677, being now prolocutor of the convocation, he was unexpectedly advanced to the archbishopric of Canterbury. In 1687 he was committed to the Tower, with six other bishops, for presenting a petition to the king against reading the declaration of indulgence. Upon King James II.'s withdrawing himself, he concurred with the lords in a declaration to the Prince of Orange for a free parliament, and due indulgence to the Protestant dissenters. But when that prince and his consort were declared king and queen, his grace refused to take the oath to their majesties, and was suspended and deprived. He lived in a very private manner till his death, which took place in 1693. His learning, integrity, and piety, made him an exalted ornament of the church. He published a volume in 12mo, entitled Modern Politics, taken from Machiavelli and other select authors; and also Familiar Letters to Mr North. Three of his sermons were printed together after his death.

[2] *Geogr. Sac.* p. 2, book ii. lib. ii. cap. xvii.

[3] Scaliger.

SANCTIFICATION, the act of sanctifying, or rendering a thing holy. The reformed divines define sanctification to be an act of God's grace, by which a person's desires and affections are alienated from the world; and by which he is made to die to sin, and to live to righteousness, or, in other words, to feel an abhorrence of all vice, and a love of religion and virtue.

SANCTION, the authority given to a judicial act, by which it becomes legal and authentic.

SANCTORIUS, or SANCTORIO, an ingenious and learned physician, was professor in the university of Padua in the beginning of the seventeenth century. He contrived a kind of statical chair, by means of which, after estimating the aliments received, and the sensible discharges, he was enabled to determine with great exactness the quantity of insensible perspiration, as well as what kind of victuals and drink increased or diminished it. On these experiments he erected a curious system, which he published under the title of *De Medicina Statica*, and which has been translated into English by Dr Quincy. Sanctorius published several other treatises, which showed great abilities and learning.

SANCTUARY, among the Jews, called also *Sanctum Sanctorum*, or Holy of Holies, was the holiest and most retired part of the temple of Jerusalem, in which the ark of the covenant was preserved, and into which none but the high priest was allowed to enter, and that only once a year, to intercede for the people.

Some distinguish the sanctuary from the *Sanctum Sanctorum*, and maintain that the whole temple was called the sanctuary.

To try and examine any thing by the weight of the sanctuary, is to examine it by a just and equal scale; because among the Jews it was the custom of the priests to keep stone weights, to serve as standards for regulating all weights by, though these were not at all different from the royal or profane weights.

SANCTUARY, in the Roman Catholic church, is also used for that part of the church in which the altar is placed, being encompassed with a rail or balustrade.

SANCTUARY, according to our ancient customs, is the same with asylum.

SAND, in *Natural History*, properly denotes small particles of siliceous stones. Sands are subject to be variously blended with different substances, as that of talcs, &c. Hence, as well as from their various colours, they are subdivided into, 1. white sands, whether pure, or mixed with other arenaceous or heterogeneous particles, of all which there are several kinds; 2. the red and reddish sands, both pure and impure; 3. the yellow sands, whether pure or mixed, which are also very numerous; 4. the brown sands, distinguished in the same manner; 5. the black sands, of which there are only two varieties, a fine shining grayish-black sand, and another of a fine shining reddish-black colour; and, 6. the green kind, of which there is only one known species, namely, a coarse variegated dusky green sand, common in Virginia.

Sand is of great use in the glass manufacture; a white kind of sand being employed for making the white glass, and a coarse greenish-looking sand for the green glass. In agriculture it seems to be the office of sand to render unctuous or clayey earths fertile, and fit to support vegetables, by making them more open and loose.

SAND-Stone, a compound stone, of which there are numerous varieties, arising not only from a difference of external appearance, but also from the nature and proportions of the constituent parts. See GEOLOGY and MINERALOGY.

SANDA, a town of Hindustan, in the province of Sinde, situated on the south bank of the Goonee river, which is there a hundred yards broad, on the route from Hyderabad, the capital of Sinde, to Luckput Bunder, and afterwards to Mandavee, on the Gulf of Cutch. Lat. 25. 6. N.

SANDAL, in *Antiquity*, a rich kind of slipper worn on the feet by the Greek and Roman ladies. It was made of gold, silk, or other precious stuff, and consisted of a sole, with an hollow at one extreme to embrace the ancle, but leaving the upper part of the foot bare.

SANDAL is also used for a shoe or a slipper worn by the pope and other Catholic prelates when they officiate. It is likewise the name of a sort of slipper worn by several congregations of reformed monks. This last consists of no more than a mere leathern sole, fastened with latches or buckles, all the rest of the foot being left bare. The Capuchins wear sandals, and the Recollects clogs; the former being of leather, and the latter of wood.

SANDANAH CAPE, the point of the high land that forms the north-eastern end of the island of Java, and the northern entrance of Baly Straits, on the west and north-west side. Long. 114. 35. E. Lat. 7. 46. S.

SANDARLIE, a small place on the western coast of Asia Minor, near the head of a bay called the Gulf of Sandarlie, fifty miles north-north-west of Smyrna.

SANDBACH, a market-town of the county of Chester, in the hundred of Northwich, 162 miles from London. It is situated on a small brook, which runs into the river Dane and into the navigable canal. It has a fine large church with a lofty tower, a good market which is held on Thursday, and is in a district of considerable fertility, celebrated for the excellence of its malt liquor. The population amounted in 1801 to 1844, in 1811 to 2311, in 1821 to 2905, and in 1831 to 3710.

SANDEC, a circle in the Austrian kingdom of Gallicia, extending over 1147 square miles. It contains eight cities, five market-towns, and 386 villages, with 198,750 inhabitants. The capital is the city of New Sandec, situated on the river Dunajec, and contains 490 houses, with 3840 inhabitants.

SANDEL, or SUNDANA, ISLAND, in the Eastern Seas, about eighty miles in length, and from fifteen to thirty-six in breadth. Long. 119. 33. to 120. E. Lat. 9. 35. to 10. 15. S.

SANDELWOOD ISLE, an island in the Eastern Seas, a hundred miles in length by thirty in average breadth. It is situated to the south of the island of Flores, about the tenth degree of north latitude.

SANDEMANIANS, in *Ecclesiastical History*, a sect that originated in Scotland about the year 1728, and was afterwards distinguished by the name of *Glassites*, from its founder Mr John Glass, who was a minister of the established church of that kingdom. Being charged with a design of subverting the national covenant, and sapping the foundation of all national establishments by the kirk judicatory, he was expelled by the synod from the Church of Scotland. But his sentiments are fully explained in a tract published at that time, entitled The Testimony of the King of Martyrs, and preserved in the first volume of his works. In consequence of Mr Glass's expulsion, his adherents formed themselves into churches, conformable in their institution and discipline to what they considered to be the plan of the first churches, as recorded in the New Testament. Soon after the year 1755, Mr Robert Sandeman, an elder in one of these churches in Scotland, published a series of letters addressed to Mr Hervey, occasioned by his Theron and Aspasio, in which he endeavours to show that his notion of faith is contradictory to the Scripture account of it, and could only serve to lead men, professedly holding the doctrines commonly called Calvinistic, to establish their own righteousness upon their inward feelings and various acts of faith. In these letters Mr Sandeman attempts to prove that faith is neither more nor less than a simple assent to the divine testimony concerning Jesus Christ, recorded in the New Testament; and he maintains, that the word faith, or belief, is constantly used by the apostles to signify what is denoted by it in common discourse, namely, a persuasion of the truth of any proposition, and that there is no difference between believing any common testimony and believing the apostolic testimony, except that which results from the nature of the testimony itself. This led the way to a controversy among those who were called Calvinists, concerning the nature of justifying faith; and those who adopted Mr Sandeman's notion of it, and who took the denomination of *Sandemanians*, formed themselves into a church order, in strict fellowship with the churches in Scotland, but holding no kind of communion with other churches. The chief opinions and practices in which this sect differs from other Christians are, their weekly administration of the Lord's Supper; their love-feasts, of which every member is not only allowed but required to partake, and which consists in their dining together in the interval between the morning and afternoon service; their kiss of charity used on this occasion, at the admission of a new member, and at other times when they deem it to be necessary or proper; their weekly collection before the Lord's Supper for the support of the poor, and defraying other expenses; mutual exhortation; abstinence from blood and from things strangled; washing each other's feet, the precept concerning which, as well as other precepts, they understand literally; community of goods, in so far as that every one is to consider all that he has in his possession and power as liable to the calls of the poor and church; and the unlawfulness of laying up treasures on earth, by setting them apart for any distant, future, and uncertain use. They allow of public and private diversions, so far as they are not connected with circumstances really sinful; but apprehending a lot to be sacred, they disapprove of playing at cards, dice, and the like. They maintain a plurality of elders, pastors, or bishops, in each church; and the necessity of the presence of two elders in every act of discipline, and at the administration of the Lord's Supper. In the choice of these elders, want of learning and engagements in trade are not a sufficient objection; but second marriages disqualify for the office; and they are ordained by prayer and fasting, imposition of hands, and giving the right hand of fellowship. In their discipline they follow strictly what they consider to be the rules of Scripture, and think themselves obliged to separate from the communion and worship of all such religious societies as appear to them not to profess the simple truth for their only ground of hope, and who do not walk in obedience to it.

SANDING ISLES, PULO SANDING, or SANDIANG, two small islands, which are both inhabited, and are situated off the south-west coast of Sumatra, near the south-eastern extremity of the Nassau or Poggy Isles, in which group they are sometimes included. They produce the wild nutmeg and some good timber.

SANDOMIR, one of the provinces into which the kingdom of Poland is divided. It extends in north latitude from 50° 25′ to 51° 52′, and in east longitude from 19° 43′ to 21° 52′, consisting of 5590 square miles; and it contains 378,000 inhabitants, mostly adhering to the Catholic church, except the Jews, who form the majority in the towns. It is a level district, situated on the left bank of the Vistula, and bears the best white wheat, which brings the highest price in the markets of Dantzig or of Odessa, to both of which it is sent, as the prices are most favourable. This province provides iron from its mines to the rest of the kingdom. It is divided into four circles, and the capital is Radom.

SANDPU, or SANPOO, the vulgar name of a river in the East Indies, which is one of the largest in the world. It is better known by that of *Brahmaputra*, or *Burrampooter*, to which the reader is referred.

SANDWICH, a town of the county of Kent, in the hundred of Eastry, and lathe of St Augustine, sixty-eight miles from London. It is situated on the river Stour, two miles from its entrance into the sea. It was once accessible by ships, but the sand has nearly choked the passage, though some plans are at present in contemplation to improve it. It is one of the Cinque Ports, and as such, is governed by a corporation composed of a mayor, a recorder, twelve jurats, and twenty-four common-council men, who have jurisdiction over Deal, Fordwich, Ramsgate, Reculver, Sarre, Stower, and Walmer. It was once fortified, and a portion of its walls is still standing. Sandown Castle, a strong fortress within the parish, commands the anchorage of the Downs. It is rather a decayed town, but has a market on Wednesday and Saturday. It returns two members to parliament, and confers on the family of Montague the title of earl. The population amounted in 1801 to 2452, in 1811 to 2735, in 1821 to 2912, and in 1831 to 3136.

SANDWICH, an island in the Eastern Seas, opposite to the island of New Ireland. It is covered with trees, and its general appearance is picturesque and pleasing. Long. of the most westerly point 50. 54. 15. E. Lat. 2. 59. 26. S.

SANDWICH ISLANDS. These islands, which are situated in the Pacific Ocean, are eleven in number. They were discovered by Captain Cook and Captain King in the year 1778, and have been subsequently visited by Vancouver, Meares, Turnbull, and various other navigators. These islands received their name from the Earl of Sandwich, during whose administration they were discovered. In their climate they resemble the West India islands, which lie in the same latitude, although, on the whole, the temperature is more moderate; nor are they subject to the dreadful hurricanes which desolate the West India Islands. The thermometer during the day never rises higher than 88°, but its mean height at noon is about 83°. There is a constant land and sea breeze every night. The vegetable productions differ little from those in the rest of the South Sea islands. The bread-fruit thrives, the sugar-canes are of unusual size, and large vegetable roots are produced, shaped like a yam, and from six to eight pounds in weight, which yield a juice that was found to be an excellent substitute for sugar. These islands are evidently peopled by the same race which is found in the islands of New Zealand, the Society and Friendly Islands, and the Marquesas; a race that possesses, without any intermixture, all the known lands between the latitudes of 47° south and 20° north, and between the longitudes of 184° and 260° east. The natives are in general above the middle size, graceful in all their movements, and capable of bearing great fatigue. They are of a much darker complexion than the Otaheitans, and are altogether an inferior people, though many have fine open countenances, and a number of the women have a sweetness and sensibility which renders them very engaging. They are distinguished from Europeans by one peculiarity, namely, a fulness of the nostril, without any flatness or spreading of the nose. They are praised by Captain King for their mild and affectionate dispositions; yet it is difficult to reconcile such dispositions with the habits of savage life, which are always ferocious and cruel. Humanity, mildness, and all the gentler sympathies of the human heart, are fostered by civilization. They are the result of cultivation, and not the spontaneous produce of the human heart; and, accordingly, they come to no maturity in the adverse soil of barbarism. Besides, they are inferior to the other islanders in that sure test of humanity, namely, respect for women. It has even been suspected, though no positive evidence of the fact has been found, that they are or have been in the practice of eating the bodies of their enemies; and it is well known, that the sacrificing of human victims was commonly practised among them, which is certainly no index of any mildness in their manners; and the same ferocious spirit is indicated by their wearing, as ornaments the most precious and invaluable, which are handed down as a sort of heir-looms in families, the bones of their enemies slain in battle, which are fashioned into various forms. Their natural capacity when they were first visited by Europeans was found to be good; they had made some improvements in agriculture and manufactures; and the eager curiosity with which they attended the armourer's forge, and the many expedients they invented for working the iron procured from Europeans, afforded strong proofs of their docility and their ingenuity. They had, however, all the peculiar customs of the most savage nations, and are still in the practice, along with all the other inhabitants of these islands, notwithstanding the example and exhortations of the missionaries settled among them, of tatooing their bodies, and also their face, which is peculiar to them and to the New Zealanders. The common dress of all ranks of people consists only of a piece of thick cloth ten or twelve inches broad, which they pass between the legs and tie round the waist. They have another dress appropriated to ceremonial occasions, which consists of a feathered cloak and helmet, and which is remarkable for its beauty and magnificence, and is reserved chiefly for persons of high rank. The common people chiefly subsist on fish and vegetables, such as yams, sweet potatoes, tamow, plantains, sugar-canes, and bread. To these the people of a higher rank add the flesh of hogs and dogs, dressed in the same manner as at the Society Islands. They also eat fowls. For further particulars, and a more full account of these islands, see POLYNESIA.

SANDY, a town of Hindustan, in the district of Khyrabad, belonging to the nabob of Oude, situated in a bleak and desolate country, without a tree or a shrub to shade the arid soil. In the vicinity is an extensive lake. Sandy is twenty-five miles south-east from Furruckabad. Long. 70. 58. E. Lat. 27. 18. N.

SANDY DESERT, an extensive tract in Hindustan, so named in the maps, bounded on the south by the province of Cutch, on the east by that of Gujerat, on the west by Sinde, and on the north by Ajmeer. This region is but little known to Europeans; but, from the accounts of those by whom it has been traversed, it does not appear to be such a uniform and barren wilderness as it has been represented, being interspersed with many fertile spots, the seats of petty chiefships or stationary tribes. The most powerful of these chiefs are the Beloochee Kosahs, who settled in the country a good many years ago, and are a race of sanguinary thieves, who infest the district of Parkur, and extend their ravages to the Joudpour territories. They amount to about 12,000. They disown all allegiance to any superior, subsisting by their horses and their swords, and hiring out their services to the different predatory chieftains. The only produce of this tract is a coarse species of grain, which only grows where the sandy soil is a little mixed with clay. Water-melons grow abundantly and in great perfection throughout the whole of this parched region, and furnish a most grateful refreshment. The river Loonee, which comes from Marwar, runs through the Gurrah district, and is said to fall into the Run, which bounds Cutch to the north. The route across this tract of country from Rahdunpore is fifty coss, and is said to be good the whole way. Thirty coss west from Pareenuggur is situated Islamnaggur. The intervening country consists of sand-hills, in traversing which the traveller is exposed to great hardship from the heat, the glare, and the want of water. All over this sandy tract are to be found scattered jungle, and coarse vegetation of different sorts, which supply the cattle with food. Islamnaggur is described as a strong fort, situated in the desert, and destitute of water without the walls. The country north from Parkur, towards Amercote, is called Dhat, and the distance is eighty coss. The country is of the same character as that already described, being composed of sand-hills and jungle, with occasional wells. In many parts there is no cultivation, and the inhabitants subsist on the produce of their numerous flocks of cattle, and camels. The natives are described as pacifically inclined, possessing few horses, and armed with swords only. It was in this tract that the army of the celebrated Mahmoud of Ghizni was nearly lost.

SANDY ISLAND, a small island near the west coast of Sumatra. Long. 100. 18. E. Lat. 1. 50. S. It is another in the Eastern Seas. Long. 112. 48. E. Lat. 10. 40. N. Also a small island in the Chinese Sea, near the coast of Cochin China. Long. 109. 12. E. Lat. 12. 28. N.

SANDYS, SIR EDWIN, second son of Dr Edwin Sandys, archbishop of York, was born about 1561, and educated at Oxford under Mr Richard Hooker, author of the Ecclesiastical Polity. In 1581 he was collated to a prebend in the cathedral of York. He travelled into foreign countries; and, upon his return, became famous for learning, prudence, and virtue. While he was at Paris, he drew up a tract, published under the title of *Europæ Speculum*. In 1602, he resigned his prebend; and the year following he was knighted by King James I., who employed him in several important affairs. He was dexterous in any great employment, and a good friend and patriot. Opposing the court, however, with vigour in the parliament in 1621, he, with Mr Selden, was committed to custody for a month. He died in 1629, having bequeathed L.1500 to the university of Oxford, for the endowment of a metaphysical lecture.

SANDYS, *George*, brother of Sir Edwin, and youngest son of Archbishop Sandys, was born in 1577. He was a very accomplished man, travelled over several parts of Europe and the East, and published a relation of his journey in folio in 1615. He made an elegant translation of Ovid's Metamorphoses; and composed some poetical pieces of his own, which were greatly admired at the time in which they were written. He also paraphrased the Psalms; and has left behind him a translation, with notes, of one Sacred Drama, written originally by Grotius, under the title of *Christus Patiens*, on which, with *Adamus Exul*, and *Masenius*, is founded Lauder's impudent charge of plagiarism against Milton. Our author became one of the privy chamber to Charles I., and died in 1643.

SANGA, a regularly-built seaport of Japan, in the island of Ximo, with wide streets, and defended by a citadel. It is forty miles north-east of Nangasaki.

SANGAMSERE, a small town of Hindustan, in the province of Bejapore, and district of the Concan, situated on the banks of the Jaigur river. Long. 73. 15. E. Lat. 17. 11. N.

SANGANEER, a town of Hindustan, in the province of Ajmeer, and district of Kotah, fortified by a strong stone-wall and ditch, and garrisoned by the troops of the rajah of Kotah. It is situated on the Upper Chumbul river.

SANGAR, a town of Hindustan, in the province of

Malwah, situated on a plain surrounded by a range of low hills. Long. 78. 50. E. Lat. 23. 50. N.

SANGARA, a town of Hindustan, in the province of Nandere, belonging to the nizam. It is situated at the junction of the Manzora with the river Godavery, forty-three miles from the town of Nandere. Long. 78. 12. E. Lat. 18. 49. N.

SANGBARAH, a town of Hindustan, tributary to the Mahrattas, in the province of Gujerat, 112 miles north-west from Ahmedabad. Long. 74. 13. E. Lat. 23. 37. N.

SANGIR, an island in the Eastern Seas, thirty miles in length by ten in average breadth. It is high land, well wooded, and the coast has better harbours, and is less dangerous from hidden rocks and shoals, than most of the eastern islands. The country is populous, and affords refreshments of various kinds to ships, such as bullocks, hogs, goats, and poultry. Cocoa-nut oil is exported, and spices are also procured. About the middle of the west coast of the island is the town, bay, and harbour of Taroona. This island was formerly under the dominion of the Dutch, who had a small garrison here. It is situated between the 3d and 4th degrees of north latitude, and the 125th and 126th degrees of east longitude. The population is estimated at 12,000.

SANGUR, a town and fortress of Hindustan, in the province of Allahabad, and district of Bundelcund. It is tributary to the Mahrattas. It is a hundred miles south-west from Chatterpoor. Long. 78. 50. E. Lat. 23. 50. N.

SANHEDRIM, or SANHEDRIN, from the Greek word *Συνεδριον*, which signifies a council or assembly of persons sitting together, was the name by which the Jews called the great council of the nation, assembled in an apartment of the temple of Jerusalem to determine the most important affairs of their church and state. This council consisted of seventy senators. The room they met in was a rotunda, half of which was built without the temple, and half within; that is, one semicircle was within the compass of the temple, the other semicircle was built without, for the senators to sit in, it being unlawful for any one to sit down in the temple. The Nasi, or prince of the sanhedrim, sat upon a throne at the end of the hall, having his deputy at his right hand, and his sub-deputy at his left. The other senators were ranged in order on each side.

The rabbin pretend, that the sanhedrim has always subsisted in their nation from the time of Moses down to the destruction of the temple by the Romans. They date the establishment of it from what happened in the wilderness, some time after the people departed from Sinai, in the year of the world 2514. Moses, being discouraged by the continual murmurings of the Israelites, addressed himself to God, and desired to be relieved at least from some part of the burden of the government. Then the Lord said to him, "Gather unto me seventy men of the elders of Israel, whom thou knowest to be the elders of the people, and officers over them; and bring them unto the tabernacle of the congregation, that they may stand there with thee: And I will come down and talk with thee there; and I will take of the spirit which is upon thee, and will put it upon them; and they shall bear the burden of the people with thee, that thou bear it not thyself alone." The Lord, therefore, poured out his spirit upon these men, who began at that time to prophesy, and have not ceased ever since. The sanhedrim was composed of seventy counsellors, or rather seventy-two, being six out of each tribe; and Moses, as president, made up the number to seventy-three. To prove the uninterrupted succession of the judges of the sanhedrim, there is nothing unattempted by the partisans of this opinion. They find a proof where others cannot so much as perceive any appearance or shadow of it. Grotius may be consulted in many places of his commentaries, and in his first book *De jure belli et pacis* (c. iii. art. 20), and Selden *De Synedriis veterum Hebræorum;* also Calmet's Dissertation concerning the Polity of the ancient Hebrews, printed before his Commentary upon the Book of Numbers.

As to the personal qualifications of the judges of this bench, their birth was to be untainted. They were often taken from the race of the priests or Levites, or out of the number of the inferior judges, or from the lesser sanhedrim, which consisted only of twenty-three judges. They were to be skilful in the law, as well traditional as written. They were obliged to study magic, divination, fortune-telling, physic, astrology, arithmetic, and languages. The Jews say they were to know to the number of seventy tongues; that is, they were to know all the tongues, for the Hebrews acknowledged but seventy in all, and perhaps this is too great a number. Eunuchs were excluded from the sanhedrim because of their cruelty, usurers, decrepid persons, players at games of chance, such as had any bodily deformities, those that had brought up pigeons to decoy others to their pigeon-houses, and those that made a gain of their fruits in the sabbatical year. Some also exclude the high priest and the king, because of their power; but others will have it that the kings always presided in the sanhedrim whilst there were any kings in Israel. Lastly, it was required that the members of the sanhedrim should be of a mature age, of a handsome person, and of considerable fortune. We speak now according to the notions of the rabbin, without pretending to warrant their opinions.

The authority of the great sanhedrim was very extensive. This council decided such causes as were brought before it by way of appeal from the inferior courts. The king, the high priest, and the prophets, were under its jurisdiction. If the king offended against the law, for example, if he married above eighteen wives, if he kept too many horses, if he hoarded up too much gold and silver, the sanhedrim had him stripped and whipped in their presence. But whipping, they say, among the Hebrews was not at all ignominious; and the king bore this correction by way of penance, and himself made choice of the person that was to exercise this discipline over him. The general affairs of the nation were also brought before the sanhedrim. The right of judging in capital cases belonged to this court, and the sentence could not be pronounced in any other place, but in the hall called *Laschat-haggazith*, or the *hall paved with stones*, supposed by some to be the *Λιθοστρωτος*, or pavement, mentioned in John xix. 13. Hence it came to pass, that the Jews were forced to quit this hall when the power of life and death was taken out of their hands, forty years before the destruction of their temple, and three years before the death of Jesus Christ. In the time of Moses this council was held at the door of the tabernacle of the testimony. As soon as the people were in possession of the land of promise, the sandhedrim followed the tabernacle. It was kept successively at Gilgal, at Shiloh, at Kirjath-jearim, at Nob, at Gibeon in the house of Obed-edom; and, lastly, it was settled at Jerusalem until the Babylonish captivity. During the captivity it was kept up at Babylon. After the return from Babylon, it continued at Jerusalem until the time of the Sicarii or Assassins. Then finding that these profligate wretches, whose number increased every day, sometimes escaped punishment by favour of the president or judges, it was removed to Hanoth, which were certain abodes situated, as the rabbin tell us, upon the mountain of the temple. From thence they came down into the city of Jerusalem, withdrawing themselves by degrees from the temple. Afterwards they removed to Jamia, thence to Jericho, to Uzzah, to Sepharvaim, to Bethsanim, to Sephoris, last of all to Tiberias, where they continued till the time of their utter extinction. And this is the account the Jews themselves give us of the sanhedrim.

But the learned do not agree with them in all this. Father Petau fixes the beginning of the sanhedrim not till Gabinius was governor of Judæa, who, according to Josephus, erected tribunals in the five principal cities of Judæa; at Jerusalem, at Gadara, at Amathus, at Jericho, and at Sephora or Sephoris, a city of Galilee. Grotius places the origin of the sanhedrim under Moses, as the rabbin do; but he makes it terminate at the beginning of Herod's reign. Mr Basnage at first thought that the sanhedrim began under Gabinius; but afterwards he places it under Judas Maccabæus, or under his brother Jonathan. We see, indeed, under Jonathan Maccabæus, in the year 3860, that the senate along with the high priest sent an embassy to the Romans. The rabbin say, that Alexander Jannæus, king of the Jews, of the race of the Asmonæans, appeared before the sanhedrim, and claimed a right of sitting there, whether the senators would or not. Josephus informs us, that when Herod was but yet governor of Galilee, he was summoned before the senate, where he appeared. It must be therefore acknowledged that the sanhedrim was in being before the reign of Herod. It was in being afterwards, as we find from the Gospel and from the Acts. Jesus Christ in St Matthew (v. 22) distinguishes two tribunals. "Whosoever is angry with his brother without a cause shall be in danger of the judgment;" this, they say, is the tribunal of the twenty-three judges. "And whosoever shall say to his brother Raca, shall be in danger of the council;" that is, of the great sanhedrim, which had the right of life and death, at least generally, and before this right was taken away by the Romans. Some think that the jurisdiction of the council of twenty-three extended to life and death also; but it is certain that the sanhedrim was superior to this council.[1]

From all this it may be concluded, that the origin of the sanhedrim is involved in uncertainty; for the council of the seventy elders established by Moses was not what the Hebrews understand by the name of sanhedrim. Besides, we cannot perceive that this establishment subsisted either under Joshua, the judges, or the kings. We find nothing of it after the captivity till the time of Jonathan Maccabæus. The tribunals erected by Gabinius were very different from the sanhedrim, which was the supreme court of judicature, and fixed at Jerusalem, whereas Gabinins established five at five different cities. Lastly, it is certain that this senate was in being in the time of Jesus Christ; but the Jews themselves inform us that they had then no longer the power of life and death (John, xviii. 31).

SANJORE, a Rajpoot town of Hindustan, in the province of Ajmeer and district of Saroway, situated on the east side of the river Bah, 115 miles west-south-west from Odeypoor. It is surrounded with the Beloochee plunderers, so that the road to it is impassable without a large escort. It is subject to the rajah of Joudpoor, who keeps a garrison stationed in it. It is 115 miles west-south-west from Odeypoor. Long. 72. 16. E. Lat. 25. 3. N.

SANKAN, a town of Arabia, in the province of Yemen, near the coast of the Red Sea, thirty-five miles north-north-west of Abu-Arisch.

SANNAZARIUS, JAMES, a celebrated Latin and Italian poet, born at Naples in 1458. He by his wit ingratiated himself into the favour of King Frederick; and when that prince was dethroned, he attended him into France, where he staid with him until his death, which happened in 1504. Sannazarius then returned into Italy, where he applied himself to polite literature, particularly to Latin and Italian poetry. His gay and facetious humour made him be sought for by all companies; but he was so afflicted at the news that Phillibert prince of Orange, general of the emperor's army, had demolished his country-house, that it threw him into an illness, of which he died in the year 1530. It is said that, being informed a few days before his death, that the Prince of Orange was killed in battle, he called out, "I shall die contented, since Mars has punished this barbarous enemy of the Muses." He wrote a great number of Italian and Latin poems. Among those in Latin, his *De Partu Virginis* and Eclogues are chiefly esteemed; and the most celebrated of his Italian pieces is his *Arcadia*.

SANOK, a circle of the Austrian kingdom of Gallicia, extending over 2151 square miles, containing ten cities, ten market-towns, and 431 villages, with 230,600 inhabitants. The capital is the city of the same name, situated on the river San. It is a poor place, with but little trade, containing a castle, and 220 houses, with 1640 inhabitants. Long. 22. 7. E. Lat. 49. 31. 5. N.

SANQUHAR, a royal burgh in Scotland, on the left bank of the Nith, between the counties of Dumfries and Ayr. The town most probably owes its origin to a castle of some note, the ruins of which are still extant, on a high bank overlooking the river Nith. This castle was the chief residence of the Queensberry family, before William, the first duke, built the noble mansion of Drumlanrig. It is a place of little trade. The population in 1831 was 1527. It is one of the district of burghs which jointly with Dumfries sends a member to parliament.

SANTA CATALINA, one of the Solomon Islands, in long. 162. 31. 30. E. and lat. 10. 53. 50. S.

SANTA CATHARINA, a province of Brazil, comprehending the island of the same name, and a territory of sixty leagues in length from north to south on the neighbouring continent, reckoning from the Sahy Grande, which separates it from St Paulo on the north, to the Mampituba, which divides it from Rio Grande on the south. On the west, the heads of the Cordillera divide it from the same provinces, its greatest width not exceeding twenty leagues. The above limits include a territory extending from 25° 50′ to 29° 20′ of south latitude. On the continent, four miles south-east of the capital, stands the town of San Jose, the inhabitants of which are principally occupied in sawing timber into planks, making bricks, and growing rice. To the north of this town the shores are studded with houses, pleasantly situated amid bananarias, orangeries, and plantations of rice, coffee, and mandioca. Nine leagues from San Jose is the village of Armaçao, situated at the extremity of the Bay of St Miguel. It is a fishing station for whales, which were formerly very numerous on the coast, and in the bays that indent it. The conveniencies for the manufacture of oil are extensive and well contrived, and all the fish on the coast are brought to this quarter. Beyond the point of Armaçao is that of Dos Ganchos, forming the southern extremity of the spacious Bay of Tejuco or Tejucas, into which a river of the same name, fifty fathoms wide, discharges itself. Ten leagues north of this place is the fine capacious harbour of Guaroupas, with its handsome town. Further northward is the Bay of St Francisco, in which there is an island with a town, both of the same name. The harbour is fine, and has three entrances, defended by forts. Ship-building is carried on at this place to some extent; the cutting of the fine timber in the neighbourhood, and other labours connected with this art, being the chief occupation of the inhabitants, who may amount to about two thousand. The largest continental town in the province is Laguna, prettily situated upon the eastern margin of the lake from which it derives its name, two miles from the bar, and sixty miles south of Desterro. In the months of November, and December particularly, a prodigious quantity of a long fish, with a forked tail, called *bagre*, enter the lake, supplying a lucrative branch of commerce. This place contains four thousand inhabitants. Fifteen miles north of Laguna is Villa Nova, or Santa Anna, situated on an elevation near the northern extremity of the same lake. More flax is manufactured here than in any other part of the province. The other towns or villages of Santa Catharina are small and of little importance. In 1812 the population, according to Cazal, was 31,530; but it has greatly increased. The province is divided into seven parishes, three of which are situated on the island of Santa Catharina, and four on the continent. The whole are included within the see of Rio de Janeiro. For a description of the island of Santa Catharina, see the article CATHERINE, ST.

---

[1] See also Mark, xiii. 9, xiv. 55, xv. 1; Luke, xxii. 52, 66; John, xi. 47; Acts, iv. 15, v. 21; where mention is made of the synedrion or sannedrim.

SANTA CRUZ, or *St Croix*, a small and unhealthy island, situated in about sixty-four degrees west longitude and eighteen north latitude. In 1643 it was inhabited by the Dutch and the English, who soon became enemies to each other; and in 1650 they were both driven out by twelve hundred Spaniards, who arrived there in five ships. The triumph of these lasted but a few months. The remains of that numerous body, which were left for the defence of the island, surrendered without resistance to a hundred and sixty French, who had embarked, in the year 1651, from St Christopher's, to make themselves masters of the island. It continued without inhabitants and without cultivation till 1733, when it was sold by France to Denmark for L.30,750. Soon afterwards the Danes built there the fortress of Christianstadt. It was then that this northern power seemed likely to take deep root in America; but, unfortunately, she laid her plantations under the yoke of exclusive privileges. Industrious people of all sects, particularly Moravians, strove in vain to overcome this great difficulty. Many attempts were made to reconcile the interests of the colonists and their oppressors, but without success. The two parties kept up a continual struggle of animosity, and not of industry. At length the government purchased, in 1754, the privileges and effects of the company. The price was fixed at L.412,500; and the navigation of the islands opened to all the subjects of the Danish dominions. It is the most valuable of the Danish possessions in the West Indies. The soil is fertile and well cultivated, and the principal productions are sugar, rum, and coffee. It is about eighty-one square miles in extent, and contains about 37,000 inhabitants, of whom 3000 are whites, 1200 free blacks and mulattoes, and the remainder slaves.

SANTA CRUZ, a small island among the Philippines, near the south coast of Luzon. Long. 121. 52. E. Lat. 13. 42. N. Also an island near the south-west coast of Mindanao. Long. 122. 12. E. Lat. 6. 40. N.

SANTA FE, a city of Spain, on the plains of Granada, and in the province of Andalusia. When, under Ferdinand and Isabella, the court of Spain determined to reduce to the Christian dominion the last refuge of the Moors in the city of Granada, as the siege was likely to be very protracted, this city was founded near it, as the head-quarters of the Catholic forces. It is in a fine situation, surrounded by the best cultivation, and enjoying the best soil in Spain, perhaps in the world; and its powers of irrigation are always greater in proportion to the heat of the weather, as the waters are supplied from the melting of the snows on the summit of the Sierra Nevada. This city has been frequently injured by earthquakes, which have at times almost destroyed its edifices. One in 1807 was especially destructive; but, from the richness of the soil, it has speedily risen from its ruins, and been as flourishing as before the visitation. It is said that a narrow strip of land, extending the whole distance across the plain, and on one part of which this city is built, is periodically subject to this calamity, which, however the inhabitants may dread it, has not power to drive them from it. Near to this place is the residence and estate granted by the Spanish government to the Duke of Wellington for his services during the war. It is called the Sota de Roma, and is finely situated.

SANTA FE DE BOGOTA, a town of South America, and capital of New Granada, is situated at the foot of a steep mountain, at the entrance of a vast plain. It is the residence of a viceroy and an archbishop, and the seat of an audiencia and a university, and contains magnificent houses, five bridges, and thirty thousand inhabitants. The air is constantly temperate. The wheat of Europe and the sesame of Asia produce abundant crops, and at all seasons. The plateau on which the town of Santa Fe de Bogota is situated bears a resemblance in several respects to that which encloses the Mexican lakes. They are both more elevated than the convent of St Bernard, the former being 8190, the latter 7008 feet above the level of the sea. Long. 74. 10. W. Lat. 4. 35. N.

SANTANDER, a city of Spain, in the province of Old Castille. It is situated on the northern coast, on the Bay of Biscay, and is one of the best ports on that shore. It carries on considerable commerce in fine wools, and imports large quantities of the salted fish of Newfoundland. The commerce with the interior has induced the construction of a good road to Reynosa, in spite of the rocks and quagmires which intervene. It is the see of a bishop, and has an ancient cathedral and several richly adorned churches. It is in north latitude 43. 28. 20. and west longitude 3. 5. 6. from London. It contains 10,000 inhabitants, one sugar refinery, some breweries, founderies, a royal one for anchors, and several tanneries.

SANTAREM, a city of Portugal, in the province of Estremadura. It is situated on a hill, which is washed by the river Tagus, and from it, such is the gradual declivity of the country, that the towers of Lisbon, though at fifty miles distance, are visible through the translucent atmosphere. The prospects from the heights above the city, either up or down the river, are enchanting. The place contains about eight thousand inhabitants, who, with the exception of a numerous body of ecclesiastics, are by no means rich. The number of churches and other religious houses is out of all proportion to the number of the inhabitants, there being thirteen churches and fourteen convents, besides places for divine worship in several of the hospitals. Great part of the town is in ruins; and though no place may be kept clean at less expense, it is excessively filthy, both in its streets and its houses. Some parts of the country about the city are highly fertile, and yield abundant crops of grapes, olives, maize, and some wheat. It was long the station of a part of the British army during the late contest, and it was several times occupied by the French.

SANTEUIL, or **SANTEUL, JEAN BAPTISTE DE**, an excellent Latin poet, was born at Paris in the year 1630. Having finished his studies, he applied himself entirely to poetry, and celebrated in his verse the praises of several great men, by which he acquired universal applause. He enriched Paris with a great number of inscriptions, which are to be seen on the public fountains and the monuments consecrated to posterity. At length, some new hymns being to be composed for the Breviary of Paris, Claud Santeuil his brother, and M. Bossuet, persuaded him to undertake that work; and he succeeded in it with the greatest applause. On this the order of Clugny having desired him to compose some for their Breviary, he complied with their request; and that order, out of gratitude, granted him letters of filiation, with an annual pension. Santeuil was caressed by all the learned men of his time, and had as his admirers the two princes of Condé, father and son, from whom he frequently received favours. Louis XIV. also gave him a proof of his esteem, by bestowing upon him a pension. He attended the Duke of Bourbon to Dijon, when that prince went thither in order to hold the states of Burgundy, and died there in 1697, as he was preparing to return to Paris. Besides his Latin hymns, he wrote a great number of Latin poems, which have all the marks of genius discoverable in the works of true poets.

SANTIAGO, a large city of Spain, in the province of

Galicia, of which it is the capital. It is about six leagues from the sea, on a little river not navigable, called the Sar, which unites with another called the Sancta, and then flows into the Ulla, and joins the river Arosa, which has at its entrance to the ocean some secure harbours for small vessels. This is an archiepiscopal city, and is one of the most richly endowed of all the cathedrals of the kingdom. In former times this church was the resort of pilgrims from every part of Spain, and a great part of the rest of Europe. The votive offerings have therefore been prodigious, and though the veneration for the shrine of St Iago has been on the decline for many years, yet the accumulation of past periods now serves to keep in idleness, if not in profligacy, a great number of ecclesiastics. The city contains a university of considerable celebrity, a very large and well-regulated hospital, and several smaller ones, besides other sumptuous public edifices. It contains about 25,000 inhabitants, the greater part of whom depend on the religious houses, especially some thousands of poor, who are not disposed to work, because the donations in food and in money from the different pious establishments are sufficient to keep them alive, and allow them to indulge in their habitual indolence. There are indeed some few manufactories of linens, laces, and tapes; they languish, however, and give employment but to very few. The surrounding country is cold and sterile, and therefore the donations of the pious are expended in obtaining necessaries from the more distant parts of the province.

Santiago, or *St Jago*, the capital of the republic of Chili, in South America, is delightfully situated in an extensive plain on the southern shore of the river Mapocho, on each side of which large mounds of stone have been raised as a security against inundation. On the opposite side of the river lie the suburbs of Chimba, Cannadilla, and Renca, which are connected with the city by means of a beautiful bridge. The streets are straight, wide, well paved, and cross each other at right angles, which divides the city into quadras or solid squares. Water is conveyed from the river by means of aqueducts, which not only supply the inhabitants, but, running through the streets, keep the town very clean. The houses are flat-roofed, of one story, and, being white-washed, give the town a very gay appearance. They are built in a quadrangular form, and all the rooms may be entered from a square court in the middle, or from doors of communication from one to the other. The entrance from the street is by a broad porch, on either side of which are stables, &c. The great square is 450 feet on each side, in the middle of which there is a fine bronze fountain. The north side is occupied by the directorial palace, a splendid building, having the city prison under the same roof. On the western side are the cathedral, and a mean-looking palace of the bishop. The most remarkable edifices are the cathedral, the church of St Dominick, the great college, which formerly belonged to the Jesuits, and the town-hall. The mint is situated in an obscure part of the town. Being the centre of the commerce of Chili, it abounds with all sorts of provisions, which are very cheap. The inhabitants are gay, hospitable, more inclined to hold intercourse with strangers, and less bigoted, than their countrymen generally are. The population is about 45,000. It is thirty leagues distant from the Pacific Ocean, seven from the Andes, and fifty-five miles east-south-east from the port of Valparaiso. Long. 70. 44. W. Lat. 33. 26. S.

SANTIPONTE, or Santiponce, a town of Spain, in the division of Andalusia and government of Seville, about five miles from that city, situated on the right bank of the river Guadiana. It is celebrated for its antiquity, having been the seat of the old Roman Italica, the city of which the Emperor Trajan was a native. The remains of Roman magnificence still visible prove it to have been a place of considerable importance. The most remarkable object is the amphitheatre, which, though in ruins, still shows its dimensions and the plan of its original construction. It is formed of Roman bricks for the foundation, and stone benches of ten rows rising one above the other, so as to seat conveniently ten thousand spectators. The ruins of the ancient city are scattered over the fields near the amphitheatre, and abundance of coins and inscriptions are to be found. A beautiful tessellated pavement, lately discovered, has upon it figures which represent the Muses and the signs of the zodiac, the outlines of which are correct, and the colours fresh and brilliant. There is, or was till lately, a rich convent of St Jerome, with many hospitable monks. A very large fair is annually held at this place, and the church of the monastery has several exquisite paintings.

SANTIPORE, a town of Bengal, in the district of Kishenagur, situated on a sandy soil, two miles east of the Bhagurutty river. Long. 28. 34. E. Lat. 23. 13. N.

SANTORIN, one of the Greek islands in the Ægean Sea, and among the richest and best peopled of their number. It is about seventy-eight square miles in extent. Its appearance is that of a mountain perpendicularly cut downwards from the sea, composed of various volcanic matters, such as basalt, puzzolana, and pumice. The surface is much covered with the latter substance in almost every part, but mixed with good vegetable mould. This soil is peculiarly adapted to the growth of wine, of which a vast quantity is made, and forms the chief drink, as there is little and in many parts no good water, but rain that is preserved. Some barley is grown, but far short of what is consumed. There are some figs, almonds, and pulse, and a little cotton wool, raised. The inhabitants amount to twelve thousand, all Greeks, some adhering to the Greek religion, but some are Catholics, and each sect has its own bishop. There are five small towns and several villages. The capital is on the east side, and called Emporia. Long. 26. 15. E. Lat. 36. 21. N.

SANTUR, a Turkish stringed instrument, resembling that kind of German psaltery which is especially used in Hungary in the dances of the common people.

SAONE, a considerable river of France, which has its source in the Vosges, near Darney, and falls into the Rhone at Lyons.

Saone, Upper, a department of France, formed out of a part of the ancient province of High Burgundy, or Franche Comté. It is bounded on the north by the Upper Marne and the Vosges, on the east by the Upper Rhine, on the south by the Doubs and the Jura, and on the west by the Côte d'Or and the Upper Marne. It extends, according to the *Statistique de la France*, over 530,990 hectares, equal to 1867 square miles, and is divided into three arrondissements, twenty-eight cantons, and 651 communes, with a population of 343,298 persons. The chief river is that from which the name is taken, which rises in the Vosges, and is navigable for only a short portion of its course through this department. The other rivers are the Oignon, the Drageon, the Amance, the Auterne, the Saolon, and the Branchin. The surface consists of mountains, hills, and valleys. A spur from the Vosges Mountains enters the eastern side of the department, but to the south-west it is quite level. The soil for the most part consists of clay, and is very stony; but much of it is fertile, and a great part covered with woods. Although the husbandry is conducted in a slovenly manner, yet it yields sufficient corn for the consumption, and more of wheat than of rye. There are abundance of good meadows which afford pasturage for cows, and the dairies produce excellent butter. Fruit is plentiful, especially walnuts, from which much valuable oil is extracted. The vine is extensively cultivated, the vineyards occupying about 20,000 acres, which enables the inhabitants to export some wine. There are mines of iron and of coal at work, which afford employment to many hands. Much of the iron is converted near the mines into the heavier hardware articles. There are some manufactures produced, but the establishments are upon a small scale, furnishing tiles, glass, paper, and liqueurs. There is also some trade in timber, and in pot and pearl ashes, from the more wooded divisions of the department.

Saone and Loire, a department of France, formed out of some portions of the ancient duchy of Burgundy, then distinguished as the Autunois, the Charollais, and the Chalonnais. It is bounded on the north by the departments of the Nievre and the Côte d'Or; on the east by that of Jura; on the south by those of the Aine, the Rhone, and the Loire; and on the west by the Allier and the Nievre. It extends over 856,472 hectares, which are equal to 3009 square miles, is divided into five arrondissements, forty-eight cantons, and 592 communes, and in 1836 it contained a population of 538,507 persons. Its inhabitants have increased since the peace at a far greater rate than the other parts of France, having been in 1818 only 470,085. The chief rivers are the two which confer their names on the department, but there are others of great value, such as the Doubs, the Arroux, the Seille, and the Garonne. It is favoured, too, by the Canal of Digoin, and the Central Canal, which commences at Digoin, and terminates in the Saone at Chalons. The surface is covered with hills, some of which are 2400 feet in height, with rich valleys between them. The soil, upon the whole, is highly fruitful, though in parts chalky, stony, or sandy. The strip from Chalons to Maçon, along the Loire, is one of the finest in France, consisting, on one side of the river, of extensive rich natural meadows, and on the other of gentle acclivities covered with corn and vines. The agriculture has been much increased by bringing into cultivation large portions of land before covered with woods. There are some mines of iron and coal, but their product is not large. There are some manufactures, chiefly for home consumption. The trade consists chiefly in exporting the fruits of the soil, especially corn, wine, hay, wool, and some timber and coal. The capital of the department is the city of Maçon, which in 1836 contained 11,944 inhabitants.

SAP, the juice found in vegetables. See Vegetable Physiology.

Sap, in sieges, is a trench, or an approach made under cover, of ten or twelve feet in breadth, when the besiegers come near the place, and the fire from the garrison grows so dangerous that they are not able to approach uncovered. There are several sorts of saps; the single, which has only a single parapet; the double, having one on each side; and the flying, made with gabions. In all saps traverses are left to cover the men.

SAPAROUA, one of the Amboyna Isles, about twenty miles in circumference. It formerly yielded to the Dutch East India Company one half of the cloves exported from the Amboyna government.

SAPATA, a small island in the Eastern Seas, elevated and barren, and white like the cliffs of Dover, with innumerable flocks of sea-fowl screaming over it. Long 109. 10. E. Lat. 10. 4. N.

SAPPAN, a river in the peninsula of Malacca, which falls into the straits, in long. 101. 47. E. and lat. 2. 37. N.

SAPPERS are soldiers belonging to the royal artillery, whose business is to work at the saps. A brigade of sappers generally consists of eight men, divided equally into parties; and whilst one of these is advancing the sap, the other is furnishing the gabions, fascines, and other necessary implements. They relieve each other alternately.

SAPPHIRA was the wife of a rich merchant in Gueldres, and equally distinguished for her beauty and her virtue. Rhinsauld, a German officer, and governor of the town of Gueldres, fell in love with her; and not being able, either by promises or presents, to seduce her, he imprisoned her husband, pretending that he kept up a traitorous correspondence with the enemies of the state. Sapphira yielded to the passion of the governor in order to relieve her husband from chains; but private orders had already been given to put him to death. His unhappy widow, overwhelmed with grief, complained to Charles duke of Burgundy. He ordered Rhinsauld to marry her, after having made over to her all his possessions; and as soon as the deed was signed, and the marriage over, Charles commanded him to be put to death. Thus the children of a wife whom he had seduced, and of a husband whom he had murdered, became lawful heirs to all his wealth.

SAPPHO, a celebrated poetess of antiquity, who for her excellence in the art has been called the *Tenth Muse*, was born at Mitylene, in the isle of Lesbos, about 610 years before Christ. She was contemporary with Stesichorus and Alcæus.

Of her numerous poems there is nothing remaining but some small fragments, which the ancient scholiasts have cited; a hymn to Venus, preserved by Dionysius of Halicarnassus; and an ode.

Ovid introduces her as making a sacrifice to Phaon, one of her paramours. She fell desperately in love with Phaon, and did all she could to win him, but in vain; upon which she threw herself headlong from a rock, and died. The Mitylenians held her in such high esteem that they paid her sovereign honours after her death, and stamped their money with her image. The Romans erected a noble statue of porphyry to her; and the ancients as well as moderns have done honour to her memory. Vossius says that none of the Greek poets excelled Sappho for sweetness of verse; and that she made Archilochus the model of her style, but at the same time took care to soften the severity of his expression. It must be granted, from what is left us of Sappho, that Longinus had great reason to extol the admirable genius of this woman; for there is in what remains something delicate, harmonious, and impassioned to the last degree.

SAPY Straits. These are between the east end of the island Sumbawa, and the west side of Commodo or Rotten Island. The southern entrance is in long. 119. 20. E. and lat. 8. 40. S. Numerous small islands are found in this strait, which by contracting, increase the rapidity of the current, and render navigation dangerous.

SARABAND, in Spanish *zarabanda*, a Spanish dance in $\frac{3}{4}$ time, formerly danced with castanets. The movement is rather slow. In the music of Corelli and other old masters, sarabands are of frequent occurrence.

SARABAT, a considerable river of Asia Minor, which rises in the Morad Dag, and passing by Sart and Magnesia, falls into the Gulf of Smyrna, in latitude 38. 40. N.

SARACENS, the inhabitants of Arabia, so called from the word *saru*, which signifies a desert, as the greater part of Arabia is; and this being the country of Mahommed, his disciples were called Saracens.

SARAGOSSA. See Zaragoza.

SARANGPOOR, a town and district of the Mahratta territories, in the province of Malwah, situated about the twelfth degree of north latitude. It is hilly, yet being watered by numerous branches of the Sopra and Gilly Sinde rivers, it is fertile and productive. The chief towns are Sarangpoor, Rajegur, and Sher.

Sarangpoor, the capital of the above district, situated on the north side of the river Sopra, is fifty-five miles north-east from Oojain. Long. 76. 30. E. Lat. 23. 38. N.

SARANGUR, a town of Hindustan, in the province of Gundwana, possessed by independent Goand chiefs, fourteen miles south-west from Bustar. Long. 82. 26. E. Lat. 19. 40. N.

SARAPILLY, a town of Hindustan, in the Carnatic, thirteen miles south from the town of Nelloor. Long. 79. 58. E. Lat. 14. 14. N.

SARATOV, a large province or government, partly in the south-east of Europe, and partly in Asia. Its form is that of a triangle on both sides of the Volga, having on the one side the country of the Don Cossacks, and on the other that of Astracan. It is very thinly peopled, containing an area of 91,000 square miles, and the population not exceeding 1,000,000, in consequence of the barrenness of the soil and the unpropitious climate. Great part of the soil is of a saline quality, and unfit for the growth of vegetables. There are several salt lakes, the most productive of which is that of Elton or Ulton. The country lying to the west of the Volga is less level, but has no hills of any great height. The ground is partly arable and partly pastoral. German colonists have been settled in the country, but with little success. The capital is of the same name, and is situated on the Volga. It is neatly built, and has wide, straight streets; but the houses are mostly of wood. The position of the place between Moscow and Astracan is favourable to trade, and it has, besides, the command of water-carriage on the Volga. The principal articles of its trade, which are not derived from the two cities already named, are fish, comar, and salt. The population is 5000. It is 374 miles north by west of Astracan, and 465 south-east of Moscow. Long. 46. 0. E. Lat. 51. 31. N.

SARAWAN, the most northerly division of Beloochistan, composed entirely of vast mountains and deserts, and divided into districts, each of which furnishes its military quota to the Mahommedan armies.

SARBATCHOU SAHA, a small island in the Sea of Japan, near the coast of Corea. Long. 131. 37. E. Lat. 42. 54. N.

SARBO, an island in the Red Sea, near the coast of Abyssinia. Lat. 15. 8. N.

SARCASM, in *Rhetoric*, a keen and bitter expression, which has the true point of satire, by which the orator scoffs and insults his enemy. Such was that which the Jews said to our Saviour: "He saved others, himself he cannot save."

SARCHAD, a town of Syria, in the district beyond Jordan.

SARCOPHAGUS, in *Antiquity*, a sort of stone coffin or grave, in which the ancients deposited the bodies of the dead which were not intended to be burned. The word, as derived from the Greek, literally signifies *flesh-eater*, because originally a kind of stone was used for tombs, which quickly consumed the bodies. One of the most celebrated specimens of antiquity is the great sarcophagus, which is commonly called the tomb of Alexander the Great. It fell into the hands of the British at the capitulation of Alexandria in Egypt in 1801, and is now deposited in the British Museum.

SARCOPHAGUS, or *Lapis Assius*, in the natural history of the ancients, a stone much used amongst the Greeks in their sepultures, is recorded to have always perfectly consumed in forty days the flesh of human bodies buried in it. This property it was much famed for, and all the ancient naturalists mention it. There was also another very singular quality in it, but whether in all, or only in some peculiar pieces of the stone, is not known; that is, its turning into stone any thing that was put into vessels made of it. This is recorded only by Mutianus and Theophrastus, except that Pliny had copied it from these authors, and some of the later writers on these subjects from him. The account Mutianus gives of it is, that it converted into stone the shoes of persons buried in it, as also the utensils which it was in some places customary to bury with the dead, particularly those which the person while living most delighted in. The utensils this author mentions are such as must have been made of very different materials; and hence it appears that this stone not only had a power of consuming flesh, but its petrifying quality extended to substances of very different kinds. Whether it ever really possessed this last quality has been much doubted.

SARDANAPALUS, the last king of the Assyrians, was the thirtieth from Ninus, of whom Herodotus merely mentions that he concealed his treasure in subterranean vaults. The character usually ascribed to him is that of a luxurious and slothful prince, who spent the greater part of his time in the harem among his women. But it is difficult to reconcile this statement with the brave and obstinate resistance he made to the attack of the rebel Arbaces, prince of Media. He defeated Arbaces twice, but at last was shut up within Ninus (Nineveh), where he destroyed himself and treasures on a funeral pile. There was, however, another Sardanapalus, the son of Anacyndaraxes, who is said to have founded Tarsus and Anchialë in one day, and whose epitaph is frequently quoted, and it is not unlikely that Ctesias, from whom Diodorus quotes, has mixed up the events that happened to these two. The second is thought to be the Esarhaddon of the Scriptures, and the first to be the Saracus of Abydenus.

SARDINIA. This kingdom is composed of two portions. One is the island bearing that name, which has long been entitled to the distinctive title of a kingdom; and the other consists of portions of the north-west of Italy, which at different periods had been distinguished as feudal or independent sovereignties under various forms of government as well as titles.

The existence of the island of Sardinia is noticed casually in the ancient writers, so as to justify the opinion of some authors on its antiquities, that it was peopled about 1700 years before our era, by a party of Etruscans; but others have contended for an origin 500 years later, and for its first colonists having been Libyans under Sardis, a descendant of the Theban Hercules, who gave his name to the island. Without entering on the dark subject of the first peopling of this island, the high antiquity of its settlement is attested by durable monuments, the materials, height, and construction of which are different from almost any other that are to be found. These Cyclopean structures are very numerous, between five and six hundred of them being to be seen on the island. They are called *nuraggis*, both by ancients and moderns, being in height about fifty feet, and in diameter at the base about ninety feet. They are strong buildings, in the form of a truncated cone, composed of masses of stone from two to five or six feet square, arranged in layers, without cement. The materials are lava, freestone, porphyry, or such other substances as the respective sites afford; and they generally crown the summits of hills, commanding plains where they are seen in every state, some being nearly complete, and others a mere heap of rubbish. On entering these edifices, which is effected by a low door, the structure is found to extend below the surface of the surrounding earth. The interior space is almost invariably divided into two floors, each consisting of a vaulted room, to which access is gained from a ramp between two concentric walls, and leading to the summit, where a flight of steps completes the ascent. The nuraggis are of two distinct kinds. Those which are the most common have no marks of the chisel, and are constructed of massive blocks, with irregular faces, and smaller stones in the interstices; the materials of the others exhibit exteriors formed by tools, though the stones are not exactly square, but are placed with a stricter regard to keeping the horizontal layers, and gradually diminish in size towards the summit.

There have been various conjectures respecting the probable object of these buildings. The darkness of their interior, and the fragments of terracotta found in them, would indicate their having been monuments for the dead, a belief so general that they have obtained in their neighbourhood the name of *Domu de Orcu*, or the house of death; but the pottery being evidently Roman, and in some instances accompanied by coins of the lower empire, indicates only that such was the use made of them at a late period. Captain Smyth, who examined these ancient monuments, says, "From their laborious construction, their number, and their general situation on *curcureddus* or eminences, more or less distant from each other, I cannot but suppose they were designed to answer the double purpose of mausolea for the eminent dead, and as asyla for the living, especially as many of them are flanked with smaller nuraggis having a subterraneous communication. But the mystery in which they are involved will probably remain impenetrable, since none of them exhibit the least trace of either literal or symbolical characters."

At whatever periods these remarkable works were erected, a long time elaspsed before any precise notice is to be discovered of the history of Sardinia, until about the year 560 before Christ, when the Carthaginians under Machæus, after a victorious campaign in Sicily, attempted the conquest of the island. They were repulsed with such loss, however, as left it in repose until the contests commenced between the Punic and Roman republics.

By successive conquests it passed into the hands of the Vandals, the Mahommedans, and the Spaniards, in whose power it remained from 1324 till the period of the disputed succession of the crown of Spain between the houses of Bourbon and Austria in 1708, when the Austrian party, with the assistance of the English fleet under Sir John Leake, succeeded in obtaining possession of the island. In 1720 it was ceded by treaty to Victor Asmodeus, who assumed the title of king of Sardinia. After this event, notwithstanding the wars which agitated the rest of Europe, Sardinia experienced a peace of seventy years, during which period the princes of the house of Savoy, especially Charles Emanuel, made the greatest exertions to ameliorate the condition of the people.

The success of the French arms in Italy by the year 1798 had been such as to compel the king, Charles Emanuel IV., to abandon the capital, Turin, and the whole of his continental dominions. He withdrew to Leghorn, where he received with delight deputies from the stamente of Sardinia, assuring him of the entire devotion of the people to his person and government. Satisfied with these assurances, he embarked, and, escorted by an English frigate, arrived at Cagliari on the 3d of March 1799, where he was welcomed with the most enthusiastic affection.

The successes of the Russian General Suwarof induced his majesty to return to the Continent, till, hearing in Tuscany of the battle of Marengo, and being inconsolable for the death of his wife, the sister of Louis XVI., he abdicated in favour of the Duke of Aosta in March 1802, and resided in privacy at Rome, where he died in 1819. His successor, Victor Emanuel, remained some time in Italy in the hope of gaining his continental dominions; but seeing little prospect of succeeding, he left Naples, where he had resided since his accession, and arrived in Sardinia on the 17th of February 1806, where he remained secure under the protection of England.

The son of Charles Emanuel followed the footsteps of his father in opposing the principles of the French revolution, which was then spreading its direful effects over all Europe, and nowhere more generally than in the continental part of the kingdom of Sardinia. The events of that period are to be found in this work in the historical parts of the two articles Europe and France. We need only state here, therefore, that the king of Sardinia returned to his continental capital in 1814, and by the treaty of Vienna the duchy or ancient republic of Genoa was added to his dominions; and that by the same treaty he ceded to the state of Geneva the circles of Carouge and Chesne, containing 12,700 inhabitants. On the restoration of Victor Emanuel, he re-established, as far as could be done, the old constitution; again introducing the Jesuists, and becoming a zealous member of the Holy Alliance. He confirmed to those who had made purchases under the French confiscation the property they had gained; restored to their owners the few estates that had not been sold; and allotted the annual sum of 400,000 lire as some compensation for the plunder which they had suffered. He however established a very severe censorship of the press, and introduced such restrictions on the process of education in the universities and the other seminaries as he judged necessary to check the prevailing tendency to infidelity and immorality. These measures, and the predisposition to revolution indulged throughout Italy, caused an insurrection in 1821, the particulars of which are narrated in this work under the head of Italy. The prosperity of the kingdom has been proceeding with regularity since the return of tranquillity, owing in a great measure to the increased demand for silk in England, Germany, France, and Russia, and in no inconsiderable degree from the annexation of Genoa to the territory, by which a trade is now carried on to almost every part of the habitable world.

The extent of the several divisions of this kingdom, and their population in 1833, were as follow:—

Provinces.	Extent in Square Miles.	Population.	Cities.	Towns.	Villages.
Turin	3,278	808,526	12	54	347
Cuneo	2,684	521,631	13	53	303
Alessandro	2,420	547,622	11	40	453
Novara	2,596	437,576	5	44	426
Aosta	1,408	71,096	1	1	78
Savoy	4,092	504,165	19	36	594
Nice	1,496	204,538	6	16	160
Genoa	2,288	583,233	19	25	700
Island of Sardinia	9,856	491,050	9	15	377
Island of Capraja	484	1,500	0	1	3
	30,602	4,170,937	95	285	3441

The whole of the inhabitants of this kingdom adhere to the Roman Catholic church, with the exception only of about 30,000 Jews, who have a restricted toleration, and some Protestants, well known under the name of Waldenses, who are settled, after long and frequent persecutions, in the valleys of Lucerne, Perusa, and St Martin, in the western part of Piedmont. According to their own account, they occupy thirteen villages, and number nearly 20,000 souls, who are allowed the free exercise of their own mode of religious worship.

The religious establishment of the kingdom is very extensive, comprehending no less than nine archbishoprics and thirty-four bishoprics, who have under them ninety-seven chapters of ecclesiastics in the cities, with 3619 parish priests in the towns and villages, besides 300 monasteries of various orders, and about eighty nunneries for females. The state of education is generally very low, and few of the peasantry can either read or write. There is a university at Turin with about eight hundred students, another at Genoa with about four hundred, and a third in the island of Cagliari with two hundred and fifty. There are also about eighty colleges where Latin is taught, and forty seminaries for the education of the ecclesiastics.

The government is an absolute and hereditary monarchy, although in the island of Sardinia the assembly of the ancient states is still continued; but their power extends only to objects of a local and insignificant nature. In Genoa, too, some shadow of the ancient republican aristocracy exists, but it has little or no influence on the determinations of the monarch. The revenues of the kingdom are stated to amount to about two millions sterling annually, and the expenditure to be nearly the same. In the latter is included the interest on a national debt of five millions, a large portion of which is owing to foreigners, and among others to the capitalists of Geneva and other parts of Switzerland; but by means of a sinking fund it is yearly diminishing. An army of thirty-five thousand men is maintained in time of peace, and a naval force, consisting of six frigates, three corvettes, six brigs, and several schooners and other small craft.

The continental parts of this kingdom present a face of the greatest possible variety. The part to the north, formerly the duchy of Savoy, is in appearance more a part of Switzerland than of Italy. It is an alpine land, separated from the plains of the peninsula by an enormous chain of mountains known as the Gray Alps. It is peculiarly interesting, from the lofty heights, whose tops are covered with snow and ice, from the narrow and deep valleys, from its perpendicular cliffs, from the numerous cascades, and from the deep lakes; and it is especially distinguished by the raging winds and violent storms of hail, rain, and snow, which occur with frequency in the more elevated regions.

The provinces of Piedmont, Milan, and Montserrat, form a vast valley, or rather plain, which was probably once covered with water, and which begins at the pass of Susa, and only terminates on the easternmost frontier of Italy. The river Po divides this valley into two nearly equal portions. Its northern side extends to the foot of the Alps, which separate it from Switzerland, some great projections of which enter it at Aosta and Ossola. The southern part of this valley is bordered in its whole length by the range of the Apennines, which separates it from the provinces on the sea-coast. This valley is bounded on the part in contact with France by the Cottian Alps.

The provinces on the sea-shore, comprehending Genoa and Nice, which surround the Gulf of Genoa, are separated from the other parts of the kingdom by the Apennines. They are collectively mountainous districts, which extend to the sea, and have only narrow valleys or strips on the shore, in which marshes, heaths, and sandy tracts of land, yielding but little, and thinly inhabited, are in fact the most cold, dreary, and uncomfortable of any part of the Apennine ranges.

The soil of Savoy is everywhere stony, and consequently not favourable to agriculture upon a great scale. There are few plains of any extent, the valleys are narrow, and the earth is very thin on the rocks, which, by the force of the mountain torrents, is often washed away, leaving the bare stone. The deposited soil in the great valley which contains Piedmont, Montserrat, and Milan, is in most parts rich and deep, except that at the foot of both the Apennines and the Alps there are vast accumulations of banks of pebbles, to which the practices of agriculture cannot be applied with any profit. The height of the mountains, which enclose the valley, give such force to the streams of water that rush down, as to prevent them from being generally under the direction of human art; but in many instances the water has been turned into channels and canals, where, by the help of sluices, it has been applied beneficially to the purpose of irrigation, and, as far as it has been accomplished, with beneficial effect.

The provinces on the borders of the Mediterranean Sea have no resemblance to Piedmont, either in respect to the soil, the climate, or the vegetation. The soil is stony and poor, the stones are in enormous blocks, and in a few parts only is it adapted for cultivation; but the olive and the vine are found to flourish.

In the island of Sardinia the land is generally rather hilly than mountainous. Several ranges of hills intersect the whole land, and two large streams cause in many parts extensive marshes, while the scarcity of water in other parts causes cultivation to be much neglected. The soil is, however, productive, and is capable of becoming, with good management, much more than sufficient for the subsistence of the inhabitants. At present it is said that scarcely one third of the land is cultivated, whereas, if the whole were, it might become, as in the time of the Romans and Carthaginians, a granary for the countries on the Continent.

The mountains within the Sardinian dominions are objects which excite the greatest interest; but a description of them will be found in this work under the general article Alps. The chains of mountains may be viewed as the cisterns for collecting those vast bodies of water which empty themselves into the Mediterranean and Adriatic Seas. The first of these seas receives the waters of the Rhone, which rises in Savoy, and at first forms the boundary towards France.

The river Var constitutes the boundary between Nice and France; and the Paglion is a river of short course in the province of Nice, which rises near to Luce, and falls into the sea at a short distance from the capital. The great river of Sardinia, however, is the winding and lengthened Po, of which an account has been given under that head.

The larger lakes of the Alps belong only in part to this kingdom. The Leman, or lake of Geneva, is divided between Sardinia and the canton of Switzerland, the southern bank of it only belonging to the kingdom. Lake Maggiore has also only its western shores in the Sardinian dominions, the eastern side belonging to the Austro-Venetian kingdom of Lombardy, and the upper part forming a portion of Switzerland. The lakes exclusively Sardinian are of smaller extent than those which are but partly in the kingdom. The lake of Bourget, in Savoy, scarcely exceeds 100,000 acres in extent, but is about 240 feet in depth, and being connected by the Canal of Savières, discharges much water into the Rhone. The lake of Annency, in Savoy, is 1350 feet above the level of the sea, and is 180 feet in depth. It has an outlet by the rivers Thon and Fier into the Rhone. The lake of Orta is a long narrow piece of water by the side of Lake Maggiore, into which its surplus water is discharged. There are some smaller lakes, a few of which are dried up in the summer; and others of them are on elevations of great height, the most remarkable of which is one on Mont Cenis, 5740 feet above the level of the sea.

The several states abound in mineral springs of great use to the healing art. In Savoy the sulphureous wells of Bonneval have attained great celebrity; but their reputation is excelled by that of the warm baths of Aix. In the valley of Aosta are the medicinal springs of St Vincenzio and of Cormaggiore, and the baths of Pré and of St Didier. In the province of Piedmont are the baths of Aqui, Balieri, and Vinadio, and the springs of St Genesio.

The mountains on the island are small chains. The most remarkable of them are, Monti di Limbara in Gallura; Monti di Villanova, between Alghieri and Bosa; Monti Genargento, between Oleastra and the Barbagien; and the Monti Arizzo and Founi, in the Barbagien itself. None of the mountains are of a height to be covered with perpetual snow. The general elevation of the range is from 1000 to 3000 feet; but the peak of Limbara is 3686 feet, and that of Genargento has an altitude of 5276, and enables the people of the neighbouring town, Aritzu, to trade in snow for the consumption of the capital. These mountains are almost covered with wood to their summits, and the lower parts have olive-woods, yielding good oil.

The rivers of the island are the Oristano, which rises near Buboso, runs from north-east to south-east, and enters the sea at the town of its name; the Flumendoso, which springs from Monti Genargento, waters the district of Barbagien, and falls into the sea at Muravera; and the Quoquinos, which rises near Tirso, and, taking a northerly direction, falls into the sea about seven miles from Castel Sardo. The lakes of Sardinia are insignificant; they are mostly formed by rain in winter, and are dried up in summer; or by the overflowing of the sea from the dilapidated state of the embankments.

Mineral springs are numerous on the island, but are for the most part neglected. The principal are those of Sardara, Villa Cidro, and Fordongianus, in the Capo de Sotto; and those at the foot of Castel Doria, at Codrongianus, and the Benetutti springs of the Goceana Mountains, on the Capo di Sopra. In a secondary rank may be noticed the thermal waters of Marrubin, of Iglesias, and of St Antonio. Aqua Cotta, at the eastern base of an insulated hillock near Villa Cidro, is a small but constantly limpid spring, of about 105° of Fahrenheit, close by a stream of potable water having a temperature of 60°, whilst that of the atmosphere is 64°. Here most of the cloth of the Campedano is fulled, the makers of it paying to the proprietor for the use of the water.

The climate of this kingdom varies excessively in the different provinces which compose it. In Savoy, in the valley of Aosta, and between the Alps of Piedmont, a real Swiss climate prevails. Often is to be seen in those valleys the summer in its glorious garb, when the surrounding hills have their tops and sides covered with snow. The air on them is too raw to bring forth the more tender fruits of Italy; but in favoured spots the grapes ripen, and the sides of the hills yield abundance of chestnuts. Though changeable, the air in these districts is on the whole pure and healthful. The valley of Piedmont, according to Saussure's division, has the climate of the north region of Italy, where the quicksilver falls below ten degrees. Even in the midst of summer the benumbing Tramonta winds descend from the heights, and night-frosts, which begin in November, continue till April. It is not unusual, in the neighbourhood of the mountains, to see the ground covered with snow during ten or twelve days. It is, however, not subject to the inconveniences of Southern Italy; and neither the burning atmosphere of Calabria, nor the Sirocco, nor earthquakes, are experienced, nor the annoyance of the sharp-biting musquito. The mulberry trees, the vines, and the maize, flourish; and the air, when not in the vicinity of rice-fields, has a balmy fragrance, and is remarkably pure and healthful. The coasts of the kingdom, from Nice to Genoa, are protected by the Apennines from the Tramonta winds, and the climate is that distinguished by Saussure as the second region of Italy, in which the olives and the agrumens attain perfection; but the evils of the Sirocco or Mistrol winds are too often felt in the whole of the district.

The island of Sardinia has some peculiarities of climate. In times of antiquity, the unhealthiness of the island is alluded to by Martial, Cicero, Pausanias, Cornelius Nepos, Strabo, Tacitus, and Claudian; and in later times the same character is given it by Dante. The chief agent of this insalubrity is found in the feculent miasma of marshes, beds of rivers and torrents, stagnant pools, and putrescent vegetation, in the vicinity of which it is always found deleteriously active, and which are well known to be quite adequate to the generation of malignant fevers. The common disease, called here *intemperie*, appears to be somewhat different from the *malaria* of Sicily and Italy; for although equally or more acrimonious in effect, it does not produce the swelled bodies and sallow skins which are the pathognomonic symptoms of the latter. Both diseases usually commence when the summer heat, assisted by slight showers, disengages the impure gases from the low grounds; and continue till the end of November, when the heavy rains have precipitated the miasma, and purified the air. But they differ, in as much as malaria is generally supposed to be weak in its effects, unless imbibed during sleep; whereas *intemperie*, though worst at night, is dangerous at all times. Instances have been known of strangers landing for a few hours only, from Italian coasters, who were almost immediately carried off by its virulence; indeed the very breathing of the air by a foreigner at night, or in the cool of the evening, is considered as certain a death in some parts, as if he had swallowed some poisonous drug. While the atmosphere is in this state, the natives never move abroad until an hour after sunrise, and they hasten home before sunset, carefully closing every door and window, or, if obliged to go out, carefully holding a handkerchief before the mouth. The extreme heat of the day is also carefully avoided, for they are apprehensive of the *colpo di sole*, or stroke of the sun, attributing its frequency and fatal effects to the malignancy of the *intemperie*.

It is agreed on all sides that fire is an excellent antidote to this evil; and it is recorded that the Lords of Oristano were wont, during the unhealthy season, to burn large fires around the town every night, to rarefy the mephitic exhalations. Most of the people remove from the plains to the higher grounds on St John's day in June, when the air begins to be unsafe, although it does not become dangerous before August. Those who, from their circumstances, are obliged to remain, keep themselves well clad in thick woollens, to avert the ardent rays of the sun. Exertion, exposure to summer showers, and fatigue of every kind, are studiously avoided; and a spare but good diet is adopted, with cool acidulated drinks. The migrations consequent on this distressing visitation, with the want of cottages, pastures, and enclosures, and the many extensive commons, give the plains of Sardinia a depopulated aspect, and may be adduced, among other causes, as a reason for the comparatively low consideration in which this once most fertile of the Tyrrhenian islands has been held. The contempt in which the inhabitants of the plains are held by those of the mountains, with the large fiefs in the hands of some of the non-resident nobles, are also serious obstacles to improvement.

The chief occupation of the inhabitants of this kingdom consists in the cultivation of the land, and is accordingly as varied as the surface of the soil, and as that of the climate, which depends on the elevation. Under the head of LOMBARDY will be found a detailed account of the agriculture of this district, the greater part of which may be adverted to as a description of what takes place in the richer portion of Sardinia, which belongs to the basin of the river Po, comprehending the greater part of the provinces of Turin, Cuneo, and Alessandria. In Savoy generally the cultivation is badly conducted. The cultivable land is divided into large portions, belonging to a few great proprietors, and is subdivided into smaller portions to tenants, who, without leases, transmit their lots from one generation to another, who pay neither money-rent nor labour to their superiors, but deliver to them or their agents one half the produce of the fields, whatever it may be, in its several kinds. The cattle on these lands are commonly the property of the lord, and are maintained on the produce of the soil, before the division is made of what it yields. The power of the tenants to transmit the land to their successors is combined with the power of subdividing it among their several children; and this is carried to such an extent, as in Ireland and in some other countries, that it has led, and is leading, to such a subdivision that a great number of the farms barely raise sufficient food for the occupants, though their provisions are of the most humble and penurious kind. Savoy is annually deficient in corn to the extent of nearly one third of its consumption. This is in some measure made up by using chestnuts and potatoes as substitutes for bread; though in Aosta and in some other parts the potato is little cultivated, and in them corn must be drawn from the neighbouring countries. The land on the coast of Nice and Liguria consists chiefly of narrow strips of valley, which in the greater portion is composed of sand, and not very appropriate for the growth of grain, though a little is grown in some of the more fertile of the valleys; but the common people only eat bread on Sundays and holidays, and at other times subsist on chestnuts obtained from the Apennines, and on inferior cheese made by themselves. They derive a part of their subsistence from fish, especially sardinias, which at some seasons are abundant; and oil, a useful accompaniment, is at a very moderate price.

The agriculture of the island of Sardinia differs so much from that of the rest of the kingdom, that it merits a special notice, the more so from its having been, in ancient times, the source of supplies of grain to the continent of Italy, and occasionally of Spain. The lands are divided into feudal and non-feudal. The former comprise those belonging to the respective nobles, as well as those sold to individuals, but recognising the feudal lord. Those not feudal belong to communities or to individuals; for landed property can be let or sold, or given away, with the consent of the tribunals, or of the husband if belonging to married females. The first lands as to importance, though the least in extent, are those called *tanche*, or enclosed lands, which are generally well cultivated. But the far larger proportion are those called *vidazzone*, or belonging to communities. They are chiefly divided into three parts, each of which is cultivated in its turn, and, while under culture, is enclosed with a line of hurdles; but the rest being fallow, lies open to the ravages of wandering flocks, and the blast of every wind that blows.

The foreign commerce of Sardinia, both by sea and by land, with the countries contiguous to it, naturally demands observation. The number and tonnage of the vessels belonging to the kingdom are shown in the following table, furnished by the British consul.

Vessels belonging to the Kingdom of Sardinia.

Year.	From one to thirty tons.	From thirty to sixty tons.	From sixty to a hundred tons.	Above a hundred tons.	Number of the Crews.
1827	1874	172	232	546	31,201
1828	1899	161	222	595	30,671
1829	1931	170	214	602	31,577
1830	1903	158	214	616	32,176
1831	1965	157	215	629	32,842

The accounts for the last seven years are not to be procured; but there is reason to believe that no very material increase has taken place during that period, and that the proportion of the national vessels of the larger class has been more augmented, while that of the smaller class has somewhat declined, as is observable in the preceding table of the five years from 1827 to 1831.

The chief articles which Sardinia imports from foreign countries are sugar, coffee, spices, cotton wool, cotton manufactured, indigo, cochineal, and other dyeing drugs, corn chiefly from the Black Sea, salted fish, salt, hides and leather, iron, steel, lead, copper, pitch and tar, tobacco, and timber. There are many smaller articles of luxury, whose aggregate amount bears but a trifling proportion in value to those here enumerated. The commerce in grain is casual, depending in a great degree on the productiveness of the harvests in Switzerland, to which country, when the domestic supply is found to be insufficient, the corn, chiefly wheat from the ports of Odessa and Taganrog, is transmitted to the Swiss districts bordering on the Sardinian territory.

A Statement of the Number and Tonnage of Vessels, distinguishing the Countries to which they belonged, which entered inwards and cleared outwards at the port of Genoa in the year 1834, *exclusive of Coasters.*

Countries.	Inwards.		Outwards.	
	Ships.	Tons.	Ships.	Tons.
British	96	15,014	95	14,973
Sardinian	998	121,000	996	117,000
American	18	3,800	25	5,398
Austrian	8	1,390	8	1,673
Danish	4	695	4	695
Dutch	11	1,400	15	1,836
French	258	19,000	256	18,597
Greek	1	83	1	83
Neapolitan	149	19,100	151	19,334
Russian	1	420	3	1,077
Spanish	148	6,400	153	6,491
Swedish	10	2,100	16	2,918
Tuscan, Roman, and Lucchese	160	3,900	179	4,882
Bremen and Lubeck	4	610	6	733
Hanoverian	1	167	2	278

The variations in the years preceding and succeeding 1834 are so little as to render our filling the pages of this work with lengthened accounts quite unnecessary; and the particular year selected is sufficient to show the general nature and extent of the trade, and the respective countries with which it is carried on.

The cities of this kingdom whose population amounts to more than 10,000 souls, are the following.

Turin	120,596	Chieri	14,000
Genoa	94,000	Savona	13,400
Alessandria	36,000	Carmagnola	13,200
Cagliari	29,000	Saluzzo	13,200
Nice	27,000	Pinerola	12,500
Asti	23,000	Boghera	12,147
Sassari	21,000	Chamberi	12,060
Cuneo	20,000	Bra	11,300
Savigliano	19,000	St Remo	11,200
Casale	18,000	Novi	11,100
Mondovi	17,000	Racconigi	11,000
Novara	16,400	Chiavari	10,800
Bercelli	16,000	Rapello	10,150
Vigevano	15,000	Tortona	10,015
Fossano	14,300		

The most valuable product of Sardinia which is exported is silk, but it has little connection with maritime commerce. The greater part of it, which goes to other countries, is transported by land-carriage, in order to supply the manufacturers of France, of Prussia, of Belgium, of Holland, and in some measure of England; for even to the latter country much is now sent by land through France, or by the Rhine. Oil is one of the greater productions exported from Genoa, after being collected there by means of the numerous coasting vessels with which the shores of Sardinia abound. The larger portion of this article is sent to England, where it is used by the wool-combers in the manufacture of cloth; but a considerable quantity of it is sent to Holland, and from thence into the interior of Germany, where it is applied to the same purposes. Rice is also exported by sea to France, though it can scarcely sustain the competition with that which is produced in the East Indies or in Carolina. Though much wine is made, it is almost wholly consumed at home, the quantity exported being trifling. Fruit is an article of foreign trade; and soap, white lead, essences, and perfumery, may be enumerated as the most prominent of the smaller articles of export. There is, however, a considerable transit trade carried on through Genoa, by which many of the products of the other parts of Italy are exchanged with those of France, to the advantage of the commission-houses in that city.

Before the seventeenth century, Genoa was the centre or channel of all the supply of manufactured silks and velvets to the other parts of Europe; but at present the manufacturing industry, as regards silk, is reduced to the point which the internal consumption demands, or to the process of preparing the raw material for the manufacturers of France, England, Holland, Germany, and Russia. For domestic use, Sardinia has sufficient manufactories to supply with silk, linen, or woollen goods, the demand for clothing. Their silks are handsome and strong, especially the stockings; but, in the absence of the best descriptions of machinery, they are dearer than elsewhere. Leather, iron goods, copper ware, glass, pottery, and the smaller articles of the household, are made at home.

As to the islanders, they are in so rude a state, that, in a commercial view, they scarcely require to be noticed; as must be the case where every man is his own tailor, shoemaker, spinner, weaver, tanner, carpenter, mason, and blacksmith, and wants nothing but his fire-arms, or other weapons of defence.

SARDIS, or Sardes. See Sart.

SARDONIUS Risus, *Sardonian Laughter*, a convulsive involuntary laughter, so named from the *herba sardonia*, which is a species of ranunculus, and is said to produce such convulsive motions in the cheeks as resemble those motions which are observed in the face during a fit of laughter. This complaint is sometimes speedily fatal. If the ranunculus happens to be the cause, the cure must be attempted by means of a vomit, and frequent draughts of hydromel with milk.

SARDONYX, a precious stone, consisting of a mixture of the calcedony and carnelian, sometimes in strata, but at other times blended together.

SARFEND, supposed to be the ancient Sarepta, a village of Palestine, eight miles south of Saida.

SARHAUT, a town of Bengal, in the district of Birbhoom, eighty-five miles west from Moorshedabad. Long. 86. 51. E. Lat. 24. 14. N.

SARI, a town of Persia, and capital of the province of Mazanderan, once the seat of Aga Mahommed Khan, and still the residence of one of the Persian princes. It is a very ancient city, and frequently alluded to by Ferdousi. It is small, but well fortified, being surrounded by a good wall and a deep ditch. It is crowded with inhabitants, and a society of Armenians is established in the vicinity of the town. Here are many merchants of credit, who carry on a considerable trade with Astracan and with the interior parts of Persia. The palace, though small, is neat and commodious. When this place was visited by Hanway, it contained four or five temples of the ancient Persians, built of solid materials, and in the shape of rotundas, about thirty feet in diameter, and raised to the height of 120 feet. The surrounding country is flat, woody, and interspersed with streams, and bounded on the north-east and south-west by a low range of hills. Long. 52. 58. E. Lat. 35. 35. N.

SARLAT, an arrondissement of the department of the Dordogne, in France. It extends over 683 square miles, and comprehends ten cantons, divided into 133 communes, with 110,447 inhabitants. The capital is the city of the same name. It stands in a low situation, on every side surrounded with naked rocks. In the neighbourhood a great quantity of oil is expressed from nuts. It contained, in 1836, 5569 inhabitants. Long. 1. 9. E. Lat 45. 3. N.

SARMATTA Isle, a small island in the Eastern Seas, about thirty miles in circumference. Long. 129. 15. E. Lat. 8. 10. S.

SARNO, a city of Italy, in the Neapolitan province of Principato Citeriore. It is situated on a river of the same name, is the see of a bishop, with a cathedral, three parish and five conventual churches, and contains 11,930 inhabitants, who grow much good wine and oil, and make paper of various kinds.

SAROS, in chronology, a period of 223 lunar months. The etymology of the word is said to be Chaldæan, signifying restitution or return of eclipses; that is, conjunctions of the sun and moon in nearly the same place of the ecliptic. The Saros was a cycle like that of Meto.

SAROS-PATAK, a city of Hungary, in the province of the Hither Theiss, and the circle of Tokay. It stands on the river Bodrog, and is well built, being the seat of a Calvinist university, which has nine professors and 1240 students, with a library of 20,000 volumes, a museum, and physical laboratory. It has manufactures of woollen cloths, and contains 1630 houses, with 9150 inhabitants. Long. 21. 29. 57. E. Lat. 48. 18. 50. N.

SAROWY, a Rajpoot town and district of Hindustan, in the province of Ajmeer. The district is situated principally between the twenty-fifth and twenty-sixth degrees of north latitude. The country, which is occupied by Rajpoot chiefs, is hilly and unproductive, although watered by the Bah and Banass rivers. The town is forty-four miles west of Odeypoor. Long. 73. 20. E. Lat. 25. 32. N.

SARRASIN, a city of the department of the Tarn and Garonne, and in the arrondissement of the same name, of which it is the capital. It is sometimes distinguished as Castel-Sarrasin. The arrondissement in extent is 267,723 acres, or 418 square miles, and contains seven cantons and eighty communes, with 72,650 inhabitants. The city stands on the river Sanguire, has some manufactories of serges and linen goods, and contains 7408 inhabitants.

SARREBOURG, an arrondissement of the department of the Meurthe, in France, extending over 418 square miles. It is divided into five cantons, and these into 116 communes, which have a population of 75,499 persons. The capital is the city of the same name situated on the river Saar; but it contained only 2340 inhabitants. There is a military bakehouse with eight ovens, which can make bread each day sufficient for an army of 40,000 men.

SARREGUEMINES, an arrondissement of the department of the Moselle, in France, 524 square miles in extent. It is divided into eight cantons, and these into 143 communes, containing, in 1836, 125,973 inhabitants. The capital is a city of the same name, situated at the junction of the river Bise with the Saar. There is some excellent china made, and it has manufactures of lacquered ware of various kinds, and some extensive tanneries. It contained, in 1836, 4113 inhabitants. Long. 7. 5. E. Lat. 46. 8. N.

SART, a village of Asia Minor, small and insignificant; now chiefly distinguished by the ruins of Sardis, once the splendid capital of Lydia. These ruins are found confusedly scattered over a verdant plain, and consist of bricks so strongly cemented together that it is scarcely possible for any violence to disjoin them.

SARTENE, one of the arrondissements into which the island of Corsica has been divided. It extends over 648 square miles, and comprehends eight cantons, divided into forty-three communes, with 25,739 inhabitants. The chief place is the city of the same name, with 2682 inhabitants.

SARTHE, a department of the north-west of France, formed out of parts of the ancient province of the Upper Maine, of Anjou, and Perche-Gouet. It is bounded on the north by the department of the Orne, on the east by those of the Eure-Loire and the Loire-Cher, on the south by the Indre-Loire and Maine-Loire, and on the west by the Maine. It is nearly of a circular form, and extends to 1,398,600 acres, equal to 2185 square miles; and it is divided into four arrondissements, thirty-three cantons, and

394 communes. The population amounted, in 1836, to 466,888 persons. They are industrious, averse to changes, and seldom leave the places of their birth, or alter the fashion of their dress. The surface is generally level, but on the north-eastern side there is a range of hills of very moderate height. The soil varies excessively, the department comprehending some of the best as well as some of the worst land in France. The north-west part consists of good corn-land, and the north-east of valuable meadows; but the south and south-west divisions are for the most part mere sandy heaths, yielding little or no corn, but in certain districts producing good wine. The chief river is that which gives its name to the department. It is navigable in the lower part, and before it joins the Loire receives the waters of thirty-six rivers and brooks. The products are the common domestic animals, with buck-wheat, maize, wheat, barley, hemp, flax, wine, honey, and various fruits. Nearly one tenth of the surface is covered with woods, which are commonly used as fuel. There are some mines of iron, and although none of them are very extensive, yet their great number enables the department to extract a sufficient quantity of that metal for its own consumption. The manufacturing industry is not considerable, being confined to hardware, paper, woollen cloths, leather, and the spinning of linen yarn. The capital is Le Mans, in the centre of the department, with a population, in the year 1836, of 23,164. It contains scarcely any other large towns.

SARTINE ISLANDS, a cluster of small islands in the Northern Pacific Ocean, so named by Pérouse. Long. 129. 18. W. Lat. 50. 56. N.

SARUM, OLD, a place in the county of Wilts, only remarkable from the proprietor of it having retained the ancient right of returning two members to the House of Commons till 1832. Some of the most distinguished statesmen have sat for this place, among the rest Lord Chatham. There is at present but one house in it, though the remains of ancient walls and the foundation of a cathedral may still be traced.

SARUN, an extensive and valuable district in the province of Bahar, situated about the twenty-sixth degree of north latitude. Its boundaries on the north are Gorakpoor and Bettiah, on the south it has the Ganges, on the east Bettiah and Hajypoor, and on the west the Dewah or the Goggrah River. It contained, according to Major Rennell's mensuration, in 1784, 5106 square miles. For its size it is one of the most prosperous districts in the Company's dominions, being well watered by the Ganges and the Gunduck, besides numerous smaller streams. Its soil furnishes abundantly all the richest productions of the East. It is also an excellent pastoral country, producing fine cattle and horses. The saltpetre exported to Europe, and used in Bengal, is principally manufactured in this district and in that of Hajypoor. In 1801, the population of this district was, in reply to various questions circulated by the board of revenue, stated at 1,204,000, in the proportion of one Mahommedan to four Hindus. The chief town is Chuprach.

SARZEAU, a city of France, in the department of Morbihan, and the arrondissement of Vannes. It depends chiefly on the fishery, and contains, including the parish, 6126 inhabitants.

SASERAM, a town of Hindustan, in the province of Bahar, and district of Rhotas. This was the favourite residence of Shere Khan, the Afghan, who, after having defeated the Moguls, and expelled the Emperor Humayoon, the father of Akbar, from Hindustan, mounted the throne and reigned five years. He was killed at the siege of Callinger in 1545, and lies buried here in a magnificent mausoleum, built in the middle of a great reservoir of water. The monument rises from the centre of the tank. Long. 84. 5. E. Lat. 25. N.

SASHES, in military dress, are badges of distinction, worn by the officers of most nations, either round their waist or over their shoulders. Those for the British army are made of crimson silk; for the imperial army, of crimson and gold; for the Prussian army, of black silk and silver; for the Hanoverians, of yellow silk; and for the Portuguese, of crimson silk with blue tassels.

SASNEE, a town and fort of Hindustan, in the province of Agra, from which the zemindar was expelled, after a desperate resistance, by the British in 1803. It is thirty-eight miles north-north-east from the city of Agra. Long. 78. 4. E. Lat. 27. 45. N.

SASRAM, a small island in the Gulf of Siam, near the coast of Cambodia. Long. 103. 48. E. Lat. 10. N.

SASSARI, a city of the island of Sardinia. It stands on the plain of Fulmenaria, in the northern part, about nine miles from Porto Torres. The situation is pleasing and healthy, and the vicinity produces abundance of wine, oil, corn, fruit, and tobacco, and is distinguished by the excellence of its cultivation. The city is well built, and, besides the cathedral, boasts of twenty-four churches, ten convents, three nunneries, and a Tridentine seminary. A university also has been formed out of a Jesuits' college. The cathedral is a large structure, with a most elaborate façade, and an interior clean and airy. It contains 19,360 inhabitants, whose chief sources of existence arise from the agriculture around them.

SATALIA, ANTALIA, or, according to others, ADALIA, a city of Asia Minor, in Caramania, beautifully situated at the head of a gulf to which it gives name. The site is a rising ground, on which the streets are placed above each other, and form a succession of terraces. On the level summit of the hill the city is enclosed by a ditch, a double wall, and a series of square towers, which are about fifty yards asunder. In an opening between two of the towers, now closed up, appear the remains of a splendid gateway, exhibiting fourteen columns, the upper part being of the Corinthian order. The port is enclosed by two stone piers, which once had towers at the extremities; but it is now in a ruinous condition. The surrounding country is fertile and productive, and the gardens round the town, filled with trees loaded with fruit, are beautiful. The climate is delightful, and the air is refreshed by alternate breezes from the sea and from the chain of the Taurus Mountains. The town is supposed to occupy the site of the ancient Olbia. The population, two thirds Mahommedan and one third Greek, is 8000. Long. 30. 45. E. Lat. 36. 50. N.

SATANAGUR, a town of Hindustan, in the nizam's territories, and the province of Hyderabad. It is fifty-five miles north by east from the city of Hyderabad. Long. 78. 16. E. Lat. 17. 56. N.

SATARAH, a well-known town and fortress of Hindustan, in the province of Bejapoor, and the Mahratta territories. Its foundation is on a rock, which stands on the westernmost point of a hill, rising from a base of from seven to eight miles in length from east to west. The passage to it is very narrow, only admitting one person at a time. It was taken by Sevajee, the founder of the Mahratta power, in 1673, and by Aurungzebe in 1690; but was retaken soon after the death of that monarch, in 1707. It capitulated to the British after a very short resistance in 1818; and being afterwards surveyed by British officers, they declared that it might be defended by two hundred troops against any force. This place owes its celebrity chiefly to its having been the state-prison of the legitimate sovereign of the Mahrattas, who was confined here by his chief minister the peishwa, who usurped the real power, while the deposed rajah was still honoured with the empty forms of royalty, and his name inserted in all public records. The representative of the Satarah rajah, though divested of all real power, was still recognised as the pageant of royalty; and the country adjacent to Satarah, in consequence of his residence, enjoyed an exemption from all military license.

The father of the late rajah was a commandant of horse; but being unfortunately of the blood of Sevajee, he was immured in the state-prison of Satarah. He died in 1808, and the Peishwa Bajerow immediately proceeded from Poonah, his residence, to superintend his obsequies, and to invest his successor with his empty dignity, and the misery of a prison thereto annexed. The Peishwa Bajerow was expelled from his throne in 1818, in consequence of joining in the coalition of the native powers against the British; and it was determined to take the Satarah rajah from his confinement as a state prisoner, and to reinstate him in a portion of his ancient dominions. The territory granted him, and which he now enjoys, is bounded by the Western Ghaut Mountains, on the south by the Warner and Krishna rivers, on the north by the Neera and Beema rivers, and on the east by the frontier of the nizam's dominions. The whole area occupies 11,000 square miles.

SATELLITE, an island in D'Entrecasteaux Channel, Van Diemen's Land, partly covered with an impenetrable thicket.

SATGONG, formerly a large trading city, in which the Europeans had their factories; but it is now an inconsiderable village, on a small creek of the river Hooghly, about four miles to the north-west of the town of Hooghly, in Bengal.

SATIMANGALUM, a town of Hindustan, in the northern district of Coimbetoor, situated on the river Bhawani. The fort is said to have been built about two hundred years ago. The town, which formerly contained eight hundred, but has now only six hundred houses, is scattered over the plain. Here is a temple of some repute dedicated to Vishnu. Coarse cotton goods are manufactured in the town and neighbourhood. Long. 77. 20. E. Lat. 10. 28. N.

SATTERAM, a town of Hindustan, in the Mysore rajah's territories, situated twenty miles south from Seringapatam. Long. 76. 53. E. Lat. 12. 9. N.

SATTIAVERAM, a town of Hindustan, on the sea-coast of the Northern Circars. It is fifty-six miles south-west from Vizagapatam. Long. 82. 45. E. Lat. 17. 15. N.

SATURDAY, the seventh and last day of the week, so called from the idol Seater, worshipped on this day by the ancient Saxons, and thought to be the same as the Saturn of the Latins.

SATURN, in *Astronomy*, one of the planets of our solar system, revolving at the distance of more than nine hundred millions of miles from the sun.

Saturn, in *Chemistry*, is an appellation which was formerly given to lead.

Saturn, in *Heraldry*, denotes the black colour in blazoning the arms of sovereign princes.

Saturn, one of the principal of the Pagan deities, was the son of Cœlus and Terra, and the father of Jupiter. He deposed and castrated his father, and obliged his brother Titan to resign to him his crown, on condition of his bringing up none of his male issue, that the succession might at length devolve on him. For this purpose he devoured all the sons he had by his wife Rhea or Cybele; but she bringing forth at one time Jupiter and Juno, presented the latter to her husband, and sent the boy to be nursed on Mount Ida, when Saturn, being informed of her having a son, demanded the child, but in his stead his wife gave him a stone swaddled up like an infant, which he instantly swallowed. Titan, finding that Saturn had violated the contract he had made with him, put himself at the head of his children and made war on his brother, and having taken him and Cybele prisoners, confined them in Tartarus; but Jupiter being in the mean time grown up, raised an army in Crete, went to his father's assistance, defeated Titan, and restored Saturn to the throne. Some time after this, Saturn being told that Jupiter intended to dethrone him, endeavoured to prevent it; but the latter being informed of his intention, deposed his father, and threw him into Tartarus. Saturn having escaped from thence, however, fled into Italy, where he was kindly received by Janus, king of the country, who associated him in the government; and hence Italy obtained the name of *Saturnia Tellus*, as also that of *Latium*, from *lateo*, to lie hidden. There Saturn, by the wisdom and mildness of his government, is said to have produced the golden age.

Saturn is represented as an old man with four wings, armed with a scythe; and sometimes he is delineated under the figure of a serpent with its tail in its mouth. This is emblematical of the seasons, which roll perpetually in the same circle. Sometimes also Saturn is painted with a sand-glass in his hand. The Greeks say that the story of his mutilating his father and destroying his children is an allegory, which signifies, that Time devours the past and present, and will also devour the future. The Romans, in honour of him, built a temple, and celebrated a festival which they denominated *Saturnalia*. During this festival no business or profession was allowed to be carried on except cookery; all distinctions of rank ceased; slaves could say with impunity what they pleased to their masters, and they could even rally them to their faces with their faults.

SATURNALIA, in Roman antiquity, a festival observed about the middle of December, in honour of the god Saturn, whom Lucan introduces giving an account of the ceremonies observed upon this occasion. "During my whole reign," says he, "which lasts but for one week, no public business is done; there is nothing but drinking, singing, playing, creating imaginary kings, placing servants with their masters at table, &c. There shall be no disputes or reproaches, but the rich and poor, masters and slaves, shall be equal." On this festival the Romans sacrificed bareheaded, contrary to their custom at other sacrifices.

SATURNINE, an appellation given to persons of a melancholy disposition, as being supposed to be under the influence of the planet Saturn.

SATYAVRATA, or Menu, in Indian mythology, is believed by the Hindus to have reigned over the whole world in the earliest age of their chronology, and to have resided in the country of Dravira, on the coast of the eastern Indian peninsula. His patronymic name was Vaivaswata, or Child of the Sun. Sir William Jones has shown it to be in the highest degree probable, that the Satyavrata of India is the Kronus of Greece and the Saturn of Italy. See Saturn, and Asiatic Researches, vol. i. p. 230.

SATYRS, in ancient mythology, a species of demi-gods, who dwelt in the woods. They are represented as monsters, half men and half goats; having horns on their heads, and a hairy body, with the feet and tail of a goat. They are generally delineated in the train that follows Bacchus. As the poets supposed that they were remarkable for piercing eyes and keen raillery, they have placed them in the same pictures with the Graces, Loves, and even with Venus herself.

SAUL the son of Kish, of the tribe of Benjamin, was the first king of the Israelites. On account of his disobedient conduct, the kingdom was taken from his family and given to David.

SAUMUR, an arrondissement of the department of the Maine et Loire, in France, extending over 516 square miles. It is divided into eight cantons and ninety-three communes, and, in 1836, contained 91,159 inhabitants. The capital is the city of the same name, situated at the influx of the Thouet into the Loire, which here forms several islands. It contains 11,925 inhabitants. There is much linen trade carried on, some tanning, some copper and cutlery goods made, and some saltpetre refineries. Long. 0. 9. 55. W. Lat. 47. 15. 24. N.

SAUNDERS' Island, in the South Atlantic Ocean, ten leagues in circumference, and discovered by Captain Cook in 1775. Long. 26. 44. W. Lat. 57. 49. S.

SAUNDERSON, Dr Robert, an eminent casuist, was

Saunderson.

born at Rotherham, in Yorkshire, on the 19th of September 1587. He was descended of an ancient family, and attended the grammar-school at Rotherham, where he made such wonderful proficiency in the languages, that at thirteen it was judged proper to send him to Lincoln College, Oxford. In 1608 he was appointed logic reader in the same college. He took orders in 1611, and was promoted successively to several benefices. Archbishop Laud recommended him to Charles I. as a profound casuist; and that monarch, who seems to have been a great admirer of casuistical learning, appointed him one of his chaplains in 1631. Charles proposed several cases of conscience to him, and received so great satisfaction from his answers, that at the end of his month's attendance he told him that he would wait with impatience during the intervening eleven months, as he was resolved to be more intimately acquainted with him, when it would again be his turn to officiate. The king regularly attended his sermons, and was wont to say that he "carried his ears to hear other preachers, but his conscience to hear Mr Saunderson."

In 1642 Charles created him regius professor of divinity at Oxford, with the canonry of Christ Church annexed. But the civil wars prevented him until 1646 from entering on the office; and in 1648 he was ejected by the visitors which the parliament had commissioned. He must have stood high in the public opinion; for in the same year in which he was appointed professor of divinity, both houses of parliament recommended him to the king as one of their trustees for settling the affairs of the church. The king, too, reposed great confidence in his judgment, and frequently consulted him about the state of his affairs. When the parliament proposed the abolition of the episcopal form of church government, as incompatible with monarchy, Charles desired him to take the subject under his consideration, and deliver his opinion. He accordingly wrote a treatise entitled Episcopacy, as established by Law in England, not prejudicial to Regal Power. At taking leave, the king advised him to publish Cases of Conscience. He replied that "he was now grown old, and unfit to write cases of conscience." The king said, "It was the simplest thing he had ever heard from him; for no young man was fit to be a judge, or write cases of conscience." Walton, who wrote the life of Dr Saunderson, informs us, that in one of these conferences the king told Saunderson, or one of the rest who was then in company, that "the remembrance of two errors did much affect him, which were his assent to the Earl of Strafford's death, and the abolishing of Episcopacy in Scotland; and that if God ever restored him to the peaceable possession of his crown, he would prove his repentance by a public confession and a voluntary penance, by walking barefoot from the Tower of London, or Whitehall, to St Paul's Church, and would desire the people to intercede with God for his pardon."

Dr Saunderson was taken prisoner by the parliament's troops, and conveyed to Lincoln, in order to procure in exchange a Puritan divine named Clark, whom the king's army had taken. The exchange was agreed to, on condition that Dr Saunderson's living should be restored, and his person and property remain unmolested. The first of these demands was readily complied with; and a stipulation was made, that the second should be observed; but it was impossible to restrain the licentiousness of the soldiers. They entered his church in the time of divine service, interrupted him when reading prayers, and even had the audacity to take the common-prayer book from him, and to tear it to pieces.

Mr Boyle, having read a work of Dr Saunderson's, entitled *De Juramenti Obligatione*, was so much pleased that he inquired at Bishop Barlow, whether he thought that it was possible to prevail on the author to write Cases of Conscience, if an honorary pension was assigned him to enable him to purchase books and pay an amanuensis. Saunderson told Barlow, "that if any future tract of his could be of any use to mankind, he would cheerfully set about it without a pension." Boyle, however, sent him a present of L.50, sensible, no doubt, that, like the other royalists, his finances could not be great. Upon this Dr Saunderson published his book *De Conscientia.*

When Charles II. was reinstated in the throne, he recovered his professorship and canonry, and soon afterwards was promoted to the bishopric of Lincoln. During the two years and a half in which he possessed this new office, he spent a considerable sum in augmenting poor vicarages, and in repairing the palace at Budgen. He died on the 29th of January 1662–63, in his seventy-sixth year.

He was a man of great acuteness and solid judgment. "That staid and well-weighed man Dr Saunderson," says Dr Hammond, "conceives all things deliberately, dwells upon them discreetly, discerns things that differ exactly, passeth his judgment rationally, and expresses it aptly, clearly, and honestly." Being asked, what books he had read most, he replied, that "he did not read many books, but those which he did read were well chosen and frequently perused." These, he said, were chiefly three, Aristotle's Rhetoric, Aquinas's *Secunda Secundæ*, and Cicero's works, especially his Offices, which he had not read over less than twenty times, and could even, in his old age, recite without book." He added, that "the learned civilian Dr Zouch had written *Elementa Jurisprudentiæ*, which he thought he could also say without book, and that no wise man could read it too often." He was not only conversant with the fathers and schoolmen, with casuistical and controversial divinity, but he was well acquainted with all the histories of the English nation, was a great antiquary, had searched minutely into records, and was well skilled in heraldry and genealogy.

It will now be proper here to give a short account of his works. 1. In 1615 he published *Logicæ Artis Compendium*, which was the system of lectures he had delivered in the university when he was logic reader; 2. Sermons, amounting in number to thirty-six, printed in 1681, folio, with the author's life by Walton; 3. Nine Cases of Conscience resolved, first collected in one volume in 1678, 8vo; 4. *De Juramenti Obligatione*, which was translated into English by Charles I. while a prisoner in the Isle of Wight, and printed at London in 1665, in 8vo; 5. *De Obligatione Conscientiæ;* 6. Censure of Mr Antony Ascham his book of the confusions and revolutions of government; 7. *Pax Ecclesiæ*, concerning Predestination, or the five points; 8. Episcopacy, as established by Law in England, not prejudicial to the Regal Power, in 1661. Besides these, he wrote two Discourses in defence of Usher's writings.

SAUNDERSON, *Dr Nicholas*, was born at Thurlstone, in Yorkshire, in 1682, and may be considered as a prodigy for his application and success in mathematical literature, in circumstances apparently the most unfavourable. He lost his sight by the small-pox before he was a year old. But this disaster did not prevent him from searching after that knowledge for which nature had given him so ardent a desire. He was initiated into the Greek and Roman authors at a free school at Penniston. After spending some years in the study of the languages, his father, who had a place in the excise, began to teach him the common rules of arithmetic. But he soon surpassed his father, and could make long and difficult calculations without having any sensible marks to assist his memory. At eighteen he was taught the principles of algebra and of geometry by Mr Richard West of Undoorbank, who, though a gentleman of fortune, yet, being strongly attached to mathematical learning, readily undertook the education of so uncommon a genius. Saunderson was also assisted in his mathematical studies by Dr Nettleton. These two gentlemen read books to him and explained them. He was next sent to a private academy at Attercliff near Sheffield, where logic and metaphysics were chiefly taught. But these sciences not suiting his turn of mind, he soon left the academy. He lived for some time in the country without any instructor; but such was the vigour of his own mind, that few instructions were necessary. He only required books and a reader.

His father, besides the place he had in the excise, possessed also a small estate; but having a numerous family to support, he was unable to give him a liberal education at one of the universities. Some of his friends, who had remarked his perspicuous and interesting manner of communicating his ideas, proposed that he should attend the university of Cambridge as a teacher of mathematics. This proposal was immediately put in execution, and he was accordingly conducted to Cambridge in his twenty-fifth year, by Mr Joshua Dunn, a fellow-commoner of Christ's College. Though he was not received as a member of the college, he was treated with great attention and respect. He was allowed a chamber, and had free access to the library. Mr Whiston was at that time professor of mathematics, and as he read lectures in the way that Saunderson intended, it was naturally to be supposed he would view his project as an invasion of his office. But, instead of meditating any opposition, the plan was no sooner mentioned to him than he gave his consent to it. Saunderson's reputation was soon spread throughout the university. When his lectures were announced, a general curiosity was excited to hear such intricate mathematical subjects explained by a man who had been blind from his infancy. The subject of his lectures was the *Principia Mathematica*, the Optics, and the *Arithmetica Universalis*, of Sir Isaac Newton. He was accordingly attended by a very numerous audience. It will appear at first incredible to many that a blind man should be capable of explaining optics, which requires an accurate knowledge of the nature of light and colours; but we must recollect that the theory of vision is taught entirely by lines, and is subject to the rules of geometry.

While thus employed in explaining the principles of the Newtonian philosophy, he became known to its illustrious author. He was also intimately acquainted with Halley, Cotes, Demoivre, and other eminent mathematicians. When Whiston was removed from his professorship, Saunderson was universally allowed to be the man best qualified for the succession. But to enjoy this office it was necessary, as the statutes direct, that he should be promoted to a degree. To obtain this privilege, the heads of the university applied to their chancellor the Duke of Somerset, who procured the royal mandate to confer upon him the degree of master of arts. He was then elected Lucasian professor of mathematics in November 1711. His inauguration speech was composed in classical Latin, and in the style of Cicero, with whose works he had been much conversant. He now devoted his whole time to his lectures and the instruction of his pupils. In 1728, when George II. visited the university of Cambridge, he expressed a desire to see Professor Saunderson. In compliance with this desire, he waited upon his majesty in the senate-house, and was there, by the king's command, created doctor of laws. He was admitted a member of the Royal Society in 1736.

Saunderson was naturally of a vigorous constitution, but having confined himself to a sedentary life, he at length became scorbutic. For several years he felt a numbness in his limbs, which in the spring of 1739 brought on a mortification in his foot; and, unfortunately, his blood was so vitiated by the scurvy, that assistance from medicine was not to be expected. When he was informed that his death was near, he remained for a little space calm and silent; but he soon recovered his former vivacity, and conversed with his usual ease. He died on the 19th of April 1739, in the fifty-seventh year of his age, and was buried at his own request in the chancel at Boxworth. He married the daughter of Mr Dickens, rector of Boxworth, in Cambridgeshire, and by her had a son and a daughter.

Dr Saunderson was rather to be admired as a man of wonderful genius and assiduity, than to be loved for his amiable qualities. He spoke his sentiments freely of characters, and praised or condemned his friends as well as his enemies without reserve. This has been ascribed by some to a love of defamation; but it has with more propriety been attributed by others to an inflexible love of truth, which urged him upon all occasions to speak the sentiments of his mind without disguise, and without considering whether this conduct would please, or the reverse. His sentiments were supposed to be unfavourable to revealed religion. It is said that he alleged he could not know God, because he was blind, and could not see his works; and that upon this Dr Holmes replied, "Lay your hand upon yourself, and the organization which you will feel in your own body will dissipate so gross an error." On the other hand, we are informed that he had desired the sacrament to be given him on the evening before his death. He was however seized with a delirium, which rendered this impossible.

He wrote a system of algebra, which was published in two volumes 4to, at London, after his death, in the year 1740, at the expense of the university of Cambridge.

Dr Saunderson had invented for his own use a Palpable Arithmetic, that is, a method of performing operations in arithmetic solely by the sense of touch. It consisted of a table raised upon a small frame, so that he could apply his hands with equal ease above and below. On this table were drawn a great number of parallel lines, which were crossed by others at right angles; the edges of the table were divided by notches half an inch distant from one another, and between each notch there were five parallels, so that every square inch was divided into a hundred little squares. At each angle of the squares where the parallels intersected one another, a hole was made quite through the table; and in each hole were placed two pins, a large and a small one. It was by the various arrangements of the pins that Saunderson performed his operations.

His sense of touch was so perfect that he could discover with the greatest exactness the slightest inequality of surface, and could distinguish in the most finished works the smallest oversight in the polish. In the cabinet of medals at Cambridge he could single out the Roman medals with the utmost correctness; and he could also perceive the slightest variation in the atmosphere. One day, while some gentlemen were making observations on the sun, he took notice of every little cloud that passed over his disk and served to interrupt their labours. When any object passed before his face, even though at some distance, he discovered it, and could guess its size with considerable accuracy. When he walked, he knew when he passed by a tree, a wall, or a house. He had made these distinctions from the different ways his face was affected by the motion of the air.

His musical ear was so remarkably acute, that he could distinguish accurately to the fifth of a note. In his youth he had been a performer on the flute, and he had made such proficiency, that if he had cultivated his talents in this way, he would probably have been as eminent in music as he was in mathematics. He recognised not only his friends, but even those with whom he was slightly acquainted, by the tone of their voice; and he could judge with wonderful exactness of the size of any apartment into which he was conducted.

SAURIN, James, a celebrated preacher, was born at Nismes in 1677, being the son of a Protestant lawyer of considerable eminence. He applied to his studies with great success; but at length being captivated with a military life, Saurin.

he relinquished them for the profession of arms. In 1694 he made a campaign as a cadet in Lord Galloway's company, and soon afterwards obtained a pair of colours in the regiment of Colonel Renault, which served in Piedmont. But the Duke of Savoy having made peace with France, he returned to Geneva, and resumed the study of philosophy and theology under Turretin and other professors. In 1700 he visited Holland, then went to England, where he remained for several years, and married. In 1705 he returned to the Hague, where he fixed his residence, and preached with the most unbounded applause. To an exterior appearance highly prepossessing, he added a strong and harmonious voice. The sublime prayer which he recited before his sermon was uttered in a manner highly affecting. Nor was the attention excited by the prayer dissipated by the sermon. All who heard it were charmed; and those who came with an intention to criticise, were carried along with the preacher and forgot their design. Saurin had, however, one fault in his delivery; he did not manage his voice with sufficient skill. He exhausted himself so much in his prayer and the beginning of his sermon, that his voice grew feeble towards the end of the service. His sermons, especially those which were published during his life, are distinguished for justness of thought, force of reasoning, and an eloquent unaffected style. Saurin died on the 30th of December 1730, aged fifty-three years.

He wrote, first, Sermons, which were published in twelve vols. 8vo and 12mo; some of which display great genius and eloquence, and others are composed with negligence. One may observe in them the imprecations and the aversion which the Calvinists of that age were wont to utter against the Roman Catholics. Saurin was, notwithstanding, a lover of toleration; and his sentiments on this subject gave great offence to some of his fanatical brethren, who attempted to obscure his merit and embitter his life. They found fault with him because he did not call the pope Antichrist, and the Church of Rome the whore of Babylon. But these prophetic metaphors, however applicable they may be, were certainly not intended by the benevolent religion of Jesus to be bandied about as terms of reproach; which would teach those to rail who use them, and irritate, without convincing, those to whom they were applied. Saurin, therefore, while he perhaps interpreted these metaphors in the same way with his opponents, discovered more of the moderation of the Christian spirit. Five volumes of his sermons were published in his life, and the rest have been added since his decease.

Secondly, he published Discourses Historical, Critical, and Moral, on the most memorable Events of the Old and New Testament. This is his greatest and most valuable work. It was first printed in two volumes folio. As it was left unfinished, Beausobre and Roques undertook a continuation of it, and increased it to four volumes. It is full of learning, being a collection of the opinions of the best authors, both Christian and heathen; of the philosophers, historians and critics, on every subject which the author examines. He also published the State of Christianity in France, 1725, 8vo; in which he discusses many important points of controversy, and calls in question the truth of the miracle said to have been performed on La Fosse at Paris; and An Abridgment of Christian Theology and Morality, in the form of a Catechism, 1722, 8vo.

A Dissertation which he published on the Expediency of sometimes disguising the Truth, raised a multitude of enemies against him. In this discourse his plan was, to state the arguments of those who affirm that, in certain cases, it is lawful to disguise truth, and the answers of those who maintain the contrary. He does not determine the question, but seems, however, to incline to the former opinion. He was immediately attacked by several adversaries, and a long controversy ensued; but his doctrines and opinions were at length publicly approved of by the synods of Campen and the Hague.

Saurin.

The subject of this controversy has long been agitated, and men of equally good principles have supported opposite sides in it. It would certainly be a dangerous maxim that falsehood can ever be lawful. There may, indeed, be particular cases when the motives to it are of such a nature as to diminish its criminality; but to lessen its guilt is a very different thing from justifying it by the laws of morality.

Saurin, *Joseph*, a geometrician of the Academy of Sciences at Paris, was born at Courtouson, in the principality of Orange, in the year 1659. His father, who was a minister at Grenoble, was his first preceptor. He made rapid progress in his studies, and, when very young, was admitted minister of Eure in Dauphiné; but having made use of some violent expressions in one of his sermons, he was obliged to quit France in the year 1683. He retired to Geneva, and thence to Berne, where he obtained a considerable living. Scarcely was he settled in his new habitation, however, when some theologians raised a persecution against him. Saurin, hating controversy, and disgusted with Switzerland, where his talents were entirely concealed, repaired to Holland. He returned soon afterwards to France, and surrendered himself into the hands of Bossuet, the bishop of Meaux, who obliged him to make a recantation of his errors. This event took place in 1690. His enemies, however, suspected his sincerity in the abjuration which he had made. It was a general opinion, that the desire of cultivating science in the capital of France had a greater effect in producing this change than religion. Saurin, however, speaks of the reformers with great asperity, and condemns them for going too far. "Deceived in my opinions concerning the rigid system of Calvin, I no longer regarded that reformer in any other light but as one of those extravagant geniuses who are carried beyond the bounds of truth. Such appeared to me in general the founders of the reformation; and that just idea which I have now obtained of their character has enabled me to shake off a load of prejudices. I saw in most of the articles which have separated them from us, such as the invocation of saints, the worship of images, the distinction of meats, &c. that they had much exaggerated the inevitable abuses of the people, and imputed these to the Church of Rome, as if sanctioned by its doctrines; besides, that they have misrepresented those doctrines which were not connected with any abuse. One thing which surprised me much when my eyes began to open, was the false idea, though in appearance full of respect for the word of God, which the reformers entertained of the perfection and perspicuity of the Holy Scriptures, and the manifest misinterpretation of passages which they bring to support that idea (for that misinterpretation is a point which can be proved). Two or three articles still raised some objections in my mind against the Church of Rome; to wit, transubstantiation, the adoration of the sacrament, and the infallibility of the church. The adoration of the sacrament I considered as idolatry, and, on that account, removed from her communion. But soon after, the Exposition of the bishop of Meaux, a work which can never be sufficiently admired, and his Treatise concerning changes, reversed all my opinions, and rendered me an enemy to the Reformation." It is said also that Saurin appeased his conscience by reading Poiret's *Cogitationes Rationales*. This book is written with a view to vindicate the Church of Rome from the charge of idolatry.

If it was the love of distinction that induced Saurin to return to the Church of Rome, he was not disappointed; for he there met with protection and support. He was favourably received by Louis XIV., obtained a pension from him, and was treated by the Academy of Sciences with the most flattering respect. At that time (1717) geometry formed his principal occupation. He adorned the *Journal des Sçavans* with many excellent treatises;

ssure.

and he added to the memoirs of the academy many interesting papers. These are the only works which he has left behind him. He died at Paris, of a fever, on the 29th of December 1737, in his seventy-eighth year. He married a wife of the family of Crousas, in Switzerland, who bore him a son, Bernard Joseph, distinguished as a writer for the theatre.

Saurin was of a bold and impetuous spirit. He had that lofty deportment which is generally mistaken for pride. His philosophy was austere; his opinions of men were not very favourable; and he often delivered them in their presence. This created him many enemies. His memory was attacked after his decease. A letter was printed in the *Mercure Suisse*, said to be written by Saurin from Paris, in which he acknowledges that he had committed several crimes which deserved death. Some Calvinist ministers published in 1757 two or three pamphlets to prove the authenticity of that letter; but Voltaire made diligent inquiry, not only at the place where Saurin had been discharging the sacerdotal office, but at the deans of the clergy of that department. They all exclaimed against an imputation so opprobrious. It must not, however, be concealed, that Voltaire, in the defence which he has published in his general history of Saurin's conduct, leaves some unfavourable impressions upon the reader's mind. He insinuates that Saurin sacrificed his religion to his interest, and that he played upon Bossuet, who believed he had converted a clergyman, when he had only given a little fortune to a philosopher.

SAUSSURE, Horace Benedict de, a celebrated naturalist, was a native of Geneva, and born in the year 1740. His father was an intelligent farmer, who lived at Conches, about half a league from Geneva, which no doubt contributed, in addition to his active education, to increase the physical strength of young Saussure, so requisite for a naturalist who intends to travel. He went daily to town for public instruction; and as he lived at the foot of a mountain, he frequently amused himself in ascending its steep and rugged sides. Thus environed by the phenomena of nature, and assisted by study, it was to be expected that he would soon conceive a predilection for natural history. Botany was his most early and favourite study, a taste which was powerfully encouraged by his local situation, and was the means of introducing him to the acquaintance of the great Haller, to whom he paid a visit in 1764, and who was astonished at his intimate acquaintance with every branch of the natural sciences.

His attachment to the study of the vegetable kingdom was also increased by his connection with Bonnet, who had married his aunt, and who put a proper estimate on the talents of his nephew. He was at that time engaged in the examination of the leaves of plants, to which Saussure was also induced to turn his attention, and published the result of his researches under the title of Observations on the Bark of Leaves. About this time the philosophical chair at Geneva became vacant, and was given to Saussure at the age of twenty-one. Rewards conferred so early have been thought to extinguish in some a zeal for the increase of knowledge; but this was not the case with De Saussure, who taught physics and logic alternately with equal success. For physics, however, he had the greatest taste, as affording the means of prosecuting the study of chemistry, mineralogy, and other kindred sciences.

He now began his travels through the mountains, not for the purpose of studying, as formerly, their flowery decorations, but their constituent parts, and the disposition of their masses. During the first fifteen years of his professorship, he was alternately engaged in discharging the duties of his office, and in traversing the mountains in the vicinity of Geneva; and in this period his talents as a great philosopher were fully displayed. He extended his researches on one side to the banks of the Rhine, and on the other to the country of Piedmont. He travelled to Auvergne to examine the extinguished volcanoes, going afterwards to Paris, England, Holland, Italy, and Sicily. It is proper to remark, that these were not mere journeys, but were undertaken purely with the view of studying nature; and in all his journeys he was surrounded with such instruments as would be of service to him, together with plans previously arranged of his whole procedure.

Saussure.

The first volume of his travels through the Alps, which was published in 1779, contains a circumstantial description of the environs of Geneva, and an excursion as far as Chamouni, a village at the foot of Mont Blanc. It contains a description of his *magnetometer*. In proportion as he examined the mountains, the more was he persuaded of the importance of mineralogy; and that he might study it with advantage, he acquired a knowledge of the German language. In the last volumes of his travels, the reader will perceive how much new mineralogical knowledge he had acquired.

During the troubles which agitated Geneva in 1782, he made his beautiful and interesting experiments on hygrometry, which he published in 1783. This has been pronounced the best work that ever came from his pen, and completely established his reputation as a philosopher. De Saussure resigned his chair to his pupil and fellow-labourer, Pictet, who discharged the duties of his office with reputation, although rendered difficult to him by succeeding so great a man. He projected a plan of reform in the education of Geneva, the design of which was to make young people acquainted with the natural sciences and mathematics at an early period; and wished that their physical education should not be neglected, for which purpose he proposed gymnastic exercises. This plan found admirers in the city, but the poverty of its funds was an obstacle in the way of any important innovation. It was dreaded, too, that if established forms were changed, they might be altered for the worse.

The attention of De Saussure was not wholly confined to public education, for he superintended the education of his own two sons and a daughter, who have since proved themselves worthy of such a father and preceptor. In 1786, he published his second volume of travels, containing a description of the Alps around Mont Blanc, the whole having been examined with the eye of a mineralogist, geologist, and philosopher. It contains some valuable experiments on electricity, and a description of his own electrometer, said to be the most perfect we have. To him we are indebted for his *cyanometer*, for measuring the degree of blueness of the heavens, which is found to vary according to the height of the observer; his *diaphanometer*, for measuring the transparency of the atmosphere; and his *anemometer*, for ascertaining the force of the winds. He founded the Society of Arts, to the operations of which Geneva is indebted for the state of prosperity which it has reached within the last thirty years. Over that society he presided to the day of his death; and the preservation of it in prosperity constituted one of his fondest wishes.

In 1794, the health of this eminent man began rapidly to decline, and a severe stroke of the palsy almost deprived him of the use of his limbs. Such a condition was no doubt painful; but his intellects still preserved their original activity, and he prepared for the press the last two volumes of his travels, which appeared in 1796. They contain a great mass of new facts and observations, of the last importance to physical science. During his illness he published Observations on the Fusibility of Stones by means of the Blow-pipe. He was in general a Neptunian, ascribing the revolutions of our globe to water, and admitting the possibility of mountains having been thrown up by elastic fluids disengaged from the cavities of the earth. In the midst of his rapid decline he cherished the hopes of recovery; but his strength was exhausted. A languor succeeded the vigour which he had formerly enjoyed; his slow pronunciation did not correspond with the vivacity of his mind, and formed a melancholy contrast to the pleasantness which he had formerly exhibited. He tried in vain to procure the re-establishment of his health; for all the remedies prescribed by the ablest physicians were wholly ineffectual. His mind afterwards lost its activity; and on the 22d of March 1799, he finished his mortal career, in the fifty-ninth year of his age, lamented by a family to whom he was dear, by a country to which he had done great honour, and by Europe, the knowledge of which he had extended.

SAUTGUR, a town of the south of India, in the province of Barramahal, among the Eastern Ghauts, thirty miles west from Vellore. Long. 78. 54. E. Lat. 12. 58. N. The pass in the Ghaut beyond this place, approaching the Mysore, has been levelled and improved since the conquest of the country by the British.

SAUVEUR, Joseph, an eminent French mathematician, born at La Flèche in 1653. He was absolutely dumb until he was seven years of age; and even then his organs of speech were not evolved so fully as to permit him to speak without great deliberation. Mathematics were the only studies he had any relish for, and these he cultivated with extraordinary success; so that he commenced teacher at twenty years of age, and rose so rapidly into vogue, that he had Prince Eugene for his scholar. He became mathematical professor in the royal college in 1686; and ten years afterwards was admitted a member of the Academy of Sciences. He died in 1716; and his writings, which consist rather of detached papers than of connected treatises, are all inserted in the Memoirs of the Academy of Sciences. He was twice married; and by the last wife he had a son, who, like himself, was dumb for the first seven years of his life.

SAVA, a town of Persia, now in ruins, in the northern part of the province of Irak. It is still the capital of a district which yields excellent pasture, though strongly impregnated with salt. It is one hundred and eighty miles north-west from Ispahan.

SAVAGE is a word so well understood as scarcely to require explanation. When applied to inferior animals, it denotes that they are wild, untamed, and cruel; when applied to man, it is of much the same import with barbarian, and means a person that is untaught and uncivilized, or who is in the rudest state of uncultivated nature.

Savage *Island*, in the South Pacific Ocean, discovered by Captain Cook in 1774. It is about thirty-three miles in circumference. Long. 169. 37. W. Lat. 19. 1. S.

Savage, *Richard*, one of the most remarkable characters that is to be met with in all the records of biography, was, according to her own confession, the son of Anne countess of Macclesfield by the Earl of Rivers, and was born in 1698. This confession of adultery was made in order to procure a separation from her husband the Earl of Macclesfield; yet, having obtained this desired end, no sooner was her spurious offspring brought into the world, than, without the dread of shame or poverty to excuse her, she discovered the resolution of disowning him, and, as long as he lived, treated him with the most unnatural cruelty. She delivered him over to a poor woman to educate as her own; prevented the Earl of Rivers from leaving him a legacy of L.6000, by declaring him dead; and in effect deprived him of another legacy which his godmother Mrs Lloyd had left him, by concealing from him his birth, and thereby rendering it impossible for him to prosecute his claim. She endeavoured to send him secretly to the plantations; but this plan being either laid aside or frustrated, she placed him apprentice with a shoemaker. In this situation, however, he did not long continue; for his nurse having died, he went to take care of the effects of his supposed mother, and found in her boxes some letters which discovered to young Savage his birth, and the cause of its concealment.

From the moment of this discovery it was natural for him to become dissatisfied with his situation as a shoemaker. He now conceived that he had a right to share in the affluence of his real mother; and therefore he directly, and perhaps indiscreetly, applied to her, and made use of every art to awaken her tenderness and attract her regard. But in vain did he solicit this unnatural parent. She avoided him with the utmost precaution, and took measures to prevent his ever entering her house on any pretence whatever.

Savage was at this time so touched with the discovery of his birth, that he frequently made it his practice to walk before his mother's door in hopes of seeing her by accident; and often did he warmly solicit her to admit him to see her; but all to no purpose. He could neither soften her heart nor open her hand.

In the mean time, whilst he was assiduously endeavouring to rouse the affections of a mother in whom all natural affection was extinct, he was destitute of the means of support, and reduced to the miseries of want. We are not told by what means he got rid of his obligation to the shoemaker, or whether he ever was actually bound to him; but we now find him very differently employed in order to procure a subsistence. In short, the youth had parts, and a strong inclination towards literary pursuits, especially poetry. He wrote a poem, and afterwards two plays, Woman's a Riddle, and Love in a Veil; but the author was allowed no part of the profits from the first; and from the second he received no other advantage than the acquaintance of Sir Richard Steele and of Mr Wilkes, by whom he was pitied, caressed, and relieved. However, the kindness of his friends not affording him a constant supply, he wrote the tragedy of Sir Thomas Overbury, which not only procured him the esteem of many persons of wit, but brought him in L.200. The celebrated Aaron Hill was of great service to him in correcting and fitting this piece for the stage and the press; and he extended his patronage still further. But Savage was, like many other wits, a bad manager, and was ever in distress. As fast as his friends raised him out of one difficulty, he sunk into another; and, when he found himself greatly involved, he would ramble about like a vagabond, with scarcely a shirt to his back.

Mr Hill also earnestly promoted a subscription to a volume of Miscellanies by Savage, and likewise furnished part of the poems of which the volume was composed. To this miscellany Savage wrote a preface, in which he gives an account of his mother's cruelty in an uncommon strain of humour. The profits of his tragedy and his Miscellanies together had now, for a time, somewhat raised poor Savage both in circumstances and in credit; so that the world just began to behold him with a more favourable eye than formerly, when both his fame and his life were endangered by a most unhappy event. A drunken frolic in which he one night engaged, ended in a fray, and Savage unfortunately killed a man, for which he was condemned to be hanged. His friends earnestly solicited the mercy of the crown, whilst his mother as earnestly exerted herself to prevent his receiving it. The Countess of Hertford at length laid his whole case before Queen Caroline, and Savage obtained a pardon.

Savage had now lost that tenderness for his mother which the whole series of her cruelty had not been able wholly to repress; and considering her as an implacable enemy, whom nothing but his blood could satisfy, threatened to harass her with lampoons, and to publish a copious narrative of her conduct, unless she consented to allow him a pension. This expedient proved successful; and the Lord Tyrconnel, upon his promise of laying aside his design of exposing his mother's cruelty, took him into his family, treated him as an equal, and engaged to allow him a pension of L.200 a year. This was the golden part of Savage's life. He was courted by all who endeavoured to be thought men of genius, and caressed by all who valued themselves upon a refined taste. In this gay period of his life he published the Temple of Health and Mirth, on the recovery of Lady Tyrconnel from a languishing illness; and The Wanderer, a moral poem, which he dedicated to Lord Tyrconnel, in strains of the highest panegyric. But these praises he in a short time found himself inclined to retract, being discarded by the man on whom they were bestowed. Of this quarrel Lord Tyrconnel and Mr Savage assigned very different reasons. Our author's known character pleads too strongly against him; for his conduct was ever such as made all his friends, sooner or later, grow weary of him, and even forced most of them to become his enemies.

Being thus once more turned adrift upon the world, Savage, whose passions were very strong, and whose gratitude was very small, became extremely diligent in exposing the faults of Lord Tyrconnel. He, moreover, now thought himself at liberty to take revenge upon his mother, in a poem called The Bastard. This poem had an extraordinary sale; and its appearance happening when his mother was at Bath, many persons there took frequent opportunities of repeating passages from the Bastard in her hearing.

Some time after this, Savage formed the resolution of applying to the queen. With this view, he published a poem on her birth-day, which he entitled the Volunteer-Laureat; for which she was pleased to send him L.50, with an intimation that he might annually expect the same bounty. But this annual allowance was nothing to a man of his strange and singular extravagance. His usual custom was, as soon as he had received his pension, to disappear with it, and secrete himself from his most intimate friends, till every shilling of the L.50 was spent; which done, he appeared again, pennyless as before. But he would never inform any person where he had been, or in what manner his money had been dissipated. From the reports, however, of some, who found means to penetrate his haunts, it would seem that he expended both his time and his cash in the most sordid and despicable sensuality.

His wit and parts, however, still raised him new friends as fast as his behaviour lost him his old ones. Yet such was his conduct, that occasional relief only furnished the means of occasional excess; and he defeated all attempts made by his friends to fix him in a decent way. He was even reduced so low as to be destitute of a lodging, insomuch that he often passed his nights in those mean houses that are set open for casual wanderers; sometimes in cellars, amidst the riot and filth of the most profligate of the rabble; and not seldom would he walk the streets till he was weary, and then lie down in summer on a hulk, or in winter with his associates among the ashes of a glass-house.

Yet, amidst all this penury and wretchedness, had this man so much pride, and so high an opinion of his own merit, that he was always ready to repress, with scorn and contempt, the least appearance of any slight or indignity towards himself, in the behaviour of his acquaintance, among whom he looked upon none as his superior. This life, unhappy as it may be imagined, was yet rendered more so by the death of the queen in 1738, which stroke deprived him of all hopes from the court. His pension was discontinued, and the insolent manner in which he demanded of Sir Robert Walpole to have it restored, for ever cut off this considerable supply.

His distress became now so great and so notorious, that a scheme was at length concerted for procuring him a permanent relief. It was proposed that he should retire into Wales, with an allowance of L.50 per annum, on which he was to live privately in a cheap place, for ever quitting his town haunts, and resigning all further pretensions to fame. This offer he seemed gladly to accept; but his intentions were only to deceive his friends, by retiring for a while, to write another tragedy, and then to return with it to London in order to bring it upon the stage.

In 1739 he set out in the Bristol stage-coach for Swansey, and was furnished with fifteen guineas to bear the expense of his journey. But, on the fourteenth day after his departure, his friends and benefactors, the principal of whom was Mr Pope, who expected to hear of his arrival in Wales, were surprised with a letter from Savage, informing them that he was yet upon the road, and could not proceed for want of money. There was no other method than a remittance, which was sent him, and by the help of which he was enabled to reach Bristol, whence he was to proceed to Swansey by water. At Bristol, however, he found an embargo laid upon the shipping, so that he could not immediately obtain a passage. Here, therefore, being obliged to stay for some time, he, with his usual facility, so ingratiated himself with the principal inhabitants, that he was frequently invited to their houses, distinguished at their public entertainments, and treated with a regard that highly flattered his vanity, and therefore easily engaged his affections. At length, with great reluctance, he proceeded to Swansey, where he lived about a year, very much dissatisfied with the diminution of his salary; for he had, in his letters, treated his contributors so insolently, that most of them withdrew their subscriptions. Here he finished his tragedy, and resolved to return with it to London; which was strenuously opposed by his great and constant friend Mr Pope, who proposed that Savage should put this play into the hands of Mr Thomson and Mr Mallet, in order that they might fit it for the stage, that his friends should receive the profits it might bring in, and that the author should receive the produce by way of annuity. This kind and prudent scheme was rejected by Savage with the utmost contempt. He declared he would not submit his works to any one's correction; and that he should no longer be kept in leading-strings. He soon returned to Bristol in his way to London; and there meeting with a repetition of the same kind treatment he had before found, he was tempted to make a second stay in that opulent city. Here he was again not only caressed and treated, but the sum of L.30 was raised for him, with which it had been happy if he had immediately departed for London. But he never considered that a frequent repetition of such kindness was not to be expected, and that it was possible to tire out the generosity of his Bristol friends, as he had before tired his friends everywhere else. In short, he remained here till his company was no longer welcome. His visits in every family were too often repeated; his wit had lost its novelty, and his irregular behaviour grew troublesome. Necessity came upon him before he was aware. His money was spent, his clothes were worn out, his appearance was shabby, and his presence was disgustful at every table. He now began to find every man from home at whose house he called. Thus reduced, it would have been prudent in him to have withdrawn from the place; but prudence and Savage were never acquainted. He staid, in the midst of poverty, hunger, and contempt, till the mistress of a coffee-house, to whom he owed about eight pounds, arrested him for the debt. He remained for some time, at a great expense, in the house of the sheriff's officer, in hopes of procuring bail; which expense he was enabled to defray by a present of five guineas from Mr Nash. No bail, however, was to be found, so that poor Savage was at last lodged in Newgate, a prison so named in Bristol.

But it was the fortune of this extraordinary mortal always to find more friends than he deserved. The keeper of the prison took compassion on him, and greatly softened the rigours of his confinement by every kind of indulgence. He supported him at his own table, gave him a commodious room to himself, allowed him to stand at the door of the jail, and even frequently took him into the fields for the benefit of the air and exercise; so that, in reality, Savage endured fewer hardships in this place than he had usually suffered during the greater part of his life. Whilst he remained in this not intolerable prison, his ingratitude again broke out, in a bitter satire on the city of Bristol, to which he certainly owed great obligations, notwithstanding the circumstances of his arrest, which was but the act of an individual, and that attended with no circumstances of injustice or cruelty.

When Savage had remained about six months in this hospitable prison, he received a letter from Mr Pope, who still continued to allow him L.20 a year, containing a charge of very atrocious ingratitude. What were the particulars of this charge we are not informed; but, from the notorious character of the man, there is reason to fear that Savage was but too justly accused. He, however, solemnly protested his innocence; but he was very unusually affected on this occasion. In a few days afterwards he was seized with a disorder, which at first was not suspected to be dangerous; but growing daily more languid and dejected, at last a fever seized him, and he expired on the 1st of August 1743, in the forty-sixth year of his age.

SAVANNAH, formerly the capital of Georgia, in North America. This city is advantageously situated for a commercial town, being accessible to large vessels from the sea, and communicating with the interior by the noble river of the same name. It is built on a high bank rising about forty feet above the water; and its spacious and regular streets and handsome buildings, mingling with the groves of ornamental trees, have an imposing appearance. The site was formerly unhealthy, on account of the surrounding swamps; but this evil has been remedied by judicious drainings, and by the substitution of the dry for the wet cultivation of rice around the city. Savannah was founded by General Oglethorpe in 1733, on a spot then known as the Yamacrow Bluff. It was captured by the British in 1778, and unsuccessfully besieged and assaulted by the French and Americans in the following year. In 1820 it suffered so much from a terrible fire, that its prosperity received a temporary check, and the population, which in 1820 had been 7523, was only 7423 in 1830; but it has since recovered from this shock, and has been for a number of years one of the most flourishing towns in the southern states, its population having increased to about 11,000 in 1835. Although the railroad from Augusta to Charlestown, and the security of the inland passage from the Savannah to that city, have of late tended to divert much of the trade thither, yet Savannah is the chief commercial dépôt in the state, and much of the cotton and rice of Georgia, with large quantities of the other exported articles, are shipped from its wharfs. In 1835, the exports included 250,000 bales of cotton, and 24,000 casks of rice; and the whole value of exported articles in 1836 amounted to 15,469,000 dollars. Twenty steam-boats of a large class, and fifty steam tug-boats, are employed on the river; and the shipping of the port amounts to 8375 tons. The banking institutions in the city are five, with an aggregate capital of 1,682,525 dollars. Long. 81. 10. W. Lat. 32. 8. N.

SAVARY, James, an eminent French writer on the subject of trade, was born at Done, in Anjou, in 1622. Being bred to merchandise, he continued in trade until 1658, when he left off the practice, to cultivate the theory. He had married in 1650; and in 1660, when the king declared his purpose of assigning privileges and pensions to such of his subjects as had twelve children alive, Mr Savary was not too rich to put in his claim to the royal bounty. He was afterwards admitted of the council for the reformation of commerce, and the orders which passed in 1670 were drawn up by his instructions and advice. He wrote *Le Parfait Negociant*, 4to; and *Avis et Conseils sur les Importantes Matières du Commerce*, in 4to. He died in 1690; and out of seventeen children whom he had by one wife, he left eleven. Two of his sons, James and Philemon Louis, laboured jointly on a great work, *Dictionnaire Universelle du Commerce*, in two vols. folio. This work was begun by James, who was inspector-general of the manufactures at the custom-house, Paris, and who called in the assistance of his brother Philemon Louis, although a canon of the royal church of St Maur, and by his death left him to finish it. This work appeared in 1723, and Philemon afterwards added a third supplemental volume. Postlethwayte's English Dictionary of Trade and Commerce is a translation, with considerable improvements, from Savary.

SAVARY, *M.*, an eminent French traveller and writer, was born at Vitre, in Bretagne, about the year 1748. He studied with applause at Rennes, and in 1776 travelled into Egypt, where he remained nearly three years. During this period he was wholly engaged in the study of the Arabian language, in searching out ancient monuments, and in examining the national manners. After making himself acquainted with the knowledge and philosophy of Egypt, he visited the islands in the Archipelago, where he spent eighteen months. On his return to France in the year 1780, he published, 1. A Translation of the Koran, with a short Life of Mahommed, in 1783, two vols. 8vo; 2. The Morality of the Koran, or a Collection of the most excellent Maxims in the Koran; 3. Letters on Egypt, in three vols. 8vo, in 1785. In these the author makes his observations with accuracy, paints with vivacity, and renders interesting every thing he relates. His descriptions are in general faithful, but are perhaps in some instances too much ornamented. He has been justly censured for painting modern Egypt and its inhabitants in too high colours. He died on the 4th of February 1788.

SAVE, a river of Germany, which has its source in Upper Carniola, on the frontiers of Carinthia. It runs through Carniola from west to east, afterwards separates Sclavonia from Croatia, Bosnia, and part of Servia, and then falls into the Danube at Belgrade.

SAVENAY, an arrondissement of the department of the Lower Loire, in France, extending over 210,279 hectares, which, in English measure, is equal to 739¼ square miles. It is divided into eleven cantons, and these into fifty-one communes, with (in 1836) 114,256 inhabitants. The capital is a town of the same name, which, in 1836, contained 2079 inhabitants.

SAVENDROOG, a celebrated fortress of the south of India, in Mysore. It is strongly situated on the summit of an immense rock, half a mile in nearly perpendicular height, and surrounded by a thick wood. It was taken by the British in 1791, without the loss of a man. Long. 77. 29. E. Lat. 12. 56. N.

SAVERNE, an arrondissement of the department of the Lower Rhine, in France. Its extent is 297,104 acres, equal to 464 square miles; and is divided into seven cantons, and these into 165 communes, with a population, in the year 1836, of 112,260 persons. The capital, a city of the same name, stands on the river Zorn, at the foot of the Vosges Mountains, in one of the most luxuriant parts of ancient Alsace. It is antiquely built, and contains 5352 inhabitants, who generally speak the German language. Long. 7. 48. 21. E. Lat. 48. 44. 20. N.

SAVIGLIANO, a city of Italy, in the kingdom of Sardinia and province of Turin. It stands on a fine plain watered by the river Maira. It is well built, and has a fine market-place, magnificent palaces, several churches and monasteries, and 18,750 inhabitants, among whom are many of the nobility. It has some considerable manufactures of silk and linen goods, and considerable trade in cattle, wine, and corn, especially in maize. Long. 6. 33. E. Lat. 44. 30. N.

SAVIGNANO, a town of Italy, in the papal delegation

SAVINGS BANKS are institutions established by act of parliament, for the safe custody of small sums deposited by the industrious classes, and for the accumulation of such sums at compound interest. The origin of savings banks is comparatively recent. Attempts at instituting such banks were made, on a small scale, at various places in England towards the end of last century and the beginning of the present: attempts of a private and isolated nature, without the benevolent individuals by whom they were made entertaining any idea of the institution ever becoming general; and it was reserved for an individual yet living to have the honour of founding an institution which served as a model for such banks, and thus of conferring an unspeakable blessing on the operative classes. We refer to the Rev. Dr Duncan, minister of Ruthwell in Dumfriesshire. In 1810 he established "the Parish Bank Friendly Society of Ruthwell;" and during the same year published a pamphlet on the subject, entitled "An Essay on the Nature and Advantages of Parish Banks." This pamphlet, in which the nature and advantages of these institutions are ably developed, had so great an effect, and the success of the Ruthwell institution had been so remarkable, that "Parish Banks," as Dr Duncan called them, but which are now described as Savings Banks, speedily sprung up, not only in most of the principal towns and boroughs of Scotland, but in several remote parishes.

Savings banks in England and Ireland were first taken under the protection of government by the act of 57th Geo. III. cap. 62, passed in 1817; but the first act in support of these institutions in Scotland did not pass till two years afterwards. A savings bank in Scotland, established under the latter act, is an institution formed by any number of persons who may choose to unite for the purpose of receiving deposits of small sums, and who, upon enrolling their rules at the quarter-sessions, acquire the privilege of suing and being sued in the name of trustees. The money and effects of the institution are vested in the trustees, for behoof of the depositors. Receipts and other documents used by the bank are exempted from stamp-duties; and provision is made by the act for a summary mode of settling disputes that may arise between the trustees and depositors. These were all the advantages which the act conferred on savings banks in Scotland. Hence these institutions did not flourish; the aggregate sums deposited in them at the period (1835) when the privileges of the English system were extended to Scotland not being estimated higher than L.100,000.

Various acts were meanwhile passed for the support of these institutions in England and Ireland; but all these statutes were consolidated in the existing English Savings Bank Act of 9th Geo. IV. cap. 92, passed in 1828, which was amended in a few particulars by the act of 3d Will. IV. cap. 14. These acts, as previously stated, were extended to Scotland in 1835.

By this statute the whole deposits may be invested in the Bank of England on account with the Commissioners for the Reduction of the National Debt, at the rate of L.3. 16s. 0½d. per cent. of interest. The savings banks are thus enabled to give a comparatively high rate of interest, which is generally L.3. 6s. 8d., or 3⅓ per cent. Each individual is allowed to deposit any sum from one shilling up to L.30 in a year, and L.150 in all, exclusive of interest; and, including interest, L.200. The bank is obliged to allow compound interest; and this interest must be made up by law at the end of every year (20th November), and added to the amount belonging to each depositor, even though he does not appear to get his book balanced. The bank is also authorized to receive the funds of friendly societies without limitation, and of benevolent and charitable institutions to the amount of L.300 in all. By this statute the whole funds are required to be invested with the National Debt Commissioners, and nowhere else; and any part of these funds, when required, is repaid by the Bank of England, without regard to fluctuations in the value of the public stocks. It likewise requires security to be given by every person—the treasurer, the actuary, the cashier, the clerks, the office-keeper—intrusted with the receipt or custody of any sum of money belonging to a savings bank; while neither these functionaries, nor the managers or trustees, nor any person having a control or direction in the management, can become depositors in the bank, or derive, directly or indirectly, any benefit from the institution. Annual returns must be made to the National Debt Office, and likewise suspended in the office of the bank, and exhibited to depositors; the manager and trustees being thus directly responsible both to the government and to the public. In short, while the greatest facilities are afforded for the increase of the funds, every possible precaution has been taken to insure their safe custody, and the direct responsibility of the managers. Nay, so liberal is the system, that the annual general meeting is open by law to depositors of the amount of L.10; but, practically speaking, every depositor who chooses is allowed to attend. Besides, the rules and regulations of every savings bank require to be approved by the Commissioners of the National Debt, and certified by the barrister-at-law appointed for the purpose, and enrolled at the quarter-sessions of the justices of the peace for the county in which the bank is situated. It may here be mentioned, that, to prevent an abuse of the institution, no person is allowed by law to be a depositor in two savings banks at the same time; and on joining a savings bank, every person is required to sign a declaration to that effect.

The act 2d and 3d Will. IV. enables depositors in savings banks, and others, to purchase government annuities, for life or for a given number of years, and either immediate or deferred. At present these annuities are limited to L.20 a year. The money advanced is returned (but without interest), provided the contracting party does not live to the age at which the annuity is to become payable, or is unable to continue the monthly or annual instalments. The transactions under the act are to be carried on through the medium of savings banks, or by societies established for the purpose. But of this scheme, the classes for whose benefit it was intended have not availed themselves to any great extent.

Since their establishment in 1817, the increase of savings banks has been beyond all expectation. The total sum of money invested by these institutions in England, Wales, and Ireland, amounts at this moment (1841) to upwards of L.22,000,000 sterling; while in Scotland, since 1835, when the English law on the subject was extended to that part of the united kingdom, the progress has also been very considerable; savings banks having been established in most of the principal towns; while, in many places, such institutions still exist, and are flourishing, under the meagre and defective statute of 1819. The National Security Savings Bank of Edinburgh was founded in April 1836; and on the 20th November 1841, after the lapse of only five years and a half, it had accumulated L.221,816. 19s. 0d., including interest; while the aggregate number of depositors was no fewer than 19,130, of whom 16,149 had balances (including interest) in their favour not exceeding L.20 each. Of this bank, 107 charitable societies, whose united deposits amounted to L.5215. 1s. 2d., had availed themselves; and sixty-two friendly societies, whose gross deposits amounted to L.216,585. 13s. 5d.

The object and principle of this great national institution cannot be too highly commended. In London, and many other parts of England, public banks do not receive small deposits, and upon none do they pay any interest. And even in Scotland, where the public banks allow interest on deposits, they are not willing to open an account under L.10. But few poor persons are able to save so large a sum, except by a lengthened course of economy. The truth therefore is, that, until savings banks were established, the poor were everywhere without the means of securely and profitably investing those small sums which they are not unfrequently in a condition to save, and were consequently led, from the difficulty of disposing of them, to neglect opportunities of making savings, or, if they did make them, were tempted by the offer of high interest to lend them to persons of doubtful character and desperate fortune, by whom they were for the most part squandered. Under such circumstances, it is plain that nothing could be more important in the way of diffusing habits of forethought and economy among the labouring classes than the establishment of savings banks, where the smallest sums are placed in perfect safety, are accumulated at compound interest, and are paid, with their accumulations, the moment they are demanded by the depositors.

But, notwithstanding the soundness of these views, various objections have been stated against these institutions. To a few only of these objections can we at present allude.

It has, for example, been objected to savings banks that the money deposited in them being sent to London and invested in national stock, is withdrawn from the spot where it was saved, and that thereby that spot is impoverished in proportion to the amount of the sum thus transferred. This objection is more specious than solid. In the first place, nine tenths of the money invested in savings banks would not be saved at all, but spent as it is earned, if these institutions did not exist. The savings bank does not transmit to London money already saved. It causes money to be saved which otherwise would have been spent. It may be said to *create* money; and it is only the fund which it creates that it transmits to London and invests in national stock. But, in the second place, no man is obliged to put his money into a savings bank, and thus to send it to London; nor will he ever dream of doing so, if he can invest it more profitably at home. Profitable and safe investment is the sole object, and money is always sure to go where it can be most profitably employed. The circumstance of an individual putting his earnings into a savings bank, affords a proof that such a mode of investment is regarded by him as the most eligible. Besides, he will at once recall it from the savings bank, which he is entitled to do, if he find he can invest it elsewhere more profitably. The savings bank, therefore, is not merely the parent of saving, but its deposits embrace only those sums which cannot be otherwise so profitably employed. It withdraws no money from productive industry. It merely embraces funds which cannot otherwise be so favourably employed, or which might not have existed, or have been placed in improper hands, and lost to the individual.

But there is no objection, no general or national objection to money being sent to London. The money thus disposed of is invested by the National Debt Commissioners, as agents, in stock; which is the same thing as if it were directly invested in productive industry. These commissioners, for example, have bought stock with the twenty-two millions of money belonging to the savings banks throughout England, Wales, and Ireland; and when they so bought in, other parties must necessarily have sold out. For any given amount of buying there must be an equal amount of selling. Now the money thus sold out will not lie idle, because money in a free country never lies idle, but will be invested in productive industry; and it is evidently the same thing for the country as if the twenty-two millions of the savings banks, instead of being converted into stock, had been at once employed in productive industry, as the money in the stocks which it displaced is so invested.

The only other objection of which we shall take notice is the following; namely, that as the money of savings banks goes into the hands of government, the minister of the day may avail himself of it, and use it for public purposes; that the depositors have only government security; and that if a revolution should take place, the funds would all be lost.

These objections, however formidable in appearance, are in reality quite fanciful and untenable. It cannot, with any degree of truth, be said that the money of savings banks goes into the hands of government. The money is invested in the Bank of England, and the National Debt Commissioners are appointed by law to purchase national stock with it. Government does not touch a fraction of the funds. Such money no more goes into the hands of the minister of the day, than the funds of any corporate body or private individual who purchases stock. Parliament passed a law for the encouragement of savings banks, and for the safe custody and increase of their funds, which law, under certain conditions, provides that these funds may be sent through the Bank of England to the National Debt Commissioners; that these commissioners shall buy stock with them, or, in other words, invest them in government securities, and allow the depositors a certain rate of interest, or, at their option, to withdraw their funds in full, without reference to the existing state of the public securities. Now, these commissioners, when the money comes into their hands, *must* buy stock with it, and return proper vouchers to the savings banks. The commissioners have been exposed to much additional labour in consequence of the great spread of savings banks; but they cost these banks nothing; for though their duty is imperative, their services are gratuitous.

It is thus evident that the funds of savings banks neither go nor can go into the hands of government. The law provides the very reverse. As well might it be said that any funds invested in national stock has this destination. But though the government does not and dares not use one fraction of the funds of these institutions, it is undoubtedly security for the money. But can the world afford higher security than that of this intelligent, free, and wealthy nation? As to a revolution, the people of this country are too intelligent, and value too much the institutions under which they live, to render such an event at all probable; but even should a season of anarchy occur, the constitution has so much elasticity and solidity in it, that, under well-directed public intelligence, it would soon recover and right itself. Besides, in all civilized countries, as was recently proved in France and Belgium, a revolution generally respects private property. In this case, the funds of savings banks would certainly be as secure, indeed we should say a great deal more secure, than any other species of property whatever. Besides, the very circumstance of a large portion of the people, as the depositors in savings banks, having a deep interest in the stability of government, would make them constitutionally to resist, not wantonly to promote, civil commotion. "Every person," says Mr Tidd Pratt, "who has vested his savings in the public funds, has a stake in the security of the country, proportioned not merely to the sum total of those savings, but to the value of that sum to himself, and will be deterred from compassing the disturbance of his native land by a personal motive, added to the influence of duty. He will feel the importance of public peace and public credit with that strong conviction which individual interest never fails to inspire; and in answer to the objections of those who would be jealous of the support thus obtained to the ruling powers, it should be observed, that he who possesses property in a country is not interested in the stability of the administration for the time being, but in the perpetual stability of universal order and good government."—(Hist. of Savings Banks, p. 21, ed. 1830.)

(C. I.)

of Forli. It contains 5100 inhabitants, mostly very poor, who are chiefly occupied in winding silk.

SAVILE, Sir George, afterwards Marquis of Halifax, and one of the greatest statesmen of his time, was born about the year 1630; and some time after his return from his travels was created a peer, in consideration of his own and his father's merits. He was a strenuous opposer of the bill of exclusion, but proposed such limitations of the Duke of York's authority as should disable him from doing any harm either to church or state; as the taking out of his hands all power in ecclesiastical matters, the disposal of the public money, and the power of making peace and war, and lodging these in the two houses of parliament. After that bill was rejected in the House of Lords, he pressed them, though without success, to proceed to the limitation of the duke's power; and began with moving, that during the king's life he might be obliged to live five hundred miles out of England. In August 1682 he was created a marquis, and soon after made privy-seal. Upon King James's accession, he was made president of the council; but on his refusal to consent to the repeal of the test act, he was dismissed from all public employments. In that assembly of the Lords which met after King James's withdrawing himself the first time from Whitehall, the marquis was chosen their president; and upon the king's return from Feversham, he was sent, together with the Earl of Shrewsbury and Lord Delamere, from the Prince of Orange, to order his majesty to quit the palace at Whitehall. In the convention of parliament he was chosen speaker of the House of Lords, and strenuously supported the motion for the vacancy of the throne, and the conjunctive sovereignty of the prince and princess, upon whose accession he was again made privy-seal. Yet, in 1689, he quitted the court, and became a zealous opponent of the measures of government till his death, which happened in April 1695. Mr Grainger observes, that "he was a person of unsettled principles, and of a lively imagination, which sometimes got the better of his judgment. He would never lose his jest, though it spoiled his argument, or brought his sincerity or even his religion in question. He was deservedly celebrated for his parliamentary talents; and in the famous contest relating to the bill of exclusion was thought to be a match for his uncle Shaftesbury. The pieces he has left us show him to have been an ingenious, if not a masterly writer; and his Advice to a Daughter contains more good sense in fewer words than is, perhaps, to be found in any of his contemporary authors." His lordship also wrote, the Anatomy of an Equivalent; a Letter to a Dissenter; a Rough Draught of a New Model at Sea; and Maxims of State; all which were printed together in one volume 8vo. Since these there were also published under his name, the Character of King Charles II. 8vo; the Character of Bishop Burnet, and Historical Observations upon the Reigns of Edward I. Edward II. Edward III. and Richard II. with Remarks upon their faithful Counsellors and false Favourites.

SAVILLE, Sir Henry, a learned Englishman, was the second son of Henry Saville, and was born at Bradley, near Halifax, in Yorkshire, on the 30th of November 1549. He entered of Merton College, Oxford, in 1561, where he took the degrees in arts, and was chosen fellow. When he proceeded master of arts in 1570, he read for that degree in the Almagest of Ptolemy, which procured him the reputation of a man eminently skilled in the mathematics and the Greek language; in the former of which he voluntarily read a public lecture in the university for some time.

In 1578 he travelled into France and other countries, where, diligently improving himself in all useful learning, in languages, and in the knowledge of the world, he became a most accomplished gentleman. At his return he was made tutor in the Greek tongue to Queen Elizabeth, who had a great esteem for him.

Saville.

In 1585 he was made warden of Merton College, which he governed thirty-six years with great honour, and improved it by all the means in his power. In 1596 he was chosen provost of Eton College, which he filled with many learned men. James I. upon his accession to the crown of England, expressed a great regard for him, and would have preferred him either in church or state; but Saville declined it, and only accepted the ceremony of knighthood from the king, at Windsor, in 1604. His only son Henry dying about that time, he thenceforth devoted his fortune to the promoting of learning. Among other things, in 1619, he founded, in the university of Oxford, two lectures or professorships, one in geometry, and the other in astronomy, which he endowed with a salary of L.160 a year each, besides a legacy of L.600 to purchase more lands for the same use. He also furnished a library with mathematical books, near the mathematical school, for the use of his professors, and gave L.100 to the mathematical chest of his own appointing; adding afterwards a legacy of L.40 a year to the same chest, to the university, and to his professors jointly. He likewise gave L.120 towards the new building of the schools, besides several rare manuscripts and printed books to the Bodleian Library, and a good quantity of Greek types to the printing press at Oxford.

After a life thus spent in the encouragement and promotion of science and literature in general, he died at Eton College on the 19th of February 1622, in the seventy-third year of his age, and was buried in the chapel there. On this occasion, the university of Oxford paid him the greatest honours, by having a public speech and verses made in his praise; which were soon afterwards published in quarto, under the title of *Ultima Linea Savilii.*

The highest encomiums were bestowed on Saville by all the learned of his time; by Casaubon, Mercerus, Meibomius, Joseph Scaliger, and especially the learned Bishop Montague, who, in his *Diatribæ* upon Selden's History of Tythes, styles him, "that magazine of learning, whose memory shall be honourable amongst not only the learned, but the righteous, for ever." His works are, 1. Four Books of the Histories of Cornelius Tacitus, and the Life of Agricola, with Notes upon them, in folio, dedicated to Queen Elizabeth, 1581. 2. A View of certain Military Matters, or Commentaries concerning Roman Warfare, 1598. 3. Rerum Anglicarum Scriptores post Bedam, 1596, a collection of the best writers of our English history. 4. The Works of St Chrysostom, in Greek, in eight vols. folio, 1613. This is a very fine edition, and composed with great cost and labour. In the preface he says, "that having himself visited, about twelve years before, all the public and private libraries in Britain, and copied out thence whatever he thought useful to his design, he then sent some learned men into France, Germany, Italy, and the East, to transcribe such parts as he had not already, and to collate the others with the best manuscripts." The whole charge of this edition, including the several sums paid to learned men, at home and abroad, employed in finding out, transcribing, and collating the best manuscripts, is said to have amounted to no less than L.8000. 5. In 1618 he published a Latin work, written by Thomas Bradwardin, archbishop of Canterbury, against Pelagius, entitled De Causa Dei contra Pelagium, et de virtute Causarum, to which he prefixed the life of Bradwardin. 6. In 1621 he published a collection of his own Mathematical Lectures on Euclid's Elements, in 4to. 7. Oratio coram Elizabetha Regina Oxoniæ habita, anno 1592, printed at Oxford in 1658, in 4to. 8. He translated into Latin King James's Apology for the Oath of Allegiance. He also left several manuscripts, written by order of King James, all which are in the Bodleian Library. He wrote notes likewise upon the margin of many books in his library, particularly Eusebius's Ecclesiastical History; which were afterwards used by Valesius in his edition of that work in 1659.

Four of his letters to Camden are published by Smith, among Camden's Letters, 1691, 4to.

SAVIOUR, an appellation which is peculiarly given to Jesus Christ, as being the Messiah and Saviour of the world. See JESUS.

SAVONA, a city of Italy, in the kingdom of Sardinia, and the province, formerly the state, of Geno. It stands on the river Ponente, near the sea, where the Egabona falls into that stream. It has a small harbour, fit only for coasting vessels, but by which trade and the fisheries are carried on in it. It is the seat of a bishop, and, besides the cathedral, has twenty parish and monastic churches. It contains 10,660 inhabitants, who manufacture silk goods, earthenware, soap, vitriol, and fire-arms. Long. 9. 25. E. Lat. 44. 16. N.]

SAVONAROLA, JEROME, a famous Italian monk, was born at Ferrara in 1452, being descended of a noble family. At the age of twenty-two he assumed the habit of a Dominican friar, without the knowledge of his parents, and distinguished himself in that order by his piety and ability as a preacher. Florence was the theatre where he chose to appear, and where he preached, confessed, and wrote. He had address enough to place himself at the head of the faction which opposed the family of the Medici. He explained the Apocalypse, and there found a prophecy which foretold the destruction of his opponents. He predicted a renovation of the church, and declaimed with much severity against the clergy and the court of Rome. Alexander VI. excommunicated him, and prohibited him from preaching. He derided the anathemas of the pope; yet he forbore for some time from preaching, and then resumed his employment with more applause than before. The pope and the Medici family then thought of attacking him with his own weapons. Savonarola having posted up a thesis as a subject of disputation, a Franciscan, at their instigation, offered to prove it heretical. The Franciscan was seconded by his brother friars, and Savonarola by his; and thus the two orders were at open war with each other. To settle the dispute, and to convince their antagonists of the superior sanctity of Savonarola, one of the Dominicans offered to walk through a fire; and in order to prove his wickedness, a Franciscan agreed to the same experiment. The multitude, eager to witness so extraordinary a spectacle, urged both parties to come to a decision; and the magistrates were constrained to give their consent. Accordingly, Saturday the 7th of April 1498 was fixed for the trial. On that day the champions appeared; but when they saw one another in cold blood, and beheld the wood in flames, they were seized with fear, and very anxious to escape, by any subterfuge, the imminent danger into which they had rashly thrown themselves. The Dominican pretended he could not enter the flames without the host in his hand. This the magistrates obstinately refused to allow; and the Dominican's fortitude was not put to the test. The Franciscans incited the multitude against their opponents, who accordingly assaulted their monastery, broke open the gates, which were shut against them, and entered by force. Upon this, the magistrates thought it necessary to bring Savonarola to trial as an impostor. He was put to the torture and examined, and the answers which he gave fully evinced that he was both a cheat and a fanatic. He boasted of having frequent conversations with God, and he found his brother friars credulous enough to believe him. One of the Dominicans who had shared in his sufferings, affirmed that he saw the Holy Ghost in the shape of a dove, with feathers of gold and silver, twice in one day alight on the shoulder of Savonarola and peck his ear; and he pretended also that he had violent combats with demons. John Francis Picus, count of Mirandola, who wrote his life, assures us that the devils which infested the convent of the Dominicans trembled at the sight of Friar Jerome, and that out of vexation they always suppressed some letters of his name in pronouncing it. He expelled them from all the cells of the monastery. When he went round the convent sprinkling holy water to defend the friars from the insults of the demons, it is said that the evil spirits spread thick clouds before him to prevent his passage. At length, the Pope Alexander VI. sent the chief of the Dominicans, with Bishop Romolino, to degrade him from holy orders, and to deliver him up to the secular judges with his two fanatical associates. They were condemned to be hanged and burned on the 23d of May 1498. Savonarola submitted to the execution of the sentence with great firmness and devotion, and without uttering a word respecting his guilt or his innocence. He was in the forty-sixth year of his age. His works have been published at Leyden in six vols. 12mo.

SAVOY. See SARDINIA.

SAVU, an island in the Eastern Seas, about twenty miles in length, low at the sea-coast, but towards the middle rising into considerable hills. According to Captain Cook and other navigators, it presents a delightful prospect from the sea. The inhabitants have made some approaches to civilization, and the island is divided into five principalities. Long. 122. 30. E. Lat. 10. 35. S.

SAW, an instrument which serves to cut into pieces several solid matters, as wood, stone, ivory, and the like.

The best saws are of tempered steel ground bright and smooth; those of iron are only hammer-hardened. Hence the first, besides their being stiffer, are likewise found smoother than the last. They are known to be well hammered by the stiff bending of the blade; and to be well and evenly ground, by their bending equally in a bow.

The lapidaries, too, have their saw, as well as the workmen in mosaic; but of all mechanics, none have so many saws as the joiners, the chief of which are the following. The pit-saw, which is a large two-handed saw, employed for sawing timber in pits, and chiefly used by the sawers. The whip-saw, which has likewise two handles, used in sawing such large pieces as the hand-saw will not easily reach. The hand-saw is made to be used by an individual, of which there are different kinds, as the frame-saw, which is furnished with cheeks. By the twisted cords which pass from the upper parts of these cheeks, and the tongue in the middle of them, the upper ends are drawn close together, and the lower set farther asunder. The tenon-saw, which being very thin, has a back to keep it from bending. The compass-saw, which is very small, and its teeth usually not set. Its use is to cut a round, or any other compass-kerf, on which account the edge is made broad, and the back thin, that it may have a compass to turn in.

At an early period, the trunks of trees were split with wedges into as many and as thin pieces as possible; and if it were necessary to have them still thinner, they were hewn on both sides to the proper size. This simple and wasteful manner of making boards has been still continued in some places to the present day. Peter the Great of Russia endeavoured to put a stop to it, by forbidding hewn dales to be transported on the river Neva. The saw, however, though so convenient and beneficial, has not been able to banish entirely the practice of splitting timber used in building, or in making furniture and utensils; and indeed it must be allowed that this method is attended with peculiar advantages which that of sawing can never possess. The wood-splitters perform their work more expeditiously than sawers, and split timber is much stronger than that which has been sawn: for the fissure follows the grain of the wood, and leaves it whole; whereas the saw, which proceeds in the line chalked out for it, divides the fibres, and by these means lessens its cohesion and solidity. Split timber, indeed, turns out often crooked and warped; but for many purposes to which it is applied this is not injurious, and these faults may sometimes be amended. As the fibres, however, retain their natural length and direction, thin

Saw-Mills.

boards particularly can be bent much better. This is a great advantage in making pipe-staves, or sieve-frames, which require still more art, and in forming various implements of a similar kind.

Our common saw, which requires only to be guided by the hand, however simple it may be, was not known to the inhabitants of America when they were subdued by the Europeans. The inventor of this instrument has been inserted in their mythology by the Greeks, with a place, in which, amongst their gods, they honoured the greatest benefactors of the earliest ages. By some he is called Talus, and by others Perdix. None except Pliny make Dædalus the inventor; but Hardouin, in the passage where this occurs, reads Talus for Dædalus. Talus is the name of the inventor according to Diodorus Siculus, Apollodorus, and others. He was the son of Dædalus's sister, and was by his mother placed under the tuition of her brother, to be instructed in his art. Having found the jaw-bone of a snake, he employed it to cut through a small piece of wood, and by these means was induced to fabricate a similar instrument of iron, that is, to make a saw. This invention, by which labour is greatly facilitated, excited the envy of his master, and prompted him to put Talus privately to death. Being asked, when burying the body, what he was depositing in the earth, he replied, a serpent. This ambiguous answer discovered the murder; and thus a snake was the cause of the invention, of the murder, and of its being brought to light. By others the inventor is called Perdix, who is supposed to have been the son of a sister of Dædalus. Perdix did not employ the jaw-bone of a snake for a saw, but the back-bone of a fish, as is mentioned by Ovid.

The saws of the Grecian carpenters had the same form, and were made with equal ingenuity as the same instruments at present. This appears from a painting preserved among the antiquities of Herculanum. Two genii are represented at the end of a bench consisting of a long table resting on two four-footed stools, and the piece of wood to be sawn through is secured by cramps. The saw with which the genii are at work bears a striking resemblance to our frame-saw. It consists of a square frame, having a blade in the middle, the teeth of which are perpendicular to the plane of the frame. The piece of wood to be sawn extends beyond the end of the bench, and one of the workmen appears standing, and the other sitting on the ground. The arms in which the blade is fastened have the same form as that which is given to them at present. In the bench are seen holes, in which the cramps holding the timber are stuck. They are shaped like the figure 7; and the ends of them reach below the boards which form the top of it.

Saw-Mills. The most beneficial improvement of the operation of sawing was the invention of saw-mills, which are driven either by water or by wind. Mills of the first kind were erected in Germany, on the small river Ruer, as early as the fourth century. The art of cutting marble with a saw is very ancient. According to Pliny, it was invented in Caria. Stones of the soap-rock kind, which are softer than marble, were sawn at that period; but it appears that the harder kinds of stone were also then sawn; for we are informed of the discovery of a building which was encrusted with cut agate, carnelian, lapis lazuli, and amethysts. There is, however, no account in any of the Greek or Roman writers of a mill for sawing wood; and as modern authors speak of saw-mills as new and uncommon, it appears that the oldest construction of them has been forgotten, or that some interesting improvement has made them appear entirely new.

Becher says that saw-mills were invented in the seventeenth century, which is a mistake; for when the Infant Henry sent people to settle in the island of Madeira, discovered in 1420, he gave orders for saw-mills to be erected, for the purpose of sawing into deals the various species of excellent timber with which the island abounded, and which were afterwards exported to Portugal. There was a saw-mill in the city of Breslau about the year 1427, producing a yearly rent of three merks; and in 1490, the magistrates of Erfurt purchased a forest, in which they erected a saw-mill, besides renting another in the neighbourhood. The first saw-mill in Norway was erected about the year 1530. In the year 1552 there was a saw-mill erected at Joachimsthal, the property of a mathematician called Jacob Geusen. In 1555, the Bishop of Ely, ambassador from Queen Mary of England to the court of Rome, having seen a saw-mill in the vicinity of Lyons, the writer of his travels gave a particular description of it. The first saw-mill was erected in Holland at Saardam in 1596, the invention of which is ascribed to Cornelius Cornelissen. The first mill of this kind in Sweden was erected in the year 1653.

Saw-Mills.

In England, saw-mills had at first a similar effect with printing in Turkey, the ribbon-loom in the dominions of the church, and the crane at Strasburg. When attempts were made to introduce them, they were violently opposed, because it was apprehended that the sawers would thus be deprived of the means of procuring subsistence. An opulent merchant in 1767 or 1768, by desire of the Society of Arts, caused a saw-mill to be erected at Limehouse, driven by wind; but it was demolished by the mob, and the damage was sustained by the nation, while some of the rioters were punished. This, however, was not the only mill of the kind then in Great Britain; for at Leith there was one driven by wind some years before. Saw-mills are very common in America, where the moving power is generally water. Some have been constructed on a very extensive plan.

The mechanism of a sawing-mill may be reduced to three principal things. The first is, that the saw is drawn up and down as long as is necessary, by a motion communicated to the wheel by water. The second is, that the piece of timber to be cut into boards is advanced by an uniform motion to receive the strokes of the saw; for here the wood is to meet the saw, and not the saw to follow the wood, therefore the motion of the wood and that of the saw ought immediately to depend the one on the other. The third is, that where the saw has cut through the whole length of the piece, the whole machine stops of itself, and remains immoveable; lest having no obstacle to surmount, the moving power should turn the wheel with too great velocity, and break some part of the machine.

When a completely cylindrical pillar is to be cut out of one block of stone, the first thing will be to ascertain in the block the position of the axis of the cylinder, then lay the block so that such axis shall be parallel to the horizon, and let a cylindrical hole of from one to two inches diameter be bored entirely through it. Let an iron bar, whose diameter is rather less than that of this tube, be put through it, having just room to slide freely to and fro as occasion may require. Each end of this bar should terminate in a screw, on which a nut and frame may be fastened. The nut-frame should carry three flat pieces of wood or iron, each having a slit running along its middle from nearly one end to the other, and a screw and handle must be adapted to each slit. By these means the frame-work at each end of the bar may readily be so adjusted as to form equal isosceles or equilateral triangles; the iron-bar will connect two corresponding angles of these triangles, the saw to be used two other corresponding angles, and another bar of iron or of wood the two remaining angles, to give sufficient strength to the whole frame. By this construction the workmen are enabled to place the saw at any proposed distance from the hole drilled through the middle of the block; and then, by giving the alternating motion to the saw-frame, the cylinder may at length be cut from the block, as required.

If it were proposed to saw a conic frustum from such a block, then let two frames of wood or iron be fixed to those parallel ends of the block which are intended to coincide with the bases of the frustum, circular grooves being previously cut in these frames to correspond with the circumferences of the two ends of the proposed frustum; the saw being worked in these grooves will manifestly cut the conic surface from the block. This, we believe, is the contrivance of Sir George Wright.

The best method of drilling the hole through the middle of the proposed cylinder seems to be this. On a carriage running upon four low wheels let two vertical pieces, each having a hole just large enough to admit the borer to play freely, be fixed two or three feet asunder, and so contrived that the pieces and holes to receive the borer may, by screws, be raised or lowered at pleasure, while the borer is prevented from sliding to and fro by shoulders upon its bar, which are larger than the holes in the vertical pieces, and which, as the borer revolves, press against those pieces; let a part of the boring bar between the two vertical pieces be square, and a grooved wheel with a square hole of a suitable size be placed upon this part of the bar; then the rotatory motion may be given to the bar by an endless band which shall pass over this grooved wheel and a wheel of a much larger diameter in the same plane, the latter wheel being turned by a winch-handle in the usual way.

Circular saws, acting by a rotatory motion, have been long known in Holland, where they are used for cutting wood used in veneering. They were introduced into this country, we believe, by General Bentham, and are now used in the dock-yard at Portsmouth, and in a few other places; but they are not as yet so generally adopted as might be wished, considering how well they are calculated to abridge labour, and to accomplish with expedition and accuracy what is very tedious and irksome to perform in the usual way. Circular saws may be made to turn either in horizontal, vertical, or inclined planes, and the timber to be cut may be laid upon a plane inclined in any direction; so that it may be sawn by lines making any angle whatever, or at any proposed distance from each other. When the saw is fixed at a certain angle, and at a certain distance from the edge of the frame, all the pieces will be cut of the same size, without marking upon them by a chalked line, merely by causing them to be moved along, and keeping one side in contact with the side of the frame; for then, as they are brought one by one to touch the saw revolving on its axle, and are pressed upon it, they are soon cut through.

SAWARDIN, a Kalmuck melody, sung while dancing.

SAWBRIDGEWORTH, a town of the hundred of Braughin, in the county of Hertford, twenty-six miles from London. It had once a market, but it has totally declined. The population amounted in 1801 to 1687, in 1811 to 1827, in 1821 to 2071, and in 1831 to 2231.

SAXE, MAURICE, COUNT OF, was born on the 13th of October 1696. He was the natural son of Frederick Augustus II. elector of Saxony and king of Poland, and of the Countess of Konigsmarc, a Swedish lady, celebrated both for her wit and her beauty. He was educated along with Frederick Augustus, the electoral prince, afterwards king of Poland. His infancy announced the future warrior. Nothing could prevail on him to apply to his studies but the promise of being allowed, after he had finished his task, to mount on horseback, or exercise himself in arms.

He served his first campaign in the army commanded by Prince Eugene and the Duke of Marlborough, when only twelve years old. He signalized himself at the sieges of Tournay and Mons, and particularly at the battle of Malplaquet. In the evening of that memorable day, he was heard to say, "I'm content with my day's work." During the campaign of 1710, Prince Eugene and the Duke of Marlborough made many public encomiums on his merit. Next year the young count accompanied the king of Poland to the siege of Stralsund, the strongest place in Pomerania, and displayed the greatest intrepidity, swimming across the river in sight of the enemy, with a pistol in his hand. His valour shone no less conspicuously on the bloody day of Gaedelbusck, where he commanded a regiment of cavalry. He had a horse killed under him, after he had three times rallied his regiment, and led them to the charge.

Soon after that campaign, his mother prevailed on him to marry the Countess of Lubin, a lady both rich and beautiful. This union lasted but a short time. In 1721, the count procured a dissolution of the marriage; a step of which he afterwards repented. The countess left him with regret; but this did not prevent her from marrying soon afterwards. The Count of Saxe was too fond of variety to submit to the duties which marriage imposes. In the midst, however, of the pleasures in which he sometimes indulged, he never lost sight of his profession. He carried along with him wherever he went a library of military books; and even when he seemed most occupied with his pleasures, he never failed to spend an hour or two in private study.

In 1717 he went to Hungary, where the emperor had an army of 15,000 men commanded by Prince Eugene. Count Saxe was present at the siege of Belgrade, and at a battle which the prince gained over the Turks. On his return to Poland in 1718, he was made a knight of the Golden Eagle.

The wars in Europe being concluded by the treaties of Utrecht and Passarowitz, Count Saxe went to France. He had always professed a partiality for that country. French, indeed, was the only foreign language which during his infancy he was willing to learn. He spent his whole time during the peace in studying mathematics, fortification, and mechanics, sciences which exactly suited his genius. The mode of exercising troops had struck his attention when very young. At sixteen he invented a new exercise, which was taught in Saxony with the greatest success. Having obtained a regiment in France in 1722, he formed it himself according to his new plan. From that moment the Chevalier Folard, an excellent judge of military talents, predicted that he would be a great man.

In 1726 the states of Courland chose him for their sovereign, but both Poland and Russia rose in arms to oppose the election. The Czarina wished to bestow the duchy on Menzikoff, a happy adventurer, who from a pastry-cook's boy became a general and a prince. Menzikoff sent eight hundred Russians to Milan, where they besieged the newly-chosen duke in his palace. Count Saxe, who had only sixty men, defended himself with astonishing intrepidity. The siege was raised, and the Russians were obliged to retreat. Soon afterwards he retired to Usmaiz, and prepared to defend his people against the two hostile nations. Here he remained with only three hundred men, until the Russian general approached to force his retreat, at the head of four thousand. That general invited the count to a conference, during which he intended to surprise him, and take him prisoner. The count, informed of the plot, reproached him for his baseness, and broke up the conference. About this time he wrote to France for men and money. Mademoiselle le Couvreur, a celebrated actress, pawned her jewels and plate, and sent him the sum of forty thousand livres. This actress had formed his mind for the fine arts. She had made him read the greater part of the French poets, and given him a taste for the theatre, which he retained even in the camp. The count, unable to defend himself against Russia and Poland, was obliged in the year 1729 to leave his new dominions, and retire into France. It is said that Anne Iwanowa, duchess dowager of Courland, and second daughter of the Czar Iwan Alexiowitz, had given him hopes of marriage, and abandoned him at that time because she despaired of fixing his wavering passion. This inconstancy lost him not only Courland, but the throne of Russia itself, which that princess afterwards filled.

Count Saxe, thus stripped of his territories, devoted himself for some time to the study of mathematics. He composed also, in thirteen nights, and during the intervals of an ague, his Reveries, which he afterwards corrected. This book is written in an incorrect but forcible style; it is full of remarks both new and profound, and is equally useful to the soldier and the general.

The death of the king of Poland, his father, in 1733, kindled a new war in Europe. His brother, the elector of Saxony, offered him the command of all his forces; but he preferred the French service, and repaired to Marshal Berwick's army, which was encamped on the Rhine. "Count," said that general, who was preparing to attack the enemy's intrenchments at Etlinghen, "I was going to send for three thousand men, but your arrival is of more value than theirs." When the attack began, the count, at the head of a regiment of grenadiers, forced the enemy's lines, and by his bravery decided the victory. He behaved with no less intrepidity at the siege of Philipsburg. For these services he was, in 1734, rewarded with the rank of lieutenant-general. Peace was concluded in 1736; but the death of Charles VI., the emperor of Germany, almost immediately kindled a new war.

Prague was besieged by the Count of Saxe in 1741, near the end of November, and was taken the same month by assault. The conquest of Egra followed that of Prague. It was taken a few days after the trenches were opened. This success gave so much joy to the Emperor Charles VII., that he wrote with his own hands a congratulatory letter to the conqueror.

In 1744 he was made marshal of France, and commanded a part of the French army in Flanders. During that campaign he displayed the greatest military conduct. Though the enemy was superior in number, he observed their motions so skilfully that they could do nothing. In January 1745, an alliance was concluded at Warsaw, between the queen of Hungary, the king of England, and the states of Holland. The ambassador of the states-general, meeting Marshal Saxe one day at Versailles, asked his opinion of that treaty. "I think," said he, "that if the king my master would give me an unlimited commission, I would read the original at the Hague before the end of the year." This answer was not a bravado; the marshal was capable of performing it.

He went soon afterwards, though exceedingly ill, to take the command of the French army in the Low Countries. A gentleman seeing the feeble condition in which he left Paris, asked him how he could in that situation undertake so great an enterprise. "The question," replied he, "is not about living, but setting out." Soon after the opening of the campaign, the battle of Fontenoy was fought. Marshal Saxe was at the point of death, yet he caused himself to be put into a litter, and carried round all the posts. During the action he mounted on horseback, though he was so very weak that his attendants dreaded every moment to see him expire. The victory of Fontenoy, which was owing entirely to his vigilance and capacity, was followed by the reduction of Tournay, Bruges, Ghent, Oudenard, Ostend, Ath, and Brussels. This last city was taken on the 28th of February 1746; and very soon afterwards the king sent to the marshal a letter of naturalization, conceived in the most flattering terms. The succeeding campaigns gained him additional honours. After the victory of Raucoux, which he gained on the 11th of October 1746, the king of France made him a present of six pieces of cannon. He was, on the 12th of January of the following year, created marshal of all the French armies, and, in 1748, commander-general of all those parts of the Netherlands which were lately conquered.

Holland now began to tremble for her safety. Maestricht and Bergen-op-Zoom had already fallen, and nothing but misfortunes seemed to attend the further prosecution of the war. The states-general, therefore, offered terms of peace, which were accepted, and a treaty concluded on the 18th of October 1748.

Saxe-Altenburg || Saxe-Coburg-Gotha.

Marshal Saxe retired to Chambord, a country-seat which the king of France had given him. Some time afterwards he went to Berlin, where the king of Prussia received him as Alexander would have received Cæsar. On his return to France, he spent his time among men of learning, artists, and philosophers. He died of a fever, on the 30th of November 1750, at the age of fifty-four.

The best edition of his Reveries was printed at Paris, 1757, in two volumes 4to. It was compared with the greatest attention with the original manuscript in the king's library. It is accompanied with many designs exactly engraved, and a life of the author written in the panegyrical style.

SAXE-ALTENBURG, a duchy in Germany, recently become an independent though a small sovereignty. It was united with Saxe-Gotha till the decease without issue of the Grand Duke of Saxe-Gotha Altenburg, when a dispute arose between the several branches of the family, which was terminated by a treaty in 1826, Gotha being transferred to the Duke of Saxe-Coburg, and Altenburg being created a sovereign state. It is 502 square miles in extent, but is not compact, and some parts are surrounded by the territories of other states. It contains ten cities and towns, and 458 villages, with (in 1836) 120,690 inhabitants, who, with the exception of 3900 Catholics, adhere to the Lutheran religion. The revenues of the state amount to L.68,250, consisting nearly one half of the rent of the domains, and the other half of direct taxes on consumption. The annual expenditure is somewhat less, and the surplus is applied to the discharge of the debt, which, in 1832, amounted to L.183,900. The force to form the contingent to the German confederation is fixed at 982 men. By a constitution fixed in April 1831, the assembly of the states is appointed to consist of nobles, burghers, and peasants, and, with the duke, to make or alter the laws. The district is hilly and woody, but more so on the western than on the eastern side. In the latter division the soil is generally fertile, producing abundant crops of corn, and containing much rich meadow-land, adapted to the fattening of cattle. The river Saale rises in this duchy, and receives many of the smaller streams which run to the Elbe. The chief manufacturing industry is spinning the flax of their own growth; but a few woollen goods are made, and some iron ware. The capital is the city of Altenburg, containing 13,800 inhabitants. Two other places contain more than 4000, viz. Ronnenburg 4640, and Eisenburg 4605.

SAXE-COBURG-GOTHA, a sovereign duchy in Germany. The Duke of Coburg, by a family arrangement, attained in 1826 the duchy of Gotha, and added it to his former dominions. The whole is a compact territory, except that a part of Saxe-Weimar projects itself into the south-eastern portion of it, and it extends over 1049 square miles. It comprehends twenty-one towns and cities, and 525 villages, with 156,639 inhabitants, of whom 127,000 are Lutherans, 11,500 are Catholics, 2900 Calvinists, and 1200 Jews, the remainder not being ascertained. The revenue amounts to L.120,000, and the expenditure to about one tenth less, the residue being applied to diminish the state debts, amounting to L.300,000. The military force to be furnished to the German Confederation is 1366 men. The northern part, or the duchy of Gotha, is on the Thuringian Mountains, some of whose elevations are near 3000 feet above the level of the sea, but decline towards the east into an undulating district, which is drained by streams running into the Elbe or the Weser. The climate, though cold, is healthy. The soil is of moderate fertility, and being well cultivated, produces good crops of corn, and a great abundance of fruits and culinary vegetables, as well as large quantities of flax. The duchy of Coburg, or southern part, is an extensive plain, except in the province of Lichtenburg, where there are some ranges

Saxe-Meiningen-Hildburghausen
||
Saxe-Weimar-Eisenach.

of hills. Some of the streams run into the Elbe, some into the Weser, and others into the Rhine. The land is better calculated for pasture than for agriculture, and does not produce corn equal to the consumption, but receives supplies from Gotha. There are mines producing copper, others iron, and some coal. These afford some employment to the inhabitants; but the country is poor, and the means of obtaining subsistence are scanty. The villagers are generally occupied in spinning flax, or in making wood ware and potash from the forests. The cities are Gotha with 18,321, and Coburg with 9067 inhabitants.

Saxe-Meiningen-Hildburghausen, a sovereign duchy in Germany. It was two duchies, though now both united under one of the great branches of the Saxon Ernestine family. It extends over 896 square miles, and comprehends thirty-two cities or towns, and 381 villages, with 149,294 inhabitants, of whom 128,000 adhere to the Lutheran profession, and the remainder consists of Catholics and Calvinists, with some Jews. The income of the state amounts to L.110,000, and the expenditure to nearly the same; but in the latter is included the interest on the public debt, which is heavy when compared with that of the other Saxon duchies, being L.550,000. It is bound to furnish a force of 1150 men to the German Confederation. Meiningen is generally a mountainous country, though none of the hills are higher than 2700 feet, and few exceed 2000 feet. The valleys between these hills are tolerably fertile, and are drained by several small streams, all of which unite in the Werra in its progress to the ocean.

The agriculture is in a backward state, and, but for the great cultivation of potatoes, would not yield sufficient for the population. Flax is grown equal to the furnishing of employment for the females; but the chief product for sale beyond the limits of the duchy is timber, and there is also some trade in wool, which has been lately improved by the introduction of merino sheep. Some tobacco is raised; and a little inferior wine is made in the southernmost parts. The duchy of Hildburghausen is of nearly the same character, except that the soil is more sandy, and the forests of less extent. The meadows are better, and produce some well-fattened black cattle; and it has some manufactories of iron and glass ware. The only cities in these duchies are Meiningen with 4500 inhabitants, Saalfeld with 4500, and Hildburghausen and Posnect with 3500 each.

Saxe-Weimar-Eisenach, a sovereign state in Germany, distinguished as a grand duchy, or rather composed of two duchies, which are not contiguous, but are separated by a part of Saxe-Gotha and a part of the Prussian province of Saxony being interposed between them. Some portions also of this dominion are separated from both parts, and surrounded by the territories of other princes. The whole of the grand duchy is 1436 square miles in extent, the duchy of Weimar being 985, and that of Eisenach 451. The population of the whole, which in 1817 amounted to 197,712, had in 1835 increased to 241,046 persons, of whom about one quarter live in the cities and towns, and the remainder in villages and on detached farms. About 220,000 are Lutherans, 10,000 Catholics, 6600 Calvinists, and the remainder are either Jews, or some of the smaller protestant sects. The number of births in 1831 was 7559, and of deaths 5280. The marriages in the same year were 1707. The whole of the dominion is rather hilly, some of the elevations reaching to 1900, and one of them to 2460 feet. Between these hills the valleys are extensive, and of considerable fertility. The most flourishing are those vales through which run the rivers Saale, Werra, and Ilmenau. The climate, like that of all Thuringia, is raw and cold, and the snow lies late in the summer on the hills; but it is considered as healthy. As the business of husbandry is mostly in the hands of small peasants, and the land cultivated on the common field system, it is, with a few exceptions, imperfectly conducted; but it yields, in the duchy of Weimar, a surplus equal to the deficiency which is annually experienced in the duchy of Eisenach; and in good seasons is enabled to furnish rye to the mining districts in the kingdom of Saxony. The chief subsistence of the lower orders is potatoes, the extension of which has kept pace with the growth of the population. Flax, hemp, rape, poppies, and hops are grown; and the sides of the hills, on the red soil, are well planted with plum, cherry, apple, and pear trees, that yield abundant fruit. The extensive forests supply a sufficiency of fuel and timber, and afford employment to large numbers, who manufacture a variety of articles from the wood. The country is most abundantly stocked with game, which, to the annoyance of the peasantry, was most sedulously preserved by the last grand duke. It is said that more than 20,000 hares and 1400 deer have been taken in one year, besides great numbers of wild boars, and some thousands of pheasants. The rivers are also well stocked with fish. The domesticated animals are not numerous, and, except sheep, whose wool has been improved in fineness, deserve no particular mention.

The chief manufactures are carried on at Eisenach and in its vicinity. They consist of woollen, linen, and cotton cloths, carpets, hosiery, earthenware, glass, leather, and seed-oil. There are mills for spinning cotton, and flax is spun by the peasants in every cottage. In each of the cities there are breweries and distilleries. Much trade arises from the passage of the goods and passengers on the great road through the state from Frankfort to Leipsig, especially at the time of the great fairs at those cities. This grand duchy has a constitution formed by the late sovereign. The states, consisting of twenty-nine members, meet at Weimar for legislative purposes; but their proceedings attract very little attention. The annual revenue, derived mostly from domains, but partly from direct taxes, amounts to L.130,285; and the expenditure, including the interest of the state debt, is L.120,460. The amount of the debt at present is about L.450,000, but it is diminishing yearly. The military force consists of one regiment of infantry and a small corps of hussars. The contingent to be furnished to the German Confederation is 2010 men. Education is sedulously attended to. There is a university at Iena of considerable celebrity, with 590 students and many able professors. There are two gymnasia, sixty-nine burgher schools, and 543 village schools. The cities containing more than 5000 inhabitants were (in 1835) Weimar, 11,005; Eisenach, 9270; and Iena, 5792.

Saxmundham
||
Saxo-Grammaticus.

SAXMUNDHAM, a town and parish of the hundred of Plomsgate, in the county of Suffolk, eighty-nine miles from London. It is situated on a hill, with good prospects around it, and is not well built, but has a large church. It has very little trade, but a market is held on Thursday. The population amounted in 1801 to 855, in 1811 to 957, in 1821 to 989, and in 1831 to 1048.

SAXO-GRAMMATICUS, descended from an illustrious Danish family, was born about the middle of the twelfth century. Stephens, in his edition of Saxo-Grammaticus, printed at Soroë, indubitably proves that he must have been alive in 1156; but he cannot ascertain the exact place and time of his birth. On account of his uncommon learning, Saxo was distinguished by the name of *Grammaticus*. He was provost of the cathedral church of Roskild, and warmly patronized by the learned and warlike Absalon, the celebrated archbishop of Lunden, at whose instigation he wrote the History of Denmark. His epitaph, which is a dry panegyric in bad Latin verses, gives no account of the era of his death, which happened, according to Stephens, in 1204. His history, consisting of sixteen books, begins from the earliest account of the Danish annals, and concludes with the year 1186. According to the opinion of an accurate writer, the first part, which relates to the origin of the Danes, and the reigns of the ancient kings, is full of fables; but the eight last books, and particularly those which regard the events of his own times, deserve the utmost credit. He wrote in Latin; and the style, if we consider the barbarous age in which he flourished, is in general extremely elegant, but rather too poetical for history. Mallet, in his *Histoire de Dannemarc* (vol. i. p. 182), says that "Sperling, a writer of great erudition, has proved, in contradiction to the assertions of Stephens and others, that Saxo-Grammaticus was secretary to Absalon, and that the Saxo, provost of Roskild, was another person, and lived earlier."

SAXONY, one of the provinces of the kingdom of Prussia. It has been formed out of several of the hereditary states of the monarchy, and also by the addition of the territory of some mediatized princes, and in a great measure by extensive parts of the kingdom of Saxony which were transferred to Prussia by the negotiations for the general peace of 1814. The parts then conveyed from Saxony were the duchy of that name and its province of Thuringia. The actual province now extends in north latitude from 50° 27′ to 53° 5′, and in east longitude from 9° 44′ to 13° 58′, being 9902 square miles. The division of the province is into three governments, assuming the names of the cities where the several administrative boards are established, viz. Magdeburg, Merseburg, and Erfurt. The population amounted in 1817 to 1,214,219, but had, like that of the other parts of Prussia, increased so as to amount in 1831, according to the census at the end of that year, to 1,449,587. Of these persons, two thirds adhere to the Lutheran church, and the other third are mostly Catholics, but with a small number of other protestant sects, and some Jews. The Catholics are chiefly found in the circles of Upper and Lower Reichsfeld, and in that of Erfurt.

The greater part of the province is a plain, with a few undulations; but on the western side, in the circles of Merseburg and Erfurt, are the Thuringian Hills, which are elevated but fertile, and include a part of the Hartz Forest, which is mountainous and woody. The whole is well watered by various small rivulets, which form the rivers Mulda, Saale, Ohre, Aland, Black-Alster, and Havel, all of which run through the Elbe to the German Ocean. There are three canals, viz. the Plauen, which unites the Havel with the Elbe, which is about twenty miles in length, and is used for navigation; the Shiffigraben, between Magdeburg and Brunswick, which is chiefly constructed for draining a rich tract of land; and the Flossgraben, in Merseburg, which connects the Elster and the Pegau, and is chiefly used for floating timber. The rivers, lakes, and ponds are very fully stocked with a variety of fishes.

No part of Germany is better cultivated than this province, and as the land is of a moderate quality, it yields abundant crops, and is considered as the granary of the Prussian dominions. The number of sheep is very great, and the wool of them, which has been much improved of late years, both supplies the home manufacturers, and also exports much to other countries. The inhabitants are industrious, cleanly, and temperate, like all the Saxons; and there is the appearance of ease in the villages and towns, where the manufacture of linens and woollens is the usual employment. There are mines, in that part which is within the Hartz, that produce silver, copper, iron, and coals; but the most productive of the mines are those of salt, which are found at a great depth in various parts of the province, and supply abundance of culinary salt when refined.

The country of Saxony is remarkable for being the cradle of the present English nation; but concerning the Saxons themselves previous to that period, we have very few particulars. The Saxons, says Mr Whitaker, have been derived by our historians from very different parts of the globe; India, the north of Asia, and the forests of Germany. Their appellation, too, has been equally referred to very different causes; the name of their Indian progenitor, the plundering disposition of their Asiatic fathers, and the short, hooked weapons of their warriors. But the real origin of the Saxons, and the genuine derivation of their name, seem to be different.

In the earlier period of the Gallic history, the Celtæ of Gaul crossed the Rhine in considerable numbers, and planted various colonies in the regions beyond it. Thus the Volcæ Tectosages settled on one side of the Hercynian Forest and about the banks of the Neckar; the Helvetii upon another and about the Rhine and Maine; the Boii beyond both; and the Senones in the heart of Germany. Thus also we see the Treviri, the Nervii, the Suevi, and the Marcomanni, the Quadi, the Venedi, and others in that country, all plainly indicated as Gallic nations, by the Gallic appellations which they bear, and all together possessing the greatest part of it. And, even as late as the conclusion of the first century, we find one nation on the eastern side of this great continent actually speaking the language of Gaul, and another upon the northern side using a dialect nearly related to the British. But as all the various tribes of the Germans are considered by Strabo as γενησιοι Γαλαται, or genuine Gauls in their origin, so those particularly that lived immediately beyond the Rhine, and are asserted by Tacitus to be indubitably native Germans, are expressly denominated Γαλαται, or Gauls, by Diodorus, and declared by Dio to have been from the earliest period distinguished by the equivalent appellation of *Celtæ*. And the broad line of nations which extended along the ocean, and reached to the borders of Scythia, was all known to the learned in the days of Diodorus by the same significant appellation of Γαλαται, Gauls.

Of these the most noted were the Sicambri and Cimbri, the former being situated near the channel of the Rhine, and the latter inhabiting the peninsula of Jutland. The denominations of both declare their original, showing them to have been derived from the common stock of the Celtæ, and to be of the same Celtic kindred with the Cimbri of our Somersetshire, and the Cymbri or Cambrians of our Wales. The Cimbri are accordingly denominated Celtæ by Strabo and Appian; and they are equally asserted to be Gauls by Diodorus, descendants of that nation which sacked the city of Rome, plundered the temple of Delphi, and subdued a great part of Europe and some of Asia.

Immediately to the south of these were the Saxons, extending from the isthmus of the Chersonesus to the current of the Elbe; and they were equally Celtic in their origin as their neighbours. They were denominated Ambrones as well as Saxons; and as such, they are included by Tacitus under the general appellation of *Cimbri*, and comprehended in Plutarch under the equal one of *Celto-Scythæ*. The name of Ambrones appears particularly to have been Gallic, being common to the Saxons beyond the Elbe, and the Ligurians in Cisalpine Gaul; as both found to their surprise, on the irruption of the former into Italy with the Cimbri. And, what is equally surprising, and has been equally unnoticed by the critics, the Welsh distinguish England by the name of *Loegr* or *Liguria*, even to the present moment. In that irruption these Saxons, Ambrones, or Ligurians, composed a body of more than thirty thousand men, and were principally concerned in cutting to pieces the large armies of Manlius and Cæpio. Nor is the appellation of Saxons less Celtic than the other. It was originally the same with the Belgic Suessones of Gaul; the capital of that tribe being now entitled Soisons by the French, and the name of the Saxons pronounced Saisen by the Welsh, Sason by the Scotch, and Sasenach by the Irish. And the Suessones or Saxones of Gaul derived their own appellation from the position of their metropolis on a river, the stream at Soisons being now denominated the Aisne, and formerly the Axon; Uesson or Axon importing only waters or a river, and S-uess-on or S-ax-on on the waters or the river. The

Suessones, therefore, are actually denominated the Uessones by Ptolemy, and the Saxones are actually entitled the Axones by Lucan.

These, with their brethren and allies the Cimbri, having been more formidable enemies to the Romans by land, than the Samnites, Carthaginians, Spaniards, Gauls, or Parthians, in the second century applied themselves to navigation, and became nearly as terrible by sea. They soon made themselves known to the inhabitants of the British isles by their piracies in the northern channels, and were denominated by them Lochlyn or Lochlynach; *lucd-lyn* signifying the people of the wave, and the *d* being quiescent in the pronunciation. They took possession of the Orkney Islands, which were then merely large shoals of sand, uncovered with wood, and overgrown with rushes; and they landed in the north of Ireland, where they ravaged the country. Before the middle of the third century they made a second descent upon the latter, disembarked a considerable body of men, and designed the absolute subjection of the island. Before the conclusion of it, they carried their naval operations to the south, infested the British channel with their little vessels, and made frequent descents upon the coasts. And in the fourth and fifth centuries, acting in conjunction with the Picts of Caledonia and the Scots of Ireland, they ravaged all the eastern and south-eastern shores of Britain, began the formal conquest of the country, and finally settled their victorious soldiery in Lancashire.

In the course of time these barbarous tribes were civilized, and settled in their lands, on which they began to exercise their industry in cultivation, and in various manufactures for their own convenience. Their possessions extended from beyond the north-western part of Germany to the southern extremity of the Erzgebirge, and were denominated the Duchy of Saxony, forming one of the most powerful German states, which was governed till the commencement of the tenth century by various Vandal houses, when Henry I. took from them the land lying between the Saale and the Elbe, and founded for its protection the margravate of Meissen, which was governed at first by various houses, but latterly became hereditary in the Askanian family. When the duchy of Saxony was taken from Henry the Lion, in the twelfth century, it was split into so many parts, that Bernhard of Askania, who succeeded to this duchy, being unable to procure any thing but the mere title, transferred the name of Saxony to the lands which he already possessed, and which still constitute a principal part of the present kingdom. After the death of Bernhard, and the extinction of his family, Frederick, landgrave of Thuringia, succeeded in the year 1423 to his titles and property. In 1485, however, his family divided itself into two distinct lines; the elder, or Ernestine, which possessed Thuringia and the electorship, and the younger, or Albertine, which possessed Meissen and the title of duke.

In the year 1547, Frederick the Magnanimous was made prisoner, and forced to resign a great part of his territory and his electorship to his cousin Maurice, of the Albertinian line; and thus the kings of Saxony are descended from the younger of the Thuringian family. In 1697, the royal family went over to the Catholic church, in the reign of Augustus I. and thereby procured for a season the crown of Poland.

During the early stages of the French revolution, Saxony took little or no part in the struggle, and only as a member of the Germanic empire furnished the contingent of troops required by that relation, which were withdrawn when Prussia formed a combination of the northern states of Germany to counteract the confederation which France had formed in the southern states. To this extent Saxony was in alliance with Prussia when France, in 1806, began the war with that power. At the decisive battle of Iena, in October of that year, a body of twenty thousand Saxons were joined to the Prussian army. The complete victory of Napoleon induced the Duke of Saxony to conclude a peace with him, and to become a member of the Rhenish confederation, of which the French emperor was acknowledged the protector.

In July 1807, the peace of Tilsit, between Russia, France, and Prussia, was concluded. In conformity with its conditions, the whole of the dominions of Prussia on the left bank of the Elbe, including the strong fortresses which commanded the passages over that river, were ceded to Saxony, and the duke was acknowledged as king. A part also of Poland, which at the last division of that country had been shared by Prussia, was, with the capital, erected into a grand duchy, called by the name of Warsaw, and the sovereignty of it was conferred on the king of Saxony. After the peace between Austria and France, which followed the battle of Wagram, the newly-created grand duchy of Warsaw was extended by additions from Austria of West Gallicia and the city of Cracow, with the vast salt mines of Wielicsla, whilst to the Saxon crown there were conveyed some portions of the kingdom of Bohemia.

When Napoleon declared war with Russia in 1812, the Saxon capital was the spot on which the several monarchs of Europe were assembled to pay homage to him whose dependents they had become. In the grand army that invaded Russia, the troops of the king of Saxony formed a part of the right wing, and advanced into Russia. They had little opportunity of distinguishing themselves, and after the burning of Moscow retired to their own country.

When in the following year the French army advanced into Germany to oppose the Russians and Prussians, the king of Saxony treated with Austria, with the pretext that it was only for the purpose of obtaining a peace. He declared his own neutrality, and gave orders to his general, Thielman, to refuse admission to the troops of any of the belligerent parties into his fortress of Torgau on the Elbe. While these negotiations with Austria were proceeding, the king left Dresden, and repaired first to Ratisbon, and from thence to Prague, whilst the French general Davoust entered his capital. About five weeks afterwards (2d May), Napoleon had gained a battle at Lutzen, over the united army of Russia and Prussia. Upon this the French emperor, who by the victory was master of Leipsig, and the whole of the king's dominions, peremptorily demanded by a special messenger to Prague, "Je veux que le roi se déclare; je saurai alors ce que j'aurai â faire; mais s'il est contre moi, il perdra tout ce qu'il a." This determined the conduct of the king. He returned to Dresden. His forces joined the French army, and the troops of that nation occupied Torgau and the other fortresses. His troops joined those of Napoleon in the successful resistance of the attack by the Russians and Prussians on Dresden, when the French general Moreau was killed; and at length, after an armistice, proceeded to Leipsig with the French. At the fatal battle before that city on the 19th of October, when the French retreated, the king was left in that city, where he was made a prisoner by the confederate armies of Austria, Russia, Prussia, and Sweden, and was removed to Berlin. The king remained under restraint from October 1813 till June 1815; whilst the allied powers were fully occupied, first, in annihilating the government of Napoleon, then in quelling his attempts to resume that power, and, finally, in settling the arrangements which the state of Europe demanded. At the congress of Vienna, the first intention seems to have been to depose the king of Saxony, and allot to other powers the whole of the territory; but gradually a more tender feeling prevailed. He was compelled to sign a treaty soon after Napoleon had arrived in Paris from Elba, by which he consented to the partition of his dominions, and joined his forces to those of the allies then advancing towards France.

By the partition Prussia received from Saxony more in extent than one half of its territory, and somewhat less than half as regarded the number of inhabitants. The loss most lamented was that of the province of Saxony, the cradle of the reigning dynasty, which was 5700 square miles in extent, and contained 875,000 inhabitants. Among the subjects of regret, the greatest was the loss of those portions of the kingdom which chiefly supplied the corn, the wood, and the salt.

Amidst the calamities that had been endured, not a complaint was made by the subjects against their monarch. They were universally satisfied, that in all the changes, he had acted more out of regard to the happiness of his people than his own aggrandisement; and when he returned from his captivity to Dresden, he was received with the affectionate feeling which would be displayed in a domestic circle, when the virtuous head of a family returned home among scenes of distress and common suffering. The country was at that time, from having been so long occupied by numerous armies of various nations, in a most dreadful state of poverty, disease, and moral depravity; but the return of peace, the restoration of the monarch, and the confidence reposed in his goodness and wisdom, produced in a very short time a wonderful effect. Order and credit in the finances were first established, and the fruitful soil, by the application of the skill and industry for which the natives are distinguished, soon produced abundance of the necessaries of life; by breeding fine-woolled sheep, the means of restoring that manufacture was effected; and the surplus wool being exported, brought in return much real wealth. The fabrics of linen, cotton, iron, and other goods, were much extended, whilst the great fairs at Leipsig became two central points yearly for beneficial commerce with foreign countries. As the tranquillity gradually produced prosperity, judicious improvements were made in the establishments for the education of the common people, as well as for the training of the medical students, of the civil and military engineers, and of the higher branches of knowledge. The king lived to a great age, the last twelve years of which were attended with improvements in every public department, and exhibited among all classes, whether agricultural, commercial, mining, or manufacturing, an advance which excited surprise in all who attentively watched its steps, and inspired that mutual confidence between the king and the people, which was retained till his death in 1827. The progress was continued under the successor of the king till the year 1831. At that time the revolution in France, which expelled the elder branch of the Bourbons, was felt in every part of Germany, and excited popular tumults. Dresden had its share, and a mob destroyed one or two of the inferior public buildings. It was, however, soon suppressed, by the discharge of a good but unpopular minister, by the division of the states into two chambers, and other trifling alterations. From that period peace has continued and prosperity has advanced.

The kingdom of Saxony, in its present state, is a compact and connected territory. It extends from 28° 5′ to 31° 13′ east longitude, and from 50° 10′ to 51° 31′ north latitude. It is bounded on the north and north-east by Prussia, on the south-east and south by Austria, on the south-west by Bavaria, on the west by the principality of Reus and the duchy of Saxe-Gotha, and on the north-west by Prussia. By a recent arrangement it has been divided into four circles, and these again are subdivided into amts or bailiwicks in the following manner:

Circles.	Amts.	Cities.	Villages.	Extent in English Acres.	Inhabitants.
Dresden ..	5	32	998	1,098,240	411,864
Leipsig....	3	38	1001	887,040	361,251
Zwickau..	5	58	873	1,182,720	549,811
Bautzen...	2	13	629	633,600	257,444
	15	141	3501	3,801,600	1,580,370

By a subsequent addition of the births, and a deduction of the deaths, the population at the end of the year 1836 was found to be 1,618,495. In the year 1818 the population was found to be 1,282,082, having thus increased in eighteen years 336,413, being at the rate of about twenty-five per cent.

The cities whose inhabitants amount to more than 5000, with their present population, are,

Dresden (besides the garrison)	66,133	Glauchau	6229
Leipsig	44,802	Zwickau	6127
Chemnitz	21,137	Grossenhain	5582
Freyburg	11,545	Dobeln	5559
Plauen	8,570	Mittweide	5506
Bautzen	8,467	Frankenberg	5415
Zittau	8,195	Reichenbach	5412
Meissen	7,525	Zschopau	5384
Schneeberg	6,769	Oschatz	5243
Annaberg	6,377	Perna	5214

The northern part of the kingdom of Saxony is for the most part a level or an undulating country; but on the south it is very mountainous. The mountains rise in three successive ridges, denominated the Vorgeberg, Mithelgeberg, and Hochgeberge; the southernmost of these, bordering on Bohemia, is the loftiest. The highest points of these mountains are those of the Fichtelberg, 3730 feet; Auersberg, 2931 feet; the Lausche, 2400 feet; and Hochwald, 2299 feet.

A part of this mountainous district, between Dresden and Bohemia, usually denominated Saxon Switzerland, has peculiar charms for the lovers of picturesque scenery. It is about twenty-eight miles in length and twenty-three in breadth, displaying deep chasms bordered by perpendicular rocks, some naked, and others clothed with every variety of trees. Rapid streams pour from declivities, forming cascades in some parts, and in others, in deep vales, meandering through verdant meadows, without their issue or their egress being discoverable by the observer from the precipices which enclose such recesses, and whence he can see no path by which the vales can be reached. Through this mass of mountains the river Elbe has worn itself a passage, by a most tortuous course, and washes the bases of rocks, in some parts of near a thousand feet in perpendicular height, from the summit of which that stream appears to the beholder as an insignificant rivulet. From the surface of this mountain plain rise pinnacles of rocks, on which castles in the feudal times were erected, some of the ruins of which add to the romantic grandeur of the prospect; whilst others, such as Königstein and Litherstein, have had applied to them all the arts of modern fortification, and are the most impregnable fortresses in the Saxon dominions. Königstein especially, though, from its great height, it appears to terminate in a point, has on its apex strong walls, surrounding buildings in which the treasures of the crown are secured in times of danger, with ground to yield potatoes enough to feed the garrison, as that vegetable grows there to perfection, though, from being fourteen hundred feet in height, the rigid cold of winter is most severely felt. This fortress, and that of Lillienstein on the opposite side of the Elbe, are considered as the keys to Bohemia. Few spots in Europe create greater interest in the geologist, the botanist, or the lover of picturesque scenery, than this portion of the country so appropriately denominated Saxon Switzerland.

The principal river of Saxony, and that to which almost all the others contribute their streams, though not till it has left this kingdom, is the Elbe. It enters from Bohemia, and is navigable for barges through the whole of its Saxon course. The other rivers are the Black Elster, which rises in Lusatia, and soon enters the Prussian territory; and the Sprec, which comes out of Bohemia, divides itself into two branches near Bautzen, and then passes into Prussia. These rivers fall into the Elbe on its right bank. On the left bank it receives the Moldau, which has two sources in Bohemia, and in Saxony unites with the Zwichau, and runs parallel to the Elbe till it joins that stream at Dessau. The White Elster rises in Voightland, with many curvatures reaches the suburbs of the city of Leipsig, and, receiving there the small river Pleisse, falls into the Saale, and is ultimately lost in the Elbe above Magdeburg. The only river that does not run to the Elbe is the Neisse, which rises in the eastern corner of the kingdom, and, passing into Silesia, is at length emptied into the Oder. There are no lakes in Saxony, nor any canals, except such as are used in the mining districts for conveying the ore to the mills.

As compared with most parts of Germany, the agriculture of Saxony is much advanced. Wherever the soil is capable of cultivation, it is worked with diligence; and the more hilly and poorer soils have a good herbage, and yield pasture to numerous flocks and herds. The sides of the mountains towards the Elbe, from Pirna to Meissen, are covered with vines which yield both red and white wine; the former from the vicinity of Pilnitz and Loschwitz, and the latter from that of Hoflasnitz, are the most valued; but the great portion of the Saxon wines is of a very indifferent quality. The best of them are produced from the vineyards belonging to the king; and though they are sold at the highest prices, it is very doubtful if the expenses of cultivation, and the rent which might be obtained for the land, do not exceed what is produced by the sale of the wines.

The whole of Saxony is highly productive of fruit, and the care and skill exercised in its cultivation is amply rewarded. Great destruction to the fruit-trees took place during the tremendous military conflicts of which the country was the theatre; but still the orchards and gardens are very extensive, and new trees, planted since the wasting warfare of 1813, are beginning to yield their products. The calamities which proved injurious to the fruit-trees have lessened the number of cattle of every description; in the year 1817, in many districts of the circle of Meissen, not a single head of cattle was to be found. The bee-hives were destroyed by the same events; but the traces of these calamities have now disappeared, and the remembrance of them is scarcely adverted to by the rising generation. The sheep were preserved by being driven to the mountains, and since the war have vastly multiplied; and the fineness of the wool, for the sake of which they are chiefly kept, has been most wonderfully increased, and excels the finest wools of Spain.

The arable land is chiefly cultivated on a three-course system, consisting of a fallow, winter sown grain, and spring sown grain. In some cases there is a fallow crop of flax, hemp, or potatoes. The winter corn that succeeds is generally rye, and sometimes, though less extensively, wheat; the summer corn which follows is chiefly oats, and sometimes barley. The greater part of the arable land is in common fields, held under a feudal tenure, over which the lord of the manor has the right of depasturing his flocks between the harvest and the next seed time. The farming occupations are generally very small, and the increase of grain throughout the whole kingdom is said not to average more than five to one. The culture of potatoes has been very much extended of late years, and forms almost exclusively the food of the labouring classes in the mountainous districts. Tobacco, hemp, flax, wood, hops, and chiccory, are grown in some parts of the kingdom, but neither of them to the extent which the consumption of the country requires. The woods of the kingdom, since the separation of its best portions, are insufficient to furnish the inhabitants with the necessary fuel; and though abundance of coal is found near Dresden, it is of so sulphureous a nature as to be deemed unwholesome, and is used only by those who are unable to pay the high price for wood which its scarcity has created.

Saxony abounds in minerals, and though the veins in general are far from being of great thickness, the ore is tolerably rich; which, added to superior skill and economy in working the mines and separating the metals, makes them very beneficial to the crown, to whom the greater portion of them belong. The mineralogical school of Freyberg has had a wonderful influence, not only in Saxony, but in all parts of the world, in increasing the knowledge and in improving the practice of the operative labourers in the mining art. The annual produce of the silver-mines is about 400,000 ounces; and besides this, they yield copper, lead, tin, iron, sulphur, quicksilver, bismuth, arsenic, and coal. Gold is found in very small quantities.

In no part of the Continent has manufacturing industry been carried to so great an extent, or occupied so large a proportion of the population, as in Saxony. Before the separation from it of the most productive agricultural provinces, it was calculated that two fifths of the inhabitants were employed in manufactures; but since that unfortunate event, it is estimated that three fifths are occupied in commerce and manufactures, and only two fifths in agriculture. It is by the extent of its manufactures alone that the country can be furnished with the means of paying for those articles of the first necessity, of which a sufficiency is not now produced within it. The provinces which supplied corn, fuel, and salt, have been ceded to Prussia, and those articles must be paid for by the sales of the minerals and manufactures. During the continuance of Napoleon's continental system, the Saxon manufacturers enjoyed a most extensive trade, and the encouragement thus obtained gave an impulse which directed the efforts and the capital of the country towards their perfection; but the division of labour was not carried to such an extent, nor was the application of machinery so generally adopted, as to enable them to withstand the competition with British goods, which peace introduced into many of those markets that they had before almost exclusively supplied. It would include almost the whole catalogue of European manufactures to enumerate the respective kinds of goods made in Saxony. Woollens, linens, cottons, and silks for clothing; iron, brass, and copper wares; paper, leather, earthenware, hats, musical instruments, and turnery ware; various chemical and dyeing preparations; clocks, watches, swords, guns, and pistols, are all comprehended in the list of Saxon manufactures.

The commerce of a country whose inhabitants are chiefly occupied in manufactures, and produce an insufficiency of food for their own consumption, must necessarily be extensive. The trade of Saxony chiefly centres in the city of Leipsig, whence, at the time of the two annual fairs, the greater part of the manufactures are disposed of, and contracts are made for such foreign commodities as the supply of the country demands. As the fairs of Frankfort-on-the-Maine precede, and those of Frankfort-on-the-Oder follow, the fairs of Leipsig, some portion of the trade is carried on by those channels. The roads leading to Leipsig are generally good, and trains of waggons loaded with goods are at all times to be seen proceeding to and from that place; many of which come from Flanders, Holland, Hamburg, and Brunswick, on one side, and from Russia, Poland, and even Turkey, on the other. At the fairs of Leipsig the new books printed in most parts of Germany are brought for publication. There the publishers meet and exchange the works of one part of the country, where the German language is spoken, with those of another. So extensive is this trade, that it is said the commissions on it to the brokers and merchants of Leipsig amount to more than 40,000 rix-thalers a year. The whole sales at the fairs in that city are estimated, including the exports and imports, at about 20,000,000 rix-thalers, or more than L.3,000,000 sterling. Saxony disposes, in this way, of sheep's wool, fine woollen goods, linen and thread lace, yarn and worsted, ironmongery, cutlery, and braziery, and also books. It receives in return corn, wine, salt, wood, and colonial wares. Although the river Elbe is navigable from the ocean to the interior of Saxony, it is only used for the conveyance of the heaviest goods, and for them but partially. It is found that the tolls on that river, with the risk of damage and of robbery, make it more advantageous to convey commodities by land than by water.

The government is a monarchy hereditary in the Saxon Albertine line, and in failure of that, in the Ernestine or Saxe-Weimar branch of the family. The monarchy may be called limited; but the limitations are of such a nature that the liberties of the people have been more secured by the mildness of the reigning family than by any restrictions that the states have or could exercise. The king enjoys the whole executive power, confirms pardons, bestows commissions, nominates the supreme judges, and enjoys the power of making peace and war, and of concluding all treaties. In making new laws, and in imposing new taxes, the states have the right to be consulted. According to the ancient constitution, which is still adhered to, the states are constituted of various elements; and, in fact, are an amalgamation of various corporations, each of which thinks only of its own peculiar interests, and contrives to cast the weight of all public burdens from the cities and the nobles, who are represented, to the country people, who have no voices. The assembly consists, first, of members chosen by the provincial representatives of the nobility; secondly, of the representatives of the prelates, who, before the Reformation, had seats, but who have since been chosen by the higher class of nobles in right of their possessing certain estates of which the prelates were deprived; and, thirdly, the university of Leipsig. These states represent only the circles of Meissen, Leipsig, Erzgebirge, and Voightland; for that of Lausatia has its own peculiar assembly of states, which differs but little from those of the other four, except that the members from the land possessors must have at least sixteen quarterings in their coats of arms. When the king pleases, these states are convoked; but as it has not been found necessary to impose new taxes, or to make alterations in the laws, they have seldom been assembled, and their session has usually been very short. The administration is conducted by a cabinet council, under which, through the medium of the privy council, orders are communicated to the departments of finance, war, domains, police, and foreign affairs.

The financial affairs of the kingdom and the credit of the government have rapidly improved. According to the budget of 1837, the income, a great part of which is derived from the estates of the crown, amounted to 5,194,873 rix-thalers, valued at about three shillings each. The expenditure amounted to the same sum, but in that was included 145,424 thalers appropriated to a reserve fund to meet unforeseen contingencies, 321,545 thalers to pay the interest of the debt, and 171,806 thalers which forms a sinking fund to extinguish the debt, which, at the rate now proceeding, a few years will accomplish, as at the close of the war it was near L.4,000,000 sterling, and is, according to the budget, reduced to L.1,177,740 sterling.

The armed force is no more than the contingent required from the kingdom by the German Confederation. It is composed of the following arms:—

The guards	370
Infantry of the line	7,080
Cavalry	2,066
Artillery	1,032
Sharp-shooters	1,454
Engineers	191
	12,193

Although the royal family profess the Catholic religion, and are zealous in discharging its injunctions, the established faith is the Lutheran, and, until the year 1811, no person of any other sect was eligible to seats in the several corporations in the provincial or general assembly of the states. At that period all sects were placed on the same footing. The whole number of Catholics is about 28,000, some of whom are attached to the royal household; but most of them are found among the inhabitants of the province of Lausatia. The number of Protestants dissenting from the established church, including Moravians and Calvinists, is not supposed to exceed two thousand. The Lutheran church is governed by four consistories or assemblies of divines, differing in the number of superintendents, but comprising together twenty-five of that order. The Catholics in Lausatia are governed by the abbot of Bautzen, on whom the pope generally bestows the title of bishop *in partibus infidelium.*

Education is well conducted in the university of Leipsig, and in the endowed classical schools of Meissen, Wurzen, and Grimma, as well as in several gymnasia. The popular education is not so well managed as in the other Protestant German states; but some steps have been taken, and others are in contemplation, which may soon make the Saxon system as effective as that of Prussia. The fine arts have been cultivated with considerable success, and both statuary and painting receive valuable assistance from the fine productions which are contained in the collections of Dresden.

SAYANSKIE, a chain of mountains in Siberia, forming a prolongation of the Altai chain, and, like them, separating Siberia from Chinese Tartary. They extend between the river Yenisei and Lake Baikal, and consist of naked rocks of red granite.

SAYMBRUMBACUM, a small town of India, in the province of the Carnatic. Near it is a remarkably fine reservoir of water, eight miles in length by three in average breadth, which in the dry season is rendered subservient to the purposes of cultivation, and being let out in small streams, serves to irrigate the lands of thirty-two villages. Long. 80. 5. E. Lat. 13. 2. N.

SAYPAN, one of the Ladrone Isles, in the Eastern Seas, about twenty miles in circumference. It was once the best peopled island of the Ladrones, but is now uninhabited; and very opposite accounts are given of its productiveness by different voyagers. Anson mentions that it presents as pleasant an aspect as Tinian; and on the west side of the island lies a safe and commodious port. Long. 145. 55. E. Lat. 15. 13. N.

SCALDS, in the history of literature, a name given by the ancient inhabitants of the northern countries to their poets, in whose writings their history is recorded.

SCALE, a mathematical instrument, consisting of several lines drawn on wood, brass, or silver, and variously divided, according to the purposes it is intended to serve; whence it acquires various denominations, as the *plain scale*, *diagonal scale*, *plotting scale*, and the like.

Scale, in *Music*, see Music. The name is derived from *scala*, a ladder, or flight of stairs, and has reference to the disposition of the notes that ascend or descend upon the written or printed musical stave.

Scale, in *Architecture* and *Geography*, a line divided into equal parts, and placed at the bottom of a map or draught, to serve as a common measure to all the parts of the building, or all the distances and places of the map.

SCALENE, or Scalenous Triangle, *scalenum*, in *Geometry*, a triangle the sides and angles of which are unequal.

SCALIGER, Julius Cæsar, a learned critic, poet, physician, and philosopher, was born at the castle of Ripa, in the territories of Verona, in 1484; and is said to have been descended from the ancient princes of Verona, though this is not mentioned in the letters of naturalization which he obtained in France in 1528. He learned the first rudiments of the Latin tongue in his own country; and in his twelfth year was presented to the Emperor Maximilian, who made him one of his pages. He served that emperor seventeen years, and gave signal proofs of his valour and conduct in several expeditions. He was present at the battle of Ravenna in April 1512, in which he had the misfortune to lose his father Benedict Scaliger, and his brother Titus, on which his mother died with grief; when, being reduced to necessitous circumstances, he entered into the order of the Franciscans, and applied himself to study at Bologna. But soon afterwards, changing his mind with respect to his becoming a monk, he took arms again, and served in Piedmont; at which time a physician persuaded him to study physic, which he did at his leisure hours, and also learned Greek; and at last the gout determined him, at forty years of age, to abandon a military life. He soon afterwards settled at Agen, where he married, and began to apply himself seriously to his studies. He learned first the French tongue, which he spoke perfectly in three months; and then made himself master of the Gascon, Italian, Spanish, German, Hungarian, and Sclavonian; but the chief object of his studies was polite literature. Meanwhile, he supported his family by the practice of physic. He did not publish any of his works till he was forty-seven years of age, when he soon gained a great name in the republic of letters. He had a graceful person, and so strong a memory, even in his old age, that he dictated to his son two hundred verses which he had composed the day before, and retained without writing them down. He was so charitable, that his house was as it were an hospital for the poor and sick; and he had such an aversion to lying, that he would have no correspondence with those who were given to that vice; but, on the other hand, he had much vanity, and possessed a satirical spirit, which created him many enemies. He died of a retention of urine in 1558. He wrote in Latin, 1. A treatise on the Art of Poetry, and, 2. Exercitations against Cardan, which works are much esteemed; 3. Commentaries on Aristotle's History of Animals, and on Theophrastus on Plants; 4. Some treatises on Physic; 5. Letters, Orations, Poems, and other works, in Latin.

SCALIGER, *Joseph Justus*, one of the most learned critics and writers of his time. He was the son of the former, and was born at Agen, in France, in 1540. He studied in the college of Bordeaux; after which his father took him under his own care, and employed him in transcribing his poems. By this means he obtained such a taste for poetry, that before he was seventeen years old he wrote a tragedy upon the subject of Œdipus, in which he introduced all the poetical ornaments of style and sentiment. His father having died in 1558, he went to Paris the year following, with a desire to apply himself to the Greek tongue. For this purpose he for two months attended the lectures of Turnebus; but finding that in the usual course he should be a long time in gaining his point, he shut himself up in his closet, and by constant application for two years gained a perfect knowledge of that language. After this he applied to the Hebrew, which he learned by himself with great facility. He made no less progress in the sciences; and his writings procured him the reputation of one of the greatest men of that or of any other age. He embraced the reformed religion at twenty-two years of age. In 1563, he attached himself to Louis Casteignier de la Roche Pozay, whom he attended in several journeys; and, in 1593, he was invited to accept of the place of honorary professor of the university of Leyden, which he complied with. He died of a dropsy in that city in 1609. He was a man of great temperance, was never married, and was so close a student that he often spent whole days in his study without eating; and though his circumstances were always very narrow, he constantly refused the presents that were offered him. He published many works, the principal of which are, 1. Notes on Seneca's Tragedies, on Varro, Ausonius, Pompeius Festus, &c.; 2. His Latin Poems; 3. A treatise de Emendatione Temporum; 4. Eusebius's Chronicle, with Notes; 5. Canones Isagogici; and many other works. The collections entitled *Scaligeriana* were collected from his conversations by one of his friends; and being ranged into alphabetical order, were published by Isaac Vossius.

SCALPING, in military history, a barbarous custom, in practice among the Indian warriors, of taking off the tops of the scalps of the enemies' skulls with their hair on. They preserve them as trophies of their victories, and are rewarded by their chiefs according to the number of scalps which they bring in.

SCANDARIEH, a village of Irak Arabi, situated on a canal which forms a communication between the Tigris and Euphrates, 120 miles north-west of Bassorah.

SCANDERBEG, the surname of George Castriot, king of Albania, a province of Turkey in Europe, dependent upon the Ottoman empire. He was delivered up with his three elder brothers as hostages, by their father, to Amurath II. sultan of the Turks, who poisoned his brothers, but spared him on account of his youth, being likewise pleased with his juvenile wit and amiable person. In a short time he became one of the most renowned generals of the age; and revolting from Amurath, he joined Hunniade Corvin, a most formidable enemy of the Ottoman power. He defeated the sultan's army, took Amurath's secretary prisoner, and obliged him to sign and seal an order to the governor of Croia, the capital of Albania, to deliver up the citadel and city to the bearer of that order, in the name of the sultan. With this forged order he repaired to Croia, and thus recovered the throne of his ancestors; and maintained the independency of his country against the numerous armies of Amurath and his successor Mahommed II. who was obliged to make peace with this hero in 1461. He then proceeded to the assistance of Ferdinand of Aragon, at the request of Pope Pius II., and by his assistance Ferdinand gained a complete victory over his enemy the Count of Anjou. Scanderbeg died in 1467.

SCANDEROON, a seaport of Syria, on a bay in the south-eastern part of the Mediterranean. About half a mile south is an octagonal castle, well built of hewn stone, called the Castle of Scanderberg, or Alexander. It is surrounded by walls, which are now low; but each side is defended by a tower. To the north is an old square tower, which is inaccessible on account of the morass. It is now reduced to a village of 185 houses, which owes all its importance to its road, the only one in Syria affording good anchorage, but still subject to sudden squalls. The village is extremely unhealthy, as is indicated by the sallow looks of the inhabitants. It is never exempt from a pestilential fever, which is occasioned by putrid exhalations from the neighbouring marshes during the heats of summer. It is thirty miles north of Antioch, and seventy north-west of Aleppo. Long. 36. 15. E. Lat. 36. 36. N.

SCANDINAVIA, a general name for the countries of Norway, Sweden, and Denmark, anciently under the dominion of one prince. The inhabitants of these countries, in former times, were excessively addicted to war. From their earliest years they applied themselves to the military art, and accustomed themselves to cold, fatigue, and hunger. Even the very sports of youth and childhood were dangerous. They consisted in taking frightful leaps, climbing up the steepest rocks, fighting naked with offensive weapons, and wrestling with the utmost fury; so that it was usual to see them grown up to be robust men, and terrible in the combat, at the age of fifteen. At this early age the young men became their own masters, which they did by receiving a sword, a buckler, and a lance. The ceremony was performed at some public meeting. One of the principal men of the assembly named the youth in public; after which he was obliged to provide for his own subsistence, and was either now to live by hunting, or by joining in some incursion against the enemy. Great care was taken to prevent the young men from too early connexions with the female sex; and indeed they could have no hope to gain the affection of the fair, but in proportion to the courage and address they had shown in their military exercises. Accordingly, in an ancient song, we find Bartholin, king of Norway, extremely surprised that his mistress should prove unkind, as he could perform eight different exercises. The children were generally born in camps; and being inured from their infancy to behold nothing but arms, effusion of blood, and slaughter, they imbibed the cruel disposition of their fathers, and when they broke forth upon other nations, behaved rather like furies than like human creatures.

The laws of this people, in some measure, resembled those of the ancient Lacedæmonians. They knew no virtue but bravery, and no vice but cowardice. The greatest penalties were inflicted on such as fled from battle. The laws of the ancient Danes declared such persons infamous, and excluded them from society. Among the Germans, cowards were sometimes suffocated in mud; after which they were covered over with hurdles, to show, says Tacitus, that though the punishment of crimes should be public, there are certain degrees of cowardice and infamy which ought to be buried in oblivion. Frotho king of Denmark enacted by law, that whoever solicited an eminent post ought upon all occasions to attack one enemy, to face two, to retire only one step back from three, and never to make an actual retreat till assaulted by four. The rules of justice were themselves adapted and warped to these prejudices. War was looked upon as a real act of justice, and force was thought to be an incontestable title over the weak, a visible mark that God had intended them to be subject to the strong. They had no doubt but that the intentions of the Deity had been to establish the same dependence among men that takes place among inferior creatures; and, setting out from this principle of the natural inequality among men, they had from thence inferred that the weak had no right to what they could not defend. This maxim was adopted with such rigour, that the name of divine judgment was given not only to the judicial combat, but to conflicts and battles of all sorts; victory being, in their opinion, the only certain mark by which Providence enables us to distinguish those whom it has appointed to command others.

Lastly, their religion, by annexing eternal happiness to the military virtues, gave the utmost possible degree of vigour to that propensity which these people had for war, and to their contempt of death, of which we shall now give some instances. We are informed that Harold, surnamed Blaatand, or Blue-tooth, a king of Denmark, who lived in the beginning of the ninth century, had founded on the coast of Pomerania a city named Julin or Jomsburg. To this place he sent a colony of young Danes, bestowing the government on a celebrated warrior called Palnatoko. In this colony it was forbidden to mention the word fear, even in the most imminent dangers. No citizen of Jomsburg was to yield to any number of enemies, however great. The sight of inevitable death was not to be taken as an excuse for showing the smallest apprehension. And this legislator really appears to have eradicated from the minds of most of the youths bred up under him all traces of that sentiment so natural and so universal, which makes men think on their destruction with horror. Nothing can show this better than a single fact in their history, which deserves to have a place here for its singularity. Some of them having made an irruption into the territories of a powerful Norwegian lord, named Haquin, were overcome in spite of the obstinacy of their resistance, and the most distinguished among them being made prisoners, were, according to the custom of those times, condemned to death. The news of this, far from afflicting them, was on the contrary received with joy. The first who was led to punishment was content to say, without changing countenance, and without expressing the least sign of fear, "Why should not the same happen to me as did to my father? He died, and so must I." A warrior named Thorchill, who was to cut off the head of the second, having asked him what he felt at the sight of death, he answered, "that he remembered too well the laws of Jomsburg, to utter any words that denoted fear." The third, in reply to the same question, said, "he rejoiced to die with glory, and that he preferred such a death to an infamous life like that of Thorchill's." The fourth made an answer much longer and more extraordinary. "I suffer with a good heart, and the present hour is to me very agreeable. I only beg of you," added he, addressing himself to Thorchill, "to be very quick in cutting off my head; for it is a question often debated by us at Jomsburg, whether one retains any sense after being beheaded. I will therefore grasp this knife in my hand; if, after my head is cut off, I strike it towards you, it will show I have not lost all sense; if I let it drop, it will be a proof of the contrary. Make haste, therefore, and decide the dispute." Thorchill, adds the historian, cut off his head in a most expeditious manner; but the knife, as might be expected, dropt from his hand. The fifth showed the same tranquillity, and died rallying and jeering his enemies. The sixth begged of Thorchill that he might not be led to punishment like a sheep: "Strike the blow in my face," said he; "I will sit still without shrinking; and take notice whether I once wink my eyes, or betray one sign of fear in my countenance; for we inhabitants of Jomsburg are used to exercise ourselves in trials of this sort, so as to meet the stroke of death without once moving." He kept his promise before all the spectators, and received the blow without betraying the least sign of fear, or so much as winking with his eyes. The seventh, says the historian, was a very beautiful young man, in the flower of his age. His long hair, as fine as silk, floated in curls and in ringlets on his shoulders. Thorchill asked him what he thought of death. "I receive it willingly," said he, "since I have fulfilled the greatest duty of life, and have seen all those put to death whom I would not survive. I only beg of you one favour, not to let my hair be touched by a slave, or stained with my blood."

Neither was this intrepidity peculiar to the inhabitants of Jomsburg. It was the general character of all the Scandinavians, of which we shall only give this further instance. A warrior, having been thrown upon his back in wrestling with his enemy, and the latter finding himself without his arms, the vanquished person promised to wait, without changing his posture, till his antagonist fetched a sword to kill him; and he faithfully kept his word. To die with arms in his hand was the ardent wish of every free man; and the pleasing idea which they had of this kind of death led them to dread such as proceeded from old age and disease. The history of ancient Scandinavia is full of instances of this way of thinking. The warriors who found themselves lingering in disease often availed themselves of their few remaining moments to shake off life, by a way that they supposed to be more glorious. Some of them would be carried into a field of battle, that they might die in the engagement. Others slew themselves. Many got this melancholy service performed by their friends, who considered it as a most sacred duty. "There is, on a mountain of Iceland," says the author of an old Iceland romance, "a rock so high that no animal can fall from the top of it and live. Here men betake themselves when they are afflicted and unhappy. From this place all our ancestors, even without waiting for sickness, have departed into Eden. It is useless, therefore, to give ourselves up to groans and complaints, or to put our relations to needless expenses, since we can easily follow the example of our fathers, who have all gone by the way of this rock." When all these methods failed, and at last when Christianity had banished such barbarous practices, the disconsolate heroes consoled themselves by putting on complete armour as soon as they found their end approaching.

SCANNING, in *Poetry*, the measuring of verse by feet, in order to see whether or not the quantities be duly observed. The term is chiefly used in Greek and in Latin verses. Thus an hexameter verse is scanned by resolving it into six feet; a pentameter, by resolving it into five feet; and so of the rest.

SCANTLING, a measure, size, or standard, by which the dimensions of things are to be determined. The term is particularly applied to the dimensions of any piece of timber, with regard to its breadth and thickness.

SCAPE-GOAT, in Jewish antiquities, the goat which was set at liberty on the day of solemn expiation. Some say that a piece of scarlet cloth, in form of a tongue, was tied upon the forehead of the scape-goat. (Hoffmann, *Lex. Univ.* in voc. *Lingua.*) Many have been the disputes among the interpreters concerning the meaning of the word scape-goat, or rather of *Azazel*, for which scape-goat is put in our version of the Bible. Spenser is of opinion that Azazel is a proper name, signifying the devil or evil dæmon. Among other things, he observes that the ancient Jews used to substitute the name *Samaël* for Azazel; and many of them have ventured to affirm, that at the feast of expiation they were obliged to offer a gift to Samaël to obtain his favour. Thus also the goat sent into the wilderness to Azazel, was understood to be a gift or oblation. Some Christians have been of the same opinion. But Spenser thinks that the genuine reasons of the ceremony were, that the goat loaded with the sins of the people, and sent to Azazel, might be a symbolical representation of the miserable condition of sinners; that God sent the goat thus loaded to the evil dæmons, to show that they were impure, thereby to deter the people from any conversation or familiarity with them; and that the goat sent to Azazel, sufficiently expiating all evils, the Israelites might the more willingly abstain from the expiatory sacrifices of the Gentiles.

SCAPEMENT, in clock-work, a general term for the manner of communicating the impulse of the wheels to the pendulum. See Clock and Watch Work.

SCAPULA, John, the reputed author of a Greek lexicon, studied at Lausanne. His name is recorded in the annals of literature, neither on account of his talents, nor learning, nor virtuous industry, but for a gross act of disingenuity and fraud which he committed against an eminent literary character of the sixteenth century. Being employed by Henry Stephens as a corrector of his press while he was publishing his *Thesaurus Linguæ Græcæ*, Scapula extracted those words and explications which he reckoned most useful, comprised them in one volume, and published them as an original work, with his own name.

The compilation and printing of the Thesaurus had cost Stephens immense labour and expense; but it was so much admired by those learned men to whom he had shown it, and seemed to be of such essential importance to the acquisition of the Greek language, that he reasonably hoped his labour would be crowned with honour, and that the money he had expended would be repaid by a rapid and extensive sale. But before his work came abroad, Scapula's abridgment appeared, which, from its size and price, was quickly purchased, while the Thesaurus itself lay neglected in the author's hands. The consequence was a bankruptcy on the part of Stephens, while he who had occasioned it was enjoying the fruits of his treachery. Scapula's Lexicon was first printed in the year 1570, in 4to. It was afterwards enlarged, and published in folio; and it has gone through several editions, while the valuable work of Stephens has never been reprinted. Its success is, however, not owing to its superior merit, but to its moderate price and commodious size. Stephens charges the author with omitting a great many important articles. He accuses him of misunderstanding and perverting his meaning, and of tracing out absurd and trifling etymologies, which he himself had been careful to avoid. Dr Busby, so much celebrated for his knowledge of the Greek language, and his success in teaching it, would never permit his scholars at Westminster school to make use of Scapula.

SCAPULAR, or Scapulary, a part of the habit of several religious orders in the Church of Rome, worn over the gown as a badge of peculiar veneration for the blessed Virgin. It consists of two narrow slips or breadths of cloth covering the back and the breast, and hanging down to the feet. The devotees of the scapulary celebrate its festival on the 10th of July.

SCARBOROUGH, a town on the shore of the German Ocean, in the lathe of Pickering, in the north riding of the county of York, and 216 miles from London. This town is distant about five leagues north-west from Flamborough Head. It has a harbour, which is dry at low water, and of late has been so improved as to afford shelter, in all gales of wind upon the coast, to vessels capable of bearing the ground. The ancient pier has been extended, and formed into a new harbour, which may be resorted to when the old harbour is crowded, and where are placed dolphins and mooring rings. A lighthouse has been erected upon the pier, which is kept burning from half flood to half ebb, as a direction to vessels entering in the night.

Though the harbour of Scarborough is thus useful as a protection for the smaller class of vessels, the trade of the port is not extensive. The chief exports consist of bacon hams, butter, and corn; and the chief imports are coals, timber, flax, and iron, with wine, gin, brandy, and rum, from the places of their growth, and groceries from London. The only manufactories are those connected with shipping, such as cordage and sail-cloth. The building of ships forms some occupation, but it is a fluctuating and precarious employment.

The chief importance of Scarborough arises from its being a most agreeable bathing-place, to which strangers repair in the summer. Besides the inducement to sea-bathing, many resort to it on account of its mineral springs, called the Spa.

The situation and view of Scarborough, either from the land or the sea, is striking and picturesque. The castle, on an extensive site, now in ruins, stands on a promontory running into the sea, and rising to the height of more than 300 feet above it. It was built in the reign of King Stephen, in 1136, and must have been then a place of unassailable strength, extending over an area of nineteen acres, the walls of which can be still traced, and having within it a copious well of water. The keep is at present in tolerable preservation. It is a square Norman building, ninety feet in height, and had formerly an embattled parapet. The walls are about twelve feet in thickness, cased with squared stones; and the mortar having been, according to ancient custom, in a fluid state, has become more durable than even the stone of the building.

The town confers the title of earl upon the family of Lumley. It returns two members to the House of Commons, as heretofore. By the municipal reform law it is now divided into two wards, in which are chosen six aldermen and eighteen councillors. The population (taken in May, when no visiters are in the town) amounted in 1801 to 6409, in 1811 to 6710, in 1821 to 8188, and in 1831 to 8760.

rdona ‖ arpa.

SCARDONA, a seaport town of Dalmatia, situated on the eastern bank of the river Cherca. It has been taken and retaken several times by the Turks and Venetians, the latter of whom ruined the fortifications and its principal buildings in 1537.

SCARIFICATION, in *Surgery*, the operation of making several incisions in the skin by means of lances or other instruments, particularly the cupping instrument.

SCARP, in *Fortification*, is the interior talus or slope of the ditch next the place, at the foot of the rampart.

SCARP, in *Heraldry*, the scarf which military commanders wear for ornament. It is borne somewhat like a battoon sinister, but is broader and continued out to the edges of the field, whereas the battoon is cut off at each end.

SCARPA, ANTONIO, was born in Lombardy between the years 1746 and 1750. He early distinguished himself as an anatomist and surgeon, and his works, in both these branches of science, have spread his reputation throughout all Europe. For many years he occupied the chairs of clinical and operative surgery in the school of Pavia; and when he became emeritus professor, he was really the director of the faculty of medicine in the university which he so greatly contributed to render celebrated. Scarpa was an exact as well as a laborious observer, and did more than most men of his time to advance the progress of surgery. Surgical anatomy, which has given a particular direction to the researches of surgeons, owes its first development to the labours of Scarpa, and forms, in some sort, the distinctive character of his productions.

His works are not altogether free from faults. They recommend themselves more by the beauty than by the precision of their style; but the excellence of the precepts which his writings convey, and the judicious and original observations on which they are based, have placed several of them in the rank of classical books, and have led to their translation into most of the languages of Europe.

Scarpa commenced his career as an anatomist, but afterwards directed his attention principally to the practice of surgery; and if he sometimes maintains opinions that are paradoxical, if his theories and his precepts are at times hardly defensible, we still recognise, even in his errors, the views of a great master, and thoughts which direct the reader to useful reflection.

Uniting to the love of science an exquisite taste for the fine arts, the author has illustrated his writings with engravings, which are models of exactness, elegance, and purity. The plates which represent the nerves of the heart, and those which accompany the treatises on hernia and aneurism, are among the most perfect productions of this kind.

Scarpa is author of a number of writings, many of them inserted in the journals of Italy, and on local subjects which are little known. His principal works are, 1. Anatomicæ Disquisitiones de Auditu et Olfactu, Pavia, 1789, in folio; 2. Tabulæ Neurologicæ ad illustrandam Historiam Cardiacorum Nervorum, Pavia, 1794, in folio; 3. Commentarius de Penitiori Ossium Structura, Leips. 1799, in 4to; 4. Sull' Ernie, Memorie Anatomico-chirurgiche, Milan, 1810, in folio; 5. Riflessioni ed Osservazioni Anatomico-chirurgiche sull' Aneurisma, Pavia, 1804, in folio; 6. Saggio di Osservazioni ed Esperienze sulle principali Malattie degli occhi, Pavia, 1801, in 4to; 7. Sul taglio Ipogastrico per l'Estrazione della pietra dalla Vesica Orinaria, Milan, 1820, in 4to; 8. Sullo Scirro e sul Cancro, Milan, 1821, in 4to; 9. Memoria sulla Ligatura delle principale Arterie; 10. Lettera sulla Ligatura temporaria delle grosse Arterie degli arti, Milan, 1823, in 8vo; 11. Saggio di Osservazioni sul taglio Retto-vesicale per l'Estrazione della pietra dalla Vesica Orinaria, Pavia, 1823, in 8vo; 12. Esame della terza Memoria del Professore Vacca sul taglio Retto-vesicale, Milan, 1824, in 8vo; 13. Memoria sull Idrocele del Cordone Spermatico, Pavia, 1823, in 4to.

Scarron.

SCARRON, PAUL, a famous burlesque writer, was the son of a counsellor in parliament, and born at Paris about the end of the year 1610, or in the beginning of the succeeding year. His father having married a second time, he was compelled to assume the ecclesiastical profession. At the age of twenty-four he visited Italy, where he freely indulged in licentious pleasures. After his return to Paris, he persisted in a life of dissipation, till a long and painful disease convinced him that his constitution was almost worn out. At length, when engaged in a party of pleasure at the age of twenty-seven, he lost "the use of those legs which danced so gracefully, and of those hands which could paint and play on the lute with so much elegance." In the year 1638 he was attending the carnival at Mons, of which he was a canon. Having dressed himself one day as a savage, his singular appearance excited the curiosity of the children of the town. They followed him in multitudes, and he was obliged to take shelter in a marsh. This wet and cold situation produced a numbness which totally deprived him of the use of his limbs; but notwithstanding this misfortune he continued gay and cheerful. He took up his residence at Paris, and by his pleasant humour soon attracted to his house all the men of wit about the city. The loss of his health was followed by the loss of his fortune. On the death of his father he entered into a process with his mother-in-law. He pleaded the cause in a ludicrous manner, though his whole fortune depended on the decision, and accordingly lost the cause. Mademoiselle de Hautefort, compassionating his misfortunes, procured for him an audience of the queen. The poet requested to have the title of valetudinarian to her majesty. The queen smiled, and Scarron considered the smile as the commission to his new office. He therefore assumed the title of "Scarron, by the grace of God unworthy valetudinarian to the queen."

Cardinal Mazarin gave him a pension of five hundred crowns; but that minister having received disdainfully the dedication of his Typhon, the poet immediately wrote a *Mazarinade*, and the pension was withdrawn. He then attached himself to the Prince of Conde, and celebrated his victories. He at length formed the extraordinary resolution of marrying, and was accordingly, in 1651, married to Mademoiselle d'Aubigné, afterwards Madame de Maintenon, who was then only sixteen years of age. "At that time," says Voltaire, "it was considered as a great acquisition for her to gain for a husband a man who was disfigured by nature, impotent, and very little enriched by fortune." When Scarron was questioned about the contract of marriage, he said he acknowledged to the bride two large invincible eyes, a very beautiful shape, two fine hands, and a large portion of wit. The notary demanded what dowry he would give her. Scarron immediately replied, "The names of the wives of kings die with them, but the name of Scarron's wife shall live for ever." She restrained by her modesty his indecent buffooneries, and the good company which had formerly resorted to his house were not less frequent in their visits. Scarron now became a new man. He grew more decent in his manners and conversation; and his gaiety, when tempered with moderation, was still more agreeable. But, in the mean time, he lived with so little economy, that his income was soon reduced to a small annuity and his marquisate of Quinet. By the marquisate of Quinet, he meant the revenue he derived from his publications, which were printed by one Quinet. He was accustomed to talk to his superiors with great freedom in his jocular style. In the dedication to his *Don Japhet d'Armenie*, he thus addresses the king: "I shall endeavour to persuade your majesty that you would do yourself no injury were you to do me a small favour; for in that case I should become more gay. If I should become more gay, I should write sprightly comedies; and if I should write sprightly comedies, your majesty would be amused, and thus your money would not be lost. All this appears so evident, that I should certainly be convinced of it if I were as great a king as I am now a poor unfortunate man."

Although Scarron wrote comedies, he had neither time nor patience to study the rules and models of dramatic poetry. Aristotle and Horace, Plautus and Terence, would have frightened him; and perhaps he did not know that there was ever such a person as Aristophanes. He saw an open path before him, and he followed it. It was the fashion of the times to pillage the Spanish writers. Scarron was acquainted with that language, and he found it easier to use the materials which were already prepared, than to rack his brain in inventing a subject; a restraint to which a genius like his could not easily submit. As he borrowed liberally from the Spanish writers, a dramatic piece did not cost him much labour. His labour consisted not in making his comic characters talk humorously, but in keeping up serious characters; for the serious was a foreign language to him. The great success of his *Jodelet Maître* was a vast allurement to him. The comedians who acted it eagerly requested more of his productions. They were written without much toil, and they procured him large sums. They served to amuse him. When the office of historiographer became vacant, he solicited for it without success. At length Fouquet gave him a pension of sixteen hundred livres. Christina queen of Sweden having come to Paris, was anxious to see Scarron. "I permit you," said she to Scarron, "to fall in love with me. The queen of France has made you her valetudinarian, and I create you my Roland." But Scarron did not long enjoy that title. He was seized with so violent a hiccough, that every person thought he would have expired. "If I recover," he said, "I will make a fine satire on the hiccough." His gaiety did not forsake him to the last. Within a few minutes of his death, when his domestics were shedding tears about him, "My goods friends," said he, "I shall never make you weep so much for me as I have made you laugh." Just before expiring, he said, "I could never believe before that it is so easy to laugh at death." He died on the 14th of October 1660, in the fifty-first year of his age.

His works have been collected and published by Bruzen de la Martiniere, in ten volumes 12mo, 1737. There are, 1. The Æneid travestied, in eight books. It was afterwards continued by Moreau de Brasey. 2. Typhon, or the Gigantomachia. 3. Many comedies, as Jodelet, or the Master Valet, Jodelet Cuffed, Don Japhet d'Armenie, the Ridiculous Heir, Every Man his own Guardian, the Foolish Marquis, the Scholar of Salamanca, the False Appearance, and the Prince Corsaire, a tragi-comedy. Besides these, he wrote other pieces in verse. 4. His Comic Romance, in prose, which is the only one of his works that deserves attention. It is written with much purity and gaiety, and has contributed not a little to the improvement of the French language. Scarron had great pleasure in reading his works to his friends as he composed them, which he called trying his works. Segrais and another of his friends coming to him one day, "Take a chair," said Scarron to them, "and sit down, that I may examine my Comic Romance." When he observed the company laugh, "Very well," said he, "my book will be well received, since it makes persons of such delicate taste laugh." Nor was he deceived. His romance had a prodigious run. It was the only one of his works that Boileau could submit to read. 5. Spanish novels translated into French. 6. A volume of Letters. 7. Poems, consisting of songs, epistles, stanzas, odes, and epigrams. The whole collection abounds with sprightliness and gaiety.

SCEAUX, an arrondissement of the department of the Seine, in France, to the south of Paris. It extends over 23,909 hectares, equal to 53,796 acres, or eighty-four square miles, and is divided into four cantons, and these into forty-three communes, which, in 1836, contained 87,708 inhabitants. The chief town, which is of the same name, had formerly a fine palace and park; but the orangery only now remains. It has considerable manufactories of china, and contains 1670 inhabitants.

SCENE, in its primary sense, denotes a theatre, or the place where dramatic pieces and other public shows are exhibited. It does not appear that the ancient poets were at all acquainted with the modern way of changing the scenes in the different parts of the play, in order to raise the idea of the persons represented by the actors being in different places.

The original scene for the acting of plays was as simple as the representations themselves. It consisted only of a plain plot of ground proper for the occasion, which was in some degree shaded by the neighbouring trees, the branches of which were made to meet together, and their vacancies supplied with boards, sticks, and the like; and to complete the shelter, these were sometimes covered with skins, and sometimes with only the branches of other trees newly cut down, and full of leaves. Afterwards more artificial scenes, or scenical representations, were introduced, and paintings used instead of the objects themselves. Scenes were then of three sorts; tragic, comic, and satiric. The tragic scene represented stately magnificent edifices, with decorations of pillars, statues, and other things suitable to the palaces of kings. The comic exhibited private houses with balconies and windows, in imitation of common buildings. And the satiric was the representation of groves, mountains, dens, and other rural appearances; and these decorations either turned on pivots, or slid along grooves as those in our theatres.

SCENE is also a part or division of a dramatic poem. Thus plays are divided into acts, and acts are again subdivided into scenes; in which sense the scene is properly the persons present at or concerned in the action on the stage at such a time. Whenever, therefore, a new actor appears, or an old one disappears, the action is changed into other hands; and therefore a new scene then commences.

It is one of the laws of the stage, that the scenes be well connected; in other words, that one succeed another in such a manner as that the stage be never quite empty till the end of the act.

SCENOGRAPHY, from the Greek σκηνη, *scene*, and γραφη, *description*, in perspective, is a representation of a body on a perspective plane; or a description of it in all its dimensions, such as it appears to the eye.

SCEPTIC, σκηπτικος, from σκεπτομαι, *I consider, look about*, or *deliberate*, properly signifies considerative and inquisitive, or one who is always weighing reasons on one side and the other, without ever deciding between them. It is chiefly applied to an ancient sect of philosophers founded by Pyrrho, who, according to Laertius, had various other denominations. From their master they were called Pyrrhonians; from the distinguishing tenets or characteristic of their philosophy they derived the name of *Aporctici*, from ἀπορειν, *to doubt*; from their suspension and hesitation they were called *ephectici*, from ἐπεχειν, *to stay* or *keep back*; and, lastly, they were called *zetetici*, or seekers, from their never getting beyond the search of truth.

That the sceptical philosophy is absurd, can admit of no dispute in the present age; and that many of the followers of Pyrrho carried it to the most ridiculous height, is not less true. But we cannot believe that he himself was so extravagantly sceptical as has sometimes been asserted, when we reflect on the particulars of his life, which are still preserved, and the respectful manner in which we find him mentioned by his contemporaries and writers of the first name who flourished soon after him. The truth, as far as at this distance of time it can be discovered, seems to be, that he learned from Democritus to deny the real existence of all

Sceptic.

qualities in bodies, except those which are essential to primary atoms; and that he referred every thing else to the perceptions of the mind produced by external objects, in other words, to appearance and opinion. All knowledge of course appeared to him to depend on the fallacious report of the senses, and consequently to be uncertain; and in this notion he was confirmed by the general spirit of the Eleatic School, in which he was educated. He was further confirmed in his scepticism by the subtilties of the Dialectic school, in which he had been instructed by the son of Stilpo; choosing to overturn the cavils of sophistry by recurring to the doctrine of universal uncertainty, and thus breaking the knot which he could not unloose. For being naturally and habitually inclined to consider immoveable tranquillity as the great end of all philosophy, he was easily led to despise the dissensions of the dogmatists, and to infer from their endless disputes, the uncertainty of the questions on which they debated; controversy, as it has often happened to others, becoming also with respect to him the parent of scepticism.

Pyrrho's doctrines, however new and extraordinary, were not totally disregarded. He was attended by several scholars, and succeeded by several followers, who preserved the memory of his notions. The most eminent of his followers was Timon, in whom the public succession of professors in the Pyrrhonic school terminated. In the time of Cicero it was almost extinct, having suffered much from the jealousy of the dogmatists, and from a natural aversion in the human mind to acknowledge total ignorance, or to be left in absolute darkness. The disciples of Timon, however, still continued to profess scepticism, and their notions were embraced, privately at least, by many others. The school itself was afterwards revived by Ptolemæus a Cyrenian, and was continued by Ænesidemus a contemporary of Cicero, who wrote a treatise on the principles of the Pyrrhonic philosophy, the heads of which are preserved by Photius. From this time it was continued through a series of preceptors of little note to Sextus Empiricus, who also gave a summary of the sceptical doctrine.

A system of philosophy thus founded on doubt, and clouded with uncertainty, could neither teach tenets of any importance, nor prescribe a certain rule of conduct; and accordingly we find that the followers of scepticism were guided entirely by chance. As they could form no certain judgment respecting good and evil, they accidentally learned the folly of eagerly pursuing any apparent good, or of avoiding any apparent evil; and their minds of course settled into a state of undisturbed tranquillity, the grand postulatum of their system.

In the schools of the sceptics we find ten distinct topics of argument urged in support of the doctrine of uncertainty; with this precaution, however, that nothing could be positively asserted either concerning their number or their force. These arguments chiefly respect objects of sense. They place all knowledge in appearance; and as the same things appear very different to different people, it is impossible to say which appearance most truly expresses their real nature. They likewise say that our judgment is liable to uncertainty from the circumstance of frequent or rare occurrence, and that mankind are continually led into different conceptions concerning the same thing, by means of custom, law, fabulous tales, and established opinions. On all these accounts, they think every human judgment is liable to uncertainty; and concerning any thing, they can only assert that it seems to be, not that it is what it seems.

This doubtful reasoning, if reasoning it may be called, the sceptics extended to all the sciences, in which they discovered nothing true, or which could be absolutely asserted. In all nature, in physics, morals, and theology, they found contradictory opinions, and inexplicable or incomprehensible phenomena. In physics, the appearances, they thought, might be deceitful; and respecting the nature of God and the duties of morality, men were, in their opinion, equally ignorant and uncertain. To overturn the sophistical arguments of these sceptical reasoners, would be no difficult matter, if their reasoning were worthy of confutation. Indeed, the great principle is sufficiently, though shortly, refuted by Plato, in these words. "When you say all things are incomprehensible," says he, "do you comprehend or conceive that they are thus incomprehensible, or do you not? If you do, then something is comprehensible; if you do not, there is no reason we should believe you, since you do not comprehend your own assertion."

Sceptre || Schaffhausen.

But scepticism has not been confined entirely to the ancients and to the followers of Pyrrho. Numerous sceptics have arisen also in modern times, varying in their principles, manners, and character, as chance, prejudice, vanity, weakness, or indolence, prompted them. The great object, however, which they seem to have in view is to overturn, or at least to weaken, the evidence of analogy, experience, and testimony; though some of them have even attempted to show, that the axioms of geometry are uncertain, and its demonstrations inconclusive. This last attempt has not indeed been often made; but the chief aim of Mr Hume's philosophical writings is to introduce doubts into every branch of physics, metaphysics, history, ethics, and theology. It is needless to give a specimen of his reasonings in support of modern scepticism. The most important of them have been noticed in the articles MIRACLE, METAPHYSICS, and PHILOSOPHY; and such of our readers as have any relish for speculations of that nature can be no strangers to his Essays, or to the able confutations of them by Reid, Campbell, Gregory, Beattie, and Stewart, who have likewise exposed the weakness of the sceptical reasonings of Descartes, Malebranche, and other philosphers of great fame in the same school.

SCEPTRE, a kind of royal staff, borne on solemn occasions by kings, as a badge of their command and authority. Nicod derives the word from the Greek σκηπτρον, which, he says, originally signified a javelin, which the ancient kings usually bore as a badge of their authority, that instrument being in very great veneration among the heathens. But σκηπτρον does not properly signify a javelin; it means a staff to rest upon, from σκηπτω, *innitor*, I lean upon. Accordingly, in the simplicity of the earlier ages of the world, the sceptres of kings were no other than long walking staves; and Ovid, in speaking of Jupiter, describes him as resting on his sceptre. The sceptre is an ensign of royalty of greater antiquity than the crown. The Greek tragic and other poets put sceptres in the hands of the most ancient kings they introduce. Justin observes, that the sceptre, in its original, was a *hasta*, or spear. He adds, that, in the most remote antiquity, men adored the *hastæ* or sceptres as immortal gods; and that it was upon this account that, even in his time, they still furnished the gods with sceptres. Neptune's sceptre is his trident. Tarquin the Elder was the first who assumed the sceptre among the Romans. Legendre tells us, that, in the first race of the French kings, the sceptre was a golden rod, almost always of the same height with the king who bore it, and crooked at one end like a crozier. Frequently, instead of a sceptre, kings are seen on medals with a palm in their hand.

SCHAFFHAUSEN, one of the cantons of Switzerland. It is bounded on the north, east, and west, by the grand duchy of Baden; and on the south by the Rhine, which divides it from the cantons of Thurgau and Zurich. It is only 120 square miles in extent, in which are comprehended three cities, four market-towns, and thirty-five villages. It contains 28,050 inhabitants, who, except about 200 Roman Catholics, adhere to the reformed church. The force to be contributed to the general confederation is fixed at 466 men, and the payment in money at 9320 francs. The chief article of cultivation is wine, which, though not of the best quality, finds a ready sale in the other cantons, and hence the hills are mostly covered with vineyards. Corn is raised about equal in amount to the consumption, and the meadows feed many cows, which produce much good butter. The river Rhine receives all the streams of the canton. The capital is the city of the same name, about one mile above the natural cascade of the Rhine. It is an antique-looking town, with a narrow street and large houses; it is also walled, and has a citadel. There are three churches, a council-house, and several hospitals; and it contains 7000 inhabitants, who carry on cotton-weaving, calico-printing, and make caps, hats, and hosiery. Long. 8. 32. E. Lat. 47. 42. N.

SCHAMACHI, the capital of the province of Shirvan, in Persia, once large, populous, and commercial, but now ruined, and its remains entirely covered with thick brushwood. The modern city is called New Schamachi, and is situated in a plain on the river Aksisi, about thirty miles from the Kur, and nearly the same distance from the Caspian. It is built in a square form, each side of which is eight hundred paces long; and the walls are in tolerable repair, built of unburned brick, and surrounded with a very broad and deep ditch. It is supposed to have contained 6000 inhabitants previous to its capture during the late war by Aga Mahommed. It was desolated by this tyrant, and has not recovered from its fallen state. Long. 48. 45. E. Lat. 40. 27. N.

SCHANCK, Cape, a rocky point, with three rocky islets lying off it, on the south coast of New Holland. It is the west point of the principal entrance into Western Port. Long. 144. 53. E. Lat. 38. 30. S.

SCHANTARSKIJA, three islands off the eastern coast of Asiatic Russia, in the Sea of Okhotzk. Long. 138. to 139. E. Lat. 55. 15. to 55. 30. N.

SCHAREDSJE, or Zaka, an island in the Persian Gulf, near the coast of Arabia, about thirty miles in circumference. Long. 54. 15. E. Lat. 25. N.

SCHASBURG, a city in the Austrian duchy of Sievenburgen, the capital of a circle of its own name. It is situated on a hill near the river Kokel, consisting of two towns, one of which is surrounded with walls, and the other a kind of suburb. It contains four Lutheran churches, with a Catholic and a Greek one, 1230 houses, and 7100 inhabitants, chiefly of the Saxon race. There is a Lutheran college, and considerable manufacturing industry employed in making cotton and linen goods. Long. 23. 43. E. Lat. 46. 10. 9. N.

SCHAUENBURG, a province of the principality of Hesse-Casel, in Germany, adjoining to Hanover, Lippe-Detmold, and Lippe-Schauenburg. It is 193 square miles in extent, a poor sandy district, except on such parts as are near the river Weser, which are of moderate fertility. It comprehends five towns and 130 villages and hamlets, with 28,600 inhabitants, whose chief occupation, besides that of agriculture, is the spinning of flax. It produces some good coal, and abundance of wood. It is divided into three bailiwicks, and the capital is the city of Rentelen, on the Weser, containing 2850 inhabitants.

Schauenburg-Lippe, a small independent principality in the north of Germany, between Hanover on the north and north-east, Hesse-Casel on the east and south-east, and the Prussian Westphalian province on the south-west and the west. It extends over 210 square miles, and comprehends two small cities, three market-towns, and 108 villages, with a population of 23,128 persons, who all adhere to the Lutheran church, except 3600 Calvinists and about 100 Roman Catholics. The revenues of the prince amount to about L.21,500, wholly drawn from his domains, no taxes of any kind being demanded; and as the reigning prince was in his minority during the time of the greatest suffering in this part of Germany, his guardian managed so prudently as to leave him without any debt. The principality is bound to provide a force of 240 men to the German confederation. The face of the country is undulating, but there are no hills of great height, and all are capable of cultivation. It rises gradually from the right bank of the Weser, into which run all the streams of the principality. It has one large lake, the Steinhuder, nearly fifty miles in compass, on which is a strong fortress used as an arsenal, and it is most abundantly stocked with fish. It has some valuable mineral springs; one near Stadthagen is resorted to for curative purposes. There are some valuable coal-mines worked, which belong to the prince, and are said to form one quarter of his revenue. There are many flocks of sheep, some yielding fine wool from the native races having been crossed by merinos. The soil produces more corn than is consumed; and it, with wool, flax, wood, and coal, are the chief objects of trade. The capital is Buckeberg, a city of 4220 inhabitants, on a gradual ascent from the Weser, and six miles from Minden.

SCHAZK, a city of Russia, the capital of a circle of the same name, within the province of Tambov. It is 737 miles from St Petersburg, on the river Schazk. It is old and ill built, and contains eight churches, only three of stone, 1011 houses, with 6800 inhabitants, chiefly making hempen goods, and cultivating that plant. Long. 41. 49. E. Lat. 54. 26. N.

SCHECHE SURE, or Surde, a small island in the Persian Gulf, with a village on the southern coast, where water and provisions may be obtained. Long. 54. 30. E. Lat. 26. 8. N.

SCHEDUAN, an immense naked rock in the Red Sea, eight miles long and five broad, at nearly an equal distance from the coasts of Asia and Africa. Lat. 27. 35. N.

SCHEDULE, a scroll of paper or parchment, annexed to a will, lease, or other deed, containing an inventory of goods, or some other matter omitted in the body of the deed. The word is a diminutive of the Latin *scheda*, or Greek σχέδη, a leaf or piece of paper.

SCHEELE, Charles William, was born on the 19th of December 1742, at Stralsund, where his father had kept a shop. When he was very young, he received the usual instructions of a private school; and was afterwards advanced to an academy. At a very early age he showed a strong desire to follow the profession of an apothecary, and his father suffered him to gratify his inclinations. With Mr Bauch, an apothecary at Gottenburg, he served his apprenticeship, which was completed in six years. He remained, however, some time longer at that place, and it was there that he so excellently laid the foundations of his knowledge. Among the various books which he read that treated of chemical subjects, Kunckell's Laboratory seems to have been his favourite. He used to repeat many of the experiments contained in that work privately in the night, when the rest of the family had retired to rest. A friend of Scheele's had remarked the progress which he had made in chemistry, and had asked him by what inducements he had at first been led to study a science in which he had gained such knowledge. Scheele replied, "The first cause, my friend, arose from yourself. Nearly at the beginning of my apprenticeship you advised me to read Neuman's Chemistry, from the perusal of which I became eager to make experiments myself; and I remember very well how I mixed together, in a conserve-glass, oil of cloves and fuming acid of nitre, which immediately took fire. I see also still before my eyes an unlucky experiment which I made with pyrophorus. Circumstances of this kind did but the more inflame my desire to repeat experiments." After Scheele's departure from Gottenburg in the year 1765, he obtained a place with Kalstrom, an apothecary at Malmo. Two years afterwards he went from thence to Stockholm, and managed the shop of Mr Scharenberg. In 1773, he changed this appointment for another at Upsal, under Mr

Loock. Here he was fortunately situated, as, from his acquaintance with learned men, and from having free access to the university laboratory, he had opportunities of increasing his knowledge. At this place also he happily commenced the friendship which subsisted between him and Bergman. During his residence at this place, Prince Henry of Prussia, accompanied by the Duke of Sudermania, visited Upsal, and chose this opportunity to see the academical laboratory. Scheele was accordingly appointed by the university to exhibit to them some chemical experiments. This office he undertook, and showed some of the most curious processes in chemistry. The two princes asked him many questions, and expressed their approbation of the answers which he returned to them. The duke asked him of what country he was, and seemed to be much pleased when Scheele informed him that he was born at Stralsund. At their departure they told the professor, who was present, that they should esteem it a favour if he would permit the young man to have free access to the laboratory as often as he chose to make experiments.

In the year 1777 Scheele was appointed by the Medical College to be apothecary at Koping. It was at that place that he soon showed the world how great a man he was, and that no place or situation could confine his abilities. When he was at Stockholm he showed his acuteness as a chemist, as he discovered there the new and wonderful acid contained in the fluor spar. It has been confidently asserted that Scheele was the first who discovered the nature of the aerial acid, and that whilst he was at Upsal he made many experiments to prove its properties. This circumstance might probably have furnished Bergman with the means of treating this subject more fully. At the same place he began the series of excellent experiments on that remarkable mineral substance manganese; from which investigation he was led to make the very valuable and interesting discovery of oxymuriatic acid. At the same time he examined the properties of ponderous earth.

At Koping he finished his Dissertation on Air and Fire; a work which the celebrated Bergman most warmly recommended in the friendly preface which he wrote for it. The theory which Scheele endeavours to prove in this treatise is, that fire consists of pure air and phlogiston. According to more recent opinions, if inflammable air be phlogiston, water is composed of these two principles. Of these opinions we may say, in the words of Cicero, "Opiniones tam variæ sunt tamque inter se dissidentes ut alterum profecto fieri potest ut earum nulla, alterum certe non potest ut plus una vera sit." The author's merit in this work, exclusive of the encomiums of Bergman, was sufficient to obtain the approbation of the public; as the ingenuity displayed in treating so delicate a subject, and the many new and valuable observations which are dispersed through the treatise, justly entitled the author to that fame which his book procured him. It was spread abroad throughout every country, became soon out of print, and was reprinted, and translated into many languages. The English translation is enriched with the notes of that accurate and truly philosophical genius Mr Richard Kirwan.

Scheele now diligently employed himself in contributing to the Transactions of the Academy at Stockholm. He first pointed out a new way to prepare the salt of benzoin. In the same year he discovered that arsenic, freed in a particular manner from phlogiston, partakes of all the properties of an acid, and has its peculiar affinities to other substances.

In a Dissertation on Flint, Clay, and Alum, he clearly overturned Beaumé's opinion of the identity of the siliceous and argillaceous earths. He published an Analysis of the Human Calculus. He showed also a mode of preparing *mercurius dulcis* in the humid way, and improved the process of making the powder of algaroth. He analysed the mineral substance called molybdena, or flexible black lead. He discovered a beautiful green pigment. He showed us how to decompose the air of the atmosphere. He discovered that some neutral salts are decomposed by lime and by iron. He decomposed plumbago, or the common black lead. He observed, with peculiar ingenuity, an acid in milk, which decomposes acetated alkali; and in his experiments on the sugar of milk, he discovered another acid, different in some respects from the above-mentioned acids and the common acid of sugar. He accomplished the decomposition of tungsten, the component parts of which were before unknown, and found in it a peculiar metallic acid united to lime. He published an excellent dissertation on the different sorts of ether. He found out an easy way to preserve vinegar for many years. His investigation of the colouring matter in Prussian blue, the means he employed to separate it, and his discovery that alkali, sal ammoniac, and charcoal, mixed together, will produce it, are strong marks of his penetration and genius. He found out a peculiar sweet matter in expressed oils after they have been boiled with litharge and water. He showed how the acid of lemons may be obtained in crystals. He found the white powder in rhubarb, which Model thought to be selenite, and which amounts to one seventh of the weight of the root, to be calcareous earth united to the acid of sorrel. This suggested to him the examination of the acid of sorrel. He precipitated acetate of lead with it, and decomposed the precipitate thus obtained by the vitriolic acid, and by this process he obtained the common acid of sugar; and by slowly dropping a solution of fixed alkali into a solution of the acid of sugar, he regenerated the acid of sorrel. From his examination of the acids contained in fruits and berries, he found not one species of acid alone, viz. the acid of lemon, but also another, which he denominated the malaceous or malic acid, from its being found in the greatest quantity in apples.

By the decomposition of Bergman's new metal, siderite, he showed the truth of Meyer's and Klaproth's conjecture concerning it. He boiled the calx of siderite with alkali of tartar, and precipitated nitrate of mercury by the middle salt which he obtained by this operation. The calx of mercury which was precipitated was found to be united to the acid of phosphorus, so that he demonstrates that this calx was phosphoretted iron. He found also that the native Prussian blue contained the same acid. He discovered, by the same means, that the perlate acid, as it was called, was not an acid *sui generis*, but the phosphoric united to a small quantity of the mineral alkali. He suggested an improvement in the process for obtaining magnesia from Epsom salt; and he advises the adding of an equal weight of common salt to the Epsom salt, so that an equal weight of Glauber's salt may be obtained; but this will not succeed unless during the cold of winter. These are the valuable discoveries of this great philosopher, which are to be found in the Transactions of the Royal Society at Stockholm. Most of his essays have been published in French by Madame Picardet and M. Morveau of Dijon. Dr Beddoes also has made a very valuable present to his countrymen of an English translation of a great part of Scheele's dissertations, to which he has added some useful and ingenious notes.

Viewing Scheele as a philosopher, we must judge of him from his many and important discoveries. What concerns him as a man we are informed of by his friends, who affirm that his moral character was irreproachable. It was matter of remark, that his chemical apparatus was neither neat nor convenient; his laboratory was small and confined; nor was he particular in regard to the vessels which he employed in his experiments, so that we may justly wonder how such discoveries and such experiments could have been made. He understood none of the modern languages except the German and Swedish; and he had not the advantage of being benefited by the early intelligence of discoveries made by foreigners, but was forced to wait till the intelligence was conveyed to him in the slow and uncertain channel of translation.

It was often wished that he would quit his retirement at Koping, and move in a larger sphere. It was suggested to him that a place might be procured in England, which might afford him a good income and more leisure; and indeed latterly an offer was made to him of an annuity of L.300 if he would settle in this country. But death put an end to this project. For half a year before this melancholy event his health had been declining, and he himself was sensible that he would not recover. On the 19th of May 1786 he was confined to his bed; on the 21st he bequeathed all of which he was possessed to his wife, who was the widow of his predecessor at Koping, and whom he had lately married; and on the same day he departed this life. Thus, in less than two years, the world lost Bergman and Scheele, of whom Sweden may justly boast, as philosophers who were beloved and lamented by all their contemporaries, and whose memory posterity will never cease to revere.

SCHEINER, Christopher, a German mathematician and astronomer, eminent for being the first who discovered spots on the sun, was born at Schwaben, in the territory of Middleheim, in 1575. He first discovered spots on the sun's disk in 1611, and made observations on these phenomena at Rome, until at length reducing them to order, he published them in one volume folio in 1630. He wrote also some smaller things relating to mathematics and philosophy, and died in 1660.

SCHELDT, a river which rises on the confines of Picardy, and runs north-east by Cambray, Valenciennes, Tournay, and Oudenarde, and receiving the Lis at Ghent, runs east by Dendermond, and then north to Antwerp. Below this city it divides into two branches, one called the Wester Scheldt, which separates Flanders from Zealand, and discharges itself into the sea near Flushing; and the other called the Oster-Scheldt, which runs by Bergen-op-Zoom, and afterwards between the islands Beveland and Schowen, and a little below falls into the sea.

SCHELESTADT, an arrondissement of the department of the Lower Rhine, in France, extending over 257,945 acres, equal to 403 square miles. It is divided into eight cantons, and these into 114 communes, with a population, in 1836, of 134,887 persons. The capital is the city of the same name, situated on a canal connected with the river Ill. It is well built and strongly fortified, and contained in the same year 9700 inhabitants, who make hats, hosiery, clocks, wax-lights, and much potash. Long. 7. 26. E. Lat. 48. 17. N.

SCHEME, a draught or representation of any geometrical or astronomical figure or problem, by lines sensible to the eye, or of the celestial bodies in their proper places for any moment. It is otherwise called a diagram.

SCHEMNITZ, a city of the kingdom of Hungary, in the province of the Hither Danube, and the capital of a circle to which it gives the name. It stands on a lofty situation, 2170 feet above the level of the sea, in a district abounding in mines, and at the source of the river Schemnitz. It is wildly built, some of the streets being separated from others by rocks, woods, and gardens, especially in the extensive suburbs, the population of which equals that within the walls. It contains one Lutheran and four Roman Catholic churches, 1720 houses, with 20,450 inhabitants. It has establishments for education, of both religions; and also a mining academy, with five professors and 150 students. It is the great seat of the operations of mining; and gold, silver, copper, iron, arsenic, and sulphur are procured and prepared for sale, the value of which is said to exceed L.200,000 annually. Long. 18. 48. 45. E. Lat. 48. 47. 45. N.

SCHERZO, a short musical composition, generally in $\frac{3}{4}$ time, of a light and playful style. In more modern symphonies, quartets, trios, sonatas, &c. the scherzo takes the place of the older minuet, but is of a much more rapid movement. Some excellent examples of the scherzo are to be found in Beethoven's works; among others, one in his second Symphony, op. 36, in D major.

SCHIECHS, or Scheichs, is a name which is applied by the Arabs to their nobles. "Among the Bedouins," says Niebuhr, "it belongs to every noble, whether of the highest or the lowest order. Their nobles are very numerous, and compose in a manner the whole nation; the plebeians are invariably actuated and guided by the schiechs, who superintend and direct in every transaction. The schiechs and their subjects are born to the life of shepherds and soldiers. The greater tribes rear many camels, which they either sell to their neighbours, or employ them in the carriage of goods, or in military expeditions. The petty tribes keep flocks of sheep. Among those tribes which apply to agriculture, the schiechs live always in tents, and leave the culture of their grounds to their subjects, whose dwellings are wretched huts. Schiechs always ride on horses or dromedaries, inspecting the conduct of their subjects, visiting their friends, or hunting. Traversing the desert, where the horizon is wide as on the ocean, they perceive travellers at a distance. As travellers are seldom to be met with on those wild tracts, they easily discover such as pass that way, and are tempted to pillage them when they find their own party the strongest."

SCHIEDAM, a city of the Netherlands, in the province of South Holland. It stands on the river Schie, near to its junction with the Maas; is well built, and contains five churches, a good exchange and town-house, and 1520 dwellings, with (in 1832) 11,588 inhabitants. The chief trade is distillation. It has 200 distilleries employed in making gin, in which are consumed annually 300,000 quarters of corn. A great number of pigs are fattened, and their flesh converted into bacon. Long. 4. 18. E. Lat. 51. 55. N.

SCHILLER, John Christopher Frederick von, was born at Marbach, a small town in the duchy of Würtemberg, on the 10th day of November 1759. It will aid the reader in synchronizing the periods of this great man's life with the corresponding events throughout Christendom, if we direct his attention to the fact, that Schiller's birth nearly coincided in point of time with that of Robert Burns, and that it preceded that of Napoleon by about ten years.

The position of Schiller is remarkable. In the land of his birth, by those who undervalue him the most, he is ranked as the second name in German literature; everywhere else he is ranked as the first. For us, who are aliens to Germany, Schiller is the representative of the German intellect in its highest form; and to him, at all events, whether first or second, it is certainly due, that the German intellect has become a known power, and a power of growing magnitude, for the great commonwealth of Christendom. Luther and Kepler, potent intellects as they were, did not make themselves known as Germans: the revolutionary vigour of the one, the starry lustre of the other, blended with the convulsions of reformation, or with the aurora of ascending science, in too kindly and genial a tone to call off the attention from the work which they performed, from the service which they promoted, to the circumstances of their personal position. Their country, their birth, their abode, even their separate existence, was merged in the mighty cause to which they lent their co-operation. And thus at the beginning of the sixteenth century, thus at the beginning of the seventeenth, did the Titan sons of Germany defeat their own private pretensions by the very grandeur of their merits. Their interest as patriots was lost and confounded in their paramount interest as cosmopolites. What they did for man and for human dignity eclipsed what they had designed for Germany. After them there was a long interlunar period of darkness for the land of the Rhine and the Danube. The German energy, too spasmodically excited, suffered a collapse. Throughout the whole of the seventeenth century, but one vigorous mind arose for permanent effects in literature. This was Opitz, a poet who deserves even yet to be read with attention, but who is no more worthy to be classed as the Dryden whom his too partial countrymen have styled him, than the Germany of the Thirty Years' War of taking rank by the side of civilized and cultured England during the Cromwellian era, or Klopstock of sitting on the same throne with Milton. Leibnitz was the one sole potentate in the fields of intellect whom the Germany of this century produced; and he, like Luther and Kepler, impresses us rather as a European than as a German mind, partly perhaps from his having pursued his self-development in foreign lands, partly from his large circle of foreign connections, but most of all from his having written chiefly in French or in Latin. Passing onwards to the eighteenth century, we find, through its earlier half, an absolute wilderness, unreclaimed and without promise of natural vegetation, as the barren arena on which the few insipid writers of Germany paraded. The torpor of academic dulness domineered over the length and breadth of the land. And as these academic bodies were universally found harnessed in the equipage of petty courts, it followed that the lethargies of pedantic dulness were uniformly deepened by the lethargies of aulic and ceremonial dulness; so that, if the reader represents to himself the very abstract of birthday odes, sycophantish dedications, and court sermons, he will have some adequate idea of the sterility and the mechanical formality which at that era spread the sleep of death over German literature. Literature, the very word literature, points the laughter of scorn to what passed under that name during the period of Gottsched. That such a man indeed as this Gottsched, equal at the best to the composition of a Latin grammar or a school arithmetic, should for a moment have presided over the German muses, stands out as in itself a brief and significant memorial, too certain for contradiction, and yet almost too gross for belief, of the apoplectic sleep under which the mind of central Europe at that era lay oppressed. The rust of disuse had corroded the very principles of activity. And, as if the double night of academic dulness, combined with the dulness of court inanities, had not been sufficient for the stifling of all native energies, the feebleness of French models (and of these moreover naturalized through still feebler imitations) had become the law and standard for all attempts at original composition. The darkness of night, it is usually said, grows deeper as it approaches the dawn; and the very enormity of that prostration under which the German intellect at this time groaned, was the most certain pledge to any observing eye of that intense re-action soon to stir and kindle among the smouldering activities of this spell-bound people. This re-action, however, was not abrupt and theatrical: it moved through slow stages and by equable gradations: it might be said to commence from the middle of the eighteenth century, that is, about nine years before the birth of Schiller; but a progress of forty years had not carried it so far towards its meridian altitude, as that the sympathetic shock from the French Revolution was by one fraction more rude and shattering than the public torpor still demanded. There is a memorable correspondency throughout all members of Protestant Christendom in whatsoever relates to literature and intellectual advance. However imperfect the organization which binds them together, it was sufficient even in these elder times to transmit reciprocally from one to every other, so much of that illumination which could be gathered into books, that no Christian state could be much in advance of another, supposing that Popery opposed no barriers to free communication, unless only in those points which depended upon local gifts of nature, upon the genius of a particular people, or upon the excellence of its institutions. These advantages were incommunicable, let the freedom of intercourse have been what it might: England could not send off by posts or by heralds her iron and coals; she could not send the indomitable energy of her population; she could not send the absolute security of property; she could not send the good faith of her parliaments. These were gifts indigenous to herself, either through the temperament of her people, or through the original endowments of her soil. But her condition of moral sentiment, her high-toned civic elevation, her atmosphere of political feeling and popular boldness,—much of these she could and did transmit, by the radiation of the press, to the very extremities of the German empire. Not only were our books translated, but it is notorious to those acquainted with German novels, or other pictures of German society, that as early as the Seven Years' War (1756–1763), in fact, from the very era when Cave and Dr Johnson first made the parliamentary debates accessible to the English themselves, most of the German journals repeated, and sent forward as by telegraph, these senatorial displays to every village throughout Germany. From the polar latitudes to the Mediterranean, from the mouths of the Rhine to the Euxine, there was no other exhibition of free deliberative eloquence in any popular assembly. And the *Luise* of Voss alone, a metrical idyll not less valued for its truth of portraiture than our own Vicar of Wakefield, will show, that the most sequestered clergyman of a rural parish did not think his breakfast equipage complete without the latest report from the great senate that sat in London. Hence we need not be astonished that German and English literature were found by the French Revolution in pretty nearly the same condition of semi-vigilance and imperfect animation. That mighty event reached us both, reached us all, we may say (speaking of Protestant states), at the same moment, by the same tremendous galvanism. The snake, the intellectual snake, that lay in ambush among all nations, roused itself, sloughed itself, renewed its youth, in all of them at the same period. A new world opened upon us all; new revolutions of thought arose; new and nobler activities were born; "and other palms were won."

But by and through Schiller it was, as its main organ, that this great revolutionary impulse expressed itself. Already, as we have said, not less than forty years before the earthquake by which France exploded and projected the scoria of her huge crater over all Christian lands, a stirring had commenced among the dry bones of intellectual Germany; and symptoms arose that the breath of life would soon disturb, by nobler agitations than by petty personal quarrels, the death-like repose even of the German universities. Precisely in those bodies however it was, in those as connected with tyrannical governments, each academic body being shackled to its own petty centre of local despotism, that the old spells remained unlinked; and to them, equally remarkable as firm trustees of truth, and as obstinate depositories of darkness or of superannuated prejudice, we must ascribe the slowness of the German movement on the path of reascent. Meantime the earliest torch-bearer to the murky literature of this great land, this crystallisation of political states, was Bodmer. This man had no demoniac genius, such as the service required; but he had some taste, and, what was better, he had some sensibility. He lived among the Alps; and his reading lay among the alpine sublimities of Milton and Shakspeare. Through his very eyes he imbibed a daily scorn of Gottsched and his monstrous compound of German coarseness with French sensual levity. He could not look at his native Alps, but he saw in them, and their austere grandeurs or their dread realities, a spiritual reproach to the hollowness and falsehood of that dull imposture which Gottsched offered by way of substitute for nature. He was taught by the Alps to crave for something nobler and deeper. Bodmer, though far below such a function, rose by favour of circumstances into an apostle or missionary of truth for Germany. He translated passages of English literature. He inoculated with his own sympathies the more fervent mind of the youthful Klopstock, who visited him in Switzerland. And it soon became evident that Germany was not dead, but sleeping; and once again, legibly for any eye, the pulses of life began to play freely through the vast organization of central Europe.

Klopstock, however, though a fervid, a religious, and for that reason an anti-Gallican mind, was himself an abortion. Such at least is our own opinion of this poet. He was the child and creature of enthusiasm, but of enthusiasm not allied with a masculine intellect, or any organ for that capacious vision and meditative range which his subjects demanded. He was essentially thoughtless, betrays everywhere a most effeminate quality of sensibility, and is the sport of that pseudo-enthusiasm and baseless rapture which we see so often allied with the excitement of strong liquors. In taste, or the sense of proportions and congruences, or the harmonious adaptations, he is perhaps the most defective writer extant.

But if no patriarch of German literature, in the sense of having shaped the moulds in which it was to flow, in the sense of having disciplined its taste or excited its rivalship by classical models of excellence, or raised a finished standard of style, perhaps we must concede that, on a minor scale, Klopstock did something of that service in every one of these departments. His works were at least Miltonic in their choice of subjects, if ludicrously non-Miltonic in their treatment of those subjects. And, whether due to him or not, it is undeniable that in his time the mother-tongue of Germany revived from the most absolute degradation on record, to its ancient purity. In the time of Gottsched, the authors of Germany wrote a macaronic jargon, in which French and Latin made up a considerable proportion of every sentence: nay, it happened often that foreign words were inflected with German forms; and the whole result was such as to remind the reader of the medical examination in the *Malade Imaginaire* of Molière,

> Quid poetea est à faire?
> Saignare
> Baignare
> Ensuita purgare, &c.

Now is it reasonable to ascribe some share in the restoration of good to Klopstock, both because his own writings exhibit nothing of this most abject euphuism (a euphuism expressing itself not in fantastic refinements on the staple of the language, but altogether in rejecting it for foreign words and idioms), and because he wrote expressly on the subject of style and composition.

Wieland, meantime, if not enjoying so intense an acceptation as Klopstock, had a more extensive one; and it is in vain to deny him the praise of a festive, brilliant, and most versatile wit. The Schlegels showed the haughty malignity of their ungenerous natures, in depreciating Wieland, at a time when old age had laid a freezing hand upon the energy which he would once have put forth in defending himself. He was the Voltaire of Germany, and very much more than the Voltaire; for his romantic and legendary poems are above the level of Voltaire. But, on the other hand, he was a Voltaire in sensual impurity. To work, to carry on a plot, to affect his readers by voluptuous impressions,—these were the unworthy aims of Wieland; and though a good-natured critic would not refuse to make some allowance for a youthful poet's aberrations in this respect, yet the indulgence cannot extend itself to mature years. An old man corrupting his readers, attempting to corrupt them, or relying for his effect upon corruptions already effected, in the purity of their affections, is a hideous object; and that must be a precarious influence indeed which depends for its durability upon the licentiousness of men. Wieland, therefore, except in parts, will not last as a national idol; but such he was nevertheless for a time.

Bürger wrote too little of any expansive compass to give the measure of his powers, or to found national impression; Lichtenberg, though a very sagacious observer, never rose into what can be called a *power*—he did not modify his age; yet these were both men of extraordinary talent, and Bürger a man of undoubted genius. On the other hand, Lessing was merely a man of talent, but of talent in the highest degree adapted to popularity. His very defects, and the shallowness of his philosophy, promoted his popularity; and by comparison with the French critics on the dramatic or scenical proprieties he is ever profound. His plummet, if not suited to the soundless depths of Shakspeare, was able ten times over to fathom the little rivulets of Parisian philosophy. This he did effectually, and thus unconsciously levelled the paths for Shakspeare, and for that supreme dominion which he has since held over the German stage, by crushing with his sarcastic shrewdness the pretensions of all who stood in the way. At that time, and even yet, the functions of a literary man were very important in Germany: the popular mind and the popular instinct pointed one way, those of the little courts another. Multitudes of little German states (many of which were absorbed since 1816 by the process of *mediatizing*) made it their ambition to play at keeping mimic armies in their pay, and to ape the greater military sovereigns, by encouraging French literature only, and the French language at their courts. It was this latter propensity which had generated the anomalous macaronic dialect, of which we have already spoken as a characteristic circumstance in the social features of literary Germany during the first half of the eighteenth century. Nowhere else, within the records of human follies, do we find a corresponding case in which the government and the patrician orders in the state, taking for granted, and absolutely postulating the utter worthlessness for intellectual aims of those in and by whom they maintained their own grandeur and independence, undisguisedly and even professedly sought to ally themselves with a foreign literature, foreign literati, and a foreign language. In this unexampled display of scorn for native resources, and the consequent collision between the two principles of action, all depended upon the people themselves. For a time the wicked and most profligate contempt of the local governments for that native merit which it was their duty to evoke and to cherish, naturally enough produced its own justification. Like Jews or slaves, whom all the world have agreed to hold contemptible, the German literati found it hard to make head against so obstinate a prejudgment; and too often they became all that they were presumed to be. *Sint Mæcenates, non deerunt, Flacce, Marones.* And the converse too often holds good—that when all who should have smiled scowl upon a man, he turns out the abject thing they have predicted. Where Frenchified Fredericks sit upon German thrones, it should not surprise us to see a crop of Gottscheds arise as the best fruitage of the land. But when there is any latent nobility in the popular mind, such scorn, by its very extremity, will call forth its own counteraction. It was perhaps good for Germany that a prince so eminent in one aspect as *Fritz der einziger*,[1] should put on record so emphatically his intense conviction, that no good thing could arise out of Germany. This creed was expressed by the quality of the French minds which he attracted to his court. The very refuse and dregs of the Parisian coteries satisfied his hunger for French garbage; the very offal of their shambles met the demand of his palate; even a Maupertuis, so long as he could produce a French baptismal certificate, was good enough to manufacture into the president of a Berlin academy. Such scorn challenged a re-action: the contest lay between the thrones of Germany and the popular intellect, and the final result was inevitable. Once aware that they were insulted, once enlightened to the full consciousness of the scorn which trampled on them as intellectual and predestined Helots, even the mild-tempered Germans became fierce, and now began to aspire, not merely under the ordinary instincts of personal ambition, but with a vindictive feeling, and as conscious agents of retribution. It became a pleasure with the German author, that the very same works which elevated himself, wreaked his nation upon their princes, and poured retorted scorn upon their most ungenerous and unparental sovereigns. Already, in the reign of the martial Frederick, the men who put most weight of authority into his contempt of Germans,—Euler, the matchless Euler, Lambert, and Immanuel Kant,—had vindicated the pre-eminence of German mathematics. Already, in 1755, had the same Immanuel Kant, whilst yet a probationer for the chair of logic in a Prussian university, sketched the outline of that philosophy which has secured the admiration, though not the assent, of all men known and proved to have understood it, of all men able to state its doctrines in terms admissible by its disciples. Already, and even previously, had Haller, who wrote in German, placed himself at the head of the current physiology. And in the fields of science or of philosophy, the victory was already decided for the German intellect in competition with the French.

---

[1] "*Freddy the unique;*" which is the name by which the Prussians expressed their admiration of their martial and indomitable, though somewhat fantastic, king.

But the fields of literature were still comparatively barren. Klopstock was at least an anomaly; Lessing did not present himself in the impassioned walks of literature; Herder was viewed too much in the exclusive and professional light of a clergyman; and, with the exception of John Paul Richter, a man of most original genius, but quite unfitted for general popularity, no commanding mind arose in Germany with powers for levying homage from foreign nations, until the appearance, as a great scenical poet, of Frederick Schiller.

The father of this great poet was Caspar Schiller, an officer in the military service of the Duke of Würtemberg. He had previously served as a surgeon in the Bavarian army; but on his final return to his native country of Würtemberg, and to the service of his native prince, he laid aside his medical character for ever, and obtained a commission as ensign and adjutant. In 1763, the peace of Paris threw him out of his military employment, with the nominal rank of captain. But, having conciliated the duke's favour, he was still borne on the books of the ducal establishment; and, as a planner of ornamental gardens, or in some other civil capacity, he continued to serve his serene highness for the rest of his life.

The parents of Schiller were both pious, upright persons, with that loyal fidelity to duty, and that humble simplicity of demeanour towards their superiors, which is so often found among the unpretending natives of Germany. It is probable, however, that Schiller owed to his mother exclusively the preternatural endowments of his intellect. She was of humble origin, the daughter of a baker, and not so fortunate as to have received much education. But she was apparently rich in gifts of the heart and the understanding. She read poetry with delight; and through the profound filial love with which she had inspired her son, she found it easy to communicate her own literary tastes. Her husband was not illiterate, and had in mature life so laudably applied himself to the improvement of his own defective knowledge, that at length he thought himself capable of appearing before the public as an author. His book related simply to the subjects of his professional experience as a horticulturist, and was entitled *Die Baumzucht im Grossen* (On the Management of Forests). Some merit we must suppose it to have had, since the public called for a second edition of it long after his own death, and even after that of his illustrious son. And although he was a plain man, of no pretensions, and possibly even of slow faculties, he has left behind him a prayer, in which there is one petition of sublime and pathetic piety, worthy to be remembered by the side of Agar's wise prayer against the almost equal temptations of poverty and riches. At the birth of his son, he had been reflecting with sorrowful anxiety, not unmingled with self-reproach, on his own many disqualifications for conducting the education of the child. But at length, reading in his own manifold imperfections but so many reiterations of the necessity that he should rely upon God's bounty, converting his very defects into so many arguments of hope and confidence in heaven, he prayed thus: "Oh God, that knowest my poverty in good gifts for my son's inheritance, graciously permit that, even as the want of bread became to thy Son's hunger-stricken flock in the wilderness the pledge of overflowing abundance, so likewise my darkness may, in its sad extremity, carry with it the measure of thy unfathomable light; and because I, thy worm, cannot give to my son the least of blessings, do thou give the greatest; because in my hands there is not any thing, do thou from thine pour out all things; and that temple of a new-born spirit, which I cannot adorn even with earthly ornaments of dust and ashes, do thou irradiate with the celestial adornment of thy presence, and finally with that peace that passeth all understanding."

Reared at the feet of parents so pious and affectionate, Schiller would doubtless pass a happy childhood; and probably to this utter tranquillity of his earlier years, to his seclusion from all that could create pain, or even anxiety, we must ascribe the unusual dearth of anecdotes from this period of his life; a dearth which has tempted some of his biographers into improving and embellishing some puerile stories, which a man of sense will inevitably reject as too trivial for his gravity or too fantastical for his faith. That nation is happy, according to a common adage, which furnishes little business to the historian; for such a vacuity in facts argues a condition of perfect peace and silent prosperity. That childhood is happy, or may generally be presumed such, which has furnished few records of external experience, little that has appeared in doing or in suffering to the eyes of companions; for the child who has been made happy by early thoughtfulness, and by infantine struggles with the great ideas of his origin and his destination (ideas which settle with a deep, dove-like brooding upon the mind of childhood, more than of mature life, vexed with inroads from the noisy world), will not manifest the workings of his spirit by much of external activity. The *fallentis semita vitæ*, that path of noiseless life, which eludes and deceives the conscious notice both of its subject and of all around him, opens equally to the man and to the child; and the happiest of all childhoods will have been that of which the happiness has survived and expressed itself, not in distinct records, but in deep affection, in abiding love, and the hauntings of meditative power.

Such a childhood, in the bosom of maternal tenderness, was probably passed by Schiller; and his first awaking to the world of strife and perplexity happened in his fourteenth year. Up to that period his life had been vagrant, agreeably to the shifting necessities of the ducal service; and his education desultory and domestic. But in the year 1773 he was solemnly entered as a member of a new academical institution, founded by the reigning duke, and recently translated to his little capital of Stuttgard. This change took place at the special request of the duke, who, under the mask of patronage, took upon himself the severe control of the whole simple family. The parents were probably both too humble and dutiful in spirit towards one whom they regarded in the double light of sovereign lord and of personal benefactor, ever to murmur at the ducal behests, far less to resist them. The duke was for them an earthly providence; and they resigned themselves, together with their child, to the disposal of him who dispensed their earthly blessings, not less meekly than of Him whose vicegerent they presumed him to be. In such a frame of mind, requests are but another name for commands; and thus it happened that a second change arose upon the first, even more determinately fatal to the young Schiller's happiness. Hitherto he had cherished a day-dream pointing to the pastoral office in some rural district, as that which would harmonize best with his intellectual purposes, with his love of quiet, and, by means of its preparatory requirements, best also with his own peculiar choice of studies. But this scheme he now found himself compelled to sacrifice; and the two evils which fell upon him concurrently in his new situation were, first, the formal military discipline and monotonous routine of duty; secondly, the uncongenial direction of the studies, which were shaped entirely to the attainment of legal knowledge, and the narrow service of the local tribunals. So illiberal and so exclusive a system of education was revolting to the expansive mind of Schiller; and the military bondage under which this system was enforced, shocked the aspiring nobility of his moral nature, not less than the technical narrowness of the studies shocked his understanding. In point of expense the whole establishment cost nothing at all to those parents who were privileged servants of the duke: in this number were the parents of Schiller, and that single consideration weighed too powerfully upon his filial piety to allow of his openly murmuring at his lot; while on *their* part the parents were equally shy of encouraging a disgust which too obviously tended to defeat the promises of ducal favour. This system of monotonous confinement was therefore carried to its completion, and the murmurs of the young Schiller were either dutifully suppressed, or found vent only in secret letters to a friend. In one point only Schiller was able to improve his condition; jointly with the juristic department, was another for training young aspirants to the medical profession. To this, as promising a more enlarged scheme of study, Schiller by permission transferred himself in 1775. But whatever relief he might find in the nature of his new studies, he found none at all in the system of personal discipline which prevailed.

Under the oppression of this detested system, and by puré re-action against its wearing persecutions, we learn from Schiller himself, that in his nineteenth year he undertook the earliest of his surviving plays, the Robbers, beyond doubt the most tempestuous, the most volcanic, we might say, of all juvenile creations anywhere recorded. He himself calls it " a monster," and a monster it is; but a monster which has never failed to convulse the heart of young readers with the temperament of intellectual enthusiasm and sensibility. True it is, and nobody was more aware of that fact than Schiller himself in after years, the characters of the three Moors, father and sons, are mere impossibilities; and some readers, in whom the judicious acquaintance with human life in its realities has outrun the sensibilities, are so much shocked by these hypernatural phenomena, that they are incapable of enjoying the terrific sublimities which on that basis of the visionary do really exist. A poet, perhaps Schiller might have alleged, is entitled to assume hypothetically so much in the previous positions or circumstances of his agents as is requisite to the basis from which he starts. It is undeniable that Shakspeare and others have availed themselves of this principle, and with memorable success. Shakspeare, for instance, *postulates* his witches, his Caliban, his Ariel: grant, he virtually says, such modes of spiritual existence or of spiritual relations as a possibility; do not expect me to demonstrate this, and upon that single concession I will rear a superstructure that shall be self-consistent; every thing shall be *internally* coherent and reconciled, whatever be its *external* relations as to our human experience. But this species of assumption, on the largest scale, is more within the limits of credibility and plausible verisimilitude when applied to modes of existence, which, after all, are in such total darkness to us (the limits of the possible being so undefined and shadowy as to what can or cannot exist), than the very slightest liberties taken with human character, or with those principles of action, motives, and feelings, upon which men would move under given circumstances, or with the modes of action which in common prudence they would be likely to adopt. The truth is, that, as a coherent work of art, the Robbers is indefensible; but, however monstrous it may be pronounced, it possesses a power to agitate and convulse, which will always obliterate its great faults to the young, and to all whose judgment is not too much developed. And the best apology for Schiller is found in his own words in recording the circumstances and causes under which this anomalous production arose. " To escape," says he, " from the formalities of a discipline which was odious to my heart, I sought a retreat in the world of ideas and shadowy possibilities, while as yet I knew nothing at all of that human world from which I was harshly secluded by iron bars. Of men, the actual men in this world below, I knew absolutely nothing at the time when I composed my Robbers. Four hundred human beings, it is true, were my fellow-prisoners in this abode; but they were mere tautologies and reiterations of the self-same mechanic creature, and like so many plaster casts from the same original statue. Thus situated, of necessity I failed. In making the attempt, my chisel brought out a monster, of which [and that was fortunate] the world had no type or resemblance to show."

Meantime this demoniac drama produced very opposite results to Schiller's reputation. Among the young men of Germany it was received with an enthusiasm absolutely unparalleled, though it is perfectly untrue that it excited some persons of rank and splendid expectations (as a current fable asserted) to imitate Charles Moor in becoming robbers. On the other hand, the play was of too powerful a cast not in any case to have alarmed his serenity the Duke of Würtemberg; for it argued a most revolutionary mind, and the utmost audacity of self-will. But besides this general ground of censure, there arose a special one, in a quarter so remote that this one fact may serve to evidence the extent as well as intensity of the impression made. The territory of the Grisons had been called by Spiegelberg, one of the robbers, " the Thief's Athens." Upon this the magistrates of that country presented a complaint to the duke; and his highness, having cited Schiller to his presence, and severely reprimanded him, issued a decree that this dangerous young student should henceforth confine himself to his medical studies.

The persecution which followed exhibits such extraordinary exertions of despotism, even for that land of irresponsible power, that we must presume the duke to have relied more upon the hold which he had upon Schiller through his affection for parents so absolutely dependent on his highness's power, than upon any laws, good or bad, which he could have pleaded as his warrant. Germany, however, thought otherwise of the new tragedy than the serene critic of Würtemberg: it was performed with vast applause at the neighbouring city of Mannheim; and thither, under a most excusable interest in his own play, the young poet clandestinely went. On his return he was placed under arrest. And soon afterwards, being now thoroughly disgusted, and, with some reason, alarmed by the tyranny of the duke, Schiller finally eloped to Mannheim, availing himself of the confusion created in Stuttgard by the visit of a foreign prince.

At Mannheim he lived in the house of Dalberg, a man of some rank and of sounding titles, but in Mannheim known chiefly as the literary manager (or what is called director) of the theatre. This connection aided in determining the subsequent direction of Schiller's talents; and his Fiesco, his Intrigue and Love, his Don Carlos, and his Maria Stuart, followed within a short period of years. None of these are so far free from the faults of the Robbers as to merit a separate notice; for with less power, they are almost equally licentious. Finally, however, he brought out his Wallenstein, an immortal drama, and, beyond all competition, the nearest in point of excellence to the dramas of Shakspeare. The position of the characters of Max. Piccolomini and the Princess Thekla is the finest instance of what, in a critical sense, is called *relief*, that literature offers. Young, innocent, unfortunate, among a camp of ambitious, guilty, and blood-stained men, they offer a depth and solemnity of impression which is equally required by way of contrast and of final repose.

From Mannheim, where he had a transient love affair with Laura Dalberg, the daughter of his friend the director, Schiller removed to Jena, the celebrated university in the territory of Weimar. The grand duke of that German Florence was at this time gathering around him the most eminent of the German intellects; and he was eager to enrol Schiller in the body of his professors. In 1799 Schiller received the chair of civil history; and not long after he married Miss Lengefeld, with whom he had been for some time acquainted. In 1803 he was ennobled; that is, he was raised to the rank of gentleman, and entitled to attach the prefix of *Von* to his name. His income was now sufficient for domestic comfort and respectable independence; while in the society of Goethe, Herder, and other eminent wits, he found even more relaxation for his intellect, than his intellect, so fervent and so self-sustained, could require.

Meantime the health of Schiller was gradually undermined: his lungs had been long subject to attacks of disease; and the warning indications which constantly arose of some deep-seated organic injuries in his pulmonary system ought to have put him on his guard for some years before his death. Of all men, however, it is remarkable that Schiller was the most criminally negligent of his health; remarkable, we say, because for a period of four years Schiller had applied himself seriously to the study of medicine. The strong coffee, and the wine, which he drank, may not have been so injurious as his biographers suppose; but his habit of sitting up through the night, and defrauding his wasted frame of all natural and restorative sleep, had something in it of that guilt which belongs to suicide. On the 9th of May 1805 his complaint reached its crisis. Early in the morning he became delirious; at noon his delirium abated; and at four in the afternoon he fell into a gentle unagitated sleep, from which he soon awoke. Conscious that he now stood on the very edge of the grave, he calmly and fervently took a last farewell of his friends. At six in the evening he fell again into sleep, from which, however, he again awoke once more to utter the memorable declaration, "that many things were growing plain and clear to his understanding." After this the cloud of sleep again settled upon him; a sleep which soon changed into the cloud of death.

This event produced a profound impression throughout Germany. The theatres were closed at Weimar, and the funeral was conducted with public honours. The position in point of time, and the peculiar services of Schiller to the German literature, we have already stated: it remains to add, that in person he was tall, and of a strong bony structure, but not muscular, and strikingly lean. His forehead was lofty, his nose aquiline, and his mouth almost of Grecian beauty. With other good points about his face, and with auburn hair, it may be presumed that his whole appearance was pleasing and impressive, while in later years the character of sadness and contemplative sensibility deepened the impression of his countenance. We have said enough of his intellectual merit, which places him in our judgment at the head of the Trans-Rhenish literature. But we add in concluding, that Frederick von Schiller was something more than a great author; he was also in an eminent sense a great man; and his works are not more worthy of being studied for their singular force and originality, than his moral character from its nobility and aspiring grandeur.

(W. W. W.)

SCHIO, a city of the delegation of Verona, in Austrian Lombardy. It stands on the river Timanchio, and carries on some large cloth manufactories, which produce excellent goods of various kinds. It contains 6950 inhabitants.

SCHIRAS, or Schirauz. See Shiraz.

SCHISM (from the Greek σχισμα, *a rent* or *fissure*), in its general acceptation signifies division or separation; but it is chiefly used in speaking of separations happening from diversity of opinions among people of the same religion and faith. Thus we say the schism of the ten tribes of Judah and Benjamin, the schism of the Persians from the Turks and other Mahommedans, &c. Among ecclesiastical authors, the great schism of the West is that which happened in the times of Clement VII. and Urban VI., which divided the church for forty or fifty years, and was at length ended by the election of Martin V. at the council of Constance. The Romanists number thirty-four schisms in their church, and bestow the name of English schism on the reformation of religion in this kingdom. Those of the church of England apply the term schism to the separation of the nonconformists, viz. the presbyterians, independents, and anabaptists, for a further reformation.

SCHISMA (σχισμα), a small theoretical interval in music, arising from the division of the monochord. Two σχισματα make up a δεισις, or a λεῖμμα.

SCHISTUS, a name given to several kinds of stones. See Mineralogy.

SCHITTUAR, or Shitwar, a small island in the Persian Gulf. Long. 53. 24. E. Lat. 26. 59. N.

SCHLEGEL, Frederick, an eminent German critic and philosophical writer, was born at Hanover in 1772, of a family which had already produced more than one writer of ability. He was the third son of the family, being three years younger than his distinguished brother, who is still alive, Augustus William. In his earlier years he is said to have displayed no remarkable genius. Though intended for the mercantile profession, he received an admirable classical education; and ultimately prevailed on his father to allow him to follow the bent of his own inclination, and to devote himself to literature. He then began to devote himself in earnest to study, which he pursued first at Göttingen and afterwards at Leipsig. From the age of seventeen, as he himself informs us, the writings of the Greek tragedians, and of Plato, combined with Winkelmann's enthusiastic criticisms on art, formed the intellectual world in which he lived. This admiration for the antique was increased by a visit which he was enabled to pay to Dresden in 1789, where he was for the first time enabled to contemplate, in their marble forms, those gods, heroes, and sages, who had been the companions of his thoughts. "These firm indelible impressions," he adds, "were in succeeding years the firm enduring groundwork for my study of classical antiquity."

As might be expected, his first literary effort, which appeared in 1794, took the direction of these his early studies.

It was a short Essay on the different Schools of Greek Poetry, which appeared in the *Berlinn Monatschrift*, displaying not only an erudition of considerable depth and extent, but an elegance of style and a clearness of classification less frequently to be found among his countrymen. Two little treatises followed, composed in 1795 and 1796; the Diotema, a view of the condition of the female sex in Greece; and a parallel between Cæsar and Alexander, which, however, was not published till twenty-six years afterwards. In this work we trace the first indications of that talent which was afterwards so conspicuously displayed in the field of philosophical and critical history.

A more important work, entitled the Greeks and Romans, appeared in 1797, which was highly praised by Heine. It was followed two or three years afterwards by a History of Greek Poetry, in which, taking Winkelmann's History of Art as his model, he has thrown into criticism an imaginative and poetical tone, which, combining as it did with profound learning and breadth of philosophical views, succeeded in bringing before the mind the true spirit of antiquity, with a freshness and distinctness of portraiture which mere erudition could not have effected. The work, however, is incomplete. In the portion which is finished, but which was afterwards considerably modified, and incorporated with another work, Frederick Schlegel reviews the Orpheic poetry, which he considers to be of the age of Hesiod; the Homeric poems, his criticism on which forms indeed the most important and the best executed part of the work; the Hesiodic epos; the middle epos, or the works of the Cydic poets; and, lastly, the productions of the Ionic, Æolic, and Doric schools of lyric poetry. The portion of the work which treats of the lyric poets is unfinished; nothing indeed but a few fragments, full of promise, affording an imperfect idea of the style in which it would have been executed. The strong hold, in fact, which the literary scepticism of Wolff had taken of the German mind, and the ardent application of his principles, not merely to the Homeric poems, but to all compositions claiming a remote antiquity, appear to have discouraged Schlegel from persevering, and the work accordingly was dropt.

In 1799 he published his Lucinde, a work, as Mrs Austin describes it, "of fancy, sentiment, and reflection," in which, however, the very anti-platonic character of his descriptions of love occasioned not a little scandal and censure. What the precise object of the author in this equivocal novel was, may admit of question, though, perhaps, it is not unaptly characterized by a German critic as a fantastic and dreamy attempt to exalt and sublimate sensual love. Certain it is, that the public in general conceived, and not without some reason, that, like Hemse's Ardinghello, it was an elaborate effort to invest sensuality with grace, and to lavish a poetical colouring on scenes and incidents of a very questionable character. Frederick Schlegel appears to have felt that the cold reception of this philosophical experiment was not without foundation; for though he threatened the public in the *Europa* with a continuation, the work remained a fragment. In the year 1800 he established himself as a private teacher in Jena, where he delivered a course of philosophical lectures with success. His first poetical compositions, which appeared in the Athenæum, seem to have been the productions of this period. In 1801 he published, in conjunction with his brother Augustus W. Schlegel, two volumes, entitled *Characteristiken und Critiken*, one of the most popular and pleasing of his works. The second volume includes his Hercules Musagetes, an elegiac poem of some length; and in 1802 he published a tragedy, Alarcos, in which he has tried, with no remarkable success, to impart the severe and gloomy simplicity of Æschylus to a legend of the middle ages. In fact, it is neither as a lyric nor as a dramatic poet that the name of Frederick Schlegel is likely to be remembered. Goethe, at least, always appeared to estimate the poetical talent of Schlegel at a low standard.[1] Still he may fairly be admitted to possess a chaste classical diction, great harmony and flexibility of diction, with considerable tenderness, while in the poetical compositions which he wrote on patriotic subjects there appears real feeling and enthusiasm. In boldness and originality of conception his poetry is unquestionably deficient; and, on the whole, it may be said that the philosophical element preponderates in the character of Frederick Schlegel, nearly as much as the poetical does in that of his brother.

But the study of the poetry and literature of the west was near about to be exchanged for that of the eastern nations. Following in the footsteps of Sir William Jones, and filled with the idea of the important additions which might be made to Europe by naturalizing in Germany the results of Indian research, and of the still greater benefits which he conceived might be derived from the pursuit of Indian literature, philosophy, and antiquities, in an enlarged, philosophical, and at the same time religious spirit, he resolved to devote himself to the study of Sanscrit. He probably overrated, on the whole, both the importance of the labour in which he was about to engage, and its probable interest to the public mind. With a view, however, to his intended investigations, he repaired to Paris in 1802, accompanied by his wife, the daughter of the celebrated Moses Mendelsohn, and, with the assistance afforded by the valuable stores of the National Library, and the hints derived from those distinguished orientalists, MM. de Langlès and Chézy, he is said to have made considerable progress in the study of Persian and Sanscrit poetry.

But he was by no means so entirely absorbed in his new task as not to find time for other studies, having contrived during his residence in France, which continued till 1805, to deliver a course of lectures on metaphysics, which appear to have met with but partial success; a result by no means surprising, when the lofty and Platonic character of Schlegel's philosophy is contrasted with the strong material tendencies which had long encumbered the metaphysical views of the French. During the same period he wrote a variety of articles on the early Italian, Spanish, Portuguese, and Provençal poetry; and published, in 1804, a collection of the romantic poems of the middle ages, and a series of letters on the different schools and epochs of Christian painting and Gothic architecture, a work for which the temporary concentration of the various treasures of modern art in the Parisian capital afforded ample materials. These letters, which he afterwards revised and enlarged, form one of the most pleasing of his compositions. He takes up the subject nearly where Winkelmann had left it, and performs, in the same spirit of love, the same service for the arts of the middle ages, which that critic had done for those of antiquity.

It was at this period of Frederick Schlegel's life (1805) that he took the step which occasioned so much surprise in some quarters, and such bitter hostility and censure in others, namely, his forsaking the tenets of the Protestant church, in which he had been brought up, and embracing Catholicism, as Count Stolberg had done a few years before. His conversion was ascribed by Voss, who, in addition to the rancour of religious opposition, was probably influenced by the jealousy of literary rivalry, to the most unworthy and interested motives, as resulting entirely from a time-serving spirit, and the prospect of honours and promotion in the service of Austria, which Protestant Germany was less likely to supply. Now that personal animosity is at an end, it seems to be conceded that there is little reason to question the sincerity of Frederick Schlegel's change of religious belief. To his poetical and enthusiastic mind, long occupied with the study of the religion, monuments, and literature of the middle ages, Catholicism presented many more attractive features than the rationalizing and semi-infidel spirit which too generally pervaded German Protestantism, in which, to use an expression of Hegel, the disciples of Luther and Calvin had "united on a basis of nullity." Of course the accession of such a convert was hailed with enthusiasm by the Catholic priesthood; and his example was shortly afterwards followed by several Protestants of rank or literary ability.

---

[1] Characteristics of Goethe, vol. i. p. 120.

In 1808 appeared his work on the Language and Wisdom of the Indians. The first part of this work is occupied with a comparative examination of the etymology and grammatical structure of the Sanscrit, Persian, Greek, Roman, and German languages. The second traces the connection of the different religions and philosophical systems that prevailed in the ancient oriental world. The last consists of metrical versions from the sacred and didactic poems of the Hindus. It cannot be denied that this work, with all its learning and sagacity of conjecture, is yet a very imperfect one. The profounder learning of Jacob Grimm has demolished many of the ingenious theories of Schlegel as to the original monuments of the German language. Much, too, has of course been added to Indian learning since it appeared; many of its views have so completely passed into commonly-received opinions, that they have ceased to strike us as novelties; and other truths which are there only hinted at, have been elucidated and confirmed. But it had the merit of opening a comparatively new path in Germany, and perhaps in other countries of Europe. "Prior to the publication of this work, the Semitic languages of the East were alone, I believe, cultivated with much ardour in Germany; its appearance had the effect of directing the national energies towards an intellectual region, where they were destined to meet with the most brilliant success; and Germany may now boast with reason of her illustrious professors of Sanscrit. If France under the restoration made such progress in oriental literature; if England, roused from her inglorious apathy, has at last founded an Asiatic Society in London, and, more recently, the Boden professorship at Oxford; these events are in a great degree attributable to the enthusiasm which this little book excited."[1]

After Schlegel's return from France, he proceeded in 1808 to Vienna, with the view, it is said, of completing from historical documents an unfinished drama on the subject of Charles V. In the following year he was appointed imperial secretary at the Archduke Charles's head-quarters, and contributed much, by his spirited proclamations, towards rousing the patriotic ardour of the country in the contest against Napoleon. After the unfortunate issue of the war, he resumed his literary activity, and in 1810 delivered his course of lectures on modern history. By many these lectures were considered as his masterpiece. They embodied in a systematic form the various opinions and incidental views which he had thrown out in his earlier essays, and contained, in a more detailed form, the proofs of many of those positions which he afterwards stated in a more brief and general form in his Philosophy of History.

In 1812 Schlegel delivered, before a numerous and distinguished audience in Vienna, his celebrated Lectures on the History of Literature, the work by which he is best known beyond the limits of his own country. Of course a work which exhibits an outline of the literary history of the world, and traces the influence of its various literatures on one another, within the compass of two volumes, cannot descend to much minuteness of detail, or delineate, with that precision which would be desirable, the characteristics of individuals. Yet, in addition to the broad and striking views which the History of Literature exhibits, to the skill and sagacity with which it traces the divergence and reunion of the various streams of literature, as if the whole had been contemplated from some vast elevation in which their mutual relations were visible as on a map, and to the general spirit of candour and impartiality which pervades the work, it may be added, that some of Schlegel's brief sketches of the great ornaments of literature are among the happiest specimens of pregnant and characteristic delineation which are to be met with in any language. The style, too, of the work is elegant and enthusiastic without being extravagant. Yet some deductions must be made, both from the impartiality of the work, and from the soundness of its views. It is difficult to conceive on what grounds of sound criticism the Lusiad of Camoens can be exalted above the Jerusalem of Tasso; and still more how the "romantic witchery" of the drama of Calderon, rich and fantastical as it is, can ever be placed on the same level with the profound imagination which combines with this romantic beauty in the theatre of Shakspeare. English literature, with the exception of Shakspeare, can hardly be said to be appreciated at all. French literature, at least after the time of Corneille, is treated with great injustice; Pascal is passed over with a single word; Malebranche is not mentioned at all. And indeed the literature of the seventeenth and eighteenth centuries is discussed in a very perfunctory and unsatisfactory manner. Some of the faults of the work are undoubtedly owing to the strong religious bias of the author. For the Catholic literature of Spain and Italy he shows an undue preference, with a corresponding coldness and indifference towards that of Protestant nations. "Frederick Schlegel," says Heine, in his lively work on Germany, "has examined all literatures from a lofty point of view; but this high position of his is always on the belfry of the Catholic Church; and whatever Schlegel says, you can't help hearing the bells jingle about him, and now and then the croaking of the ravens that haunt the old weathercock." "Yet," he adds, "I know no better book of the kind; and indeed I know not where one can procure such a complete view of the literature of all nations, unless by putting together the multifarious lucubrations of Herder."

With the History of Literature the critical career of Frederick Schlegel may be said to have closed; for a flattering and somewhat exaggerated criticism on Lamartine's *Méditations Poétiques*, which appeared in the *Concordia*, scarcely deserves to be noticed as an exception. From 1812 he was much occupied with political and diplomatic employments. Having acquired the friendship and confidence of Prince Metternich, he was employed by him in various diplomatic missions; and for several years after the peace of 1814 he was one of the representatives of the court of Vienna at Francfort. A pension, with letters of nobility, and the title of aulic confessor, were conferred upon him by the emperor. These diplomatic functions, of course, occasioned a temporary interruption to his literary pursuits; but in 1818 he returned to Vienna, where they were resumed with ardour. The years 1819 and 1820 were marked by the simultaneous outbreak of revolutions in different countries in Europe; by a wild republican spirit among the youth of Germany, leading, as in the case of Kotzebue, to the assassination of those who were at the time considered as enemies of their country; by the formation of associations for disseminating pernicious and anti-social doctrines, often countenanced even from academical chairs; in short, by evident symptoms of a wide-spread conspiracy against the existing forms of government and society. It was to counteract this spirit, which preventive measures of force might control but could not eradicate, that Frederick Schlegel, in conjunction with his friend Adam Müller founded a religious and political journal, entitled *Concordia*, in which, while opposing the irreligious and dangerous notions which were abroad, he propounded not a few principles as to government, which excite surprise when coming from such a quarter, and addressed to the subjects of a government supposed to be so attached to absolutism, and so bent on maintaining the existing state of things, as the Austrian government.

---

[1] Life of Frederick Schlegel, prefixed to his Philosophy of History, by J. Burton Robertson, p. 26.

In 1827 he delivered at Vienna another course of Lectures on the Philosophy of Life, of which, indeed, an outline had appeared in the *Concordia* for 1820. The work is of great, nay even of startling originality, and deep interest, embracing questions of the most solemn importance, which are discussed with a grave eloquence, and in a deeply religious strain of feeling, but strangely immethodical in its arrangement, and, whether from the imperfection of their expression, or the real obscurity of the ideas themselves, in some parts scarcely intelligible. This work was almost immediately followed by another course of Lectures on the Philosophy of History, which have lately been translated into English, and which appear not unworthy of the reputation of the author. Towards the close of the year 1828 Schlegel went to Dresden, where he delivered nine Lectures on the Philosophy of Language, in which he farther developed and expanded those philosophical views which he had already laid down in his Philosophy of Life. The course, however, was interrupted by death. "On Sunday the 11th of January 1829, he was, between ten and eleven o'clock at night, preparing a lecture which he was to deliver on the following Wednesday, and had begun a sentence with the remarkable words, 'But the consummate and perfect knowledge,' when sickness suddenly arrested his pen. From that illness he never recovered."

We have already briefly expressed our opinion of the nature of Schlegel's genius. It was philosophical and critical, rather than poetical; but he had that species of poetical imagination without which there can be no lofty or useful criticism, which enables the critic to rise above artificial and natural peculiarities, and to judge with truth and certainty upon broad and universal principles. Even when his criticism is imperfect or erroneous, it is often valuable; for it abounds in new and original views, excites the mind to independent speculation, and teaches the habit of viewing literature, the arts, and philosophy, not as isolated subjects of study, but as acting and re-acting with the most important influences upon each other. From his powerful and inventive mind many of the speculations of his brother appear to have been derived. In the study of the oriental languages and literature, the poetry of the Provençals, and that of Spain, Frederick Schlegel led the way; and in the History of Literature will be found the germs of many of those views which were developed at greater length by his brother in his Dramatic Course. (W. W. W. W.)

SCHMALKALDEN, one of the provinces into which the principality of Hesse Casel, in Germany, is divided. It extends over 116 square miles. It is a hilly district, including part of the Thuringian Forest, some of the points of which reach the height of 3100 feet. It is watered by several small streams, all of which lose themselves in the river Werra. The soil is mostly sandy and sterile, and rarely produces more corn than suffices for a quarter of the consumption. The mines yield rock-salt and iron, and the latter creates the chief employment of the inhabitants next to agriculture. The province contains one city, four market-towns, thirty-five villages, and twenty-four hamlets, with 24,500 inhabitants, mostly Protestants. The capital is the city of the same name, situated on the small river Schmalkalde. It is interesting in an historical view, as having been the place where the Protestant league was formed to secure religious liberty, at the commencement of the Thirty Years' War in Germany. It is surrounded with walls and ditches; but is dilapidated, and scarcely capable of defence. It has an ancient castle, three churches, several institutions for education, 1050 houses, and 5100 inhabitants, whose chief occupation is making ironmongery, cutlery, and weapons, especially swords and bayonets. The salt-mines produce about 12,000 quintals of refined salt. Long. 11. 1. E. Lat. 50. 44. 36. N.

SCHMIEDENBERG, a city of Prussian Silesia, in the government of Reichenbach and circle of Hirschberg. It stands on the river Yssel, at the foot of the Kahlenberg Mountains, but is 1400 feet above the level of the sea. It is an open place, of only two streets, more than two miles in length, and contains 550 houses, with 4830 inhabitants, who make some of the finest damask table-linens, and many other kinds of goods. The mountain behind it rises to 3300 feet.

SCHŒNOBATES (from the Greek, σχοινος, *a rope*, and βαινω, *I walk*), a name which the Greeks gave to their rope-dancers. By the Romans they were called *funambuli*. The *schœnobates* were slaves whose masters made money of them, by entertaining the people with their feats of activity. Mercurialis (*De Arte Gymnastica*, lib. iii.) gives us five figures of schœnobates, engraven after ancient stones.

SCHOLASTIC, something belonging to the school.

Scholastic Divinity is that part or species of divinity which clears and discusses questions by reason and arguments; in which sense it stands in some measure opposed to positive divinity, which is founded on the authority of fathers, councils, &c.

SCHOLIAST, or COMMENTATOR, a grammarian who writes *scholia*, that is, notes and glosses, upon ancient authors who have written in the learned languages.

SCHOLIUM, a note, annotation, or remark, occasionally made on some passage, proposition, or the like. This term is much used in geometry and other parts of mathematics, where, after demonstrating a proposition, it is customary to point out how it might be done some other way, or to give some advice or precaution in order to prevent mistakes, or add some particular use or application thereof.

SCHOMBERG, FREDERICK-ARMAND, DUKE OF, a distinguished officer, sprung from an illustrious family in Germany, and the son of Count Schomberg by an English lady, daughter of Lord Dudley, was born in 1608. He was initiated into the military life under Frederick-Henry prince of Orange, and afterwards served under his son William II. prince of Orange, who highly esteemed him. He then repaired to the court of France, where his reputation was so well known that he obtained the government of Gravelines, of Furnes, and the surrounding countries. He was reckoned inferior to no general in that kingdom, except Marshal Turenne and the Prince of Condé; men of such exalted eminence, that it was no disgrace to acknowledge their superiority. The French court thinking it necessary to diminish the power of Spain, sent Schomberg to the assistance of the Portuguese, who were engaged in a war with that country respecting the succession to their throne. Schomberg's military talents gave a turn to the war in favour of his allies. The court of Spain was obliged to solicit a peace in 1668, and to acknowledge the house of Braganza as the just heirs to the throne of Portugal. For his great services he was created Count Mentola in Portugal; and a pension of L.5000 was bestowed upon him, with the reversion to his heirs.

In 1673 he came over to England to command the army; but the English being at that time disgusted with the French nation, Schomberg was suspected of coming over with a design to corrupt the army, and bring it under French discipline. He therefore found it necessary to return to France, which he soon left, and went to the Netherlands.

In the month of June 1676, he forced the Prince of Orange to raise the siege of Maestricht; and it is said he was then raised to the rank of Marshal of France. But the French *Dictionnaire Historique*, whose information on a point of this nature ought to be authentic, says that he was invested with this honour the same year in which he took the fortress of Bellegarde from the Spaniards whilst serving in Portugal.

Upon the revocation of the edict of Nantes, when the persecution commenced against the Protestants, Schomberg, who was of that persuasion, requested leave to retire into his own country. This request was refused; but he was permitted to take refuge in Portugal, where he had reason to expect he would be kindly received on account of past services. But the religious zeal of the Portuguese, though it did not prevent them from accepting assistance from a heretic when their kingdom was threatened with subversion, could not permit them to give him shelter when he came for protection. The inquisition interfered, and obliged the king to send him away. He then went to Holland by the way of England. Having accepted an invitation from the Elector of Brandenburg, he was invested with the government of Ducal Prussia, and appointed commander-in-chief of the elector's forces. When the Prince of Orange sailed to England to take possession of the crown which his father-in-law James II. had abdicated, Schomberg obtained permission from the Elector of Brandenburg to accompany him. He is supposed to have been the author of an ingenious stratagem which the prince employed after his arrival in London, to discover the sentiments of the people respecting the revolution. The stratagem was, to spread an alarm over the country that the Irish were approaching with fire and sword. When the prince was established on the throne of England, Schomberg was appointed commander-in-chief of the forces, and master of the ordnance. In April 1689 he was made knight of the garter, and naturalized by act of parliament; and in May following he was created baron, earl, marquis, and duke of the kingdom of England, by the name and title of Baron Teys, Earl of Brentford, Marquis of Harwich, and Duke of Schomberg. The House of Commons voted to him L.100,000 as a reward for his services. Of this he only received a small part; but after his death a pension of L.5000 a year was bestowed upon his son.

In August 1689 he was sent to Ireland to reduce that kingdom to obedience. When he arrived, he found himself at the head of an army consisting only of twelve thousand foot and two thousand horse, while King James commanded an army three times more numerous. Schomberg thought it dangerous to engage so superior a force, and being disappointed in his promised supplies from England, he judged it prudent to remain on the defensive. He therefore posted himself at Dundalk, about five or six miles distance from James, who was encamped at Ardee. For six weeks he remained in this position, without attempting to give battle, while from the wetness of the season he lost nearly the half of his army. Schomberg was much blamed for not coming to action; but some excellent judges admired his conduct, as evincing great military talents. Had he risked an engagement, and been defeated, Ireland would have been lost. At the famous battle of the Boyne, fought on the 1st of July 1690, which decided the fate of James, Schomberg passed the river at the head of his cavalry, defeated eight squadrons of the enemy, and broke the Irish infantry. When the French Protestants had lost their commander, Schomberg went to rally and lead them on to charge. While thus engaged, a party of King James's guards, which had been separated from the rest, passed Schomberg, in attempting to rejoin their own army. They attacked him with great fury, and gave him two wounds in the head. As the wounds were not dangerous, he might soon have recovered from them; but the French Protestants, perhaps thinking their general was killed, immediately fired upon the guards, and shot him dead on the spot. He was buried in St Patrick's cathedral. Bishop Burnet says Schomberg was "a calm man, of great application and conduct, and thought much better than he spoke; of true judgment, of exact probity, and of a humble and obliging temper."

SCHOOL, a public place, in which the languages, the arts, or sciences, are taught. Thus we say, a grammar school, a writing school, and a school of natural philosophy. The word is formed from the Latin *schola*, which, according to Du Cange, signifies discipline and correction. He adds, that it was anciently used for all places where several persons met together, either to study, to converse, or do any other matter. See Education and Universities.

SCHOONER, in nautical language, a small vessel with two masts, whose main-sail and fore-sail are suspended from gaffs, reaching from the mast towards the stern, and stretched out below by booms, and whose foremost ends are hooked to an iron, which clasps the mast so as to turn therein as upon an axis, when the after-ends are swung from one side of the vessel to the other.

SCHOUTEN'S Island, on the eastern coast of Van Diemen's Land, consists of lofty mountains separated by deep valleys.

SCHREVELIUS, Cornelius, a laborious Dutch critic and writer, who has published some editions of the ancient classics, more distinguished for their elegance than accuracy. His Greek Lexicon is esteemed the best of all his works. He died in 1667.

SCHRYARI, an ancient wind-instrument of the bagpipe kind, long disused.

SCHULTENS, Albert, professor of Hebrew and of the oriental languages at Leyden, and one of the most learned men of the eighteenth century, was born at Groningen, where he studied till the year 1706, and thence continued his studies at Leyden and Utrecht. Schultens at length applied himself to the study of Arabic, both printed and in manuscript, in which he made great progress. A short time afterwards he became minister of Wassenar; and in two years professor of the eastern tongues at Franeker. At length he was invited to Leyden, where he taught Hebrew and the Oriental languages with extraordinary reputation till his death, which happened in the year 1750. He wrote many learned works, the principal of which are, 1. A Commentary on Job, in two vols. 4to; 2. A Commentary on the Proverbs; 3. Vetus regia Via Hebraizandi; 4. Animadversiones philologicæ et criticæ ad varia loca Veteris Testamenti; 5. An excellent Hebrew Grammar. Schultens discovered in all his works sound criticism and much learning. He maintained against Gousset and Driessen, that in order to have a perfect knowledge of Hebrew, it is necessary to join with it not only the Chaldaic and Syriac, but more particularly the Arabic.

SCHURMAN, Anna Maria, a most extraordinary German lady, was born at Cologne in 1607. Her natural genius discovered itself at six years of age, when she cut all sorts of figures in paper with her scissars without a pattern. At eight she learned in a few days to draw flowers in a very agreeable manner. At ten, she took only three hours to learn embroidery; and afterwards she was taught music vocal and instrumental, painting, sculpture, and engraving, in all of which she succeeded admirably. She excelled in miniature-painting, and in cutting portraits upon glass with a diamond. Hebrew, Greek, and Latin, were so familiar to her, that the most learned men were astonished at it. She spoke French, Italian, and English, fluently. Her handwriting, in almost all languages, was so inimitable, that the curious preserved specimens of it in their cabinets. But all this extent of learning and penetration could not protect her from falling into the errors of Labadie, the famous French enthusiast, who had been banished France for his extravagant tenets and conduct. To this man she entirely attached herself, and accompanied him wherever he went; nay even attended him in his last illness at Altena in Holstein. Her works, consisting of De Vitæ Humanæ termino, Dissertatio de Ingenii Muliebris ad doctrinam et meliores litteras aptitudine, and her Letters to her learned correspondents, were printed at Leyden in 1648, but enlarged in the edition of Utrecht, 1662, in 12mo, when they appeared under the following title: A. M. Schurman Opuscula Hebræa, Græca, Latina, Gallica, Prosaica, et Metrica. She likewise published at Altena, in Latin, a defence of her attachment to Labadie, whilst she was with him in 1673. She died in Friesland in 1678.

SCHWABACH, a city of the kingdom of Bavaria, in the circle of the Rezat, situated on a river of the same name. It is the seat of the provincial courts of law, and of the boards of administration. It contains one reformed and two Lutheran churches, two Catholic chapels, and a Jews' synagogue, with 650 houses, and 6960 inhabitants, who are employed in various manufactures, principally in spinning cotton and making hosiery, but also in producing cutlery, paper, and toys of wood and of ivory.

SCHWARTSBURG-SONDERHAUSEN, a small sovereign principality in Germany, taking its first name from an ancient castle, and the second from its capital. It is 360 square miles in extent, is divided into seven bailiwicks, which comprise twelve towns and cities, 83 villages, 8600 houses, and 51,767 inhabitants, all adhering to the Lutheran confession except 200, who are Catholics. The revenue of the prince, chiefly derived from domains, amounts to L.40,000, and the expenditure is nearly equal to it, including interest on the public debt, which does not exceed one year's income. The contingent fixed to the German confederation is a force of 450 men. By a decree issued in 1830, an assembly of the states is provided, which, with the prince, is in future to make or alter the laws, and to regulate the finances. It is generally a hilly and woody district. It produces, by the help of extensive cultivation of potatoes, a little more corn than it consumes, and the surplus of it, with the produce of the forests, form the chief articles of trade. Much flax is grown, and there are some inconsiderable mines of iron, and these two articles afford some employment. The capital is Sonderhausen, with 3600 inhabitants, and the city of Arastad has 4800; the others are small places.

SCHWARZBURG-RUDOLSTADT, a sovereign principality in Germany. It is 400 square miles in extent, and is divided into eleven bailiwicks, which comprise eight cities and towns, 155 villages, 10,281 houses, and 60,000 inhabitants, all professing Lutheranism, except 150 Catholics and about the same number of Jews. The income of the state is L.32,500, arising partly from domains, besides which the prince has estates in Holstein, which are his private property. The debt amounts to about two years' income, but by a sinking fund is gradually diminishing. The contingent of force to the German confederation is fixed at 539 men. The greater part of the territory is on the Thuringian Hills, but between them are valleys of considerable fertility, especially that through which the Saale passes, and in which the capital, Rudolstadt, stands; but much of the land is poor, and scantily rewards the labour of the husbandman. It does, however, with the aid of potatoes, which are extensively cultivated, yield sufficient bread-corn, chiefly rye, for the subsistence of the inhabitants. Flax is extensively grown; but the mines afford more employment, yielding iron and lead, and some earths well adapted for making pottery-ware, all of which, with the addition of glass manufactories, give subsistence to the labouring classes. There are two cities, viz. Rudolstadt with 4000, and Frankenhausen with 3900 inhabitants.

SCHWATZ, a town of the Austrian province of Tyrol, in the circle of Innspruck. It stands on the river Inn, and having been destroyed in the course of hostilities during the year 1809, has been since rebuilt. It has again become a seat of the cotton manufacture, and of the fabrication of iron and cutlery goods and copper ware, mines of the latter being near to it. The population in 1837 amounted to 7500, and has now grown to upwards of 10,000. Long. 12. 34. E. Lat. 47. 32. N.

SCHWEIDNITZ, a city of Prussian Silesia, in the government of Reichenbach, the capital of a circle of the same name, which extends over 203 square miles, and contains three other towns and seventy-one villages, with 41,300 inhabitants. It stands on the river Weistrig, at the foot of a lofty hill. It was the strongest fortification on the frontier, but having been taken by the French in 1807, has not since been restored. It contains two Catholic and two Lutheran churches, one of the former of which has the highest tower in Germany. It has a gymnasium, military storehouse, and barracks now unoccupied, and 700 houses, with 11,600 inhabitants, who carry on extensive manufactures of woollen, silk, and linen goods. Long. 16. 31. 25. E. Lat. 50. 47. 8. N.

SCHWEINFURT, a city of the kingdom of Bavaria, in the circle of the Upper Maine, the capital of an extensive bailiwick of the same name. It stands on the river Maine, which protects it on one side, and is defended by fortifications on the other parts. It is not well built, the streets being narrow and crooked. It contains a fine palace, eight churches, 780 houses, and 7100 inhabitants, who are occupied in various small branches of manufactures. Long. 9. 44. E. Lat. 50. 10. N.

SCHWERIN, a city, the capital of the grand duchy of Mecklenburg-Schwerin, in Germany. It is finely situated, part being on the side of the lake of Schwerin, and part on an island on that lake, the two parts being connected by bridges. It contains the palace of the grand duke, with gardens, which exhibit more taste than the residence. It is fortified, but very imperfectly. It contains one Catholic and three Lutheran churches, the various appendages of a capital for a small state, 1100 houses, and 12,880 inhabitants, who have various manufactures adequate to the domestic consumption. Long. 11. 26. E. Lat. 54. 43. N.

SCHWETZ, a town of West Prussia, in the government of Marienwerder, the capital of the circle of the same name, which extends over 537 square miles. It stands on the Vistula, at the spot where the Schwartzwasser falls into that stream, and contains an old castle, and 260 houses, with 2260 inhabitants. Long. 18. 22. 15. E. Lat. 53. 24. 10. N.

SCHWYZ, a canton of Switzerland, which gives its name to the whole confederation. It is bounded on the north by Zurich, on the north-east by St Gall, on the east by Glarus, on the south by Uri, and on the west by Lucerne and Zug. It extends over 344 square miles, and comprises six towns, twenty-seven communes, and 36,390 inhabitants, who all adhere to the Roman Catholic church. It furnishes a contingent of 602 men to the force of the confederation, and a contribution of 3010 francs yearly. The government is a pure democracy. The surface is intersected by a chain of mountains in the form of an arch, on both sides of which are some beautiful and moderately fertile valleys; and the mountains in summer afford excellent pasturage for cattle, which is the chief object of trade. It neither produces nor consumes much corn, and of what it does use, a part is obtained by the sale of cattle and of cheese. The most remarkable of the mountains is the Righi, 5680 feet, on whose summit is a tavern, where visiters are accommodated. The chief river is the Sihl, which conveys to the Limmat all the waters of the several brooks that are formed from the mountains. The capital of the canton has the same name. It stands between the Righi and Myten Mountains, and has a fine council-house, a church, and a monastery, and contains 4790 inhabitants, who have very little commerce of any kind except what is created by the visits of tourists. Long. 8. 33. E. Lat. 47. 1. N.

SCIAGRAPHY, or SCIOGRAPHY, the profile or vertical section of a building, used for showing the inside of it.

SCIAGRAPHY, in *Astronomy*, is a term made use of by some authors to signify the art of finding the hour of the day or night by the shadow of the sun, moon, or stars.

SCICLI, a city of the island of Sicily, in the province of Noto. It stands on a river of the same name, in a hollow way between two lofty rocks which terminate in the sea near the small harbour of Petershaven. It is in a humid atmosphere, but contains 10,500 inhabitants, who are industriously employed in various manufactures of cloth, pottery-ware, and leather.

SCIENCE, in *Philosophy*, denotes any body of doctrines deduced from self-evident principles.

SCIGLIANO, a city of Italy, in the Neapolitan province of Calabria Citeriore. It is situated in a valley on the great road, is defended by a castle, and contains 5620 inhabitants, who are employed in making mattresses and blankets.

SCILLY, a group of islands off the coast of Cornwall, from which they are distant about thirty miles. These islands are supposed by some to have been the Cassiterides or Ten Islands with which the Phœnicians traded; but that is a disputable point. There are six islands of this group that are inhabited, but they are all in one parish, that of St Mary, in which is the parish church. There are a few small islands, or rather bare rocks, with no inhabitants, among which is that which gives its name to the whole group. The island of St Mary contains more inhabitants than all the others, and the town on it is the only one. In 1831 it contained 1311 inhabitants. It has a harbour, a church, and strong fortifications. On the island of St Agnes is the important lighthouse, which is of the highest value to ships approaching the channel in wintry or foggy weather. There is likewise on it a small church. The cultivation of these islands is imperfect, and does not, in common years, produce more than a bare sufficiency of food for the population, which is consequently on the decline; appearing by the census of 1821 to have amounted to 2614, and by that of 1831 to 2465. In unfruitful seasons the greatest distress for food has been experienced, though in all seasons fish is the common aliment. These islands are dangerous to approach, and have been fatal to many ships, as well as to Admiral Shovel and a part of his fleet in the beginning of the last century. There are establishments of pilots ready to assist vessels, and they often conduct vessels into the harbour of St Mary, through intricate and hazardous passages. There are said to be several Druidical remains on these islands. The population in 1831 was, St Mary, 1311; Tresco, 470; St Agnes, 289; St Martins, 230; Bryher, 128; and Sampson Isle, 37.

SCINDAPSOS, σκινδαψος, a four-stringed musical instrument, according to Athenæus (lib. iv. c. 25).

SCIO, an island of the Mediterranean, not far from the coast of Smyrna, and one of those classed as the Sporades. It was known to the ancients by the name of Chios, and by the Turks is now called Sakez-Adassi. It is situated between the parallels of 38° 8′ and 38° 30′, and between the meridians 25° 50′ and 26° 11′, thus being in length twenty-two and in breadth twenty-one geographical miles. It is separated from the shore of Anatolia by a strait, called sometimes the Strait of Bianca, and sometimes that of Scio, which is seven leagues long, and has a depth of water of twenty fathoms. The road, or, as it is called, the Great Port, has depth for ships of the greatest draught of water; and near to it is the harbour of Fin or Delfyn. To the south of this last port, at about two leagues distance, is the capital of the island, the city of Scio, which, in spite of the dreadful disasters which it has endured, still exists. It was built by the Genoese when they possessed the island. It is wholly constructed of stone or brick, and was till recently much cleaner in its appearance than most towns in this part of the world. Mr Galt, who visited it in 1810, says, that "the houses are built in the Italian style, with lofty pyramidal roofs. Except in the particular of dress, and with the exception of the streets where the shops are situated, every thing about Scio has the appearance of a town in Christendom. The shops are well filled, many of them with those gorgeous stuffs of woven gold and silver which are but rarely to be seen even in London. This was one of the principal manufacturing seats of the Turkish empire; and silks, which rival in beauty and elegance the richest of France and Italy, are produced in the looms of Scio. In the town are about ninety places of worship belonging to the Greek and Roman persuasions. There is a cathedral, a respectable building, adorned with modern paintings. Almost the whole of the lower class are silk weavers and embroiderers. Many of the villas in the neighbourhood of the town are large buildings, with attached pleasure-grounds and beautiful gardens."

At a later period the city contained about 5000 houses, and the inhabitants were estimated at 25,000 persons. Besides the city, there were on the island seventy-six large villages, containing Armenians, Turks, and Greeks. The latter were calculated by none below eighty, but by some at a hundred thousand.

A traveller, Mr Laurent, who visited the island in 1818, says, "All the ideas which fancy can form of an earthly paradise seem realized here; the face of the country, itself most fruitful, is cultivated with the greatest assiduity, and every part presents rich vineyards intermingled with fruitful trees. The valleys are intersected with paths shaded by trees, spreading over the traveller's head their luxuriant branches, bending in the seasons under the weight of lemons, oranges, and pomegranates. The inhabitants seem willing to join their efforts to add to the charms of their island; by all the foreigner is welcomed, and the traveller hears the salute of the peasant, *kalé emera, kalé espera*, good day, or good evening, as he passes along."

Among the productions of the island, wine is one of much celebrity when drank on the spot; but, from the delicacy of its flavour, it suffers by removal. The corn produced is not equal to more than two months' consumption; the fruits, which are the chief means of subsistence, are the finest in the Levant; the figs are of an incredible size, and the lemons and oranges exported are said to have risen to the value of L.25,000. Mastic gum is an article of great importance, and the shrub from which it exudes was very extensively cultivated. The other articles of export were cotton wool, silk, terebinth, wrought silks, and tanned hides.

Literature was more cultivated in Scio than in any other of the Greek islands; and no priest officiated there who had not been a member of the college.

The richest of the inhabitants were merchants at the head of considerable houses, with commercial establishments under the management of partners in Odessa, Venice, Fiume, Trieste, Leghorn, Genoa, Marseilles, Vienna, and London. They lived here in elegantly-furnished houses, were hospitable to strangers, and in the enjoyment of a degree of ease and freedom which was nowhere else to be witnessed within the other territories under the dominion of the Turks.

The favourable circumstances in which the people lived was in a great part owing to the power over the island having been granted to a sultana, a sister of the sultan, who, satisfied with a sum of money annually collected by the people among themselves, left them almost to their own religion, laws, manners, and occupations; but she is said to have prided herself on the superiority of those under her sway to any other Turkish subjects.

Scio.

It was owing to this state of things that, when the revolutionary movements among the other Greeks in the Turkish dominions were commenced, no disposition was felt in Scio to embark in the same course. There was a small Turkish garrison in a fortress under an aga, to whom the people gave assurance that no disposition to revolt existed among them; and some of the most respectable heads of families gave themselves as hostages for the pacific and tranquil conduct of their countrymen. The Turkish fleets never molested them, but passed by to subdue the other islands then in a state of insurrection. One of the insurgent Greek leaders, however, with a fleet entered the harbour, and landed a body of troops to attack the arsenal, in which the small garrison of the Turks was collected. In the attack on the fort, the Sciotes of the lowest classes, in spite of the remonstrances of their primates, joined their fellow-Christians. The fort was taken, and the garrison, as well as all the Turks in the city, were put to the sword.

Soon afterwards, in 1822, whilst the island was under the dominion of the rabble and the small body of insurgent Greeks, the Turkish fleet entered the harbour, upon which the invaders escaped from the superior force. As the populace had joined them in spite of the remonstrances of the principal inhabitants, the latter, in number above two hundred, repaired on board the ship of the Capitan Pasha, with the most solemn assurance of their innocence, and the most unqualified submission to the Porte. The admiral received them with great civility, expressed himself willing to forget all that had passed, and ordered coffee and a variety of refreshments. He soon landed, taking with him a force of 10,000 men, a few of whom were regular troops, but the far greater number were volunteers, under no control, who had been induced to embark from the capital by the promise of plunder. Then consequently began a general massacre of the men, with the plunder of the houses, and the capture of the women, girls, and boys, as slaves, to be sold by the captors to the harems for the gratification of the natural and the unnatural vices of the Turks. The details given by eye-witnesses who escaped were such as to harrow up the soul. Every house and every garden were strewed with corpses; beneath the orange-trees, on the sides of the fountains, on the rich carpet, and on the marble pavement, lay the young, the beautiful, and the aged, in the midst of their loved and luxurious retreats. Day after day passed, and, lying as they fell, alone or in groups, no hand bore them to their graves, while survivors yet remained to perish. At last, when all was over, they were thrown in promiscuous heaps into large pits.

Twenty thousand persons are computed to have thus perished during the few days the massacre lasted. A few were happy enough to escape and pass the barrier of rocky mountains, and thus for a time were secure; and a few were received into boats or vessels on the coast, and thus were rescued from immediate destruction. The greater number, especially the younger women and boys, were made objects of plunder by the volunteers; they were mingled together as indiscriminately as a flock of sheep, were driven into the ships, and were thus transported to the capital, where they were exposed to sale like cattle, and a very few were redeemed by their friends, who, privately, it being unlawful for a Greek to buy a Greek, purchased them through Turkish agents.

Those who had delivered themselves up to the Capitan Pasha were removed to a solitary prison, and there, in spite of Lord Strangford's intercession, were, after he had thought their lives secure, all decapitated. Even the Sciotes in Constantinople were not spared, but in a short time were plundered and put to death. The English ambassador exerted himself in the cause of humanity, but no diplomatic personage of the other states of Europe interfered in behalf of these wretched sufferers.

Sciopius.

SCIOPPIUS, Gaspar, a learned German writer of the seventeenth century, was born at Neumark, in the Upper Palatinate, on the 27th of May 1576. He studied at the university with so much success, that at the age of sixteen he became an author, and published books, says Ferrari, which deserve to be admired by old men. But his dispositions did not correspond with his genius. Naturally passionate and malevolent, he assaulted without mercy the characters of eminent men. He abjured the system of the Protestants, and became a Roman Catholic, about the year 1599; but his character remained the same. He possessed all those qualities which fitted him for making a distinguished figure in the literary world; imagination, memory, profound learning, and invincible impudence. He was familiar with the terms of reproach in most languages. He was entirely ignorant of the manners of the world. He neither showed respect to his superiors, nor did he behave with decency to his equals. He was possessed with a frenzy of an uncommon kind, being a perfect firebrand, scattering around him, as if for his amusement, the most atrocious calumnies. Joseph Scaliger, above all others, was the object of his satire. That learned man having drawn up the history of his own family, and deduced its genealogy from princes, was severely attacked by Scioppius, who ridiculed his high pretensions. Scaliger in his turn wrote a book entitled the Life and Parentage of Gaspar Scioppius, in which he informs us that the father of Scioppius had been successively a grave-digger, a journeyman stationer, a hawker, a soldier, a miller, and a brewer of beer. These statements inflamed Scioppius with greater eagerness to attack his antagonist. He collected all the calumnies that had been thrown out against Scaliger, and formed them into a huge volume, as if he had intended to crush him at once. He treated with great contempt the king of England, James I., in his *Ecclesiasticus*, and in his *Collyrium Regium Britanniæ Regi graviter ex oculis laboranti munere missum*, that is, An Eye-salve for his Britannic Majesty. In one of his works he had the audacity to abuse Henry IV. of France in a most scurrilous manner, on which account his book was burned at Paris. He was hung in effigy in a farce which was represented before the king of England, but he gloried in his dishonour. Provoked with his insolence to their sovereign, the servants of the English ambassador assaulted him at Madrid, and corrected him severely; but he boasted of the wounds he had received. He published more than thirty defamatory libels against the Jesuits; and, what is very surprising, in the place where he declaims with most virulence against that society, he subscribes his own name with expressions of devotion: "I Gaspar Scioppius, already on the brink of the grave, and ready to appear before the tribunal of Jesus Christ, to give an account of my works." Towards the end of his life he employed himself in studying the Apocalypse, and affirmed that he had found the key to that mysterious book. He sent some of his expositions to Cardinal Mazarin; but the cardinal did not find it convenient to read them.

Ferrari tells us, that during the last fourteen years of his life he shut himself up in a small apartment, where he devoted himself solely to study. The same writer acquaints us, that he could repeat the Scriptures almost entirely by heart; but his good qualities were eclipsed by his vices. For his love of slander, and the furious assaults which he made upon the most eminent men, he was called the Cerberus of literature. He accuses even Cicero of barbarisms and improprieties. He died on the 19th of November 1649, at the age of seventy-four, at Padua, the only retreat which remained to him from the multitude of enemies whom he had created. Four hundred books are ascribed to him, which are said to discover great genius and learning. The chief of these are, 1. Verisimilium Libri iv. 1596, in 8vo; 2. Commentarius de Arte Critica, 1661, in 8vo; 3. De sua ad

Catholicos Migratione, 1660, in 8vo; 4. Notationes Criticæ in Phædrum, in Priapeia, Patavii, 1664, in 8vo; 5. Suspectarum Sectionum Libri v. 1664, in 8vo; 6. Classicum Belli Sacri, 1619, in 4to; 7. Collyrium Regium, 1611, in 8vo; 8. Grammatica Philosophica, 1644, in 8vo; 9. Relatio ad Reges et Principes de Stratagematibus Societatis Jesu, 1641, in 12mo. This last-mentioned work was published under the name of *Alphonso de Vargas*.

SCIOPTIC, or Scioptric Ball, a sphere or globe of wood, with a circular perforation, where a lens is placed. It is so fitted that, like the eye of an animal, it may be turned round every way, and is used in making experiments in a darkened room.

SCIPIO, Publius Cornelius, a renowned Roman general, surnamed *Africanus* for his conquests in that country. His other signal military exploits were, his taking the city of New Carthage in a single day; his complete victory over Hannibal, the Carthaginian general; and the defeat of Syphax king of Numidia, and of Antiochus in Asia. He was as eminent for his generous behaviour to his prisoners as for his valour. He died 180 B. C. aged about fifty-one.

Scipio, *Lucius Cornelius*, his brother, surnamed *Asiaticus* for his complete victory over Antiochus at the battle of Magnesia, in which Antiochus lost fifty thousand infantry and four thousand cavalry. A triumph, and the surname of *Asiaticus*, were the rewards of his valour. Yet his ungrateful countrymen accused him, as well as his brother, of peculation, for which he was fined; but the public sale of his effects proved the falsehood of the charge, for they did not produce the amount of the fine. He flourished about 190 B. C.

Scipio, *Publius Æmilianus*, was the son of Paulus Æmilius, but being adopted by Scipio Africanus, he was called *Scipio Africanus junior*. He showed himself worthy of adoption, following the footsteps of Scipio Africanus, whom he equalled in military fame and public virtues. His chief victories were the conquest of Carthage and Numantia; yet these signal services to his country could not protect him from an untimely fate. He was strangled in his bed by order of the Decemviri, who dreaded his popularity, 129 B. C. aged fifty-six.

SCIRO, an island of the Archipelago, to the west of Mytilene, to the north-east of Negropont, and to the south-east of Sciati. It is fifteen miles in length and eight in breadth. The vines form the beauty of the island, and the wine is excellent; nor do the natives want wood. There is but one village, and that is built on a rock, which runs up like a sugar-loaf, and is ten miles from the harbour of St George. The inhabitants are Greeks.

SCIROCHO, or Sirocco, a name generally given in Italy to every unfavourable wind. In the south-west it is applied to the hot suffocating blasts from Africa; and in the north-east it means the cold bleak winds from the Alps.

SCLAVONIA, a province of the Austrian empire, still occasionally dignified with the name of kingdom. It is bounded on the west by Croatia, on the north and east by Hungary, from which it is separated by the river Drave, and partly by the Danube, and on the south by Turkey, the river Save separating it from the territories of the sultan. The shape of this province is long and narrow, and it contains a superficies of about 5000 square miles. A chain of lofty mountains, which rises in Croatia, intersects it in its whole length from east to west. This elevated ridge is covered with forests, containing the finest oak and other valuable trees; but a proper water conveyance is wanting to render this natural product of the soil a valuable article of export. The rest of the country consists of fine plains, with a fertile soil, and a climate which, although mild, is cooler than might be expected under the parallels of forty-five and forty-six. This is to be attributed to the presence of the forest-covered mountain chain just mentioned. During dry years the open parts of the mountainous tracts are barren; in favourable years they produce excellent crops of wheat, barley, flax, hemp, and madder. The climate of the plains is sufficiently genial for the cultivation of maize, silk, and the fruits of the south of Europe. Limestone, sulphur, coal, salt, and some ferruginous substances, are amongst the most abundant mineral treasures of Sclavonia; but these have not yet been thoroughly investigated. Much of the mountain chain yet remains unexplored. The manufactures are too insignificant to require specific notice; those of glass and potash appear to be the most important. The exports consist of corn, tobacco, nuts, plums, hides, wax, honey, and madder; the imports are chiefly iron, salt, and oil. Domestic weaving and knitting is universally practised, so that few of the finer fabrics of Great Britain or France are required, especially amongst a people the bulk of whom live in mud-huts. The transit trade is of more importance, in consequence of the three great rivers, the Danube, the Drave, and the Save, which directly or indirectly communicate with a large tract of country.

Under the Romans, Sclavonia formed a part of Pannonia, and derived its present name from a tribe of Sclavi or Slavi, who settled here in the sixth or seventh century. Subsequently, the Venetians, having acquired an ascendency over Dalmatia, extended their acquisitions to this country. In the tenth century it came under the dominion of Hungary, to which it remained subject, until, in the year 1526, it was overrun and subdued by the Turks. It was finally subjected to the house of Austria by the peace of Carlowitz, which was ratified in 1699. The country remained divided into military districts until 1745, but since that time a beginning has been made towards giving some of them a civil constitution. These form three counties. The military district, or generalate, consists of Brod, Peterwardin, and Gradisca. It is under a military government, at the head of which is the commanding general in Sclavonia, who resides at Peterwardin. The counties are subject to the kingdom of Hungary, each having its governor and vice-governor. Although Sclavonia has undergone a material improvement since its annexation to Austria, yet the population is not characterized either by industry, or by that degree of intelligence necessary to turn the natural advantages of the country to good account. The Sclavonians proper, or aborigines, do not now form the majority of the inhabitants; they are largely intermixed with Magyars, Wallachians, Gypsies, Germans, Greeks, Jews, and Armenians. There are but few Protestants in the country. The most numerous religious denominations are the Roman Catholic, the Greek Catholic, and the Greek non-united Church. The population in 1831 amounted to 370,000, which is about eighty-five inhabitants to every square mile.

SCONE, a village of Scotland, now chiefly remarkable for being the place where the kings were anciently crowned. Kenneth II. upon his conquest of the Picts in the ninth century, having made Scone his principal residence, delivered his laws, called the Macalpine laws, from a tumulus, named the *Mote Hill of Scone*. The old palace was begun by the Earl of Gowrie, but was completed by Sir David Murray of Gospatrick, the favourite of King James VI. to whom that monarch had granted it; and the new possessor, in gratitude to his benefactor, put up the king's arms in several parts of the house. During the middle ages of the Scottish monarchy Scone was the occasional residence of the kings; and it was here that they were crowned, sitting on the famous stone called the stone of Dunstaffnage or stone of Scone, which, if the ancient chronicles may be believed, was the pillow on which Jacob slept when journeying through the plains of Luz. Edward I. carried it off, to the great mortification of the Scotch, who looked upon it as a kind of palladium. The abbey and palace were demolished by a mob from Dundee at the Reformation. Charles II., before the battle of Worcester, was crowned in the chapel at Scone.

The old pretender resided here for some time in 1715, and his son paid it a visit in 1745. On the site of the ancient palace a splendid edifice has been reared by the Earl of Mansfield, who represents the old family of Stormont. In the modern structure much of the old furniture has been preserved, particularly a bed that belonged to James VI., and another of which the curtains were wrought by the fair hands of Queen Mary when a prisoner in Lochleven Castle. The old market-cross stands in the midst of the pleasure-grounds. The modern village is regularly built, and of a neat appearance.

SCORE, or PARTITION, in *Music*. Either of these terms means that written or printed arrangement of different parts for voices or instruments, or for both, by which the structure of any piece of music, consisting of a number of such parts, is brought successively under the eye, measure after measure, so as to enable the student of composition to study the work, or the conductor of an orchestra to accompany the whole suitably on the piano-forte or organ, or instantly to perceive and correct errors in the performance, especially during rehearsals. In a score or partition, all the staves required in any given page for the different parts should be marked with their proper clefs, &c., and, on the left margin, with the names of the different voices or instruments, and then braced together at the left side, while at every bar of the measure a straight line is drawn down the page, from the top of the highest stave to the bottom of the lowest. For the sake of perspicuity, in every partition the same number of staves ought to be used from beginning to end on every page, even where many bars of rests occur in this or that part; and also the clefs, &c. ought to be marked on every page, as well as the names of the different voices or instruments. The general neglect of these simple precautions renders many partitions extremely confused and perplexing to their readers. In the article MUSIC, we have used the word *partition* in preference to the word *score*, for various reasons; and especially as we had already the word *partition* used in the sixteenth century by an English writer of eminent musical authority, in the very sense in which we employ it. Thomas Morley, in his "Plaine and easie Introduction to practicall Musicke," edition of 1597, page 34, has stamped the word *partition* as an English musical term. He says, "and to the ende that you may the more easily understand the contryving of the parts, and their proportion one to another, I have set it downe in *partition*." He then gives the example, part under part, in partition.

SCORIA, or DROSS, amongst metallurgists, is the recrement of metals in fusion, or, more determinately speaking, is that mass which is produced by melting metals and ores. When cold, it is brittle, and not dissoluble in water, being properly a kind of glass.

SCORIFICATION, in *Metallurgy*, is the art of reducing a body, either entirely or in part, into scoria.

SCOT, MICHAEL of Balwirie, a renowned Scottish worthy of the thirteenth century. This singular man made the tour of France and Germany, and was received with some distinction at the court of the Emperor Frederic II. Having travelled enough to gratify his curiosity or his vanity, he returned to Scotland, and gave himself up to study and contemplation. He was skilled in languages; and, considering the age in which he lived, was no mean proficient in philosophy, mathematics, and medicine. He translated into Latin, from the Arabic, the history of animals by the celebrated physician Avicenna. He wrote a book concerning the Secrets of Nature, in which he treats of generation, physiognomy, and the signs by which we judge of the temperaments of men and women. We have also a tract of his on the Nature of the Sun and the Moon. He there speaks of the grand operation, as it is termed by alchymists, and is exceedingly solicitous about the projected powder, or the philosopher's stone. He likewise wrote what he calls *Mensa Philosophica*, a treatise replete with astrology and chiromancy. He was much admired in his day, and was even suspected of magic; and he had Roger Bacon and Cornelius Agrippa for his panegyrists.

SCOT, *Reginald*, a judicious writer in the sixteenth century, was the younger son of Sir John Scot of Scotshall, near Smeethe, in Kent. He studied at Hart Hall in the University of Oxford; after which he retired to Smeethe, where he lived a studious life, and died in 1599. He published the Perfect Platform of a Hop-Garden; and a book entitled the Discovery of Witchcraft, in which he showed that all the relations concerning magicians and witches are chimerical. This work was not only censured by King James I. in his *Dæmonology*, but by several eminent divines; and all the copies of it that could be found were burned.

SCOTAL, or SCOTALE, is where any officer of a forest keeps an ale-house within the forest, under colour of his office, making people come to his house, and there spend their money for fear of his displeasure. We find it mentioned in the charter of the forest, "Nullus forestarius faciat *Scotallas*, vel garbas colligat, vel aliquam collectam faciat." The word is compounded of *scot* and *ale*, and, by transposition, is otherwise called *aleshot*.

SCOTALES were meetings formerly held in England for the purpose of drinking ale, of which the expense was paid by joint contribution. Thus the tenants of South Malling, in Sussex, which belonged to the Archbishop of Canterbury, were, at the keeping of a court, to entertain the lord or his bailiff with a drinking, or an ale; and the stated quotas towards the charge were, that a man should pay threepence halfpenny for himself and his wife, and a widow and cottager a penny halfpenny. In the manor of Ferring, in the same county, and under the same jurisdiction, it was the custom for the tenants named to make a scotale of sixteen pence halfpenny, and to allow out of each sixpence a penny halfpenny for the bailiff.

Common scotales in taverns, at which the clergy were not to be present, are noticed in several ecclesiastical canons. They were not to be published in the church by the clergy or the laity; and a meeting of more than ten persons of the same parish or vicinage was a scotale that was generally prohibited. There were also common drinkings, which were denominated leet-ale, bride-ale, clerk-ale, and church-ale. To a leet-ale probably all the residents in a manorial district were contributors; and the expense of a bride-ale was defrayed by the relations and friends of a happy pair, who were not in circumstances to bear the charges of a wedding dinner. This custom prevails occasionally in some districts of Scotland even at this day, under the denomination of a *penny bride-ale*, and was very common about half a century ago. The clerk's-ale was in the Easter holidays, and was the method taken to enable clerks of parishes to collect their dues more readily.

SCOTIA, in *Architecture*, a semicircular cavity or channel between the tores in the bases of columns.

SCOTISTS, a sect of school divines and philosophers, so called from their founder Joannes Duns Scotus, a Scottish cordelier, who maintained the immaculate conception of the Virgin, or that she was born without original sin, in opposition to Thomas Aquinas and the Thomists. As to philosophy, the Scotists were, like the Thomists, Peripatetics; only distinguished by this, that in each being, as many different qualities as it had, so many different formalities did they distinguish, all distinct from the body itself, and making as it were so many different entities; but these were metaphysical, and as it were superadded to the being. The Scotists and Thomists likewise disagreed about the nature of the divine co-operation with the human will, the measure of divine grace that is necessary to salvation, and other abstruse and minute questions, which it is needless to enumerate.

HISTORY OF SCOTLAND.

Sect. I.—*Roman Period.*

A. D. 85 to 446.

It will not be expected that in such a sketch of the history of Scotland as is alone suited to this work, we should enter into the great controversy concerning the origin of the Scottish people, a subject upon which much needless acrimony, and many unprofitable volumes, have been thrown away.[1] It will be more suitable to mark the progress of the great events in our national history, and to pass over its minor features; to fix the attention upon results rather than to perplex it with details; to establish a series of points by which an intelligent reader may guide his memory and direct his studies; and occasionally to note those authors from whose pages he may fill up the picture.

Julius Cæsar. Before Christ, 55.

Julius Agricola.

It is well known, that our first authentic knowledge of Britain comes from Julius Cæsar. Fifty-five years before the Christian era, this extraordinary man invaded the island from Gaul; but his operations were attended with little success, his stay was brief, and it is certain that he knew nothing of Scotland. It was not till nearly a century and a half after Cæsar's descent, and during the reign of the emperor Vespasian, that Julius Agricola, at the head of a Roman army, penetrated into the northern parts of Britain. The details of his various campaigns, the resistance which he encountered, and the vestiges of his progress which yet remain, have furnished matter of laborious investigation to our antiquaries. Among their conflicting accounts, it seems certain that he first pushed his conquests as far as the Friths of Forth and Clyde; that in succeeding campaigns he penetrated northwards; and that in his last great expedition, during which his army was accompanied by a numerous fleet, which sailed along the coast, he was opposed by a barbarian chief named Galgacus. A sanguinary battle was fought between this leader and Agricola, the exact site of which has been keenly disputed. There seems to be little doubt, however, that previously to its occurrence the Roman general had passed the Frith of Tay, and that although victorious over the fierce and undisciplined multitudes which opposed him, he experienced a check which compelled him to desist from any further aggression. Two great events marked the last years of the government of Agricola. He explored the northern coasts of Scotland by his fleet; and to him the Roman world, in all probability, owed its first certain knowledge that Britain was an island. He endeavoured, in the second place, to secure his conquests from future attack by a chain of forts connecting the Friths of Forth and Clyde. Having completed these defences, he was recalled by the jealousy of Domitian, and left Britain in the year 85.

gricola aves Bri- in. . D. 85.

adrian.

. D. 121 161.

Lollius Urbicus.

From this time till the reign of Hadrian, a period of thirty-six years, we hear little of the Romans, either in southern or northern Britain. Early in the second century, (A.D. 121), this emperor in person made an expedition into Scotland; and about twenty years later, Lollius Urbicus, the Roman governor under the emperor Antoninus, distinguished himself by the courage and ability which he displayed against the turbulent and warlike tribes which inhabited the northern parts of the island. Two facts, however, are admitted by the Roman writers, which demonstrate how uncertain was the tenure by which these masters of the world held their northern possessions in Britain. The emperor Hadrian, apparently distrusting the sufficiency of the line of forts already formed by Agricola, constructed a wall or fortified rampart from the Tyne to the Solway. It has been supposed by some antiquaries, that the emperor entirely abandoned to the barbarians the wide country between this new defence and the more ancient *Vallum* which united the Friths of Forth and Clyde; but the discovery of a succession of coins along the line of this last rampart, belonging to the intermediate emperors, appears to indicate the contrary.[2] From the adoption of this measure it is however evident, that the courage and successes of the barbarians had given much annoyance to the Romans; and this is corroborated by the second fact to which we allude, namely, that between the period of Hadrian's death and the succession of Antoninus Pius, (A. D. 138), the wall between the Forth and Clyde had been so completely destroyed, that Lollius Urbicus entirely reconstructed it. This fact is proved by inscriptions, which the reader may consult in Horsley's *Britannia Romana*.[3] During the remaining years of his government, this able officer devoted himself to opening up the country by roads; to the construction of various camps and fortalices, of which the site has been traced with much industry and success by the latest writer on the subject; and to the introduction of those useful arts which were best calculated to raise and humanize the character of the northern barbarians. His administration in Britain appears to have terminated with the death of his master, Antoninus Pius, A. D. 161.

Severus. A. D. 207.

From this period till the beginning of the third century, all is dark in Britain. But in the year 207, the emperor Severus received intelligence that the Caledonians had invaded the Roman provinces; and with a vigour and alacrity which, considering the distance of the seat of war, and the barren prize to be contested, is not easily explained, he hastened in person to reduce the insurgent Caledonians. This expedition, making every allowance for the exaggeration with which the exploits of an emperor were usually recorded, must have been an extraordinary one. In the comparatively civilized country which extended between the walls of Hadrian and Antoninus, he could meet with little opposition; but when he left this last line of defence, and conducted his army into the wild regions beyond the Frith of Forth, ultimately penetrating into Moray, we must suppose him to have encountered very formidable obstacles. The savage and uncleared state of the country, the extent of the forests, the unhealthy and

---

[1] The reader is referred to Innes's Critical Essay on the ancient Inhabitants of Scotland, as the best work yet written on this subject. Its arrangement is defective; but its good sense, and the authenticity of the documents upon which its deductions are founded, are highly praiseworthy. Pinkerton's Dissertation on the Scythians or Goths, Dr. Jamieson's Dissertation on the Origin of the Scottish Language, and the first volume of the ponderous work of Chalmers, entitled Caledonia, may be consulted with the greatest advantage. In their pages, the critical student who may desire to pursue the subject, will find ample references to all the noted works upon this question.

[2] Chalmers's Caledonia, p. 116.

[3] Horsley's Britannia, Rom. l. i. c. 10; Innes's Critical Essay, vol. i. p. 12. The remains of the wall are popularly called Grim's Dyke. Grym in Welsh and Cornish, signifies strong, and is used perhaps metaphorically, as Chalmers conjectures, for a "strength or a rampart." Caledonia, vol. i. p. 129.

[4] We may here refer the critical reader to Chalmers's dissertation on the actions of Lollius Urbicus, contained in the first volume of his Caledonia.

Severus. A.D. 207.

His great northern expedition.

interminable marshes, the mountainous ranges which presented such formidable obstacles to the march of a regular army, the rivers, of which the fords were unknown, and the want of subsistence for his troops, except what he carried along with him, must have combined to throw infinite difficulties in his way. The classical writers who have described his campaign inform us, in general terms, that he was obliged to fell the forests, to drain the marshes, to open up the country by roads, and to construct bridges; and they affirm that the Roman emperor did not retrace his steps till he had proceeded so far north, that the soldiers remarked the extraordinary length of the days and shortness of the nights, in comparison with those of Italy.[1] There seems good reason to believe that the spot where the Roman eagles terminated their flight in this memorable expedition, was the promontory separating the Cromarty and the Moray Friths. Here, according to Chalmers, the Caledonians sought for peace, surrendered their arms, and relinquished a portion of their country.[2] The critical student must pardon the vagueness of these expressions, as the historians of the time do not enable us to be more definite.

Death of Severus at York. A.D. 211.

Severus retired to York in a feeble state of health; but it was not to repose upon his laurels, for scarcely had he reached that station when news arrived that the Caledonians were again in arms. Irritated by disappointment and disease, he determined instantly to renew the war; intrusted the leading of the army to his son Caracalla; and issued orders to spare neither age nor sex. But death happily arrested these inhuman projects. The emperor expired at York, and the son does not appear, on any good evidence, to have executed the orders of the father.

Previously to his celebrated northern campaign, Severus is said to have reconstructed the rampart originally built by Hadrian between the Tyne and the Solway; a circumstance from which there arises a strong presumption that the Caledonians had encroached upon the Roman provinces, and regained much of the intermediate country between the walls of Hadrian and Antoninus.

A.D. 211 to 446.

Decay of the Roman power.

Constans. A. D. 306.

Theodosius.

Honorius. A.D. 422.

From this period, (A.D. 211), which marks the commencement of the third, to nearly the middle of the fifth century, (446), the Romans appear to have abandoned all thoughts of extending their conquests. The vast fabric of their empire was now, as is well known, in a state of melancholy feebleness and decay; attacked on every side by those fierce tribes who were destined to destroy it; and unable to retain provinces far nearer and more important than those in Britain. For some time, however, an effort was made to defend the northern Romanized Britons from the repeated incursions of the Caledonians. In the commencement of the fourth century, (A.D. 306), Constans revisited Britain for this purpose; in the year 368, after a sanguinary and destructive invasion of the barbarians, a temporary tranquillity was restored by the arms of Theodosius; in 398, Stilicho, alarmed by new excesses and increasing weakness in the northern provinces, sent such effectual aid as enabled the Roman governors once more to repel the enemy; and, lastly, in the year 422, the emperor Honorius, having in vain endeavoured to rouse the provincial inhabitants to a vigorous effort in their own defence, sent a legion to their assistance, by whose efforts the fortifications of the two walls were repaired, and the barbarians once more driven back into their more northern seats. But this was the last relief which could be wrung by her miserable children from a parent who was herself expiring; and it secured for them but a brief period of tranquillity. Imperial Rome, with a tardy and ostentatious justice, conferred freedom on the southern Britons; and restoring a country which she was no longer able to hold, informed them that henceforth they must trust to their own efforts for the defence of their independence. Having given this parting advice to men who appear to have been little able to follow it, the Romans abandoned Britain for ever.

A.D.

SECT. II.—*The Pictish Period.*

A.D. 4 to 843. The a- ginal tr s.

In the brief sketch which has been given of the Roman dominion in north Britain, which extended from the year 85 to 446, a period of little more than three centuries and a half, we have seen that the Romanized Britons were constantly exposed to the invasions of their more northern neighbours, who threatened at last to wrest from them the whole of the country, which had been fortified by Roman skill and mainly defended by Roman soldiers. The question now arises, who were these fierce and indomitable tribes? And to this inquiry, in which antiquaries have spilt almost as much ink as the Romans did blood, the research of a laborious writer enables us to give a satisfactory answer. It appears from the investigation of Chalmers that "at the epoch of Agricola's invasion, the ample extent of north Britain was inhabited by one-and-twenty tribes, who were connected by such slight ties as scarcely to enjoy a social state. These were the *Ottadini*, who appear to have occupied the whole extent of coast from the southern Tyne to the Frith of Forth;[3] the *Gadeni*, whose seats lay in the interior country, from the Tyne on the south to the Frith on the north; the *Selgovæ*, whose western boundary was the Dee, and their southern limit the Solway Frith; the *Novantes*, who inhabited the midland and western parts of Galloway; and the *Damnii*, who possessed the shires of Ayr, Renfrew, and Stirling, with a portion of Dunbarton and Perth. Such were the five tribes," says this author, "which occupied, during the first century, that ample region extending from the Tyne and the Solway on the south, to the Forth and the Clyde on the north, varying their limits with the fluctuations of war, conquest, or internal dissensions, during the succession of many ages."[4] Beyond the Forth we find the Horestii, the Venricones, the Taixali, the Vacomagi, the Albani, the Attacotti, the Caledonii, the Cantæ, the Logi, the Carnabii, the Catini, the Mertæ, the Carnonaceæ, the Creones, and the Epidii. The names of these twenty-one original tribes, which are taken from Chalmers, are by him transcribed from the account of Ptolemy, checked by the ancient treatise and map of Richard of Cirencester.[5] Of the manners of this ancient people, it is impossible, in the absence of all authentic documents, to speak with certainty. From the general account given by Cæsar, they were little removed in the scale of social life or of civil government from the rudest savages. They led a pastoral life, living on the milk of their flocks, or the produce of the chase; they were polygamous and idolatrous; their religion, which was Druidical, was stained with human sacrifices; and their rude form of civil government was intimately connected with their religion. They were armed with slight shields, short spears, and daggers; and sometimes fought in small cars, which were drawn by little spirited horses. They raher burrowed in huts than lived in houses, went naked from choice, were brave to excess, capable of enduring all sorts of privation and fatigue, and had such loose ideas of property, that Dio does not hesitate to call them robbers. This character, with the exception of their Druidical form of worship, exhibits little more than the general features of every savage people; and there seems no reason to believe that the lapse of three centuries created any great change in those fierce and indomitable tribes which, inhabiting the more northern parts of the island from the Forth to Caithness, and latterly wresting from the Romans the provinces which they had subdued, were never brought under the yoke, or humanized by the arts of that great people.

[2] The son of Severus is indeed affirmed to have fought on the banks of the Carron with the heroes of Ossian; but much has yet to be proved before we venture to transplant these shadowy contests into the field of history.

[3] Including the half of Northumberland, the eastern portion of Roxburghshire, all Berwickshire, and East Lothian.

[4] Caledonia, vol. i. p. 62.

[5] It ought however to be stated, that some grave doubts hang over the genuineness of this early writer. Dr. Stukeley's account of him is vague, and the story told by Professor Bertram regarding his discovery of the manuscript and the map is still more suspicious. I have abstained from giving from Chalmers the exact limits of the possessions held by the last sixteen tribes, who inhabited the whole extent of country beyond the Forth to the extremity of Caithness. The research and erudition which he has displayed is entitled to all praise; but it is difficult to believe that the boundaries of these remote, fierce, and wandering aborigines should be ascertainable with as much precision after the lapse of eighteen centuries as the *marches* of Middlesex or Yorkshire. Two points, however, and these of leading importance, Chalmers conceives that he has established: the first, that Britain, from its extreme southern to its most remote northern point, was peopled from Gaul; and the second, that the aborigines over the whole island were a Celtic race.

A.D. 446.
The Picts.

At the period of the Roman abdication, we find that north Britain was inhabited by the descendants of the Caledonian clans which we have enumerated, who, under the name of Picts or Picti, became for four centuries the predominating nation in Scotland. Among these we must be careful to distinguish the five Romanized tribes who possessed Valentia, or the country between the walls of Agricola and Antoninus, not as a race of different descent, but of improved civilization, while their fiercer brethren beyond the Forth bore fresh upon them all the stamp of barbarian life. The name of Picti is conjectured to be derived from Peithi, a British word which characterises *those that are without*, or the people of the open country.[1]

Thirty-eight Pictish kings.

From Drest to Bred.

It would be a vain, and in a sketch of this nature, an idle labour, to enter upon the obscure and sanguinary annals of the Pictish period; an era upon which, to use a quaint expression of Chalmers, archæology is loquacious, and history silent. From an ancient manuscript, first printed by Innes,[2] and which had belonged to Lord Burleigh, this author has given us a list of their kings, from Drest, who succeeded in the middle of the fifth century, (A. D. 451), to a prince named Bred, who died about the middle of the ninth century, (A. D. 843). During the four centuries which elapsed between the accession of the first and the last of these monarchs, thirty-eight Pictish kings are enumerated. Of their authentic history there is scarcely a vestige; but the blank has been filled up by the fables of Boyce, which unhappily were afterwards embalmed in the elegant Latinity of Buchanan.

Rise of the kingdom of Strathclyd.

Origin of Dunbarton.

King Arthur.

Some points in this period, however, have been ascertained, and they are well worthy of notice. We have already seen, that on the entire abdication of Britain by the Romans, the five tribes which inhabited Valentia were declared independent. They were no longer provincial subjects of Rome, but a free, though an effeminate people. The constant attacks of the Picts rendered it necessary for them to unite in their own defence; and from this union arose a new kingdom, denominated by ancient authors sometimes the *Regnum Cumbrense*, or more frequently the kingdom of Strathclyd. It appears to have included the present Liddesdale, Teviotdale, Dumfries-shire, Galloway, Ayrshire, Renfrew, Strathclyde, the midland and western parts of Stirlingshire, with the largest portion of Dunbartonshire.[3] "The metropolis of this kingdom," says Chalmers, "was Alclyd, a city which they still retained when the pen dropt from the hand of the venerable Bede, in 734, and which is situated on the north bank of the Clyde, at the influx of the Leven. The descriptive name of Alclyd, which signifies the rocky height on the Clyde, was applied to the bifurcated rock, on the summit of which these associated Britons had a strong hill fort, which formed a secure residence for their reguli or kings. To this fortress the Scoto-Irish subsequently applied the name of *Dun*-Briton, signifying the fortress of the Britons, an appellation which, by an easy transition, has in modern times been converted into Dunbarton.[4] Among the little kings who reigned over Strathclyd, there are none whose names or exploits are worthy of preservation, with the single exception of the semi-poetic Arthur. It is sad that the severer hand of history should strip this glorious "Childe" of his many-coloured robes, and reduce him to the cold reality of a Cumbrian Pendragon. At the commencement of the sixth century, Arthur, the chief military leader or Pendragon of the Cumbrian Britons, expelled his sovereign, Huail or Hoel, from Strathclyde, and commenced a reign of which it is impossible to separate the facts from the fictions with which they have become incorporated.

The Saxons in Scotland.
A.D. 449.

A.D. 547.
Ida.

Northumbria founded.

Aella.

Edwinsburgh or Edinburgh.

But the Pictish period is not only distinguished by the rise of a new kingdom, it is marked by the arrival in Scotland of a new people, the Saxons, a race of Gothic origin, who invaded and finally effected a settlement in Lothian. This remarkable event, so important in its remote consequences upon our national history, took place in the middle of the fifth century (A. D. 449). It was not difficult for the Saxons, a people who certainly were far their superiors in courage and in arms, to subdue the feebler race of the Ottadini. They do not at first appear to have attempted to push their conquests to the northward of the Forth, but contented themselves with the occupation of a portion of the province of Valentia. After the lapse of a century, however, Ida, one of the boldest and most adventurous of the sons of Woden, landed at Flamborough, and brought an important accession to the strength and numbers of his countrymen. It was by this great chief that the Saxon kingdom of Northumbria was founded; nor was he arrested in his victorious career, till he had extended his dominions from the Humber to the Forth. Ida was succeeded in the Northumbrian kingdom by Aella, and Aella by Ethelred, under whose reigns occurred no event of importance; but Edwin his successor, who came to the throne in the beginning of the seventh century, appears to have added essentially to the extent of the Saxon conquests, and to have impressed not only the southern Britons, but his fiercer and more northern neighbours the Picts, with the terror of his arms. There appears little doubt that Edinburgh or Edwinsburgh, the present capital of Scotland, owes its foundation to this energetic Saxon chief.[5]

Hitherto, in speaking of the northern inhabitants beyond the Forth, we have designated them by the single appellation of the Picts. We must now mark the arrival of a different people, although probably sprung from the same ancient stock.

The Scots.

A.D. 503.

Scots settle in Kintire.

At the commencement of the fourth century, we find that the ruling or dominant people in Ireland were the Scots, a Celtic race; and although there is no sufficient evidence that they had formed any permanent settlement in Britain previously to the abdication of the island by the Romans, it is certain that in the year 360 they invaded the Roman provinces in that kingdom, and were repelled by Theodosius. In the beginning of the sixth century, three Irish chiefs, Loarn, Fergus, and Angus, sons of Erc, king of Dalriada, by which we are to understand the province of Ulster, led a colony into the ancient province of the British Epidii, and effected a settlement upon the promontory of Kentire.[6] As far as any light is afforded by the Irish annals, in this occupation of Kentire the Scoto-Irish met with but feeble opposi-

tion; and a long period of obscurity succeeds, in which little more is distinguishable, except the fact that a series of Scoto-Irish kings, or reguli, are found in Scotland, from the commencement of the fifth century, (503), when Fergus held the throne, till the accession of Kenneth, the son of Alpin, who reigned from the year 836 to 843, under whom the ascendancy of the Scoto-Irish or Scotch, appears to have been established. Upon this portion of our history we are tempted to transcribe the following observations of Chalmers.

"In the records of time, there scarcely occurs a period of history so perplexed and obscure, as the annals of the Scoto-Irish kings and their tribes. The original cause of this obscurity is the want of contemporaneous writing. An ample field was thus left open for the contests of national emulation. Ignorance and ingenuity, sophistry and system, have all contributed to make what was dark still more obscure. The series and genealogy of the kings have been involved in peculiar perplexity by the contests of the Irish and Scottish antiquaries, for pre-eminence in antiquity, as well as in fame. And Cimmerian darkness has overspread the annals of a people too restless for the repose of study; too rude for the elaboration of writing."[1] After such an acknowledgment, it would be idle labour to follow this indefatigable inquirer into the twilight-history of these times; but this period is distinguished by one great event which shines brightly amidst the surrounding gloom, namely, the conversion of northern Britain to Christianity.

Conversion to Christianity.

Columba. A.D. 521.

Conversion of the Northern Picts.

A.D. 568.

Already the Romanized Britons of the South had received the true faith, and the Scoto-Irish appear to have been converted to Christianity by St. Patrick, previously to their establishment in Kentire. St. Ninian, himself a Briton, though educated as a monk at Rome, had, in the commencement of the fourth century, founded a monastery in Galloway; and in the sixth century, St. Kentigern signalized himself by his pious labours among the Britons of Strathclyde; but the conversion of the northern Picts was reserved for St. Columba. This great and good man was born in Ireland, in the year 521. His descent was royal, and his education was at first carefully conducted under the best masters which his native island, long before this converted to Christianity, could supply. Of these the most noted was St. Ciaran, the apostle of the Scoto-Irish of Kentire; and from him, in all probability, Columba imbibed his first desire to introduce the gospel into the desolate and barbarous dominions of the northern Picts. It was in the year 568, that embarking with twelve of his friends, in a boat of wicker work which was covered with hides, he set out upon his benevolent mission, and landed in the Island of Hy, or Iona, which was situated near the confines of the Scottish and Pictish territories. The difficulties which he had to encounter on his first arrival, were of the most formidable kind. He found a people so barbarous that his life was attempted; the king, when the holy man first approached his residence, ordered its gates to be shut against him; the priests, who were druids, and possessed much influence, employed all their eloquence to counteract his efforts; and the nature of the country, woody, mountainous, and infested with wild beasts, rendered travelling most dangerous and painful.[2] It is also said that at first the saint required an interpreter to make himself intelligible, although after a short residence he appears to have found little difficulty in conversing with the barbarians. But none of these obstacles was sufficient to baffle the zeal and courage of Columba; and so blest were his labours, so rapid the effects produced by the example of his virtues, that in a few years the greater portion of the Pictish dominions was converted to the Christian faith; churches were erected, monasteries established, in various places, and Columba, as primate, became an object of the utmost love and veneration among the barbarous tribes, and fierce and warlike princes whom he had called from darkness into light. At that time his monastery was perhaps the chief seminary of learning in Europe. It was from this nursery, that not only all the monasteries, and above three hundred churches which he himself had established, were supplied with learned pastors, but which also gave divines to many of the religious establishments among the neighbouring nations.[3] Columba died in the year 597, in the seventy-seventh year of his age; a man not less distinguished by his zeal and labour in the dissemination of the gospel, than by the simplicity of his manners, the sweetness of his temper, and the holiness of his life.

A.D. 597. Death of Columba.

Disappearance of the Picts.

We have already observed, that it would be foreign to the object of this historical sketch, to involve our readers in the dark and wholly uninteresting annals of the Pictish kings. But one remarkable event must not escape our notice, we mean the disappearance of the Pictish people after the middle of the ninth century. There seems every reason to believe, that the story of the total extermination of the Picts by the sword of the victorious Kenneth Macalpin, is a fable invented at a later period, and certainly supported by nothing approaching to contemporary evidence. A more rational and intelligible account ascribes this event, not to the destruction, but to what may more correctly be denominated the absorption of the Picts by the predominating nation of the Scots. Both were probably a people of the same race, speaking a similar language, and little different in their manners and civil government. Both were animated by the emulation of outstripping each other in power and extent of territory; and this led to protracted struggles, in which the Picts maintained their independence with difficulty, and the Scots, gradually enlarging their dominions, acquired a predominating influence. Such being the relative condition of the two nations, an event took place which united in one person the claim to the Pictish and the Scottish throne.[4]

Kenneth Macalpin. A.D. 836.

Achaius or Eocha, king of the Scots, who died in the year 826, had married Urgusia, a Pictish princess, the sister of Constantine and Ungus, successively kings of the Picts. His grandson was Kenneth Macalpin, a prince of great hardihood and ambition, who succeeded to his paternal throne in 836. On the death of Uven, the Pictish monarch, in 839, Kenneth asserted his claim to the Pictish throne, in right of his grandmother, Urgusia. The feeble state of the nation, and the incapacity of the true heir, combined to favour his ambitious designs; and after a struggle of three years, he succeeded in uniting the two crowns in his own person.[5] The observations of Chalmers upon this event, and the important consequences which it drew after it, are well worthy of notice. "During such confusions," says this author, "amidst a rude people, whose forms of government were little fixed, and whose laws were less regarded, the loss of a battle, or the death of a king, was an adequate cause of an important revolution. Of all these events, Kenneth dexterously took advantage; and finding a feeble competitor, he easily stept into the vacant throne. In his person a new dynasty began. The king was changed, but the government remained the same. The Picts and Scots, who were a congenial people, from a common origin, and spoke cognate tongues, the British and Gaelic, readily coalesced; yet has it been asserted by ignorance, and believed by credulity, that Kenneth made so bad a use of the power which he had adroitly acquired, as to destroy the whole Pictish people in the wantonness of his cruelty. To enforce the belief in an action which is in itself unknown, and so inconsistent with the interest of a provident sovereign, requires stronger proofs than the assertions of uninformed history, or the report of vulgar tradition. The Picts continued throughout the succeeding period (from 843 to 1097) to be mentioned by contemporary authors, though they were governed by a new race, and were united with a predominant people."[1]

Sect. III.—*The Scottish Period.*

A.D. 843–1097

The union of the two nations of the Picts and the Scots, under one powerful prince, forms the commencement of the third great division of Scottish history, which extends from the middle of the ninth century (843) to the expiration of the eleventh (1097), a period of two centuries and a half.

Extent of the Pictish and Scottish kingdoms.

For ages before the time of this union, the Pictish dominions were confined by the Forth on the south, Drumalban on the west, and the German Ocean on the east and north; while at the period of its occurrence the Scots possessed the whole western coast, from the Clyde to Loch Torridon, with the extensive kingdom of Argyle, which stretched its arms from the Clyde on the south to Loch Eir and Loch Maree on the north, and reached from the sea on the west to Drumalban[2] on the east. These extensive dominions were now united; the name of Scotia, as marking the whole kingdom, gained ground over that of Pictavia; and from the tenth century (934), when the Saxon Chronicle first mentions *Scotland* as invaded by Athelstan, this distinctive appellation for the kingdom of North Britain gradually gained ground till it excluded every other.

It has been observed by Sir Walter Scott, "that the descendants of Kenneth Macalpine pass us in gloomy and obscure pageantry, like those of Banquo in the theatre;" and it might have been added, that the impression left upon the mind by the perusal of their various reigns is as shadowy and unsubstantial. To fatigue and perplex the reader, by a detail of historical passages, which led to no great results, is not the purpose of this sketch, but to mark the features which prominently distinguish the period. Nor were these either few or unimportant.

Invasions by the Danes.

1. The first event which demands our notice, is the commencement of those invasions by the Danes, which for several centuries continued to be the greatest scourge of Scotland. It was under the reign of Constantine, the second monarch in succession from Kenneth, that these fierce pirate leaders, known under the name of *Vikinghr*, or sea-kings, first made their appearance in North Britain. Having established a settlement in Ireland, they soon became acquainted with the commodious havens of the Scottish coasts; and after a partial visit in 866, a more formidable armament sailed from Dublin, under Anlaf and Ivar, in 870. During this invasion, they took Alcluyd, or Dunbarton, ravaged the whole extent of North Britain, and returned glutted with slaughter and booty to Ireland. These sea-wolves having once tasted blood, were not slow to return. Thrice under the same reign were their vessels seen on the coasts of the devoted country, in 871, 875, and 876; and at last, in 881, the Scottish monarch met his death on the banks of the Forth, in an ineffectual attempt to defend his people, and repel their ravages. Reappearing under the reign of Donald, who succeeded to the throne in 893, they were defeated on the banks of the Tay, in the vicinity of Scone, and again, in 904, repulsed by the same prince, who lost his life, after he had slain their leader. This, however, did not prevent their return in 907, and afterwards, in 918, under the reign of Constantine the Third, who, with the assistance of the northern Saxons, encountered and repulsed them at Tinmore; a check which appears for a considerable period to have given repose to the kingdom.

A.D. 866. Anlaf and Ivar.

Defeated by Donald, 904.

The Danes repeatedly invade Scotland.

A.D. 970.

In 961, under the reign of Indalf, who had succeeded to the throne in 953, the Vikinghr made a descent in the bay of Cullen, in Banffshire; and this monarch with difficulty defeated them in a desperate action, in which he lost his life. In 970, Kenneth the Third, who is represented as a monarch of extraordinary vigour and ambition, succeeded to the throne, and under his reign the Danes reappeared with a numerous fleet in the Tay; but after a sanguinary struggle, in which they at first succeeded, were ultimately defeated by the bravery of the Scots, commanded by Kenneth in person. This contest, which appears to have been attended with an enormous loss on both sides, took place at Luncarty, where many tumuli still remain, to mark the field of battle.[3]

Kenneth the Third defeats them at Luncarty.

Danes defeated at Mortlach by Malcolm the Second. A.D. 1010.

After this the country enjoyed a quiet of nine years; but in 1003, the Norsemen, who had now for some time permanently settled themselves in Orkney, again made their appearance in great strength upon the coast of Moray. They seized and fortified the promontory known by the name of the Burgh-head of Moray, where they found a commodious harbour, and from which, in 1010, they led an army to plunder that fertile region. But they were met and defeated with great slaughter by Malcolm the Second, in the battle of Mortlach, where the king, in gratitude for his victory, endowed a religious house, which became the seat of the earliest Scottish bishopric.

Treaty between Malcolm and Sweno, A.D. 1014. Final departure of the Danes.

These repeated repulses checked and disheartened the pirate kings; but they disdained to relinquish the contest. Their last efforts appear to have been made on the coast of Angus and Buchan, where they were repulsed in successive conflicts, fought at Aberlemno, Panbride, and Slaines Castle. At length a convention, or pacific treaty, was entered into between Malcolm, and Sweno, king of Denmark, in the year 1014, which was followed by the evacuation of the Burgh-head of Moray, and the final departure of the Danes. Thus, after a severe struggle, which at various intervals, and with various success, appears to have continued for nearly a century and a half, (866 to 1014), the energy of the Scots ultimately triumphed over the efforts of the Norsemen; and while the Danish rovers established themselves in some of the finest countries in Europe, and in England alternately fixed themselves as permanent settlers, or extorted an odious tribute as the price of their absence, Sweno, though one of their most powerful princes, found himself at last compelled to desist from the contest.

Acquisition of Cumberland by Malcolm the First.

2. The second event of importance which marked this period, was the enlargement of the Scottish provinces of Malcolm the First, by the pacific acquisition of Cumberland from Edmund the Saxon king of England. Against this young prince, the Danes, who had established themselves in the northern part of his dominions, declared war, and calling the Norwegians to their assistance, threatened to subdue the whole country. Edmund opposed them with great courage and success, reduced Northumberland, then a Danish province, and next turned his arms against Cumbria, or Cumberland. After wasting this little country, then inhabited by the Britons, under their king or chief leader, Dunmail, the English prince, aware perhaps of the difficulty of retaining his new acquisition, delivered it up to Malcolm the First, under the condition that he would become his associate *(medwertha)* in war, or, as the terms are explained by Matthew of Westminster, "that he would de-

fend the northern parts of England from the invasions of his enemies, whether they came by sea or by land."[1] It is to be remembered, that this transaction was entered into between two independent princes, the one of Saxon, the other of Celtic race, more than a century before the feudal usages or tenures were introduced into England by the Normans; an observation which might have been deemed unnecessary, had not some ingenious writers affected to detect in the stipulations of Malcolm the acknowledgment of feudal dependence. In this manner did Cumbria, in the middle of the tenth century, become a portion of the Scottish dominions.[2]

Kenneth III.
A.D. 970.
Conquest of Strathclyd.

3. This treaty was followed by the reigns of Indulf, Duf, and Culen, a dark and sanguinary period, occupied by domestic war and civil commotion; but under Kenneth the Third, who came to the throne in 970, occurred another event of no little moment in the history of the country. This was the conquest of the ancient British kingdom of Strathcluyd by the arms of that monarch. We have seen this independent state arise, in the middle of the fifth century, from a union of the Romanized British tribes, who, on the desertion of the island by the Romans, were drawn together by the ties of common danger and mutual defence. From this time, (446), they had, under various reverses and multiplied attacks, enjoyed a precarious independence for upwards of five centuries; nor did they permit themselves to be incorporated in the Scottish monarchy without a determined struggle. The arms and the energy of Kenneth, however, were successful; and one of those gleams of romantic light, which sometimes soften the gloomy annals of these ages, fell on the ruins of Strathcluyd. Dunwallon, the last of its kings, after exhibiting the utmost courage and resolution in defence of his people, assumed the religious habit, travelled to Rome, and died a monk.[3]

Acquisition of Lothian by Malcolm II.
A.D.1018.

The last prominent feature which marks this period, was the further enlargement of the Scottish dominions, by the acquisition of Lothian, hitherto a part of England. It took place in 1016, under the reign of Malcolm the Second, the son of Kenneth the Third, to whose conquest of Strathcluyd we have just alluded. It was this same Malcolm whose courage we have seen victorious over the Danes at Mortlach, and to whose convention with Sweno Scotland owed its freedom from the ravages of the pirate kings. In the beginning of the eleventh century, (1018), this warlike prince engaged in hostilities with Ughtred, earl of Northumberland. Their forces met at Carham, near Werk, on the southern bank of the Tweed, and a sanguinary battle was fought, which effectually checked the Scottish prince. Ughtred, however, having been assassinated, was succeeded by his brother Eadulph, a feebler ruler, who, from a dread of a second invasion, was induced to purchase the friendship of Malcolm, by the cession of the whole of Lothian.[4]

Such are the great features which distinguish the early history of Scotland, from the middle of the ninth to the commencement of the eleventh century, (843 to 1018), and upon which it is both wiser and easier to fix the mind than to crowd and burden it with lists of barbarous and forgotten kings. We see a people, still rude, ignorant, and, except for the sweetening influences of Christianity, little removed from savage life; but we find them able not only to vindicate their freedom against those incessant and cruel invasions, which broke, and for a time subdued the neighbouring country of England, but animated by an ambition which, under successive princes, largely extended their dominions, by the successive acquisitions of Cumberland, Strathcluyd, and Lothian. Nor is the remaining portion of the Scottish period, from 1018 to 1097, unmarked by some great events. In 1031, under the reign of Malcolm the Second, Canute, the Danish king of England, invaded Scotland. This prince, the most powerful monarch of his time, as he possessed not only England, but Denmark and Norway, led an army against Malcolm. The cause of the war is involved in much obscurity. It was however connected with some claim or dispute regarding Cumberland, and it terminated in Malcolm retaining the possession of that province, and performing the conditions upon which it had been transferred to him.[5]

A.D. 31.
Malco II.

In the historical romance of Boyce, and the classical pages of Buchanan, Malcolm the Second figures as the first and one of the greatest of Scottish legislators. It was referred for the learning and acuteness of Lord Hailes to detect his apocryphal laws as the forgery of a much later age.

Malcolm the Second, whose severe and vigorous reign had been marked by many sanguinary domestic feuds, not necessary to be detailed, was succeeded in 1033 by his grandson Duncan, the "gracious Duncan" of Shakspeare, whose imperishable drama is founded upon a fictitious narrative, which Holinshed copied from Boyce. Let us for a moment, in a spirit rather of homage than of criticism, disentangle the dross of fact from the ore of fiction. Lady Macbeth was the Lady Gruoch, and had regal blood in her veins. She was the grand-daughter of Kenneth the Fourth. Her husband, Macbeth, was the son of Finlegh Maormor, or the supreme ruler of Ross. The real wrongs of the Lady Gruoch, the root of her implacable revenge, were even more deep than those of her mighty counterpart. She had seen her grandfather Kenneth dethroned by Malcolm, her brother assassinated, and her husband burned, griefs amply sufficient to turn her milk to gall. Macbeth, on the other hand, had wept a father slain also by Malcolm; and thus revenge and ambition were equally roused in both their bosoms. The purpose which had been arrested by the superior vigour and courage of Malcolm, was executed on his more feeble grandson. Duncan, in 1039, was assassinated at Bothgowanan, near Elgin;[6] and Macbeth seized the sanguinary sceptre, which he held with a vigorous grasp for fifteen years, until he was defeated and slain by Macduff, in 1054.

On his death, a contest for the throne arose between Lulach, the son of the Lady Gruoch, and great-grandson of Kenneth the Fourth, and Malcolm Ceanmore, great-grand- of Malcolm the Second; and this struggle terminated in son 1057, by the defeat of Lulach, and the accession of his rival, Malcolm, who was contemporary with Edward the Confessor.

Malcolr III.
Malcolr marries Margare sister of Edgar Ætheli

The accession of Malcolm Ceanmore to the Scottish throne was soon afterwards followed by an event, which, although taking place in the sister country, produced the most important effects upon the history of Scotland. This was the invasion and conquest of England by the Normans, and the establishment of an entirely new dynasty in that country. The first consequence of this change was favourable to Malcolm, as it led to his marriage with a Saxon princess, whose character had a marked and favourable influence upon the ruder manners of her husband and his people. This lady was Margaret, who was the sister of Edgar Ætheling. It is important to trace her lineage. Canute, the Danish king of England, had banished Edwin and Edward, the children of Edmund Ironside, the last of the pure Saxon dynasty, for Edward the Confessor was half a Norman. They found a retreat in Hungary, where Edwin died; but from this country Edward, in 1057, was recalled by Edward the Confessor. This prince had three children, a son, Edgar, commonly called Edgar Ætheling, the heir of the Saxon line, and two daughters, Margaret and Christian. On the conquest of England, the nobles of Northumberland, who were principally of Danish origin, led by two chiefs, named Maerleswegen and Gospatric, becoming disgusted at the Norman tyranny, fled to the court of Malcolm, taking with them Edgar and his two sisters. Edgar was weak, almost to imbecility; and in the event of his dying, or being found incapable of filling the throne, his claims as heir of the Saxon line descended to his sister. She was beautiful, accomplished, and pious; and a union which perhaps, at a distance, had been suggested to Malcolm by ambition, on a nearer view was perfected by love.

Invasion of England.

The marriage of the Scottish monarch was soon followed by an invasion of England, in which Malcolm mercilessly ravaged the bishopric of Durham. The manner in which this predatory inroad was conducted marks the ferocity of the times. Malcolm and his subjects were Christians; yet even the churches were destroyed and burnt, while the unhappy persons who had fled to them for sanctuary were massacred, or consumed in the flames. During the occurrence of these savage scenes in England, Gospatric, one of the most powerful of the Northumbrian barons, whose assistance William the Conqueror had secured, swept through Malcolm's territory of Cumberland, and laid waste the country in a miserable manner, upon which the Scottish prince returned home, leading captive, says an English historian, such a multitude of young men and maidens, "that for many years they were to be found in every Scottish village, nay, even in every Scottish hovel."[1]

A.D. 1069.

There seems to be little doubt that this expedition of Malcolm was intimately connected with the determined stand made against William the Conqueror by the Northumbrian earls who had carried Edgar Ætheling into Scotland. Combining in 1069 with their brethren, the Danes, who brought a powerful fleet to their assistance, they advanced as far as York, where they put the Norman garrison to the sword; and here it is probable they expected to be joined by Malcolm, but being disappointed in their hope, they made peace with William, who had the address to dissolve the confederacy. Malcolm alone continued faithful to the cause of the Saxon prince; and, though deserted by his confederates, yet by invading England fulfilled his agreement.

William the Conqueror retaliates.

This inroad led to a dreadful retaliation on the part of William. "To punish the revolt," we use the words of Lord Hailes, "and to oppose a wilderness to the invasions of the Danes, he laid entirely waste the fertile country which lies between the Humber and the Tees." "At this time," says William of Malmesbury, "there were destroyed such splendid towns, such lofty castles, such beautiful pastures, that had a stranger viewed the scene he might have been moved to compassion, and had one inhabitant been left alive, he would not have recollected the country." Of this fine district the inhabitants seem to have been almost wholly exterminated. Many who escaped the sword died of famine, many sold themselves for slaves, while those of higher quality, Norman as well as Saxon, sought an asylum in Scotland, and found at the court of Malcolm a favourable reception.

Invasion of Scotland in 1072.

William having secured peace at home, prepared an armament against Scotland, and in 1072 he invaded that country, both by sea and by land. Malcolm wisely met superior power by an offer of submission. He sought and obtained peace, gave hostages, and performed homage. So far all is certain; but a question arises, for what was this homage performed? The answer may be given in the words of one of the most able inquirers upon the subject: "According to the general and most probable opinion, this homage was done by Malcolm for the lands which he held in England."[2]

Gospatric settles in Scotland.

We have already met with Gospatric, the powerful Northumbrian earl who fled from the Conqueror to the court of Malcolm, bringing with him the heir of the Saxon line, with his sisters. Proving treacherous to Malcolm, Gospatric obtained from William the government of Northumberland; but on his return from his successful expedition against Malcolm, the Norman conqueror, from jealousy or disgust, degraded his Northumbrian ally, who once more fled to the Scottish king. Malcolm, on his part, not only forgave him, but presented him with the lands and castle of Dunbar, and the castle of Cockburnspath. He who held these estates, lying on the borders between the two countries, might be said to have the keys of Scotland at his girdle; and the circumstance is worthy of remembrance, not only as marking the origin of a potent family, destined to act a leading part in the future history of the country, but as indicating the policy of Malcolm, who, conscious of the inferiority of his own Celtic race, manifested a wise anxiety to prevail on strangers, whether Normans, Danes, or Saxons, to settle in his dominions.

A.D. 1079-1093. William Rufus.

The remaining portion of the reign of this energetic prince (1079–1093), is chiefly distinguished by a struggle with William Rufus, who, upon the death of the Conqueror, had succeeded to the English throne. This prince appears to have withheld from Malcolm part of the English possessions to which he claimed a right; and with the view of compelling a surrender of them, the Scottish king invaded England, and penetrated as far as Chester, on the Were. Rufus led against him a superior force; and Malcolm, aware of his approach, prudently declined a contest, and by a timely retreat, secured his plunder and his captives.

Rufus invades Scotland, A.D. 1091.

This appears to have taken place in May 1091; and in the autumn of the same year, the Norman prince, having equipped a fleet, and levied a numerous land force, led his army in person against Scotland. He continued his march to the shores of the Forth; but here his progress was stayed, in consequence of his receiving intelligence that his fleet had been destroyed by a tempest. There were no vessels to transport his troops across the Forth. The Scots, with a policy which they early learned, and repeatedly practised, had driven away their cattle, and cleared the country of its provisions; and at this crisis, when his soldiers were perishing from famine, Malcolm led his army against the English, crossed the Forth, and advanced into Lothian; a territory originally, as we have seen, acquired from the Angles, and therefore esteemed a part of England, although now subject to the Scottish king. Here having chosen a strong position, he encamped, and avoiding a battle, harassed the enemy, proposing to cut off his supplies, and expel him by famine. While both parties were thus situated, Edgar Ætheling, now with Rufus, and Robert, the king's brother, exerted themselves to conciliate a peace. The English monarch, notwithstanding his fiery temper, knew how to bend his fury to his interest; and Malcolm, perceiving that he could obtain his purpose by treaty, wisely preferred this to the risk of a battle. It is important to mark the conditions of the agreement. William Rufus, we find, consented to restore to Malcolm twelve manors, which the Scottish prince had held under the Conqueror, and to make an annual payment to him of twelve marks of gold.[3] Malcolm, on his part, consented to do homage to William, and to hold his lands under the same tenure of feudal service and obedience to him, as he had formerly paid to his father the Conqueror.

Peace between Malcolm and Rufus.

Here pausing for a moment upon a subject which has

Question of homage.

given rise to some discordant opinions, and which, now that the bitterness of national rivalry is at an end, may, we trust, be calmly considered, we would remark that, taking the testimony of English historians as our guide, all as yet seems clear, as to the much debated subject of homage. Simeon of Durham expressly declares that Malcolm agreed to obey William Rufus on the same conditions as those on which he had obeyed William the Conqueror. Under the Conqueror it is certain that Malcolm held twelve manors in England. These Rufus had seized; but he now restored them, and Malcolm renewed his obligation of homage. On a former occasion when, as we have seen, the Scottish king, in 1072, paid his homage to the Conqueror in person, the ground upon which he paid it is equally clear. Previously to the battle of Hastings, the Scottish monarchs had obtained from the Saxon kings some possessions in England. This was before the introduction of the strict feudal tenures, which came in with the Normans; but there is no doubt that these possessions were held under the condition of aiding the Saxon princes in repelling the incursions of the Danes.[1] When William the Conqueror established himself in England, Malcolm, as we have seen, considered him as a usurper of the rights of his brother-in-law, Edgar Ætheling; and, on this ground, as well as perhaps from an indisposition to embrace a system which must have been new to him, he had at first refused to pay his homage for the lands he held in England. Circumstances, however, made him change this resolution. The prevailing power of William, the acquiescence of the English under his government, and the inactivity and imbecility of Edgar Ætheling, his brother-in-law, induced him to desist from a conflict in which he ceased to have an interest. A more intimate acquaintance with the feudal tenures introduced into England taught him that, in the acknowledgment of superiority for the lands which he held in that country, there was no sacrifice of dignity as an independent monarch, and as all idea of restoring Edgar was abandoned, he paid his homage to the conqueror.[2]

New disputes between Malcolm and Rufus, A.D. 1092.

The point of homage seemed thus prudently settled; but the proud and fiery temper, which appears to have been an infirmity of both princes, soon led to a new contest between Malcolm and Rufus. A jealousy of the incursions of the Scots had formerly led the Conqueror to build two strong castles, the one at Durham, the other at Newcastle. To these his successor now added a third at Carlisle; a barrier which, however necessary, might possibly be considered as encroaching on the freedom of the lands which Malcolm held in Cumberland. A dispute arose, and a personal interview between the two kings having been considered the best mode of settling their differences, Malcolm repaired to Gloucester, where Rufus met him and proposed that he should do homage in presence of his English barons. This the Scottish monarch refused; although he was ready, he said, to perform his homage on the frontiers of both kingdoms, as had been the ancient usage. The reply was angrily received, and the two kings having parted with expressions of defiance, Malcolm assembled an army, and advancing with a speed whetted by the indignity with which he had been treated, burst into Northumberland, which he wasted with fire and sword. Sweeping onwards to Alnwick, he was about to possess himself of the castle, when the Scottish army was attacked by Robert de Mowbray. In the battle which ensued Malcolm was slain, and Edward, his eldest son, shared the fate of his father.

Death of Malcolm, A.D. 1093.

We have already observed that the mild and gentle disposition of his queen, St. Margaret, had an admirable influence over the fierce and impetuous character of this prince. Of her life we have an interesting account from the pen of Turgot her confessor; and we cannot resist borrowing a few touches from this early specimen of biography. When the king set out on his last expedition against England, Margaret was suffering from a fatal and lingering complaint. She only lived to hear of the death of her husband and her son. Her last moments are thus described by that faithful minister, who related what he saw: "During a short interval of ease, the queen devoutly received the communion. Soon after, her anguish of body returned with redoubled violence; she stretched herself upon her couch and calmly waited for the moment of her dissolution; cold, and in the agonies of death, she ceased not to put up her supplications to heaven. These were some of her words: 'Have mercy upon me, O God; according to the multitude of thy tender mercies blot out mine iniquities; make me to hear joy and gladness, that so the bones which thou hast broken may rejoice.' At that moment," continues Turgot, "her son, Edgar, returning from the army, approached her couch. 'How fares it,' said she, 'with the king and my Edward?' The youth stood silent. 'I know all; I know all. By this holy cross, by your filial affection, I adjure you to tell me the truth.' He answered, 'your husband and your son are both slain.' Lifting up her eyes and her hands to heaven she then said, 'Praise and blessing be to thee, Almighty God, that thou hast been pleased to make me endure so bitter anguish in the hour of my departure, thereby, as I trust, to purify me in some measure, from the corruption of my sins; and thou, Lord Jesus Christ, who, through the will of the Father, hast enlivened the world by thy death, oh deliver me.' While pronouncing the words 'deliver me,' she expired."[3]

Death St. M garet.

Chara of Ma colm.

"In reviewing the reign of Malcolm the Third," says Lord Hailes, "we may discern a character of steady persevering courage. From his early youth to his last invasion of England, his conduct was uniform. He maintained his throne with the same spirit by which he won it. Though he was the ruler of a nation uncivilised, and destitute of foreign resources, and had such antagonists as the Conqueror and William Rufus to encounter, yet, for twenty-seven years, he supported this unequal contest, sometimes with success, never without honour. That he should have so well asserted the independency of Scotland is astonishing, when the weakness of his own kingdom, and the strength and abilities of his enemies are fairly estimated."[4]

Donal seizes crown A.D.

Malcolm's eldest son had fallen, as we have seen, with his father. His remaining sons, Ethelred, Edmund, Edgar, Alexander, and David, were all under age; and his brother Donald, who, on the usurpation of the throne by Macbeth, had taken refuge in the Hebrides, appears to have remained in that distant retreat during the whole reign of the late king. These islands were then independent of the Scottish crown. They were inhabited by a warlike race, whose chiefs yielded to the Norwegian king a fluctuating subjection; and many of these leaders having joined him, Donald, with a powerful fleet, invaded Scotland and seized the crown; but it was for a very brief season. Duncan, a son of Malcolm, but illegitimate as is generally believed, had, in 1072, been delivered to William Rufus as a hostage for his father's fidelity. He had received his education at the Norman court, and having been knighted by the English monarch, was retained in his service. With permission of William, he now invaded Scotland, and assisted by a band

[2] In this account of the expedition of William Rufus into Scotland, and in the remarks on the disputed point of the homage, we have been induced to treat the subject a little more in detail, availing ourselves of some manuscript notes of the late David Macpherson, a writer of great research and judgment. This seemed the more necessary, as the subject of Rufus's invasion of Scotland, and Malcolm's stipulated homage, has been considered by high authority as one involved in extreme obscurity.

[3] Hailes's Annals, vol. i. pp. 40, 41, 4to edit. We have availed ourselves of Lord Hailes's translation of the passage from Turgot describing the queen's death.

Duncan. Donald.

Edgar. A.D.1097.

of English and Norman adventurers expelled Donald Bane. He, in his turn, after a reign of little more than a year, was assassinated, and Donald once more ascended the throne, from which, in 1097, he was again expelled by William Rufus, who dispatched Edgar Ætheling with a powerful army into Scotland. By this prince the aged usurper was defeated, and Edgar, the son of Malcolm and Margaret, the nephew of Edgar Ætheling, ascended the throne. This event took place in the close of the eleventh century; and, with the captivity and death of Donald Bane, who is the last of the race of Scoto-Irish kings, the Scottish period expires.

And here, after having passed over a portion of our history which extends from the middle of the ninth to the end of the eleventh century, let us pause to say a few words on the condition of the church, the state of the laws, and the manners of the people. To every critical student of this period one thing appears certain. Throughout its whole extent, we find the predominant people a Celtic race. The laws were Celtic, the government Celtic, the usages and manners Celtic, the church Celtic, the language Celtic. "If," says Chalmers, "Malcolm Canmore, a Celtic prince, who did not arrogate the character of a lawgiver, had been disposed to effect a considerable change in this Celtic system, he would have found his inclination limited by his impotence. The Scottish kings, during those times, seem not to have possessed legislative power. Whenever they acted as legislators, they appear to have had some coadjutors; either some maormors, a term by which we are to understand the chief civil ruler of a district, or some bishops." We shall see, when we pursue our inquiry into a later period, that the children and grandchildren of this Celtic monarch, when they attempted to introduce new maxims of government, were opposed in Galloway and in Moray by frequent insurrections.

State of the Church.

Looking now first to that most important and interesting point, the state of the church, we have already seen that, at the commencement of the Pictish period in 446, Christianity had been introduced into North Britain. Of the exact constitution, discipline, and orders in the early Scottish church, from the conversion of the Scots to the commencement of the Scoto-Pictish period (843), much has been written; and it is well known that the advocates of episcopacy and the supporters of presbyterianism have each endeavoured to deduce, from an examination of these remote ages, irrefragable arguments for their peculiar opinions. Into this discussion it belongs not to our plan to enter. We deal with general results, and dare not embark in controversy; but we may be permitted to observe, from the authentic monuments which still remain in our own times, and it seems difficult to avoid the conclusion, that the primitive and most ancient form of church government in Scotland was episcopal. At the memorable epoch of the union of the Picts and the Scots, we find a bishopric of Lindisferne extending far into Lothian. In Lothian itself, the religious houses of Melrose, Coldingham, Tyningham, Pefferham, and Abercorn, had been long established. In Galloway, the bishopric of Whithorn, which we have seen founded by St. Ninian, had fallen soon after the commencement of the ninth century. Looking beyond the Friths, we find that, at the same period, various religious cells had been settled by the disciples of Columba; and that not long afterwards, Kenneth Macalpin, anxious to testify his respect for the relics of this apostle of the Scots, removed his relics from Iona to Dunkeld, where he built a church, which became not only the seat of a bishop, (849), but, till supplanted by St. Andrews, the seat of the primate of the Scottish church. There is an ancient legend quoted by Spottiswood from the register of St. Andrews, which, if any credit is to be attached to it, gives the honour of founding the see of St. Andrews to Hungus king of the Picts, who died in 833. This prince, it appears, had invaded Northumberland, and upon his return was overtaken by Athelstan, king of the West Saxons, at the head of a powerful army. "Having given order for battle against the next day," says the historian, "Hungus betook himself to prayer, spending most part of the night in that exercise. A little time before day, falling into a slumber, it seemed to him that the apostle St. Andrew stood by him and assured him of the victory, which vision being related to the army, did much encourage them. The history addeth that, in the joining of the battle, there appeared in the air a cross in the form of the letter X, which so terrified the enemies as presently they gave back, king Athelstan himself being killed. Hungus, to express his thankfulness for the victory, gave to the church of Regulus, now called St. Andrews, divers rich gifts, as chalices, basons, the image of Christ in gold, and of his twelve apostles in silver. He gave likewise a case of beaten gold for preserving the relics of St. Andrew, and restored to the spirituality the tithe of all corn, cattle, and herbage within the realm, exempting them from answering before any temporal judge; farther, he did appoint the cross of St. Andrew to be the badge and cognizance of the Picts, both in their wars and otherwise, which, as long as that kingdom stood, was observed, and is by the Scots as yet retained."[1]

State of the Church. A.D. 843–1097.

This extract we have given rather as a curious example of the earliest tradition as to the national emblem of the cross of St. Andrew, than from any high opinion of the authenticity of king Hungus's devotion. The following list of the Scottish bishoprics, according to the date of their foundation, is taken from Keith's Catalogue. It is to be observed, however, that in some of its dates we must regard it rather as an approximation to the truth, as far as it can be ascertained from authentic sources, than as fixing the exact years of the erection.

Parishes early established.

Of these episcopal sees, the reader will observe, that only the bishoprics of the Isles, Galloway, Glasgow, Dunkeld, St. Andrews, and Mortlach, afterwards Aberdeen, belong to the period of which we now treat, from 843 to 1097; although the remaining sees are added, to afford to the reader some idea of their comparative antiquity. "The united kingdom of the Picts and Scots," says Chalmers, "was formed under the regimen of parishes, though neither the times nor the circumstances of this formation can be clearly ascertained amid the gloom which hangs over the Scotican church during the Scottish period. We may easily suppose that those ecclesiastical districts were gradually established subsequent to the great epoch of 843. They were pretty generally settled during the Scottish period, though they were inconveniently large. They were established by private persons, rather than by public authority. But that parishes existed during the reign of Malcolm Canmore, is certain from unquestionable records. Thus, in the charter of David the First to the monastery of Dunfermline, this monarch uses these words: Preterea pater meus (his father was Malcolm the Third,) et mater mea dederunt ecclesiæ Sanctæ Trinitatis *parochiam* totam de Fotheriff.[2] It seems equally certain," he continues, "that when churches were erected, parishes laid out, and parochial duties statedly performed, ecclesiastical dues must have been incidentally paid. In the charters of Alexander the First, and of David, tithes are mentioned as if they were familiarly known, and had been long established. It is clear that tithes were paid to the clergy during the reign of Malcolm Canmore, and probable that such ecclesiastical dues were payable as early as the commencement of the tenth century (910,) when Constantine the king, and Kellach the bishop, solemnly vowed to observe the faith, discipline, and rights of the churches."[1] During the reign of Malcolm Canmore, according to the high authority of Innes,[2] several national councils were held in Scotland for the establishment of ecclesiastical discipline, and the reformation of the rude and fierce manners of the people. Some extracts from the canons passed in these councils are inserted by Turgot, the confessor of Malcolm's pious consort St. Margaret, in the interesting life which he has given us of this princess.[3]

[1] Spottiswood's History of the Church of Scotland, p. 23.

[2] Chalmers's Caledonia, vol. i. p. 432.

Tithes. Ecclesiastical councils.

The Culdees.

During this obscure period, we meet with frequent mention of an order of religious men named Culdees, who first appear in the beginning of the ninth century. They seem to have been a kind of secular presbyters or monks, the Gaelic term Culdee meaning a recluse or hermit. With the exception of the form of the tonsure and the rule of observing Easter, they professed the same rites and ceremonies as the rest of the church. It has been erroneously pretended that the Culdees rejected bishops. So far was this from being the case, that we have repeated instances of the colleges of these Celtic monks having been instituted and ordained by the bishops themselves, while they, wherever they had a college about the see, possessed a vote in the election of the bishop.[4] Of this distinct order, we find that there existed in North Britain, during the Scottish period, religious houses at Abernethy, Dunkeld, St. Andrews, Dunblane, Brechin, Mortlach, Aberdeen, Monymusk, Lochleven, Portmoak, Dunfermline, Scone, and Kirkcaldy.[5]

Laws, manners, and language.

It remains to say a few words on the laws, manners, and language of the Scottish period. To affect to speak with certainty upon the laws which regulated the government, restrained the crimes, or directed the succession of a fierce and barbarous people who have left no written muniments, would betray presumption and ignorance. As far as can be conjectured, we find the crown neither strictly hereditary nor strictly elective, but directed in its descent by what has been termed the law of *Tanistry;* an institution by which the person in the family of the reigning prince who was judged best qualified, whether son, brother, or even more remote relative, was chosen under the name of Tanist, to lead the army during the life of the king, and to succeed to him after his death. Chalmers has asserted, that, at this era, the tenure of land throughout the country determined with the life of the possessor; an opinion requiring some modification, as it indicates a state of barbarism even greater than is discovered by the few glimpses of light which sometimes shoot athwart this twilight of our history. By a custom which the Scots evidently brought with them from Ireland, denominated in Irish *gabhail-cine,* meaning literally family settlement, it appears, that the fathers of families divided their lands among their sons, sometimes in equal, sometimes in unequal portions, and strictly excluded females from any share in this appropriation. As to their legislative code, there seems to be little doubt that the nearest approach we can make to the laws or usages of Celtic Scotland, must be by the study of such fragments as remain to us of the brehon laws of Ireland. "This brehon law," says Cox, "was no written law, it was only the will of the brehon or lord; and it is observable that their brehons or judges, like their physicians, bards, harpers, poets, and historians, had their offices by descent and inheritance. These hereditary judges or doctors," continues he, "were but very sad tools. The brehon, when he administered justice, used to sit on a turf or heap of stones, or on the top of a hillock, without a covering, without clerks, or indeed any formality of a court of judicature." This state of law, observes the author of Caledonia, may be traced among the Scoto-Irish in Scotland till recent times. Every baron had his mote-hill, whence justice was distributed to his vassals by his baron bailie.[6] There seems to be little doubt that Malcolm, from his marriage with a Saxon princess, and his frequent intercourse with the Saxon and Norman people, was an admirer of their superior civilization, and anxious to introduce their usages among his own ruder subjects. But that he succeeded to any material degree is extremely problematical; and the notion that he introduced the complicated system of the feudal law into Scotland, has been long ago exploded.

Tanistry.

Laws.

Manners of the people.

In a rapid sketch of this nature, little room can be given to any detailed description of the manners of the people during the Scottish period. The natural state of the Celtic tribes in Scotland was similar to that which we find existing among them in Ireland, namely, a state of constant war; and to those who consider how slow is the progress of improvement, and how strong the principle of imitation and tradition among a savage people, it will be no subject of wonder that we find little change produced by the lapse of centuries upon the manners of the ancient British, whether we look to Wales, Ireland, or North Britain. Their marriages, their mode of burial, their dress, their war cries, were similar. Armorial bearings, during this whole period, were unknown; seals, and coined money they had none; and it has been remarked by Chalmers, that the Gaelic people of Scotland borrowed their very terms for the several denominations of money from the Scoto-Saxon inhabitants. Thus, the Gaelic feorling, farthing, is from the Saxon feorthing; the Gaelic peighin, a penny, is from the Saxon penig.

Inaugural stones.

In those rude ages of which we now write, stones of memorial were frequently employed, and many of them still remain; yet as they are found without inscriptions, and only occasionally ornamented by rude hieroglyphics, the memory of the events which they describe has perished, and the field is left open to antiquarian conjecture. Inaugural stones also were used by them, upon which not only the Irish and Scottish kings were placed on their accession to the crown; but the chiefs of septs or petty *reguli,* were accustomed on the same to take the oaths to their vassals, when they succeeded to the power of the former chief. To the same class of inaugural stones belongs, as is well known, the famous coronation stone of Scotland. Tradition reports this singular relic to have been brought from Ireland by Kenneth; it was undoubtedly carried off from Scone by Edward the First, who inserted it into a chair, which he placed before the shrine of Edward the Confessor in Westminster Abbey. It is almost impossible to speak with any precision of the state

[2] Idem. p. 588.

[3] And here having spoken of St. Margaret, we cannot refrain, in these brief remarks on the early state of the Scottish church, from alluding to a beautiful picture preserved by this same worthy Bishop Turgot, in which he describes the love of Malcolm for St. Margaret, and the influence which the mild piety of the Saxon princess acquired over the fiery temper of her Celtic husband. "Malcolm," says he, (we use Lord Hailes's translation), "respected the religion of his spouse, was fearful of offending her, and listened to her admonitions. Whatever she loved or disliked, so did he. Although he could not read, he frequently turned over her prayer-books, and kissed her favourite volumes. He had them adorned with gold and precious stones, and presented them to her in token of his devotion. She instructed him to pass the night in prayer, with groans and tears. I must acknowledge, that I often admired the works of the divine mercy, when I saw a king so religious, and such signs of deep compunction in a layman."—Hailes, vol. i. p. 15.

Manners.

of society in this remote period, yet a few incidental gleams of light are reflected from the lives of the early saints. Thus, in Adomnan's life of Columba, which was written only eighty years after the saint's death, we find frequent mention of houses of wattle, similar probably to those which the Constable Richard de Moreville, in a charter of the twelfth century, denominates *claiæ niscatæ*.[1] Even the abbey of Iona was built of the same rude materials. The clothing of the monks seems to have been often composed of the skins of beasts, though latterly they had woollen stuffs and linen; the first probably manufactured by themselves, the linen imported from the continent. Venison, fish, milk, flesh, and wild fowl, were the common food of the people. "The monks of Iona," says Chalmers, "who lived by their labour, cultivated their fields, and laid up corn in their garners." But it is to be recollected that the monks were every where, for ages, the improvers themselves, and the instructors of others in the useful arts. Even Iona had its orchards in the rugged times of the ninth century, till the *vikinghr*, or pirate kings, ravaged and ruined all. Looking to their shipping, we find that their little vessels were constructed by covering a keel of wood and a frame of wicker work with the skins of cattle and of deer. These were denominated *currachs*. Afterwards they were enlarged and made capable of containing a respectable crew. It was in a vessel of this description, a wicker boat covered with hides, that Columba, accompanied by twelve of his friends, embarked from Ireland, in the year 563, and landed in Iona. With these few remarks, we close the Scottish period of our national history.

Sect. IV.—*Scoto-Saxon Period.*

A.D.1097–1306.

We have already seen, that the death of Malcolm Canmore at Alnwick gave rise to a temporary usurpation of the throne by Donald his brother, that he was expelled by Duncan, an illegitimate son of Malcolm, who had been educated at the court of William Rufus; and this Duncan having been assassinated, Edgar Atheling led an English army into Scotland, and placed Edgar, the son of Malcolm Canmore, on the throne.

Alexander I. A.D.1106

Edgar's reign was brief, pacific, and of little interest; but his successor, Alexander the First, the eldest surviving son of Malcolm, was a prince of a powerful and vigorous character. From his accession to the throne, in the commencement of the twelfth century, (1106), to the death of Alexander the Third (1285), in the close of the thirteenth, a period little short of two centuries, the nation was progressive and prosperous in a degree unequalled during the whole course of its future history. Under a succession of six monarchs, Alexander the First, David the First, Malcolm the Fourth, William the Lion, Alexander the Second, and Alexander the Third, it maintained its independence against foreign aggression, and not only preserved the integrity, but extended the boundaries of its dominions. Its commerce, its manufactures, its agriculture, and all the arts which improve and humanize an ignorant and fierce people, were encouraged; and throughout this long period, in the personal characters of each of these successive princes, though varying in their shades, there was that ingredient of energy and boldness which communicated itself to their people, and maintained the nation at the standard to which each ruler in his turn had raised it.

A.D.1106–1285.

Let us for a moment pursue our system, and like a traveller gazing from a mountain height, and noting the landmarks of a new country, endeavour to detect the leading and influential events in this division of our national history. In the character of Alexander the First, every thing seems to have been in excess; but happily the qualities which were so overcharged, were most of them of the better sort. He is traditionally remembered by the epithet of the *fierce;* and though humble and courteous to his clergy, whom he deemed entitled to this homage as God's servants, not his, he was, to use the words of an ancient and authentic writer, "terrible beyond measure to his subjects." The leading event of his reign was the struggle which he maintained for the independence of the Scottish church against the pretended rights claimed, first by the see of York, and afterwards by that of Canterbury. On the election of Turgot, a monk of Durham, to the bishopric of St. Andrews (1109,) the archbishop of York insisting on his having the right of consecrating him. To this the Scottish king declared he would never agree; and a compromise having taken place, by which the point was left undecided, Alexander, on the death of Turgot, altered his ground, and chose for his successor Eadmer, a monk of Canterbury. The same right of consecration, and founded on the same ground of the alleged dependence of the Scottish church upon the primacy of England, was now advanced by Canterbury; but it was still more haughtily and peremptorily refused by Alexander. A compromise again took place. Eadmer accepted the ring from the king, and took the pastoral staff from the altar, as if receiving it from the Lord; but finding his authority weakened, and the countenance of the monarch withdrawn from him, he intimated his resolution of repairing to Canterbury for advice. This Alexander violently opposed, declaring that as long as he lived, the bishop of St. Andrews should never be subject to that see. Nor did he fail here, as in all his other enterprises, to keep his word; Eadmer remained an elected but unconsecrated bishop. At length weary of the contest, and trammelled in his usefulness, he desired permission to resign, restored the ring to the king, replaced the pastoral staff on the high altar, and returned to Canterbury. Robert, prior of Scone, was elected to fill the vacant see, and the king's determined efforts to maintain the independence of the Scottish church were crowned with success. It had continued for fourteen years, and Alexander survived its termination only a single year. He died in 1124, leaving no children by his wife Sybilla, a natural daughter of Henry the First, and was succeeded by his brother, David the First.

Alexander I. A.D. 1106-1124

Struggle for the independence of the Scottish Church

Death of Alexander I.

David I. A.D.1124.

Edgar, the brother of this prince, had, on his death-bed, bequeathed to him that portion of Cumberland which was possessed by the Scottish kings. The legacy had two good effects. It called the young prince early to the cares and labours of administration; and it removed him from Scotland to a country where he became acquainted with a more advanced civilization and with better regulated government. These advantages were not thrown away upon David. His natural dispositions were excellent; his love of justice, his capacity for labour, his sense of the national honour and independence, his affection to every class of his people, his tenderness to his children, his piety to God, were all so conspicuous in his character, that Buchanan, an author who cannot be suspected of adulation, pronounces him the perfect exemplar of a good king; and the progress made by the country during the twenty-nine years of his reign goes far to justify the assertion.

War with Stephen.

His reign was contemporary with that of Henry the First and of Stephen in England, and it opened with many difficulties. The question of the independence of the church was again started; and before it could be brought to a termination, the forcible seizure of the English crown by Stephen, who deposed Matilda, the daughter of Henry the First, involved him in a war with that usurper. During the life of Henry the First, David and Stephen had sworn to maintain the right of Matilda; and the Scottish monarch, in obedience to his oath, invading England, compelled the barons of the northern portion of that kingdom to swear fealty to this princess. His efforts however were more honourable than successful; and after a war which lasted three years, David was ultimately defeated in the great battle of the Standard, fought on Cutton Moor, in the neighbourhood of Northallerton. Peace was now concluded, and the terms to which Stephen consented, indicate that, although defeated, the Scottish king was but little humbled.

---

[1] Liber de Melrose, vol. i. p. 95.

Battle of the Standard. A.D. 1138.

The earldom of Northumberland, with the exception of the two castles of Newcastle and Bamborough, was ceded to Prince Henry, David's eldest son. As an equivalent for these fortresses, lands were granted to him in the south of England; the barons of Northumberland were to hold their estates of Henry the Prince of Scotland, reserving their fealty to Stephen; and in return, David and all his people became bound to maintain an inviolable peace with England.

Character of David I.

The remaining years of the reign of this wise monarch were pacific and prosperous. The war had convinced him that the English were far superior to his people in arms and discipline; it had been undertaken in fulfilment of his oath to Henry, not from any love of conquest, and having satisfied his conscience, he devoted his life to the arts of good government. "During the course of his sage administration," says Lord Hailes, "public buildings were erected, towns established, agriculture, manufactures, and commerce promoted. The barbarities of his people in their invasions of England, had affected him with the deepest anguish, and believing that religion was the only agent which could humanize and improve the savage multitudes whom he had led, but could not restrain, he endowed the church with new privileges, enriched it with extensive grants of land, founded various bishoprics, built many monasteries, and exhibited in his own person so fine an example of royal greatness, chastened and purified by Christian humility and devotion, that it could not fail to have the best effects upon his people."

Death of Prince Henry. A.D. 1152.

Towards the close of his reign, it was his misfortune to lose his eldest son, Prince Henry, just as he had reached manhood, and exhibited many of the excellent qualities of his father. The blow sunk deep into his heart; but David's first care had been for his people, and he roused himself to provide for the pacific succession of his grandson, Malcolm, a child in his twelfth year. By his orders, this boy, the son of Prince Henry, was carried in a progress through his dominions, to receive the homage of the barons and the people, and was solemnly proclaimed heir to the crown. Having performed this wise but mournful duty, the aged king within a year followed his son to the grave. It is a remarkable and beautiful circumstance, that he was found dead in an attitude of devotion. "His death had been so tranquil," says Aldred, who knew him well, "that you would not have believed he was dead. He was found with his hands clasped devoutly upon his breast in the very posture in which he seems to have been raising them to heaven."

Death of David I. A.D. 1153.

Malcolm IV.

The reign of Malcolm the Fourth, which lasted only twelve years, offers little for our observation. It began with those evils which so invariably attend a minority; war without, and insecurity within the kingdom. Somerled the thane of Argyle, strengthened by the naval powers of the Isles, invaded Scotland, and for some years continued to harass the country by repeated attacks, which at length terminated in an amicable agreement. The transactions of Malcolm with Henry the Second of England impress us with an unfavourable notion of this young prince. It had been a promise of the English monarch made to David the First, in 1149, that if he succeeded to the crown of England, he would cede to Scotland for ever the territory between the Tyne and the Tweed. Instead of insisting on this, Malcolm, overreached by the superior sagacity of Henry, or betrayed by the treachery of his councillors, abandoned to England his whole possessions in the northern counties, and received in return the honor of Huntingdon; a measure which created universal discontent in the nation. These feelings of disgust were imprudently increased by an expedition of the young prince into France, where he joined the army of Henry, claimed from him the distinction of knighthood, and outraged the feelings of national jealousy, by forgetting his station as an independent prince, and fighting under the banner of the English monarch. A deputation from the Scots was sent into France to remonstrate against this conduct, nor did they hesitate in bold language to reproach their king for the desertion of his duty. Galloway rose into rebellion; the inhabitants of Moray about the same time threw off their allegiance; and Somerled the thane of Argyle invaded the country with a formidable fleet. Although the obstinacy of the king had brought these disasters upon himself, his energy and decision met and overcame them. He hurried from France, conciliated his nobles, invaded and subdued Galloway, repulsed Somerled, and after suppressing the rebellion in Moray, adopted the extraordinary measure of dispossessing its ancient inhabitants, compelling them to settle in more distant parts of his dominions, and planting new colonies in their room. These energetic measures were his last, for he died immediately after, at an early age, and was succeeded by his brother William the Second, son of Henry, prince of Scotland, and grandson of David the First.

Malc IV. A.D. 53- 1165.

Willia the L A.D. 5- 1214.

The administration of this prince presents us with the longest reign in the range of Scottish history, extending from 1165 to 1214, nearly half a century. In this protracted division, the most important event was, the disgraceful surrender of the national independence to Henry the Second in 1174, and its recovery by William in 1189. Both transactions require our serious notice. It was the weakness of William to be guided by impulse. Smitten with an admiration for the warlike qualities of Henry the Second, and uninstructed by the misfortunes of his predecessor Malcolm, he first courted this prince, and being disappointed in his object of procuring from his justice the restitution of Northumberland, he imprudently defied him. War ensued; and the king of the Scots having advanced with his army to Alnwick, was surprised, made prisoner, and shut up in the castle of Falaise in Normandy. His impatience under captivity, and the longing of the barons and clergy for their king, led to a pusillanimous treaty, which will ever remain a blot upon the national honour. With consent of his barons and clergy, given at Valogne on the 8th of December 1174, William agreed to become the liegeman of Henry for Scotland, and all his other territories; to deliver up to the English monarch the castles of Roxburgh, Berwick, Jedburgh, Edinburgh, and Stirling; to give his brother David and some of his chief barons as hostages, and to receive in return his liberty. In this treaty, it is remarkable, that while little care was shown as to the independence of the people, a prudent, and, as it has been well denominated, a memorable clause was introduced, which left entire the independence of the Scottish church; and this clause, the bishops and clergy took the first opportunity of asserting before the Papal legate in a council held at Northampton (1176).

Returns Scotlan

On his return to his dominions, William appears to have devoted himself with much energy and success to the cares of government. His dominions were weakened and distracted by repeated insurrections in Ross and in Galloway. In these wild and remote districts, the native chiefs claimed almost a royal sway; and the people, ferocious in their habits, and jealous of all intercourse with England, were ready, upon the slightest provocation or encouragement, to

William the Lion.

rise in rebellion. A pretender to the crown also appeared in Galloway, in the person of Donald, the grandson of Duncan, commonly called the bastard king of Scotland. This adventurer having seized Ross, and wasted Moray, William led an army against him; nor was it till after a desperate struggle that Donald fell near Inverness, and by his death restored tranquillity to the country.

The Scottish Church declared independent. A.D. 1188.

We have already seen how firmly the Scottish church had renounced the idea of any dependence upon the metropolitan sees of York or Canterbury; we have adverted to that careful reservation of their rights at the moment when the king and the nobles bartered away what was not theirs to give, the national independence. In this resolute conduct the clergy were supported by the king; and in 1188, Clement the Third pronounced a solemn decree, by which he declared the "church of Scotland to be the daughter of Rome, and immediately subject to her; and that to the Pope alone, or his legate de latere, should belong the power of pronouncing any sentence of excommunication against that kingdom."

The kingdom recovers its independence.

This important declaration was soon followed by another event still more memorable, in which the kingdom recovered its independence. On the death of Henry the Second, Richard Cœur de Lion, his successor, then intent upon collecting money for his expedition to the Holy Land, invited the king of Scotland to his court, and upon William's engagement to pay to him the sum of ten thousand merks, agreed to restore his kingdom to its independence, reserving the homage formerly due by the Scottish kings for the lands which they held in England. The instrument by which this transaction was completed, declares, that Richard had delivered up to William king of Scots, his castles of Roxburgh and Berwick, had granted to him an acquittance of all obligations which had been extorted from him by Henry the Second, in consequence of his captivity, and had ordained the boundaries of the two kingdoms to be re-established as they existed at the date of William's imprisonment. The Scottish king was at the same time put in possession of all his fees in the earldom of Huntingdon; and all the charters of homage done to Henry the Second by the Scottish barons were delivered up, and declared to be cancelled for ever. We are to ascribe it to the wise regulations of this treaty, and the fidelity with which they were observed on both sides by its authors and their successors, that for a century after its date, there occurred no national quarrel or hostilities between the two countries. The remaining portion of the reign of William demands little notice. During the latter years of it, the succession of John to his brother Richard the First threatened to dissolve the pacific relations between the two countries; but war was happily averted, and the Scottish monarch reserved his energies for the pacification of his own realm, disturbed by a rebellion in the northern counties. In 1214, the king died at Stirling, after a reign of forty-eight years, the longest, as already stated, in Scottish history. His name of William the Lion was probably owing to the circumstance, that, before his time, none of the Scottish kings had assumed a coat armorial. The Lion rampant first appears upon his shield.

Alexander II. A.D. 1214

William was succeeded by his son Alexander, a youth of seventeen, to whom the Scottish barons had sworn homage in 1201, and who was one of the wisest of our kings, whether we regard the justice of his administration, the seasonable severity with which he subdued all internal commotions in his kingdom, the firmness exhibited in his maintenance of the rights of the church, or the wisdom, forbearance, and vigour which marked his policy towards England. His reign was one of constant action, and full of incident. It commenced with his joining the English barons who resisted the tyranny of John. This conduct drew down upon him and his kingdom a sentence of excommunication (1216); but the papal terrors appear to have been little dreaded at this time; and in 1218, Honorius not only abrogated the sentence pronounced by his legate, but confirmed the liberties of the Scottish church.

Alexander II. marries the Princess Joanna of England.

On the accession of Henry the Third to the English throne, Alexander, who was occupied with quelling the repeated insurrections in the northern parts of his dominions, showed every disposition to cultivate amity with England; and his marriage to the princess Joanna, sister of Henry, had a favourable effect in strengthening the ties between the two monarchs.

Increase in the power of the nobles.

War with England, A.D. 1244.

One of the striking features which mark the reign of this monarch, is the gradual increase that is to be observed in the power of the nobles, and the corresponding decrease in the authority of the crown; but if this had injurious effects upon the general prosperity of the kingdom, and distracted it by internal private feuds, it encouraged a feeling of independence, and fostered that warlike spirit, which proved the best safeguards against the encroachments of their more powerful neighbours. This was strikingly shown on the occurrence of a rupture between England and Scotland in 1244. Some time before this, Alexander had claimed from Henry, in right of inheritance, the counties of Northumberland, Cumberland, and Westmoreland; and although the English king did not grant him his full demand, he admitted its justice, by transferring to him an equivalent in certain lands, which he accepted in full of all claims. For these lands the Scottish king did homage; and both monarchs remained on friendly terms for some years, when jealousies suddenly arose, and Henry, alleging that homage had been unjustly withheld, led an army against Scotland. Under these threatening circumstances, the Scottish king, although he had recently experienced the resistance of his nobles to his personal requests, found himself strongly supported by the same barons against the meditated attack of England. They raised in a short time an army of a hundred thousand foot, and a thousand horse, and this demonstration of the national strength had happily the effect of restoring peace without bloodshed. It is worthy of notice, that when a papal legate visited Scotland under this reign, and held a provincial council in the capital, the king manifested the same jealousy of such a proceeding as had been exhibited by his predecessors. He seemed afraid lest the admission of a papal messenger, whose message regarded England alone, should be deemed derogatory to the independence of the Scottish church; and although, at the request of the nobility of both countries, he consented to his coming into the kingdom, he declined a personal meeting, and stipulated that this permission should not be drawn into a precedent.

Death of Alexander II. A.D. 1249.

Accession of Alexander III.

Having engaged in a maritime expedition against Angus of Argyle, one of those petty island chiefs, whose dubious allegiance, in those remote times, oscillated between Norway and Scotland, Alexander had conducted his fleet as far as the Sound of Mull, when he was seized with a fever, and died in a small island there named Kerraray, in the 35th year of his reign. He was succeeded by his son, Alexander the Third, a boy in his eighth year; and the kingdom, which had enjoyed under his father's wise and vigorous administration, an uncommon degree of prosperity, became immediately exposed to the many evils of a minority. Two parties divided the nobility; the one led by Walter Comyn, earl of Menteith, the other by Durward the high Justiciar; and Henry the Third secretly wrote to the Pope, requesting him to interdict the coronation of the young king. Scotland, he said, was a fee of England, Alexander his vassal, and his permission as superior had not been obtained. The Pope appears to have rejected his demand with promptitude, as derogatory to the rights of a sovereign Prince; and the ceremony of the coronation was performed at the abbey of Scone, the coronation-oath being read first in Latin, and afterwards in Norman-French.

Alexander soon afterwards, in fulfilment of a former treaty, Alexander III. marries the Princess Margaret of England.

espoused Margaret, the youthful daughter of Henry, at York, and exhibited a spirit and intelligence superior to his years, in refusing to pay homage for his kingdom of Scotland. "I came," said he to the artful monarch who made the proposal; "I came into England on a joyful and pacific errand, not to answer to an arduous question, which belongs to the states of my kingdom." He at the same time made no objection to take the oath of fealty for the lands which he held in England.

Intrigues of Henry III. with Scotland.

Defeated in this attempt to overreach a minor sovereign, Henry commenced a series of intrigues with the Scottish nobles, with the object of obtaining an entire control over the affairs of the sister kingdom; and the country was divided and distracted by two factions, the one acting under English influence, and the other more honestly contending for the freedom of their prince and the independent administration of the government. These scenes of civil faction and foreign interference continued till the monarch, having arrived at manhood, and developing a character of much energy and judgment, took the reins into his own hand, and compelled his nobility to respect the laws and support his measures.

Haco, king of Norway, defeated at Largs. A.D. 1263.

Scarcely had this happy change occurred, when the kingdom, which had already suffered from the vicinity of the fleets of Norway, was threatened with invasion by Haco, one of its most warlike princes. The dispute which led to this menace originated in a circumstance already noticed; the precarious homage paid by the petty piratical chiefs of the Western Isles, who, as circumstances pressed on the one side or the other, acknowledged a feudal dependence on Scotland or on Norway. To support them in their independence on Alexander, Haco made a descent on the western coast of Scotland with a mighty fleet, but sustained a signal defeat at Largs, and on his return with the shattered remains of his ships, sickened and died at Orkney. The results of this victory were highly favourable to Scotland. It fixed the chiefs of the Western Isles in their allegiance, secured to Alexander the homage of the king of Man, and convinced Norway that Scotland was not to be so easily subdued or overawed as its piratical princes had anticipated.

Death of Alexander III. A.D. 1285.

The remainder of this reign was prosperous, as far as the circumstances of the kingdom are considered, but unfortunate for the monarch, who found himself suddenly deprived by death of all his children. His eldest son, Alexander, died soon after his marriage, and his only daughter Margaret, the wife of Eric, king of Norway, was cut off in childbed, leaving an infant daughter, Margaret, commonly called the Maiden of Norway, the heiress of the Scottish throne. These calamities induced the king, who was a widower, to make a second marriage. Having selected Ioleta de Coney, daughter of the Count de Dreux, the nuptials were celebrated at Jedburgh; and the nation, under a wise monarch still in the prime of life, flourishing at home and at peace abroad, looked forward to a long season of prosperity, when all its hopes were overcast in a moment. Alexander, when riding in a dark night, on the brink of a dangerous rocky ledge near Kinghorn, was precipitated from the top to the bottom, and killed on the spot.

Death of the Maiden of Norway.

The death of the king was deeply lamented, and not without cause, for he left the kingdom in most difficult circumstances, exposed to the ambition and attack of Edward the First, one of the ablest princes who had ever reigned in England, and its happiness at home dependant upon the precarious life of an infant. To fill the cup of Scotland's calamity, this child, Margaret, the Maiden of Norway, when on her passage from that country to take possession of her throne, sickened and died in Orkney; and on her death arose that celebrated competition for the Scottish crown, which threatened to plunge the kingdom into all the miseries of civil war.

A.D. 1285. Design of Edward I.

The moment was favourable to the designs of Edward the First, who determined to make himself master of Scotland. While in that country the various competitors collected their forces and prepared to support their claims, the English monarch having given orders for assembling the strength of his kingdom by a certain day, invited the nobility and clergy of Scotland to meet him at Norham, for the purpose of deliberating upon the succession to the crown. It has been made a subject of dispute, whether Edward was invited by the Scottish people to be umpire in the contest for the crown, or whether he proposed himself as judge, and the subject is involved in some obscurity. It is by no means improbable, that English intrigue and a regard to their own interest, had induced some of the competitors, if not to invite, at least most readily to accept the mediation of the English monarch; but it is equally true, and the point is of far greater importance, that there is no evidence to prove that there was any invitation of this kind, either by the people of Scotland, or even by a majority of its nobles and clergy. Be this as it may, the competitors for the crown, with a large proportion of the nobility and clergy of Scotland, accepted the mediation of Edward, and met this monarch at Norham, (May 1291).

Edward acts as umpire. A.D. 1291.

Claims of Bruce and Balliol.

Of these claimants for the crown the two principal were John Balliol and Robert Bruce. It was quite apparent that the question lay between them, the rights of the other competitors being evidently inferior to theirs. The title of these two chiefs arose out of the circumstance, that on the death of all descendants of Alexander the Third, the crown reverted to the descendants of David, earl of Huntingdon, brother of king William the Lion. This David left three daughters, Margaret, the eldest, who married Alan, lord of Galloway; Isabella, the second, who married Robert Bruce, father to the competitor Robert Bruce, lord of Annandale; and Ada, the third daughter, who married John de Hastings. It was evident, therefore, that the question lay between Balliol and Bruce. Balliol pleaded that he was entitled to the crown as the descendant of the eldest daughter, being great-grandson to David, earl of Huntingdon. Bruce admitted that he sprung from the second daughter, but contended that, being grandson of the earl of Huntingdon, and therefore a degree nearer, his claim was superior.

Conduct of Edward I.

Edward's scheme against the independence of Scotland was now ripe for execution; and announcing his determination to give a just decision, he, to the dismay of many present, required the Scottish barons to swear fealty to him as their Lord Paramount. It was in this character alone, he said, that he was entitled to give, and as such alone that he would pronounce, a judgment. The scene which now ensued was a humiliating one. The right of Edward was admitted; and Bruce, Balliol, the remaining competitors, the barons and the clergy, set their hands to an instrument, in which they acknowledged that the English king was feudal superior of Scotland. There can be little doubt that they knew this claim of Edward to be untenable upon any ground of truth or justice, but they saw it ready to be enforced by a determined prince at the head of the whole strength of his dominions, and they did not dare to resist it. Edward, accordingly, having received their oaths of homage, proceeded to investigate the contending claims, and awarded the crown to John Balliol.

He invades Scotland.

It was probably part of the plan of the English monarch to quarrel with his vassal king. It is at least certain, that he availed himself of the earliest appearance of spirit and resistance in this unfortunate prince to summon him, in terms of reproach and indignity, to his court in England, and at last goaded him and his people into what he termed rebellion. In the war which ensued, Edward found it an easy matter to overrun a kingdom unprepared to resist so formidable an enemy. The town of Berwick was carried by storm;

Edward's success.

Dunbar, the key of the borders, surrendered; Balliol was taken prisoner and sent to the Tower; while the English prince concluded what he deemed the conquest of Scotland, by removing from Scone to Westminster the sacred stone upon which the long line of its kings had been crowned and anointed. But at this sad moment Scotland, which in vain looked for a deliverer amongst its feudal nobles, found one in a man of far inferior rank.

Rise of Wallace.

William Wallace was the son of Sir Malcolm Wallace, who held the estate of Ellerslie, near Paisley. Having been outlawed by the English for an alleged murder, committed on one by whom he had been grievously injured, he fled into the fastnesses of his country, and assembling round him a small band of followers, who were weary of their servitude, commenced that kind of predatory warfare, which led from one success to another, till he saw himself at the head of a formidable force. With this he boldly descended into the low country, and after having defeated the English in the sanguinary battle of Stirling, was soon after chosen Governor of Scotland. This title he only accepted as acting in the name of John Balliol, whom he had always acknowledged as his hereditary king. Into the exploits and career of this great man it is impossible, within our limits, to enter; but making every allowance for the passionate admiration of his countrymen, and regarding him as reflected in the cold glass of history, rather than invested with the brilliant hues of romance, there will still be found all that constitutes a heroic character, if the accomplishment of the greatest results with the most confined means, an entire devotion to his country, a contempt of power for its own sake, unextinguishable hatred of oppression, and a personal courage which nothing could shake for a moment, were ever entitled to such an epithet.

Battle of Falkirk. A.D. 1298.

It was however impossible for Wallace, with all his great qualities, to reconcile the Scottish nobles to his envied elevation, or to compose the feuds and jealousies which divided and weakened their efforts. Edward, who had been absent in Flanders when his officers were defeated at Stirling, hurried back to England, and once more invading Scotland at the head of an immense army, encountered and defeated Wallace in the battle of Falkirk. The result of this victory was the temporary subjugation of a country, whose allegiance expired the moment its invaders retired. Wallace voluntarily resigned the office of Governor, Robert Bruce and John Comyn were chosen Guardians, and for five years the war was continued with various success; but Edward, who in this interval had thrice invaded the kingdom, by these unceasing efforts and superior numerical strength, at last subdued the spirit, and appeared to have completed the conquest of this devoted people. The Guardians submitted and were pardoned; sentence of outlawry was pronounced against Simon Fraser and the few followers of Wallace who still held out; and at last this great chief himself was betrayed into the hands of the conqueror, and executed at London. It was at this crisis, which seemed to seal for ever the fate and liberty of the Scottish people, that a deliverer arose in the person of Robert Bruce.

Wallace executed.

Section V.

A. D. 1306 to 1436.

Reign of Robert Bruce.

Nothing could be more extraordinary, or apparently more unpropitious to the cause of freedom, than the circumstances which led to this great result. Robert Bruce, earl of Carrick, and grandson of the competitor for the crown, had acted a dubious and interested part during the years that Wallace, and the few patriotic barons who adhered to him, made their stand for the independence of their country. He inherited, with vast landed estates, the right to the crown possessed by his grandfather; but, had he urged his claim, it might have been at the risk of the forfeiture of these possessions, which made him one of the most powerful barons in Scotland; and, although, in his early career, we can detect occasional outbreaks of the patriotic feeling, he preserved his allegiance to Edward the First, and appears to have been treated with confidence by that monarch.

Reign of Bruce. A.D. 1306.

Murder of Comyn.

The injuries inflicted on the country seem at last to have aroused both Bruce and Comyn, and they formed a secret agreement to rise against the English. But Comyn's heart failed him. He betrayed the purpose to Edward, and meeting Bruce, who had been made aware of his treachery, in the church of the Grey friars at Dumfries, that proud baron reviled him as an informer, and stabbed him to the heart on the steps of the high altar. He was instantly proclaimed a traitor by Edward, excommunicated as a sacreligious murderer by the Pope, a price set upon his head; and from the first and most influential noble in the kingdom, he felt that he must either assert his right to the crown, and trust to his sword for its defence, or be content to sink into the condition of an outlaw and a fugitive. His decision was instantly taken. He rode with his little band to Scone, and was there solemnly crowned; but being aware of the advance of an English army, he hastily concentrated his forces, and after ravaging Galloway, marched against Perth, then in possession of Edward.

Bruce proclaims himself king. A.D. 1306.

He is at first unfortunate.

But the early portion of Bruce's career was disastrous; and those military talents, which afterwards conducted him through a course of unexampled victory, were nursed amid incessant defeat and hardship. He was put to flight at Methven, his small army dispersed, and he himself driven an almost solitary wanderer through Lennox and Kintyre, to seek an asylum in Rachrin, a little island on the northern coast of Ireland. Here he remained during the winter, unaware of the execution of his faithful followers, who had fallen into the hands of Edward; of the imprisonment of his queen and daughter, and the extraordinary severity with which the English monarch seemed determined to rivet the fetters upon his native country.

Bruce defeats the English at Loudon Hill. A.D. 1307

In the spring he passed over from Rachrin to Arran, accompanied by his brother Edward Bruce, Sir James Douglas, and about three hundred men. His own castle of Turnberry, on the coast of Carrick, was then occupied by Lord Percy, an officer of Edward. Bruce attacked it, put the English garrison to the sword, and, after a variety of minor enterprises, in which, although often repulsed, he and his followers gained experience and confidence, he ventured, although at the head of only six hundred spearmen, to meet the earl of Pembroke, with three thousand cavalry, at Loudon Hill, (May 1307). The result of this conflict, owing to the admirable dispositions of Bruce, was the entire defeat of the English; and from this point, the crisis of his fortune, to the hour when the liberty of his country was for ever secured on the field of Bannockburn, the career of this extraordinary man presented an almost continued series of success.

Bruce's wise policy.

It was perhaps fortunate for Scotland that he was opposed, not by Edward the First, who had died when on his march to Scotland, (1307), but by his son, Edward the Second, a prince of far inferior talent; yet the military resources of England were so formidable, and the barons who wielded them such experienced leaders, that Bruce, who had to struggle against domestic enemies, as well as foreign invasion, may well be praised for the admirable judgment with which he wielded the strength of his little kingdom. It was his policy to avoid a general battle, and to starve and distress the formidable armies which England repeatedly sent against him, by wasting the country, retiring slowly before his enemies into the woods and fastnesses, and when they were compelled by famine or the season to retreat, by hanging on their rear, and cutting them off in detail Convinced that, from the

Robert Bruce. Scottish infantry.

poverty of Scotland, it was in vain to attempt to rival the mounted chivalry of England, he turned his whole attention to the formation and discipline of his infantry. They were armed with a spear eighteen feet in length, a sword and battle-axe at their girdle, a short cut-and-thrust dagger, a steel bonnet, and a back and breast-piece buckled over a tough leather jerkin. They were trained to form sometimes in squares, sometimes in circles, more or less deep, according to the nature of the ground and of the service. Such was the main army of Bruce, his pikemen; but after he had restored peace and security to his kingdom, and began in his turn to act upon the offensive, he often employed the only kind of cavalry which Scotland could raise, the border prickers, who, lightly armed, mounted on hardy little horses, and carrying as their provisions a bag of meal slung at their saddle-bow, darted upon the richest districts of England, or stripped them of their wealth, and scoured like a whirlwind across the border, ere the force of the country could be raised in its defence.

Battle of Bannockburn. A.D. 1314.

To pursue the details of his obstinate contest with England, is impossible. It was during the first years a war of defence, in which Bruce struggled for existence. This secured, it became aggressive; but his efforts were confined to the recovery of his dominions out of the hands of those Scottish barons who had embraced the service of the enemy, or his castles from the English governors to whom they had been entrusted. At last, when Edward the Second, at the head of an army a hundred thousand strong, composed of the flower of his kingdom, and led by his most experienced officers, had penetrated into the country, Bruce found himself driven from his favourite maxim, and compelled to hazard a battle. On the field of Bannockburn, near Stirling, thirty thousand Scottish foot, and five hundred horse, led by the king in person, and under him commanded by Douglas, Randolph, and the Steward of Scotland, encountered and entirely defeated the formidable array of England. Edward fled from the field to Dunbar, and the broken remains of his army, in dispersed bodies, made their retreat in much disorder into England, (June 24, 1314).

In this memorable victory it may be said, without exaggeration, that a lesson in the history of liberty was taught, not only to Scotland, but to the world; to every people who have felt the misery of servitude, or tasted the sweets of freedom. It proved that a country may be, as Scotland was under Edward the First, brought by oppression and cruelty to the very brink of despair; its cities sacked, its fields laid waste, till famine was the consequence; its best leaders executed or imprisoned, its hearths left desolate, its very offerings of praise proscribed, and its refuge in religion attempted to be cut off; but that, till exterminated, a free-born people cannot be said to be subdued.

Effects of the victory at Bannockburn.

The immediate effects of this great victory upon the spirit of the respective countries, were not less remarkable. It convinced the Scots, that, with a good heart and skilful leaders, their squares of infantry, with their long pikes, were a match for the English horse, however superior in arms and numbers; it taught the king, that what he had most to dread was the discharge of the English bowmen; and admonished him, that, however complete had been the defeat, however glorious the consequences of the victory, his favourite military maxim, to avoid a general battle, was still his best and safest course. It affords a striking view of the character of this great man, that his success at Bannockburn led neither to presumption, nor, much as he had suffered, and deeply as he had been injured in his tenderest relations, to a cruel retaliation. On the contrary, it was followed up by Bruce with an immediate proposal for peace; but he would consent to treat only on the footing of an independent king, and the offer was rejected.

Rober Bruce A.D. 14- 1328.

From 1314 to 1328, an interval of nearly fourteen years, the war was continued with almost uninterrupted success on the part of the Scots; while a series of reverses were endured by England, which are chiefly to be ascribed to the pusillanimous character of the monarch, and the great military ability not only of Bruce, but of the officers whom he had trained, Sir James Douglas, Randolph earl of Moray, the young steward of Scotland, and many others. It may convey some idea of Bruce's incessant occupation in the field, when it is mentioned, that during this interval, England was twelve times invaded, either by the king in person, or by his officers, its border counties were exposed to ravages, and on frequent occasions the fires which marked the Scottish march were seen burning beside the gates of York; nor were the Scottish king's proposals for a peace accepted, till the English districts, which were compelled to purchase safety by the payment of a heavy tribute, threatened in their misery, to throw themselves into the arms of Scotland. At last, on the first of March 1328, an English parliament assembled at York. Bruce was acknowledged king of Scotland, Scotland itself recognised as a free and independent kingdom, and peace established, after a sanguinary war of twenty years.

The w conclu A.D. 28.

Death Bruce. A.D. 1 9.

This great consummation was not long survived by him to whom, under God, the result was chiefly due. The king, whose constitution had been broken by the fatigues and exposure of his early life, began to droop soon after he saw the liberty of his country permanently established; and he died at Cardross on the 7th of June 1329.

David Regen of Rando.

The death of Bruce was a severe trial to Scotland. His only son David, who succeeded him, was a boy of six years old; and while the nation was thus exposed to all the evils of a long minority, Edward the Third, one of England's most warlike monarchs, was just commencing his career, which soon developed uncommon talents, and great ambition. Randolph indeed, who was chosen Regent, and the good Sir James Douglas, with other veteran officers, still remained; but Douglas was slain in Spain, whither he had proceeded on his way to Jerusalem with his master's heart; and the earl of Moray only survived the death of Bruce for three years. To add to these calamities, the monarchs who successively filled the Scottish throne, and on whose personal character, in these rude times, much of the success and vigour of the government depended, were little similar to their great predecessor. From the death of Bruce till the reign of James the First, the first prince who in any measure was worthy of a comparison with him, a period of nearly a century elapsed,[1] in which the sceptre passed into the hands of three princes, David the Second, Robert the Second, (the first sovereign of the house of Stewart, being the son of the Steward of Scotland, by Marjory, Bruce's only daughter,) and, lastly, Robert the Third. Contemporary with these Scottish princes were Edward the Third, Richard the Second, Henry the Fourth, and Henry the Fifth, all, with one exception in Richard, wise, warlike, and fortunate monarchs. The odds, therefore, were infinitely against Scotland, a country far inferior in its population and resources to England, and torn by domestic feuds; and yet against reiterated attacks it maintained the contest for its liberty. Unable to descend into minute detail, we take a summary of the larger portion of this calamitous interval of Scottish history, from another work. "A period of sixty-four years elapsed between the death of Robert Bruce and the birth of James the First, during which time, although torn by anarchy and domestic faction, the country maintained a remarkable struggle for its liberty. It

---

[1] We date not from the birth of James, but his return from captivity in England. It may be proper to mention, that the authorities for this sketch, from Alexander the Third to the reign of Mary, are the same as those followed by Mr. Tytler, in his History of Scotland, now in the course of publication.

David II.

was in this period, eight times invaded by a foreign force; it was betrayed and deserted by David the Second, the unworthy son and successor of Bruce; it saw, on many occasions, the most powerful of its nobles enlisted under the banner of its enemies; it had to struggle against the military genius and political talents of Edward the Third, and Henry the Fourth and Fifth; and yet, with limited resources, and divided councils, so tenaciously did the people cling to their liberty, that, though sore oppressed, they were never conquered. Amid almost constant war, and its dreadful accompaniments, famine and the pestilence, they still preserved their freedom, preferring the prospect of living in a country reduced by repeated invasion to a solitude or a desert, or even the last alternative of being totally exterminated, to the most flattering offers of being united to England, when coupled with the condition that they should renounce their national independence."[1] We have above alluded to the degeneracy of David the Second, whose long reign of forty-two years was divided into a minority, the greater part of which was passed in France; a captivity in England, the result of his calamitous defeat in the battle of Durham; and a train of subsequent reverses all occasioned by his headstrong character and devotion to his selfish pleasures. But the darkest stain upon David, was his intrigues with Edward the Third, in which he hesitated not to sacrifice the independence of the country, to swear homage to the English prince for his kingdom of Scotland, and even to propose to his parliament, that the order of succession solemnly settled by his heroic father, should be altered in favour of an English prince. It is needless to say that so degrading a proposal was indignantly repelled, and that the death of the prince who had offered the insult was regarded as a national deliverance.

1371.

Robert II. the first of the house of Stewart. Robert III. an indolent prince.

In Robert the Second, who succeeded him as the first of the house of Stewart, and his son, Robert the Third, the nation, though still exposed to the repeated attacks of England, experienced a short breathing time, owing to the death of Edward the Third, and the incapacity of Richard the Second; but neither of these Scottish princes possessed the vigour or the talents requisite to wield the sceptre with success, in the midst of the difficulties by which they were surrounded. The second Robert came to the crown when age had chilled his vigour; and his son and successor, Robert the Third, was of too indolent and gentle a character to hold his part against a fierce feudal nobility, led by his brothers, the Earls of Fife and Buchan, the first a man of great ambition, the second a monster of crime, who gave himself up to every species of lust and rapine, and has been traditionally remembered as "the Wolf of Badenoch."

James I. A long minority. 405.

All this led to great disorder. The king, unwilling to burden himself with the cares of government, devolved the administration upon his son, the duke of Rothsay, a young man of violent passions, though of considerable ability, who had made himself particularly obnoxious to his uncle, the earl of Fife. This led to a fatal collision. Fife, whose authority was increased by his being made duke of Albany, proved too strong for the young prince. His father, the king, was persuaded that the excesses of his son required restraint, and the unhappy youth was hurried to Falkland, and shut up in a dungeon, where he was intrusted to the care of two ruffians, who starved him to death. It was at first reported that he had been cut off by a dysentery; but the horrible tale of his sufferings soon after transpired. "A poor woman in passing through the palace garden, had been attracted by his groans, and had found means to support him by thin cakes which she slid into the grated window of his prison, and it is said by her own milk, conveyed through a reed; but she was detected, and put to death by his keepers; and after fifteen days, the body of the miserable captive was found in a state too shocking to be described. In the extremities of hunger, he had gnawed and torn his own flesh."[2] Robert, depressed by this calamity, and incapable of exertion, committed the whole cares of the government to the duke of Albany; and the power of that daring man was increased by another event which completely broke the spirit of the king, and was probably the cause of his death. This was the seizure by the English of his eldest son James, then a youth in his fifteenth year, and on his passage to France. The consequences were very fatal to the country. The prince was carried to the Tower; the father did not long survive the captivity of the son; and on his death, which took place in 1406, his brother, the duke of Albany, succeeded to the prize which had long been the object of his ambition, the undisputed regency of the kingdom.

James I.

Regency of the Duke of Albany.

The young king, James the First, was a captive, and Henry the Fourth knew too well the value of the prize to part with him. For nineteen years he was detained in England; and, during this long interval, Albany became the uncontrolled governor of Scotland. It has been suspected that the intrigues of this able and unprincipled man with the English monarch, had led to the seizure of the young king. That they prolonged the period of his captivity, there can be no doubt.

He cultivates peace with England.

It was clearly the best policy of the regent to cultivate peace with England, and to conciliate Henry the Fourth, as this prince could at any time put a termination to his authority, by restoring James to his kingdom; and the same desire to retain the power which he had so nefariously usurped, induced Albany to cultivate the friendship, and overlook the crimes and excesses of the great feudal barons. All this led to dreadful confusion in Scotland, which, although freed for a time from the incessant invasions of its more powerful neighbour, was torn by private war, whilst the lives and property of its people were exposed to the attack of every unprincipled feudal baron who sheltered himself under the protection of the regent.

A.D. 1424.

James I. returns to his country. A.D. 1424.

This miserable state of things was at length terminated by the return of James to his dominions; a prince whose character presented a striking contrast to that of his father and grandfather. During the nineteen years in which he had been unjustifiably detained in that country, he enjoyed advantages which almost repaid him for his captivity. Henry the Fourth, a prince who well understood the art of government, had made it his generous care that James should receive an excellent education; and he had the advantage of being instructed in war, by accompanying his victorious successor, Henry the Fifth, to France. On his return to his own dominions, he was in the prime and the vigour of manhood. His character, formed in the school of adversity, was one of great power. He found his kingdom a scene of lawless excess and rapine; a condition to which it had been reduced from the want of a firm hand to restrain oppression and enforce the laws. Since the death of Bruce the power of the aristocracy had been on the increase, while that of the crown had proportionally lost ground, and fallen into contempt. His object, as can be clearly discerned through the history of his brief reign, was to restore the kingly authority, to rescue the commons from oppression and plunder, to give security to property, encouragement to the industry and pacific arts of his people, and to compel his barons to renounce their ideas of individual independence, and become good subjects.

Character of James I.

James's principles of government.

James's extreme severity to the house of Albany.

The regency of Albany, his uncle, and of his son Murdoch, who had succeeded him, was naturally and justly regarded by James as little else than a long usurpation. He was mortified that Albany, against whom, as the murderer of his brother, he entertained the deepest resentment, should have escaped his merited punishment; and the royal

[2] Lives of Scottish Worthies, vol. ii. p. 242.

Execution of Duke Murdoch, and the Earls of Athole and Lennox.

vengeance fell with a proportionably heavier force upon Murdoch, his son and successor; nor is it possible to deny that James's retribution was cruel and excessive. Murdoch, the duke of Albany, his two sons, the earl of Athole, and Alexander Stewart, with his father-in-law, the earl of Lennox, a venerable nobleman, eighty years of age, were tried, condemned, and executed. James, the duke's youngest son, having escaped, collected a band of freebooters, and after sacking and plundering Dunbarton, took refuge in Ireland; but five of his men fell into the king's hands, and were torn in pieces by wild horses. So horrid a punishment, and the exterminating severity exhibited to all connected with the house of Albany, can admit of no justification; and there is every reason to believe, that the early and miserable death of the monarch, is to be traced to the deep feelings of revenge with which some of his nobles from that moment regarded him. Neither is it possible to believe that the king in this instance carried along with him the feelings of the people. Yet looking at the state of things in Scotland, it is easy to understand his object. It was his intention to exhibit to a nobility, long accustomed to regard the laws with contempt, and the royal authority as a name of empty menace, a memorable example of stern and inflexible justice, to convince them that a great change had already taken place in the executive part of the government; to furnish also a warning to the people, of the punishment which awaited those who imagined that fidelity to the commands of their feudal lord was paramount to the ties which bound them to obey the laws of their country.

State of Scotland in relation to England and the continent.

Having given this severe and sanguinary lesson, the next efforts of the monarch were addressed to the internal administration of his kingdom. From without he had nothing to dread; he was at peace with England, and his marriage with Jane Beaufort, the niece of Cardinal Beaufort, had, from her near relationship to the English monarch, strengthened the ties between the two countries. France was the ancient ally of Scotland; and the Netherlands profited too much from the Scottish trade not to be anxious to preserve the most friendly relations. The king could therefore direct his undivided attention to his affairs at home. His great principle, and it was one worthy of so wise a prince, seems to have been a determination to govern the country through the medium of his parliament. Of these convocations of the national legislature, which had been rarely held under the regencies of the two Albanys, no less than thirteen occurred during his brief reign, which, dating from his return in 1424, lasted only thirteen years. It is to him that Scotland owes the first clear recognition of the principle of representation by the election of the commissaries for shires; it was by him that one of the greatest improvements was introduced into the administration of justice, by the institution of a court of law known by the name of the SESSION. Nor was this all. Previously to his time, the laws and the acts of parliament had been published in Latin, and the great majority of the inferior judges to whom their execution was entrusted, were unable to understand them. To remedy this grievance, the king commanded the acts of parliament to be drawn up in the spoken language of the land; an improvement so important, that it forms an era in our legislation. Other points of almost equal interest occupied his attention. By his personal presence in the Highlands, and by the military force which he brought along with him, when he visited those remote districts of his dominions, he introduced laws and order where there had formerly been little else than feudal licence and contempt for all authority. Although he cultivated the arts of peace, he did not forget that its surest preservative was an attention to the military strength of his country. *Weapon-shawings*, or military musters, were held periodically; and having witnessed, when resident in England, and in the war of Henry the Fifth with France, the great superiority of the English over the Scottish archers, he made it his earnest care that his subjects should cultivate this warlike accomplishment. In many of the acts of the various parliaments of this monarch, we can also trace an attention to the encouragement of agriculture, to the interests of foreign trade and domestic manufactures, to the state of his shipping and navy, to the prices of labour, and the melioration of the condition of the labourers of the soil, which clearly demonstrates the high and important objects that occupied the king's mind, although the means he employed were not exactly those which should have suggested themselves to the experience of a more advanced age. Amid these severer duties, James gave an example to his rude barons of the cultivation of intellectual accomplishments. He was himself a poet; and the king's book, or KING'S QUAIR, composed during his captivity in England, is still read by many with delight and enthusiasm. He was a reformer of the language of his country; he composed pieces of music, and sang and accompanied himself on various instruments. It is probable, however, that these employments were rather the solace of his tedious confinement in England, than objects of serious pursuit after his return.

Weapon-shawings.

James a scholar a a poet.

James a sassinate

Feb. 20 1436.

Having so zealously devoted himself to the best interests of his kingdom, James had the satisfaction to see his measures attended with success, and all seemed secure and prosperous, when he suddenly became the victim of a dark conspiracy. Under circumstances of extreme ferocity he was assassinated in the monastery of the Blackfriars at Perth, by Sir Robert Graham, the earl of Athole, and some accomplices who had been dependants of the house of Albany. The court was then at Perth, and James had taken up his residence in the Dominican monastery beside the town. The king was betrayed by his chamberlain, who facilitated the entrance of the conspirators, by removing or damaging the locks of the royal apartments. When the alarm was given, it is said that a lady who waited on the queen, named Catherine Douglas, thrust her arm into the staple of the door, and thus, before it was broken, heroically afforded a brief interval in which the king contrived to conceal himself in a small vaulted chamber, where for some time he evaded discovery. The conspirators, under the idea that he had escaped, had dispersed themselves through the palace, and the unfortunate monarch might have been safe, if he had not prematurely attempted to leave his concealment. The noise which he made recalled one of the ruffians, who shouted to his companions; and springing down into the vault, they threw themselves upon their defenceless victim and murdered him, after a desperate resistance. Although considerable obscurity hangs over the ramifications of the plot which ended thus fatally to the king, there exists no doubt that it owed its origin to indignation at the fate of Albany, and those deep feelings of feudal revenge which had been long cherished by the friends of that unhappy house; affording a terrible lesson to princes of the reaction which may take place, when justice forgets her calmer mood, and pushes her punishments beyond example into revenge.

James a boy of years o A.D. 1

Punish- ment o murder

The death of James the First was a severe calamity to the country, exposing it for the third time since the death of Bruce to all the evils of a long minority. His eldest son, who succeeded to the throne by the title of James the Second, was a boy only six years old; and although the character of the queen-mother was marked by considerable talent and vigour, these qualities were feeble substitutes for the masculine wisdom, the determined courage, and the unwearied care of the husband whom she had lost. Her first duty was the arrest and punishment of his murderers; and this she executed with speedy and immitigable severity. But the death of the king once more gave a licence, and offered to the feudal nobles an opportunity of recovering their power of which they were not slow to avail themselves.

Graham, the principal murderer of the late monarch, in the midst of the cruel tortures which preceded his death, had avowed that the day was at hand when the Scottish nobles would venerate his memory for having rid them of a tyrant; and these proud and powerful barons, when they remembered the magnitude of James's plans, and the stern and sometimes unjust severity with which he carried them into execution, could not but feel that now was the time to recover the privileges which they had lost, and to provide some strong and permanent barrier against all future encroachments of the crown.

General observations.

This observation is the key to the history of the country, not only during the reign of this monarch, but for the next century. It unfortunately happened, that with the exception of James the Fourth, who on his accession was a youth of seventeen, Scotland was visited by a series of minorities in James the Second, James the Third, James the Fifth, and Mary, which occupied the long interval between 1436 and 1560; and during this period of more than a century, the extraordinary increase in the power of the nobles, the diminished respect for the crown, and its proportionate weakness against attack and encroachment, are too prominent features to escape notice. We see events, the same in character, and merely varied in name and minor incidents, occurring during the whole time: a monarch of greater or of less energy, emerging from his minority, and making an effort to recover the power which he had lost; a band of turbulent and selfish nobles leagued against him, and only detached from their brethren, and persuaded to act with the crown, by an appeal to their interest and their fears. These remarks were strikingly exemplified in the scenes which took place during the minority of James the Second.

Minority of ames II.

Immediately after his coronation, a struggle commenced for the possession of the chief power in the government. In a parliament held at Edinburgh, the queen-mother was entrusted with the custody of the young king, while Archibald earl of Douglas and duke of Touraine, was appointed lieutenant-general of the kingdom, a title probably including all the powers of a military governor. In civil matters the chief authority seems to have fallen into the hands of the chancellor Crichton, who had the command of Edinburgh Castle, in which the queen-mother, with the young prince, had taken refuge soon after the murder of her husband. This princess, however, soon found that Crichton turned the possession of the royal person into an engine for his own advancement, and refused to her that frequent intercourse with her son which she had expected, and to which she was entitled.

Having combined therefore with Sir Alexander Livingston, a baron who had been in favour with the late king, she contrived, by stratagem, to possess herself of the person of the young king, whom she shut up in a large wardrobe chest, and carried as her luggage to Leith, from whence she hastened to Stirling Castle, which had been assigned to her as a jointure-house.

eadful e of tland.

The kingdom was now divided between three factions, that of the queen and Livingston, who possessed the person of the king, Sir Alexander Crichton the chancellor, and thirdly, the earl of Douglas, whose immense estates in Scotland, and his foreign wealth and influence as duke of Touraine, rendered him by far the most formidable baron in the country. From this moment to the period when James, having attained majority, began to act for himself, an interval of thirteen years, the history of the nation presents little else than one uniform scene of civil anarchy and of unpunished crime. "The young monarch beheld his kingdom converted into a stage on which his nobles contended for the chief power; whilst his subjects were cruelly oppressed, and he himself handed about, a passive puppet, from the failing grasp of one declining faction, into the more iron tutelage of a more successful party in the state." In this melancholy drama the chief parts were played by Crichton and Livingston, who, deeming it for their interest to crush the overgrown power of the house of Douglas, inveigled the young earl and his brother into the Castle of Edinburgh, brought suddenly against them a charge of treason, and put them to instant death.

A.D.1449. James II. humbles the house of Douglas.

It was fortunate for the country, that when thus torn by domestic factions, its foreign relations were of a pacific character, England, France, and the Netherlands, being all animated with the most friendly dispositions, while the young king, as he advanced from boyhood into maturer years, developed a character of prudence, vigour, and intelligence, which appeared destined to restore a better state of things to his kingdom. Having married the daughter of the duke of Gueldres, he assumed the government, and selected as his principal councillor, Kennedy, bishop of St. Andrews, a prelate of great wisdom and integrity, whose rank as head of the church, invested him with an authority to which the people, amid the general corruption, looked with much reverence and affection. It was probably by his advice, that James, whose passions were naturally violent, and who viewed with indignation the arrogance of the earl of Douglas, engaged in a systematic plan for the reduction of his overgrown power. Without attempting at once, and by any arbitrary exertion of strength, to deprive this potent chief of his high offices, a measure which might have been followed by extreme commotion, he gradually withdrew from him his countenance and employment; surrounded himself by able and energetic councillors, whom he promoted to the principal places of trust; and thus weakened the authority of the proud baron, rather by the formidable counterpoise which he raised against it, than by any act of open aggression. This conduct was attended with the best results. The earl of Douglas, finding his consequence decreasing, and his power on the wane, retired for a while from Scotland, and respect for the character of the monarch increased with the feeling of security derived from an improved administration of the government. During the absence of the chief, James had time to reduce the minor barons who were his dependants, to attach his own friends more powerfully to his interest, and to concentrate a strength, which, on Douglas's return from Italy, convinced him that he must consent to play a second part to his prince. The result was what might easily have been anticipated. A collision took place between this haughty potentate and the young sovereign whose commands he had so often defied. Douglas, naturally rash and fearless, had consented, under a safeconduct bearing the royal signature, to visit James in the Castle of Edinburgh. After the royal feast, the king remonstrated with his guest; disclosed to him the proofs he possessed of his combinations against the government; reproached him for the frequent murders of his subjects committed by his order; and condescended to intreat him to forsake such dangerous courses, assuring him of his pardon and favour. Douglas, instead of embracing the offer, replied to it with haughtiness and insolence; and James, losing all command of himself, and braved to his face, drew his dagger and stabbed him to the heart. Falling at his feet, he was instantly despatched by the nobles, who, hearing the commotion, rushed into the apartment.

A.D.1451

Murder of the Earl of Douglas by James II.

A.D.1452. Defeat of the ninth Earl of Douglas by James II.

This atrocious murder was followed by a struggle between the royal party and the friends and vassals of the unfortunate baron, in which the king was completely successful. Sir James Douglas, who succeeded his brother in the earldom, attempted to brave the monarch, renouncing his allegiance, and throwing himself into the arms of England; but his projects against his country were defeated. He was equally unfortunate in his alliance with the Lord of the Isles, whose naval force he directed against the west of Scotland; and at length, in a fruitless effort to regain his lost power by invading the Merse along with the earl of Northumberland, he was totally routed by the earl of Angus, and driven a landless fugitive into England.

A.D.1460.
Death of James II. at Roxburgh.

The remainder of this reign was employed by the king in an endeavour to complete the work which he had begun; by strengthening the power of the crown, and giving security to the persons and property of his subjects; by attaching to his party the great and influential body of the clergy, carrying into effect various parliamentary enactments for the defence of the borders against the attacks of England, and cultivating the warlike character of his people. Amid these kingly cares, he unwisely suffered himself to be entangled by the contests between the Yorkists and Lancastrians; and having espoused the party of Henry the Sixth, levied an army, and met his death by the bursting of one of his own guns at the siege of Roxburgh. He was succeeded by his son James the Third, a boy in his eighth year.

James III.
A.D.1461.

The death of a sovereign thus cut off in the prime of his manhood and usefulness, leaving an infant successor, would have been a deep calamity at all times, but it was especially so at this moment. James the Second had with uncommon vigour and judgment reduced the overgrown power of his nobles; but he died before his plans were matured, leaving the nation at war with England, the seeds of civil disunion lurking in his kingdom and ready to spring up, and the more northern parts of the realm held by fierce chiefs, who were disposed, on the slightest provocation, to throw off their allegiance. With these island lords, Edward the Fourth entered into a strict alliance; and the banished Douglases, now become English subjects, agreed to assist him in a confederacy, the object of which was nothing less than the conquest and partition of Scotland. It was to be expected that the favour shewn by that country to the expatriated monarch Henry the Sixth, should have deeply incensed his rival; but the facility with which he purchased his instruments, and found them in the ranks of the Scottish nobles, who became the vassals of England, is a mortifying fact.

Energy of the queen-mother.
State of the kingdom.
Death of Mary of Gueldres.
A.D.1463.

From these general remarks it is easy to anticipate the history of this reign, and the scenes which it presented. Into their minuter details it is impossible to enter. For a while the energy of the queen-mother supported the government. On the news of the death of her husband, instead of giving herself up to unavailing grief, she repaired with all speed to the camp before Roxburgh, carrying with her her infant son, now king; him she presented to the nobles, and urged them for him and his father's sake to press forward the siege. She was obeyed, and Roxburgh was taken; but fatal disputes soon succeeded to this success, and it required all the vigour of the queen, with her chief minister, Bishop Kennedy, a man of high character and talent, to struggle against the difficulties which surrounded them. In the northern parts of the kingdom all was unsettled; and the earl of Ross espousing the cause of Edward the Fourth, proclaimed himself king of the Hebrides, while the earl of Angus, on whom, after the fall of the house of Douglas, a large share of their power had devolved, undertook to support the party of Henry the Sixth, contrary to the wishes of the queen and Bishop Kennedy. At this crisis, the young sovereign lost his mother Mary of Gueldres; and, after a few years, Bishop Kennedy followed her to the grave; events which deprived the government of its best, or rather of its only support. Yet amid all these complicated dangers, it is remarkable, that for fifteen years, the interval occupied by the minority of this prince, the affairs of the country were prosperous.

Rise of the house of Boyd.

On the death of Bishop Kennedy, the chief power in the government had fallen into the hands of William Lord Boyd, the high Justiciar, a baron hitherto little known, but whose power rose, in a few years, to a height which almost rivalled that of the once formidable Douglases. He became governor of the king's person; filled every office with his dependants; married his eldest son, who was created earl of Arran, to the king's sister; and acquired so much influence over the young king, rather, it would seem, by terror than by love, that he appeared completely subservient to his wishes. The decay of this family was as sudden as its rise. A marriage had been negociated between the king and Margaret princess of Denmark, and scarcely was it concluded, when a faction of the nobles, at the head of whom was the monarch himself, suddenly attacked the Boyds, arraigned them of high treason, seized and confiscated their large estates, and brought to the scaffold their principal leader. A divorce was instituted against the earl of Arran and his wife, the princess Mary, sister to the king; and she was compelled to give her hand to Lord Hamilton, a favourite of the young monarch. It was through this marriage that the family of Hamilton, which now rose into great power upon the ruin of the Boyds, became, in the subsequent reign of Mary, the nearest heirs to the crown.

James II
attains ma
jority.
State of the kingdom.

James had now attained majority, and in assuming the full administration of the government, he found his kingdom more opulent, more secure, and more powerful, than could have been anticipated from the struggles of his minority. The important isles of Orkney and Zetland had been acquired with the daughter of Denmark; the rich town of Berwick, and the border fortress of Roxburgh, had been occupied by the Scots; the earldom of Ross had been annexed to the crown; the independence and liberty of the Scottish Church established by the erection of St. Andrews into an archbishopric; and, lastly, a marriage treaty with England, by which the youngest daughter of Edward the Fourth was betrothed to the king's eldest son, seemed to promise security and peace in this formidable quarter. If such had already been the success of this reign, it seemed not unreasonable to look forward to still greater prosperity in after years; and yet the history of the country, from the moment when the monarch attained his majority, presents a melancholy contrast to this beginning. This reverse we are inclined to ascribe partly to the personal qualities of the king, partly to some changes in the power and dispositions of the great body of the feudal nobles, which are discernible at this period, not in Scotland only, but in all the feudal kingdoms of Europe.

Characte
of James
III.

Some of our historians have represented James the Third as a compound of indolence, caprice, and imbecility; but their opinion seems rash and unfounded. His character was different from that of the age in which he lived, and in some respects it was far beyond it. The times were rude, warlike, and unintellectual. The king was fond of repose, and addicted to a seclusion in which he might devote himself to pursuits which bespoke a refined and cultivated mind: a passion for mathematics, and the study of judicial astrology, a taste for architecture, a love for the science and practice of music, and a generous disposition to patronize the professors of literature and philosophy, rather than to surround himself with a crowd of fierce retainers, were the prominent features in the mind of this unfortunate prince; tastes which have been reprobated by contemporary historians, but which, if duly regulated, were rather praiseworthy than the contrary. Unfortunately, however, this due regulation was wanting. James had the weakness, not only to patronize, but to confer feudal rank, and distinctions, hitherto appropriated to the nobles, upon the professors of his favourite studies. Architects, musicians, painters, and astrologers, were admitted to the familiar converse of the sovereign, while the highest nobles found a cold reception or a positive denial of access. Is it any subject of surprise, that a fierce nobility should have been disgusted with such conduct, and that the king's warlike brothers, the earls of Albany and Mar, should have been regarded as the chief support of the state?

James III.

General remarks on the feudal nobility of Europe.

But in studying the history of this reign, we shall detect other causes of the sanguinary scenes in which it concluded. Not only were the feudal nobility of Scotland induced by the neglect and favouritism of the king to long for a change, but it is worthy of remark, that for some time previous to this period, the feudal nobility of Europe had been in a state of extraordinary commotion and tumult; and events had occurred which diminished in the eyes of the aristocracy and of the people the respect entertained for the throne. The revolution in England under Henry the Fourth, the subsequent history of that kingdom during the contest between the houses of York and Lancaster, the political struggles in France under Louis the Eleventh, the relative condition of the greater nobles in Germany and of the rights of the imperial crown under the emperor Sigismund, the dissensions which divided the Netherlands, and the civil factions which agitated the government in Spain, all combined to render resistance so common, and so lucrative in the eyes of the feudal nobility in Europe, that its frequency can be a subject of little wonder; and if, when we take into account the frequent communication between Scotland and the continent during the period of these commotions, we may easily imagine their effect upon the still ruder and more independent nobility of that country. We have been tempted to throw out these general observations, because the reign of James the Third is in one respect most remarkable. It is the era from which we may date the rise of a republican spirit, and the first propagation of those popular principles, of which the operation can be traced, in a greater or less degree, through the whole course of its subsequent history.

Contest of James III. with his brothers, Albany and Mar. A.D. 1479–1480.

To return from such remarks to the events of this reign, we find the king engaged in a contest with his two powerful brothers, Albany and Mar. To the first had been entrusted the wardenship of the east marches, the government of Berwick, and the castle of Dunbar, the principal key of the kingdom; and there seems no doubt that he had abused his high powers to an extent which bordered upon treason. Against Mar was brought a still more atrocious charge. He had plotted, it was said, to cause the king's death by magical arts; and being convicted by the evidence of his wizard accomplices, was imprisoned, and, according to one account, secretly executed. Another story ascribes his death to the consequences of a fever, for which having a vein opened, he in an excess of phrensy tore off his bandages and bled to death. Against Albany the king proceeded with unusual vigour. He attacked him in Dunbar, made himself master of the fortress, and would have seized his person, but the rebellious prince availed himself of the situation of the castle, which was open to the sea, and fled first to England, and afterwards to France.

War with England. A.D. 1480.

At this moment, Louis the Eleventh was at war with Edward the Fourth, and he unfortunately possessed such influence over the Scottish king, that he brought about a rupture between James and Edward. It was a step signally impolitic. Albany, the king's brother, returning from France, threw himself into the arms of England; the nobility were full of complaints against the government; the Lord of the Isles embraced the interests of Edward; and after a long interval of peace had softened the national animosity between the kingdoms, it was a miserable sight once more to witness the renewal of hostilities.

This contest led to some extraordinary scenes. Albany having openly avowed his purpose to dethrone his brother, assumed the title of Alexander king of Scotland, and entered into a treaty with Edward, by which he basely consented to sacrifice the independence and dismember some of the finest portions of the kingdom. To effect his designs, he had the address not only to secure the co-operation of the banished earl of Douglas, with the Lord of the Isles and his northern vassals, but he detached from James's service Angus, Gray, Huntly, Lennox, and many others of the leading nobility in Scotland. A conspiracy was formed against the monarch and his favourites; the conjuncture of his assembling his army, preparatory to his invasion of England, was deemed the most favourable moment for the execution of their purpose; and in the camp at Lauder its success was equally sudden and terrible. The nobles, led by Angus, seized Cochrane, James's favourite, who, from a mean station, had been promoted to high rank and enriched with the earldom of Mar; they then broke into the king's tent, made him prisoner, arrested the band of ignoble associates who shared his confidence, and proceeded to inflict summary vengeance on them all. Cochrane was hanged over the bridge of Lauder; Rogers, a musician, Hommel, Leonard, Preston and others, shared his fate; and the unfortunate monarch, having been conveyed to the capital, was shut up in the castle of Edinburgh. The result of this success was what might have been expected. Albany, who all along had acted from motives of personal ambition, having once possessed himself of the king's person, ruled the government at his will.

James III. A.D. 1482. Conspiracy against the king.

Base conduct of Albany.

But usurpation of the supreme power was not the full extent of his treachery. He attached Edward the Fourth to his service by the sacrifice of the national independence. In a secret treaty, the English prince engaged to assist Albany, who hitherto had only assumed the title of lieutenant-general of the kingdom, in placing the crown on his own head; and as the base price of this assistance, the new king and his nobles agreed to withdraw their oaths from king James, and to live under the sole allegiance of the king of England. It may give us some idea of the low estate to which the nobles of Scotland had fallen, when we mention, that not only the earl of Douglas, now banished and living in England, but the earls of Angus, Buchan, Athole, and many others, were willing parties to this wanton sacrifice of their country.

A.D. 1482.

Party against Albany.

The plot, however, was defeated, and happily a party yet remained among the nobles, who, though their vengeance had been directed against the king's favourites, were friends to the crown and to the country. They had joined Albany with the object of sacrificing Cochrane and his associates, but had been kept in ignorance of his ultimate intentions; and the moment these became apparent, they united with the king and overwhelmed the opposite faction. And here, in the manner in which Albany was treated, is to be found the cause of all the subsequent misfortunes of the king. His brother deserved punishment, and ought to have met with no pity. He had been guilty of open and repeated treasons, had levied war against his prince; and imprisoned his royal person, leagued himself with his enemies, sold the independence of his country, and assumed the title of king. His guilt and ambition had seduced from their allegiance a large party of the nobles; and if ever there was a time in which a great example was to be made, that time was now come. Yet, instead of this wholesome severity, the duke of Albany was treated with a lenity for which it is impossible to account. On acknowledging his manifold treasons, and laying down his office of lieutenant-general, he not only received a full pardon, but was permitted to retain not only his vast estates, but his wardenship of the marches, and was simply interdicted from coming within six miles of the court, or continuing his illegal combination with Angus, Athole, and Buchan.

Impolitic lenity to Albany. A.D. 1482.

A.D. 1483. Renewed rebellion of Albany.

Whether we are to ascribe this misplaced mercy to the king's attachment to his brother, or to a suspicion that he was not strong enough to inflict a more exemplary punishment, it is difficult to decide; but the result demonstrated what has been so often taught, the folly of a misplaced lenity. In a few weeks Albany was again in rebellion. At his invitation, an English army invaded Scotland; Dunbar, the most important castle in the kingdom, as the key of the eastern borders, was delivered up by this base person to the enemy, while he himself fled into England, and organized with Edward the Fourth the plan of a more formidable invasion. At this crisis occurred the death of the English monarch, and the seizure of the crown by Richard the Third; events which gave James an interval of rest, in which he acted with unusual firmness and energy. He assembled a parliament at Edinburgh, in which the sentence of forfeiture was pronounced against the duke of Albany and all his adherents; he entered into an intimate alliance with Charles the Eighth of France, and he concluded a truce with Richard the Third, who was too much occupied with his own complicated affairs, to have leisure or inclination to continue the war with Scotland. Thus strengthened, the king found it no difficult matter to resist the last effort of Albany and Douglas, who having once more invaded Scotland at the head of a small force, were completely defeated at Lochmaben; an event followed not long after by the death of Douglas, in the abbey of Lindores, where he had been confined, and of Albany, who was slain in a tournament in France.

Final defeat of Albany.
A.D.1483.

The Scottish nobles renew their intrigues against James.

It might have been expected that James, who was thus delivered from his most powerful enemies, would have been permitted to reign in peace. But he was destined to be unfortunate; and, although his nobles had refused to alter the succession in favour of his ambitious brother, they soon after appear to have entered into intrigues with England for the purpose of placing the crown on the head of his son, the prince of Scotland, who was then a youth in his sixteenth year. Much obscurity hangs over the origin of this conspiracy. Advances seem first to have been made by the faction of the prince to Richard the Third, who, although he was animated by an anxious desire to remain at peace with Scotland, did not scruple to hold out secret encouragement to James's enemies. To what extent such secret negociations proceeded, it is not easy to discover; but after the death of Richard they were renewed, and his successor, Henry the Seventh, showed as little scruple as his predecessor in encouraging the malcontents.

Causes of the conspiracy against the king.

Five years had now elapsed since the death of Cochrane the king's favourite, and the dreadful scenes exhibited in the camp at Lauder. Since that time a change appears to have taken place in James's character. His devotion to study and retirement had given way to a sense of duty; he had exhibited not only capacity for government, but unwonted resolution in the attack and discomfiture of his enemies; and, although the impolitic lenity with which he had treated Albany was rather a weakness than a virtue, it was believed that he was now convinced of his error, and had resolved that the laws against treason should no longer slumber or be despised. These reflections filled the barons who had been conspirators at Lauder with the greatest alarm. They were well aware that a sentence of treason hung over their heads. They knew themselves guilty of aggravated offences; they had imprisoned the king, usurped the government, and without regular trial or conviction, had put his favourites and councillors to death. As long as the chief power had remained in their own hands, they felt tolerably secure, but circumstances had once more restored the king to his wonted authority; and the dread of the retaliation which might be inflicted, with the certainty that, at all events, their power would be abridged, appears once more to have driven them into rebellion. Such at least seems to be the most probable way of accounting for the rise of that conspiracy in which this unfortunate prince lost his crown and his life. The worst feature in the story is the unworthy part acted in it by his son, afterwards James the Fourth, over whom the malcontent barons gained a fatal influence, and who, seduced by the prospect of a crown, lent himself a tool to the dethronement of his father. When once organized, the plot proceeded to its maturity, and thence hurried on to its catastrophe with an appalling rapidity.

A.D.14
Collisi
between
the two
parties.

The two parties of the king and the conspirators first tried their mutual strength in a Parliament. It was proposed by the popular faction that an amicable adjustment of all disputes should take place between themselves and the sovereign, and that such barons as were still obnoxious to a charge of treason, should receive a full pardon. To this the party of the king peremptorily refused their consent. James, aware of the unworthy conduct of his son, the heir apparent, created his second son duke of Ormond, and seemed to point him out as his successor. He at the same time rewarded the principal barons who had espoused his interest, and took decisive measures, by the appointment of vigorous officers, to have the laws against treason severely administered. These steps convinced his opponents that their proceedings had been discovered; and without giving the monarch time to assemble an army, or even take measures for his personal defence, they threw off the mask, broke out into open rebellion, declared that James the Third, by his crimes and oppressions, had forfeited all title to the throne, and proclaimed his son, by the title of James the Fourth.

Even now, had not the king suffered himself to be misled by his paternal feelings, the conflict might have concluded in his favour; for it is evident that a large class of the nobility, and the whole body of the people, were against these nefarious proceedings. So strong was this feeling, that James, who, on the advance of the rebels to the capital, had taken refuge in the northern part of his kingdom, soon found himself at the head of a formidable army, and advanced instantly against the insurgents, whom he found stationed at Blackness, near Linlithgow.

of James
III.
His ill-
judged le
nity to t
prince a
his assoc
ates.

It was now the time for action, the time for a determined execution of those laws which late years had seen so constantly treated with contempt. But whether the affectionate heart of the monarch sickened at the sight of his subjects in mortal array against each other, or some symptoms of disaffection breaking out in his own force rendered him apprehensive of their fidelity, James not only consented to an accommodation, but offered terms to the prince and his associates, which were culpably lenient. He permitted the son who had usurped his kingly name and prerogative, and the subjects who had defied the authority of the crown and the laws, to negociate with arms in their hands on a footing of equality. On the part of the misguided prince, now no longer a boy, no petition for forgiveness, no expression of penitence was suffered to escape. In the pacification at Blackness, the youth spoke throughout, not as a son conscious that he had offended, but as a sovereign transacting a treaty with his equal. The treaty, in truth, was a triumph to the discontented nobles. The prince and his friends who had encouraged him to resistance, agreed to become obedient subjects on receiving the king's forgiveness, while the monarch not only consented that their lives, honours, and estates, should be preserved, but that the household of the heir apparent should be maintained, and his friends and adherents supported with due dignity. It required little penetration to foresee that the tranquillity which was established on such a foundation could not long subsist. It was a confession of weakness pronounced at a time when firmness at least, if not severity, was the only guide to the permanent settlement of the convulsions which agitated the kingdom.

Treaty o
Blacknes

Renewed
rebellion
the princ
and his
party.

The consequences which any person of ordinary judgment might have anticipated, were not long of occurring. James retired to his capital, his army was dismissed, the northern barons, whose valour had saved his crown, were permitted to return to their estates, and James, anticipating a continuance of tranquillity, proceeded to reward his friends and re-organize his court, when he received intelligence that his son the prince, with the same fierce barons who had so lately sworn allegiance, were again in arms, and in more formidable numbers than before. In this emergency, indeed, the king acted with courage and promptitude; but having disbanded the strongest division of his army, which consisted of his northern barons and their vassals, the force which he mustered was much inferior to that of his opponents. It was therefore determined to await in the capital the arrival of the northern barons; but unfortunately this resolution was abandoned, and the monarch with inferior numbers, attacked the insurgents, who were commanded by the prince his son, at Sauchy Burn, within a mile of Bannockburn. The consequences proved most calamitous. The royal forces, after an obstinate struggle, gave way to their opponents; and James, flying from the field, was murdered by an unknown hand, at a little hamlet called Miltown, a few miles distant from the field of battle. He perished in the prime of life, and it is said his youthful successor was seized with overwhelming remorse on being informed of the miserable fate of his father. However this may be, he was immediately proclaimed king, and the homage of his barons, the early possession of a sceptre, and the lustre of a court, soon stifled his repentant feelings.

Defeat and death of James III. at Sauchy. A.D.1488.

James IV. proclaimed king.

Character of James III.

The character of James the Third has been represented by Boyce, Buchanan, and those writers who have been contented to follow their authority, as a compound of weakness, wilfulness, and crime; a character contradicted by the history of his reign. It must indeed be admitted, that James's indulgent treatment of his rebellious subjects, and of the prince his son, partook of weakness, although there are few father's hearts in which he will not find an advocate; but in other respects the best refutation of the ideal pictures of Buchanan is to be found in the real history of the reign. James's misfortunes are, in truth, to be attributed more to the extraordinary circumstances of the times in which he lived, than to any flagrant vices or defects in the monarch himself. At this period, in almost every kingdom in Europe with which Scotland was connected, the power of the great feudal nobles, and that of the sovereign, had been arrayed in jealous hostility against each other. The time appeared to have arrived when both parties seemed convinced that they were on the confines of a great change; that the power of the throne must either sink under the superior strength of the greater nobles, or the independence and tyranny of these feudal tyrants receive a blow from which it would not be easy for them to recover. In the different countries of Europe indeed, the result was not uniform, but in all the same elements of faction were seen arrayed against each other. Thus, in France, the struggle under Louis the Eleventh had terminated in favour of the crown; yet the lesson to be derived from it was not lost upon the Scottish nobility, who were in constant communication with this country. In Flanders and the states of Holland, they had before them the spectacle of an independent prince deposed and imprisoned by his son; and in Germany the reign of Frederic the Third, who was contemporary with James the Third of Scotland, presented one constant scene of struggle between the emperor and his nobility, in which this capricious potentate was uniformly defeated.

General observations.

There is yet one other observation to be made upon this remarkable revolution, by which, for the first time in Scottish history, a king was solemnly deposed by a faction of his own subjects. Although the barons who led the successful faction represented themselves as the friends of liberty, driven to a resistance of royal oppression, the middle classes and the body of the people took no share in the struggle. Many individuals belonging to these classes, who were feudal vassals of the great lords, must no doubt have been compelled to serve under them; but as far as they were represented by the commissaries of burghs who sat in Parliament, they appear in this struggle to have joined the party of the sovereign and the clergy, by whom, during this reign, frequent efforts were made to introduce a more effectual administration of justice, and a greater respect for property and the rights of individuals.

Laws, mingled with alternate threats and exhortations, are to be found upon these subjects in the records of each successive Parliament of this reign; but the offenders continued refractory, and these offenders were the very men, whose offices, if conscientiously administered, ought to have secured the rights of the great body of the people. It was the nobles who were the justiciars, chancellors, chamberlains, sheriffs; and these, it was well known, were often the worst oppressors, partial and venal in their administration of justice, severe in exacting obedience, and opposed to every right which interfered with their own power. Their privileges as feudal nobles came repeatedly into direct collision with their duties as servants of the government, and they made no scruple to sacrifice the last to the preservation of the first; duty to privilege and self-interest. It is from this cause that we discern an honourable distinction between the clergy and the feudal nobles, in the struggle between the crown and the faction by which it was attacked. In this contest, wherever the greater offices in the government were in the hands of the clergy, it will be found that they generally supported the sovereign; when they were entrusted to the nobility they almost uniformly combined against him.

James IV. succeeds to the throne.

When James the Fourth succeeded to the throne left vacant by the murder of his father, he was in his seventeenth year; but his character at that early age had vigorously developed itself, and although it has sometimes been asserted, there is no reason to believe that the prince had been an unwilling assistant, or a passive tool in the hands of the conspirators. Their first care was to hold at Scone the ceremony of the coronation; their next to conclude a three years' truce with England, then under the government of Henry the Seventh; their third, to assemble a Parliament and provide for their own safety, by the forfeiture of their enemies and the rewards distributed to their friends.

Artful conduct of the nobles.

And here it is not unimportant to mark the course which they artfully pursued. If any party in the state were at this time liable to a charge of treason, it was evidently the friends of the young king, and not the barons who had continued faithful to his father; but the difference consisted in this, that the treason of the prince's party had been accompanied with success, whereas the resistance of the friends of his father had been overwhelmed, and himself dethroned and murdered. They who now were in possession of the supreme power, therefore boldly turned the tables, summoned their opponents on a charge of treason, and as the facts were notorious, pronounced sentence against them. They next voted their own acquittal in strong and significant terms; and considering under whose dictation the act was drawn up, it is difficult to read, without a smile, the compliments pronounced upon their treason, when they declare that their sovereign lord, and his *true* barons, who served with him in the field, were innocent of the late battle and pursuit, and had no blame in exciting the disturbances which had terminated so fatally.

A.D. 1489

The innocence of these barons was however far from being generally admitted; and the Parliament had scarcely risen, when Lennox, Huntly, Marischal, and other powerful chiefs, rose in arms to avenge the death of their king. Lord Forbes, who had joined them, marched through the country, bearing the bloody shirt of the unfortunate prince suspended from a spear; and had it not been for the promptitude with which their opponents met the enterprise, the movements of Lennox, who advanced upon Stirling, might have delivered the country from their domination. But this chief, betrayed by some of his followers, was surprised and completely routed by Lord Drummond at Fallamoss; Dunbarton, Lennox's strongest hold, surrendered, and the defeat added new strength to the young king and his friends.

Character of James IV.

Tranquillity being restored, James, as he approached manhood, exhibited signs of considerable ability, and energy in following up his purposes. Amid a love of pleasure, which had never been restrained by early discipline, and often hurried him into foolish and criminal excesses, he did not so far forget himself as to neglect his higher duties. He cultivated amicable relations with England, renewed the league with France, entered into a commercial alliance with Denmark, and in a Parliament held in the capital, directed his earnest endeavours to the establishment of good order, and the administration of equal justice throughout the kingdom. Happily the character of Henry the Seventh, his caution, sagacity, command of temper, and earnest desire for peace, were well calculated to check the ardour and impetuosity of the Scottish prince; and for twenty years, with the exception of a brief effort made by James in favour of Perkin Warbeck, the country enjoyed the blessing of repose.

Twenty years' peace.

Occupations of the king.

This interval was wisely occupied by the monarch in reducing the northern portion of his dominions to obedience, and in an attempt, by the frequent convocation of his parliament, to promulgate useful laws, and, which proved a more difficult task, enforce their observance. It was evident, that as the king grew older, he became convinced of the fatal errors of his early years, and upbraided himself for having lent himself to a selfish and unprincipled faction, who, unless he consulted their wishes and gratified their ambition, might be disposed to treat him as they had treated his father. Aware that they were too powerful to be quelled, he prudently adopted a safer course, by gradually recalling to confidence and power the friends and ministers of his father. Among these, one of the ablest was Andrew Wood of Largo. This remarkable man, whose genius for naval adventure was combined with a powerful intellect in civil affairs, rose by degrees to be one of James's most confidential servants, and appears to have been almost exclusively trusted in his financial concerns. We find in him many qualities apparently inconsistent, when judged by modern notions. He was originally nothing more than an enterprising merchant; but at this time all merchant ships were armed, and generally acted on an emergency as ships of war. Wood, therefore, in the course of a life devoted to mercantile and commercial adventure, had become a skilful naval commander; and in the commencement of this reign, when the English privateers infested the narrow seas and attacked the Scottish shipping, had signalised himself by the capture of five vessels, and the subsequent defeat of a second squadron, commanded by Stephen Bull a London merchant. These successes endeared him to the king, who had a passion for naval enterprise, and lost no opportunity of encouraging such a taste in his nobles. The advice of such a councillor as Wood, was of essential service to James. His travels in different countries had enlarged his mind, and made him ready to adopt their improvements in various points in which Scotland was behind her neighbours. He had been an affectionate servant of the late king; and to his advice we are perhaps to trace the coldness and severity with which James now began to treat some of the leaders in the late rebellion. Yet, while the monarch endeavoured to keep their power in check, he showed his prudence in abstaining from such severe measures as might have driven them into open opposition; and combining firmness with gentleness, he contrived to reconcile the opposite factions among his nobles, and to maintain his own authority over them all.

James IV. recalls his father's councillors.

Andrew Wood of Largo.

A.D.1489.

State of the Highlan

In the midst of these cares, the state of the Highlands occupied his special attention, and the principles of his policy were certainly wise and salutary. He endeavoured by every means in his power to attach to his interests the principal chiefs of these remote districts; he contrived, through them, to overawe and subdue the petty island princes who affected independence; he carried into their territories, which had been hitherto too exclusively governed by their own capricious and often tyrannical institutions, a more regular and rapid administration of civil and criminal justice, making them obedient to the same laws which regulated his lowland dominions; and lastly, he repeatedly visited the Highlands in person. In 1490, on two different occasions, the king rode from Perth across the "Mount," a term applied to the chain of mountains which extends from the Mearns to the head of Loch Rannoch, accompanied by his chief lords and councillors. In 1493, he twice penetrated into the Highlands, and in the succeeding year thrice visited the isles.

A.D.14

A.D.14

James's voyage the Hig lands in 1494.

One of these voyages, undertaken in 1494, during the spring months, was conducted with great state. He was accompanied by his chief ministers, his household, and a considerable fleet, many of the vessels composing which were fitted out by the nobles at their own expense. The pomp of the armament was well calculated to impress upon such wild districts an idea of the wealth and military power of the prince; while the rapidity of his progress, the success with which he punished all who braved his power, his generosity to those who sued for mercy, his familiarity with the lower classes of his subjects, and his own gay manners, increased his popularity, and confirmed the ties of allegiance. On arriving in this voyage at Tarbert in Kentire, James repaired the fort originally built there by Bruce, established an emporium for his shipping, transported thither his artillery, and by such wise and energetic precautions, ensured peace to districts which formerly had derided the royal vengeance. The chiefs, aware that the king could carry hostilities at a short warning into the heart of their territories, submitted to a force which it would have been vain to resist. One only, the Lord of the Isles, had the folly to defy the royal vengeance, and soon repented his temerity. He was summoned to take his trial for treason, pronounced guilty, stripped of his almost regal power, and his lands and possessions forfeited to the crown.

Forfeitu of the L of the Isl

Perkin Warbeck in Scotland. A.D.14

We must now advert for a moment to a singular episode in the history of the country. Perkin Warbeck, whose mysterious story still offers some field for historical scepticism, after his first unsuccessful attempt upon the English crown, took refuge in Scotland in the year 1495. There seems strong ground for suspecting that James, at the request of the duchess of Burgundy, had embraced the interests of this adventurer at a much earlier period than is generally suspected; but whether he really believed him to be the prince whose name he assumed, or whether he was induced to espouse his cause as a means of weakening England, is not easily discoverable. It is certain, however, that in 1494, the Scottish king had projected an invasion of England in favour of the duke of York, and that the plan miscarried by the treachery of Perkin's friends.

James invades En land wit Warbeck

On the arrival of the mysterious stranger at his court, James at once received him with royal honours, gave him in marriage a lady connected with the royal family,[1] collected an army, and, attended by Warbeck, invaded Northumberland. But the proceeding was rash and impolitic; and its author found, within a short time, that the cause of Perkin was unpopular in England, and the war unacceptable to his own subjects. So deep was the national antipathy between the two nations, that the English no sooner saw the claimant of the crown invading their country at the head of a Scottish force, than they suddenly cooled in

---

D.1497. rkin ves otland.

their enthusiasm; and the desolating fury with which James conducted hostilities, supported by a body of foreign mercenaries, completed their disgust. It was evident to the king that Henry the Seventh held his crown by a tenure too firm to be shaken by so feeble a hand as Perkin's; and having drawn back his army, he soon after concluded a truce with England, and refusing to deliver him to Henry, took measures for his quiet and amicable retreat from his dominions.

nes's e con- t to his bility.

These negotiations having been concluded, James had leisure to attend to his affairs at home. He was aware that the chief errors of his father's reign were to be traced to his neglect of the great body of his nobility. To reign without their cordial co-operation was impossible, as long as Scotland remained a feudal kingdom; and it was happy for this prince that the course of conduct which his own disposition prompted him to pursue, was the best calculated to render him a favourite with this influential body. Under the reign of his father the nobles had little intercourse with their prince. They lived in gloomy independence at a distance from court, resorted thither only on occasions of state or counsel; and when parliament was ended, or the emergency had passed away, they returned to their castles full of complaints against a system which made them strangers to their sovereign and ciphers in the government.

rease of power he wn.

All this was happily changed under the present monarch. Affable in his manners, a lover of magnificence, and a still greater lover of mirth and pleasure, the prince delighted to see himself encircled by a splendid nobility. He bestowed upon his highest barons those offices in his household which ensured their attendance upon his person; his court became a scene of perpetual amusement, in which his nobles laboured to surpass each other in extravagance and revelry; and while they impoverished themselves, they became more dependent upon the sovereign. In this manner the seclusion of their own castles became irksome to them; as their residence on their estates was less frequent, the ties which bound their vassals to their service were loosened; and the consequences proved in every way favourable to the royal authority.

e of navy.

James now turned his principal attention to his navy. It is well known that at this moment the maritime enterprises of the Portuguese, and the discoveries of Columbus, had created a wonderful sensation throughout Europe. Even the cautious and calculating spirit of Henry the Seventh had caught fire at the triumphs of naval enterprise; and an expedition which sailed from England under the command of John Cabot, a Venetian merchant, and his son Sebastian, was rewarded by the discovery of North America. These successes roused the adventurous spirit of the Scottish king, and as Scotland had hitherto been deficient in any thing approaching to a navy, he became eager to supply the want, and maintain his place with other continental kingdoms. With this view, he paid great attention to his fisheries, and to foreign commerce, the best nurseries of seamen; and those enterprising merchants and hardy mariners who had hitherto speculated solely on their own capital, found themselves encouraged by the king and the government..

T king en r- ag his fi ies, hi vy, an is co erce.

In a former parliament, complaints had been made of the want of boats to be employed in the fisheries, and of the wealth lost to the country from the few ships to be found in its sea-ports. It was now provided, that vessels of twenty tons and upwards, should be built in all the principal seaports, and that all stout vagrants found in these districts should be impressed, and compelled to learn the trade of mariners. Among his merchants and private traders were many men of ability, whom the king treated with favour. He exhorted them to extend their voyages, to arm their trading ships, to import artillery, and to build ships of force at home. Nor was this all. He studied the subject of his navy, and made himself personally familiar with its details; he practised gunnery, embarked in little experimental voyages, conversed with his mariners, and visited familiarly at the houses of his merchants and sea officers, by whom his fame was carried to foreign countries. All this was useful. The best foreign artizans being sure of a generous reception, flocked to Scotland from France, Italy, and the Low Countries; and if the king's credulity sometimes encouraged impostors, his enthusiasm also collected round him men of real knowledge and experience.

University of Aberdeen founded A.D. 1494.

While we advert to these laudable exertions of the king, the labours of an enlightened prelate for the dissemination of useful learning, ought not to be passed over. Scotland, at this period, possessed only two universities, St. Andrews, founded in the beginning of the fifteenth century, and Glasgow, founded in 1453. To these Elphinstone, bishop of Aberdeen, now added a third. The papal bull was issued in 1494, but the buildings of King's College were not completed till about the year 1500. It supported professors of divinity, of the civil and canon law, of medicine, and of classical literature, in which its first principal, Hector Boece or Boyce, was no contemptible proficient. Soon after this, James married the princess Margaret of England, daughter of Henry the Seventh; a wise and politic alliance, although in the marriage treaty the diplomatic skill and penurious habits of her father seemed to have gained a victory over the Scottish commissioners.

Marriage of the king, A.D. 1502.

Northern rebellion, A.D. 1505, 1506.

From the public rejoicings that followed his nuptials, the king was called to repress a rebellion in the north, which appears to have been excited by an imprudent alteration in the policy hitherto pursued in these quarters. This had led to a confederation of the Highland chiefs, who determined to reinstate in his insular sovereignty the grandson of the last lord of the Isles; and so deep was the discontent, that it required the utmost efforts of the prince to restore these remote districts to tranquillity. In this he at last succeeded, divided them into new sheriffdoms, repaired and garrisoned the castles in the hands of the crown, and sent Wood and Barton, two of his best officers, with a small squadron to co-operate with Arran, his lieutenant-general, in reducing the insurgent chiefs. Having adopted these measures, which were soon followed by the complete re-establishment of tranquillity, James, at the head of a considerable force, visited the border districts, and, assisted by Lord Dacre, the English warden, compelled the Armstrongs, Jardines, and other powerful septs, to forsake their habits of plunder, and respect the laws. He then proceeded by negotiations to strengthen his pacific relations with France, and the Netherlands; while he prudently resisted the solicitations of Pope Julius the Second, who endeavoured to detach him from his alliance with Louis, and to induce him to join the emperor and the Venetians in their attempt to check the successes of the French in Italy.

A.D. 1509 Henry VIII. succeeds to the English throne.

Not long after this, occurred the death of Henry the Seventh, an event unfavourable to Scotland. The proud, capricious, and tyrannical character of his son and successor Henry the Eighth, rendered him little qualified to respect or preserve the pacific relations with that country, which had been wisely cultivated by his father; and it soon appeared that the Scottish prince, a spirited monarch, jealous of his own dignity, and little accustomed to dictation, was not disposed to submit to it from his brother-in-law.

Quarrel between James IV. and Henry.

Matters proceeded smoothly for some time; but when Henry the Eighth engaged in war with France, the ancient ally of Scotland, James at once warmly espoused the party of Louis, and although against the best interests of his kingdom, suffered himself to be drawn into the quarrel. The history of the war is well known. Julius the Second having, in conjunction with Ferdinand of Spain, gained all he wished, by the league of Cambray, became alarmed at the progress of the French in Italy, and to check their arms, prevailed upon Henry the Eighth, whose imagination had lately been dazzled by dreams of Edward the Third and Henry the Fifth, to invade France. Louis, on the other hand, negotiated with James the Fourth, and to embarrass the king of England, induced him to declare war against Henry the Eighth. It was a fatal resolution; but the Scottish prince was beloved by his people, and so popular with the great body of his nobles, that his appeal to arms was answered by the muster of one of the most numerous and best equipped armies, and one of the most formidable fleets ever fitted out by the country.

The Scot. fleet dispersed

The fleet amounted to twenty-three sail, of which thirteen were large ships, the rest small armed craft. Of this armament the destination was Ireland, but its command was entrusted to the earl of Arran, an officer of no experience in naval affairs; and the result was its total dispersion and discomfiture. The land army, on the other hand, which was led by the king in person, amounted to a force little short of a hundred thousand strong, with which James invaded England, and after some slight successes, encamped in a strong position on the hill or rising ground of Floddon, one of the last and lowest eminences which detach themselves from the range of the Cheviots. It was a strong position, impregnable on each flank, and in front defended by the Till, a deep and sluggish stream, which is tributary to the Tweed.

Defeat of the Scottish army at Floddon, 9th Sept. A.D. 1513.

Henry the Eighth, before passing with his army into France, had entrusted the defence of his kingdom to the earl of Surrey, a brave and experienced officer, who lost no time in collecting a force with which, although it did not amount to half the number of the Scots, he did not hesitate to march against the king. But what he wanted in numbers, Surrey supplied by military experience and coolness; while James, blind, obstinate, and attending only to the dictates of his personal courage, threw away his advantages both of numbers and position. The result was one of the most calamitous defeats ever experienced before or since by Scotland. Surrey was permitted by the king to cross the Till in the face of his army. Contrary to the remonstrances of his veteran officers, he would suffer no one to attack him; although the moment was so favourable that, if Angus, Lindsay, and Huntly had been allowed to charge with their men, nothing less than a miracle could have saved the English earl. To the entreaties of Borthwick, the master of his artillery, he was equally obstinate. Had the guns been brought to bear upon the enemy when crossing the bridge of the Till, they must either have been beaten back or thrown into such disorder as would have exposed them to immediate rout; but this too the king would not suffer. With amazing folly he renounced the use of his artillery, that arm of war which, with so great care and expense, he had strengthened or rather created, at the very moment it became serviceable, and might have saved himself and his army. What James's motive was in this, unless the indulgence of some idle chivalrous punctilio, it is impossible to discover; but its consequences were grievous. Surrey completed his arrangements, passed the ford and the bridge, marshalled his army at leisure, and placing his entire line between James and his country, advanced by an easy ascent upon the rear of the Scottish army. Upon this the king set fire to the huts and temporary booths of his encampment, and descended the hill with the object of preoccupying an eminence on which the village of Branksome is built. His army was divided into five battles, some of which had assumed the form of squares, some of wedges, all being drawn up in a line about a bow-shot distance from each other. The enemy were divided into two battles, each of which had two wings. The English van was led by lord Thomas and lord Edmund Howard, Surrey himself commanded the centre of the host, Sir Edward Stanley and lord Dacre the rear and the reserve. On the side of the Scots, Huntly and Hume led the advance, the king the centre, and the earls of Lennox and Argyll the rear. The battle commenced at four in the afternoon, and after an obstinate contest, which continued till nightfall, concluded in the total defeat of the Scots. Among the slain was the king himself, who, surrounded by a circle of his nobles, had fought with desperate courage, besides thirteen earls, and fifteen lords and chiefs of clans. The loss of common soldiers was estimated at ten thousand men. Of the gentry it is impossible to say how many were slain. Scarcely a family of note could say that they had not lost one or more relatives, while some had to lament the death of all their sons. Whether we regard this miserable slaughter of the sovereign with the flower of his nobility and country, or look to the long and sickening train of national calamities which it entailed upon the kingdom, it is not too much to pronounce the battle of Floddon the greatest national misfortune ever endured by Scotland.

Charac
of Jame
IV.

The character of the unfortunate monarch who thus perished in the prime of life, for James had not completed his forty-second year, was marked by very contradictory qualities. Although devoted to his pleasures, wilful, and impetuous, he was energetic and indefatigable in the administration of justice, a patron of all the useful arts, and laudably zealous for the introduction of law and order into the remotest parts of his dominions. The commerce and the agriculture of the country, the means of increasing the national security, the navy, the fisheries, the manufactures, were all subjects of interest to him; and his genuine kindness of heart, and accessibility to the lowest classes of his subjects, rendered him deservedly beloved. Yet he plunged needlessly into all the miseries of war, and his thirst for individual honour, and an obstinate adherence to his own judgment, led to the sacrifice of his army and his life, and once more exposed the kingdom to the complicated evils of a minority.

Coronat
of Jame
V.
A.D. 1

The news of defeat always flies rapidly, and the full extent of the national calamity soon became known in the capital, which was seized with the utmost sorrow and terror. The magistrates, with the forces of the borough, had joined the king's army, and many of them shared his fate; but the merchants, to whom their powers had been deputed, acted with much firmness and spirit. They armed the townsmen, published a proclamation, enjoining the women who were seen waiting in the streets to cease their lamentations, and repair to the churches, where they might pray for their lords and husbands, and took all the necessary precautions to defend the city in the event of any immediate attack. Soon afterwards the welcome intelligence arrived that Surrey, having suffered severely in the battle, had disbanded his host, and a breathing interval was allowed. The infant king was crowned at Scone, the castle of Stirling appointed as his residence, the government of it entrusted to lord Borthwick, and the archbishop of Glasgow, with the earls of Huntly and Angus, selected to be the councillors of the queen-mother, till a parliament should assemble. At the same time suspicions seem to have arisen that too much influence in the government ought not to be given to this princess, whose near connection with England might subject her to foreign influence; and a secret message was dispatched to France inviting the duke of Albany, the next heir to the throne, to repair to Scotland and assume the office of regent.

State of
Scotland

It was necessary, in the mean time, to consider the best schemes for the restoration of tranquillity and the preservation of order under the shock which a defeat so terrible had given to the country; and the prospect which presented itself, on taking a general view of the condition of the kingdom, was discouraging. The dignified clergy, a class of men who were undoubtedly the ablest and the best educated in Scotland, from whose ranks the state had been accustomed to look for its wisest councillors, were divided into factions among themselves occasioned by the vacant benefices. The archbishop of St. Andrews, the prelates of Caithness and the Isles, and other ecclesiastical dignitaries, had fallen in the field of Floddon; and the intrigues of the various claimants for these high prizes distracted the church and the council. There were evils also to be dreaded from the character and youth of the queen-mother. Margaret had been married at fourteen, and was now only twenty-four. Her talents were excellent, as we know from the testimony of such able judges as Surrey, Dacre, and Wolsey; but in some points she too nearly resembled her brother Henry the Eighth. She was hasty in her resentment, headstrong, and often ready to sacrifice her calmer judgment to her passion or her pleasure; and in her thirst for power or personal gratification she sometimes cared as little for the purity of the means by which these objects were accomplished.

aracter the ueen-mo-er.

e is made ent. D. 1514.

Soon after the death of the late king this princess gave birth to a son, who was named Alexander, and created duke of Ross; and in a parliament, which met after her recovery, she was confirmed in the office of regent, and entrusted with the custody of the young king and his brother.

At this moment the most powerful nobles in Scotland were the earls of Angus, Home, Huntly, and Crawford. Angus wielded the whole strength of the house of Douglas; Home was chamberlain, and commanded the eastern borders; while Huntly and Crawford ruled the northern districts. The earl of Arran, in the mean time, arrived from France along with the Sieur de la Bastie, who had been a favourite of the late king, and brought a message from the duke of Albany. Arran was nearly related to the royal family, and entitled, by his high birth, and the office of Lord High Admiral which he held, to act a leading part in the government; but his talents were of an inferior order, and unable to compete with the trying circumstances in which the country was placed.

e een-mo- r mar- the l of gus.

Scarcely had the queen recovered from her confinement when she married the earl of Angus, a nobleman of great accomplishments and personal attractions, but, in the words of lord Dacre, "childish, young, and attended by no wise councillors." Had the princess entered into a second marriage after due consultation had been held with the council assigned to her by parliament, and after a decent interval, no one could have blamed her. She was yet in the bloom of her best years, and from her youth, as well as her high rank and the important duties entrusted to her, she required the protection of a husband; but the precipitation with which she hurried into the match with Angus was scarcely decorous, and certainly unwise, nor was it long before she bitterly repented her choice.

coun- ivided fac- s.

The first effects of this unfortunate step was to increase the bitterness of the pre-existing feuds amongst the nobles. Home and Angus marshalled themselves and their vassals against each other; Arran, assisted by Lennox and Glencairn, aspired to the regency; Beaton, archbishop of Glasgow, an intriguing prelate, supported the interests of Albany and the French faction; while Huntly, lord Drummond, and the earl Marischal gave their influence to Angus and the queen, who courted Henry the Eighth, and took the name of the English party. At this unfortunate crisis the country received a new blow in the death of Elphinstone, who had been nominated archbishop of St. Andrews. For the vacant primacy there were three competitors; Gawin Douglas, uncle to the earl of Angus, Hepburn, prior of St. Andrews, and Forman, bishop of Moray, respectively nominated by the queen, the chapter, and the pope. These ambitious ecclesiastics scrupled not to muster their armed vassals, and to vindicate their claims by an appeal to the sword, an indecent spectacle, which could not fail to lower the church in the eyes of the people.

It was under this deplorable state of things that Henry the Eighth carried to perfection a base system already begun by his father, that of keeping in pay a number of spies and pensioned supporters. He bribed the Scottish nobles, entertained a constant correspondence with the queen his sister, and even went so far as to propose her flight with the young king and his brother to the English court. It may give us some idea of the loose principles of some of the leading men, that Angus and his uncle, Gawin Douglas, who ranks higher as a poet than a politician, did not hesitate to give their countenance to a plan which amounted to nothing short of treason.

Arrival of the Duke of Albany. A.D. 1515. His character.

In the midst of these scenes the duke of Albany arrived from France, and assumed the regency; but unfortunately his determined predilection for the French interests was as unacceptable to many of the wisest and best men in the country, as the queen and Angus's devotion to England. At this moment Scotland required an upright and vigorous governor, animated by a sincere love of his country, and who could hold the balance with judgment between contending parties. But Albany was ignorant of the constitution, of the language, and of the manners of the country. His family also made him an object of suspicion, his father having traitorously attempted to seize the crown. He was the son of a French mother, had married a French woman, and having his chief estates in France, constantly styled the French king his master; nor does it appear that either his talents or his temper were calculated to counterbalance such disadvantages.

Albany assumes the government.

On his assumption of the government the effects of all this were soon perceived. The queen refused to give up the custody of the infant monarch; Home, the chamberlain, threw himself into the arms of England; Angus, guided solely by selfishness and the ambition of becoming chief ruler, deserted his wife, the queen. France, instead of assisting her ancient ally to defeat the intrigues of Henry the Eighth, which were carried on by his able minister lord Dacre, first betrayed strong symptoms of a change of policy, and at length refused to renew the alliance with Scotland; and although Albany, amid these difficulties, acted with considerable spirit and ability, it was impossible for him to compose the jarring elements, or restore tranquillity and order to the country.

He returns to France.

Dissatisfied and dispirited, he retired for a few years to France, and returned to Scotland only to find the dangers which threatened the kingdom more imminent, and the task of encountering them more difficult. In his absence De la Bastie, the person who enjoyed his chief confidence, and to whom he had entrusted the offices of warden of the marches and deputy governor, was murdered by the Homes in the most savage manner. The Highlands and Isles, long deprived of regular government, were torn by various factions, and exhibited scenes of the wildest excesses. And Angus, whose feudal power was far too great for a subject, had acted in open defiance of the laws, and domineered in the most tyrannical manner over all who dared to oppose his commands. The arrival of Albany compelled this chief to fly from the capital, and the regent exerted himself with the utmost vigour to put down the despotism of the Douglases.

Albany's return. A D. 1521

He was forthwith reconciled to the queen, received from her the keys of the castle of Edinburgh, and with them the custody of the young king; he assembled a parliament, summoned the Douglases to answer a charge of treason, and, although thwarted in his administration by the intrigues of lord Dacre and the treachery and venality of the Scottish nobles, he compelled Angus, his principal enemy, to leave the kingdom.

State of the kingdom.

It would be difficult, and if easy, uninstructive, to enter into the history of this period, when the country was torn by contending factions, and exposed to all the miseries incident to a feudal minority. Albany's worst enemies were lord Dacre and the Anglo-Scotican party which he kept in his pay. It was his policy to throw distrust and suspicion upon every measure of the regent and the queen; to represent the regent as avaricious and tyrannical, to accuse him of a design to seize the crown, and to insinuate that the king's life was not safe in his custody. All of these tales are to be found in his correspondence with his master, Henry the Eighth, and there can be little doubt that the greater portion of them were false, and the whole grossly exaggerated. So at least we must judge from the conduct of the Scottish Parliament, which treated a message, soon afterwards sent by Henry the Eighth, and founded upon these idle accusations, with a calm and resolute denial. This monarch, acting upon the impulse of the moment, and thwarted by the politic measures of the Regent, had dispatched a herald, who conveyed a severe reprimand to the queen, and, at the same time, insisted that the Scottish nobles should instantly dismiss Albany. Their reply to this haughty communication was spirited and dignified. They derided the fears expressed for the life of the young king, declaring that Albany was a faithful servant of the country, and had been invited by themselves to assume the regency. "Here it is our pleasure," said they, "that he shall remain, nor shall he be permitted or enjoined to depart at the request of your grace, or any other sovereign prince. And as to the threat of hostilities, (thus they concluded their answer), if, because we assert our own rights, we should happen to be invaded, what may we do but trust that God will espouse our just quarrel, and demean ourselves, as our ancestors have done before us, who, in ancient times, were constrained to fight for the conservation of this realm, and that with good success and honour?"

A.D. 1522.

War with England. A.D. 1522.

This answer was followed, on the part of Henry, by an immediate declaration of war. The earl of Shrewsbury, at the head of the force of the northern counties, invaded Scotland on the side of the Merse and Teviotdale; an English fleet ravaged and laid waste the coasts of the Frith of Forth; and Albany the Regent retaliated by breaking into England at the head of a large army. He was driven to this solely by a desire to vindicate the national honour; for he seems to have been conscious of the disadvantages which attended a war with England, and he knew that the majority of the nobles were animated by the same feelings. Under these circumstances he wisely determined to follow Bruce's principles as to war with this country, to avoid any protracted invasion, not to hazard a general battle, and while he showed a determination to maintain the independence of the country, and to resist any foreign dictation, to evince at the same time his readiness to conclude an honourable peace.

The same disposition being evinced by lord Dacre, the minister to whom Henry entrusted the management of Scottish affairs, a truce was concluded; but Albany, on disbanding his army and resuming his civil duties, found himself surrounded with difficulties. Nothing indeed could be more complicated or irksome, than the various contending interests which he had to understand and reconcile. His engagements with France prompted him to continue the war with England; his better judgment admonished him to remain at peace. Amid the universal corruption and selfishness which infected the body of the nobles, many of whom were in the pay of England, he looked in vain for any one to whom he could give confidence, or entrust with the execution of his designs, while the queen-mother, with whom he had hitherto acted, betrayed him, and corresponded with Dacre.

Albany's second visit to France.

The impossibility of overcoming these intricate evils without a more powerful military force than he could at present bring into the field, induced the Regent once more to pass into France, for the purpose of holding a conference with Francis the First, on the best method of reducing the English faction. A council of regency was appointed, consisting of Huntly, Arran, Argyll, and Gonzolles, a French knight, in whom Albany placed great confidence; and after an absence of some months, during which the war again broke out with great fury, he revisited Scotland, bringing with him a fleet of eighty-seven small vessels, in which he had embarked a fine body of six thousand foreign troops.

He returns to Scotland.

War wit Englan A.D. 1

With this strong reinforcement he hoped to gain a preponderating influence over the nobility, and to decide the contest with England; but he was miserably disappointed. The presence of foreign troops, always unacceptable to a people jealous of their rights, was particularly so to the Scots, who were poor, and had to support the foreigners at a great expense. This rendered the war unpopular with the great body of the nation; the queen-dowager was devoted to England; and the nobles, although prepared to assemble an army for the defence of the borders, were opposed to any invasion of England upon a great scale, or to a war of continued aggression. As many of these barons, however, were at that moment receiving pensions from France, the payment of which any too decided demonstration might have interrupted, they artfully concealed their repugnance. An army of forty thousand men mustered on the Borough-moor beside Edinburgh, and Albany, taking the command in person, advanced to the borders; but on arriving at Melrose the mask was dropped, the leaders showed symptoms of insubordination, the soldiers catching the infection, murmured against the foreign mercenaries, and discontent gathering strength, at last broke out in an open refusal to advance. No entreaties or threats of the Regent could overcome this resolution; and after a short season, news arrived that the earl of Surrey, having assembled an army, was advancing against them. The intelligence of his speedy approach strengthened the Scottish nobles in their determination not to risk a battle. So completely had the majority of them been corrupted by the money and intrigues of Dacre and the queen-dowager, that Albany did not venture to place them in the front, but formed his advance of the French auxiliaries and his artillery, the single portion of this army which had acted with spirit. To have attempted to fight Surrey with these alone, would have been the extremity of rashness, to have awaited the advance of the English earl with an army which refused to proceed against the enemy, might have rendered defeat inevitable. In these critical circumstances, Albany, who has been unjustly attacked by some ill-informed writers, adopted the only alternative which was safe or honourable. He disbanded the Scottish portion of his army, and he himself retreated with his French auxiliaries and his artillery to Eccles, from which, after a short season, he returned to the capital, and here he assembled the parliament.

Albany retreats.

A Parliament assembled.

Its proceedings, as might have been anticipated, were distracted and impeded by mutual accusations and complaints. The Regent could not conceal his animosity to those leaders who had so recently deserted him almost in the presence of the enemy. The nobles recriminated; they blamed him for squandering the public treasure, and notwithstanding the inclement season of the year, insisted on his dismissing the foreign troops, whose residence had become burdensome. All this was calculated to disgust and mortify the governor; and he requested permission to retire once more to France, for the purpose of holding a conference with Francis the First, and inducing him to grant him further assistance against the designs of England. His request was complied with, on the condition that if he did not return to Scotland within a limited period, the league with France, and his own regency, should be considered as at an end. In the mean season, the custody of the king's person was entrusted to the lords Cassillis, Fleming, Borthwick, and Erskine, while the chief management of affairs was committed to a council, composed of the chancellor, the bishop of Aberdeen, and the earls of Huntly and Argyll. Having made these arrangements, the duke of Albany quitted the kingdom, convinced, in all probability, of the impossibility of reconciling the various factions and interests by which it was torn in pieces. Although he gave hopes that his absence

Albany leaves Scotland. A.D. 152

should not exceed three months, there is strong reason for believing that when he embarked it was with the resolution, which he fulfilled, of never returning to Scotland.

Revolution in the government.

On the departure of Albany, it soon became apparent that a secret understanding had for some time been maintained between two of the most powerful factions in the country, and that his leaving the kingdom was the signal for the breaking out of an important revolution. The chief actors were the earl of Arran and the queen-mother, and there is ample evidence that their proceedings were agreeable to England. The young king was now in his thirteenth year, and his mother and Arran, having gained to their interest the peers to whom his person had been entrusted, carried him from Stirling to Edinburgh, proceeded to the Palace of Holyrood, declared in a council that he had assumed the government, and issued proclamations in his name. The peers of Margaret's party then tendered their allegiance, abjured their engagements lately made with Albany, declared his regency at an end, and promised to maintain henceforth the authority of their sovereign.

Angus returns from France. His base conduct.

It was the evident object of the queen and Arran to obtain, by this revolution, the entire command of the government. The measure was remonstrated against, in the strongest manner, by the bishops of St. Andrews and Aberdeen. They represented the utter folly of conferring the supreme power on a boy of twelve years old, and they stated, with truth, that Albany was still the Regent; but Margaret, supported by her brother Henry the Eighth, who hoped, through her, to govern Scotland, proved too strong for these prelates, and for a while her schemes succeeded. It was, however, only for a short season. Jealousies arose between her and Arran, who, from his near relationship to the crown, aspired to the chief power. The queen, whose love for Angus, her husband, had long since turned into hatred, fixed her affections on Henry Stewart, a son of lord Evandale, raised him to the office of treasurer, and could she obtain a divorce, determined to marry him; and Henry the Eighth, who began to find her demands too importunate, and her obedience problematical, recalled the earl of Angus from France, with the design of making him an instrument in his projects for the reduction of Scotland. This baron appears to have increased in experience and talent for intrigue, by his residence in that country, but not in public principle; and his first step was to sell himself to Henry in a secret treaty, by which he engaged to support the English interests in Scotland. In return, he and his brother, Sir George Douglas, hoped, by Henry's aid, to place themselves at the head of the government, and to be restored to the vast estates and power which they had lost.

The arrival of Angus in his native country, was the signal for immediate hostilities between him and the queen-mother, his wife, who had raised Henry Stewart to the office of chancellor, and detested her husband, in proportion to the progress of her avowed and indecent attachment to this favourite. Hitherto she and her supporters, Arran, Lennox, and the master of Kilmaurs, had been supported by pensions from the English court, and in return, had favoured the views of Henry the Eighth; but the principles of this venal association were of course capricious and selfish, and the arrival of Angus, who now wielded the power of the Douglases, threatened to break it to pieces.

Miserable state of the country.

The country, indeed, presented a miserable spectacle; a minor sovereign deserted by those who owed him allegiance and support, while his kingdom was left a prey to the rapacity of interested councillors, and exposed to the attacks of a powerful neighbour, whose object was to reduce it to the condition of a dependant province. In such circumstances it is certainly a matter of wonder that it retained its liberty.

Three factions struggled for the pre-eminence, and tore the country in pieces. The first was that of Albany, the late regent, which was supported by French influence, and conducted by the chancellor Beaton; the second had for its leaders the earl of Arran and the queen-regent, who held the king's person, and possessed the chief executive power; at the head of the third were the earl of Angus and his able brother George Douglas, who were wedded to the interests of the English government. It is impossible, within our limits, and it would be uninstructive, to enter into a detail of the continued plots and intrigues which constitute the sickening history of this period. It soon became apparent that the party of the queen-mother was the weakest. Arran, a capricious man, deserted her; her private conduct rendered her disreputable in the eyes of the people; and soon afterwards a coalition between Beaton the chancellor and Angus, carried the whole power of Albany's party to a union with the house of Douglas. Margaret sunk under this, and consented to a negotiation. She resigned the custody of her son to a council of peers nominated by parliament, and, stripped of her power, consented to a reconciliation with Angus, her husband, in whom, along with the chancellor Beaton, the chief power in the government now centered. A feeble effort indeed was made by Arran to destroy the influence of the united factions; but the armed force with which he advanced to Linlithgow was dispersed by the prompt attack of Douglas, and the address of this politic baron soon afterwards prevailed on Arran to join his party.

Angus obtains possession of the king's person.

The earl of Angus had now gained a complete triumph over his enemies. He possessed the person of the young king, he was assisted by the talents and experience of the chancellor Beaton, he had witnessed the gradual decay of the faction of Albany and the French monarch, and he had been joined by Arran, who, although personally a weak man, from his high birth and great estates possessed much power. His first step was wise and temperate. A pacification for three years was concluded with England; and it was hoped that this might be followed by a marriage between the young king and Henry's daughter, the princess Mary a measure which, if guarded so as to preserve the independence of Scotland, might have been attended with the happiest results.

Decay of French influence in Scotland.

The country, so long distracted by border war and internal anarchy, might now, under a judicious administration, have looked forward to something like tranquillity. Had Angus been reconciled to the queen, his wife; had he been contented with his recovery of greater power than he had lost, and been willing to administer the government with justice and moderation; there was every reason to hope for the maintenance of peace, security, and good order. The French party in Scotland had completely sunk. Dr. Magnus, Henry's English minister, who, during his residence in Scotland, had been an object of great jealousy to the people, was recalled; and lord Dacre, whose money and intrigues for so many years had corrupted the Scottish nobles, and introduced disunion and treachery into all their councils, was removed by death from the scenes of his mischievous activity. All these things were favourable; and the well affected, who sighed for the blessings of peace and good government, anticipated a period of repose.

Marriage of the queen-mother to Lord Methven.

It was a vain expectation, destroyed by the precipitate folly of the queen-mother, and the grasping ambition of Angus. That powerful baron had hitherto aimed at one great object, which he now deemed himself on the very point of attaining: to accomplish a reconciliation with his wife, the queen-mother, and, possessing her estates, with the custody of the young king's person, to engross the whole power of the government. At this crisis Margaret, so far from becoming less hostile to Angus, gave herself up more inconsiderately than before, to her passion for Henry Stewart, and procuring a divorce from a husband whom she hated, espoused her paramour with a precipitation which disgusted the people.

Angus's intrigues. The secret council annulled.

This imprudent step determined Angus to change his ground, and a dread of some counter revolution threw him upon new and more violent courses. By a successful stroke of policy, he procured the passing of an act of Parliament which annulled the authority of the secret council, the only power which stood between him and absolute dominion. At the same moment, the parliament declared that the minority of the young king was at an end, and that having completed his fourteenth year, he was to be considered as an independent sovereign. While the youthful monarch thus nominally assumed the government, that provision which entrusted the keeping of the royal person to certain peers in rotation, remained in force; and as Angus had artfully summoned the parliament at that precise time, when it belonged to himself and the archbishop of Glasgow to assume their periodical guardianship of the king, the consequence of this state manœuvre was to place the whole power of the government in their hands.

The king's minority declared at an end.

A new secret council was nominated, composed solely of the creatures of Angus; the great seal was soon after taken from Beaton, the young king was watched with the utmost jealousy, and compelled to give his consent to every thing proposed to him by his new masters. An act of parliament was passed, granting a remission to the heads and followers of this all-powerful faction for the crimes, robberies, or treasons, committed by them during the last nineteen years; every office of trust or emolument in the kingdom was disposed of to the one or other of its supporters, and the ancient tyranny of the house of Douglas once more attained a degree of strength which rivalled, or rather usurped the royal power. At this unhappy period, as has been observed in another work, "the borders became the scene of tumult and confusion, and the insolence of the numerous vassals of this great family was intolerable; murders, spoliations, and crimes of varied enormity, were committed with impunity. The arm of the law, paralysed by the power of an unprincipled faction, neglected to arrest the guilty; the sources of justice were corrupted; the highest and most sacred ecclesiastical dignities became the prey of daring intruders, or were sold to the highest bidder; and the young king, carried about through the country by Angus, apparently in great state, but merely a puppet in the hands of his masters, sighed in vain over a captivity to which there appeared no prospect of a termination."[1] An attempt indeed was made for his deliverance, first by the laird of Buccleugh, one of the most powerful of the border barons, and afterwards by the earl of Lennox, who deserted the party of the Douglases, and to whom the young monarch was much attached. But Buccleugh was routed with considerable loss, and Lennox defeated and slain.

Miserable state of the country.

Angus courts Henry VIII. General remarks.

These unsuccessful attempts only strengthened the power of Angus. He entered into a more strict alliance with Henry the Eighth, obtained the friendship and support of Beaton, the archbishop of St. Andrews, and unchecked by any opposition, ruled all things at his will. Nothing indeed could be more miserable than the picture presented by the country; a monarch in captivity, a nobility in thraldom, a people groaning under the most complicated oppressions, yet with their hands tied, and compelled by the miserable system under which they lived to serve their oppressors. It may be asked, what was the secret history of this enormous power, this degraded and implicit obedience? The answer is to be found in the fact, that the Douglases were masters of the royal person; they could compel the king to affix his signature to any deeds or letters which their tyranny or their caprice might dictate. Angus, the supreme lord of all this misrule, was chancellor, and the great seal at his command; his uncle, Douglas of Kilspindy, was treasurer, and commanded the whole revenues of the country; the law, with all its terrible feudal processes of treason and forfeiture, could be wielded by them at pleasure. So long as the king remained in their hands, this powerful machinery was all theirs; the moment he escaped, the system broke to pieces, and their power was at an end.

The ki
escape

Of all this James, who had now entered his seventeenth year, was perfectly aware; and as every hour of his captivity made the Douglases more hateful to him, his mind became intently occupied with projects for his escape. Nor was it long ere he effected it. With an address superior to his years, the king had either succeeded in lulling the suspicions of his keepers, or a continuance of unchecked power had made them careless. James was at Falkland. Angus, Douglas his brother, and Archibald his uncle, were absent on their private affairs; only Douglas of Pathhead, the captain of the royal guard, remained. The young monarch called for the park-keeper, and, as had been his wont, proposed to hunt next morning. Therefore, says a graphic old chronicler,[2] he "caused him to warn all the whole tenants and gentlemen thereabouts who had the speediest dogs, that they would come to Falkland wood on the morn, to meet him at seven hours, for he was determined he would slay a fat buck or two for his pleasure; and to that effect caused warn the cooks and stewards to make his supper ready, that he might go to his bed the sooner, and to have his *desjeune* (breakfast) ready by four o'clock, and commanded James Douglas of Pathhead to pass the sooner to his bed, and caused bring his collation, and drank to James Douglas, saying to him, that he should have good hunting on the morrow, bidding him be early astir. Then the king went to his bed; and James Douglas, seeing the king in his bed, wist that all things had been sure enough, and passed in like manner to his bed. When the watch was set," continues Pitscottie, "and all things in quietness, the king called on a yeoman of the stable, and desired him bring one of his suits of apparel, hose, cloak, coat, and bonnet, and putting them on, stept forth as a yeoman of the stable, and was unperceived of the watches, till he had passed to the stables, and caused saddle a horse for himself, and one led, and took two servants with him, namely, Jocky Hart, a yeoman of the stable, and another secret chamber boy, and leapt on horse, and spurred hastily his journey to Stirling, and won there by the breaking of the day, over the bridge, which he caused to be closed behind him, that none without licence might win that passage. After this he passed to the castle, and was received there by the captain, who was very glad of his coming, and prepared the castle with all things needful. Then he caused shut the gates, and let down the portcullis, and put the king in his bed to sleep, because he had ridden all that night."

Despair
the Dou
glases.

Having thus regained his liberty, James's first act was to summon a council, and issue a proclamation, interdicting Angus and the Douglases from all approach within six miles of the court, under pain of treason. Nor did they venture to disobey it. On discovering the flight of the king, Angus, Archibald, and Sir George, had hastily assembled a few followers, thrown themselves on horseback, and were riding to Stirling, when they were met by the herald, who read the act, and commanded them in the king's name to halt. For a moment they hesitated, but it was only for a moment. Their sovereign was free; the weapons which but a day before they had wielded with such irresistible force, were now ready to be employed against themselves. A single step forward, and they were guilty of treason, their property and their lives at the mercy of the crown. All this rose rapidly and fearfully before them; and aware how vain it would be at such a moment to meet the power of their enemies, they retreated to Linlithgow.

The monarch, who now took the government into his own

Scotland.
James V.
A.D. 1528.

James V. assumes the government.
His character.

hands, had not completed his seventeenth year; but he had been nursed in the school of difficulty, and his character had acquired a consistency and vigour far superior to his age. This was the more to his credit, because the Douglases had neglected his education; and while they gave him no opportunities of cultivating the qualities which might have made him a blessing to his people, permitted him to indulge in that love of pleasure and tendency to dissipation which was incident to his temperament and time of life. Happily his character, although it did not escape the pollution of such a base system, survived it; and, with some great faults, the king possessed at the same time not a few of the highest qualities which became a wise and good prince. Strict and scrupulously just, unwearied in his application to business, earnest in his endeavours to remove the complicated burdens which, under the tyranny of the late oligarchy, had oppressed the people; generous, though somewhat warm in his temper, easy of access, a stranger to pride, and fond, almost to a fault, of mingling familiarly with all classes of his subjects; he soon rendered himself, young as he was, an object of respect to his nobles, and of affection to his people.

Principles of James's government.

The principles which regulated his future government sprung naturally from the circumstances of his early life. The sternest resentment against Angus and the house of Douglas, was combined with a determination to assert and regain the rights of the crown, and to abridge the power of an aristocracy, which had grown intolerable during a long minority. Towards his uncle, Henry the Eighth, it was impossible that his feelings could be any other than those of resentment and suspicion. It was by this prince that there had been introduced into Scotland an organised system of corruption, of which his able and unscrupulous minister, lord Dacre, had been the author. Many Scottish nobles had become the pensioned agents of the English government; paid informers swarmed in the court and through the country. All idea of conquering Scotland by force of arms had been long since abandoned; but a more insidious expedient was adopted, by which the English king, maintaining the Douglases in their usurped dominion, received in return their homage and fidelity, and administered the government at his pleasure.

James's great objects, which we can trace through the whole remaining period of his reign, were to put an end to this system of foreign dictation; to restore its ancient and constitutional prerogatives to the crown; to bridle the exorbitant power of the great nobles, raising up as a check upon them the large and influential body of his clergy; to encourage the mercantile and commercial classes of his people; and to facilitate the administration of the laws, and insure equal justice to the lowest orders of the community.

Proceed-
ngs against
he House
f Douglas.

For the accomplishment of such ends, it was first necessary to exhibit a wholesome example of retributive justice upon those who had been the greatest delinquents. It was declared treason for any person to hold intercourse with Angus, and every Douglas was commanded to leave the capital on pain of death. Angus himself was commanded to remain beyond the waters of the Spey, and required to deliver his brother Sir George Douglas, and his uncle Archibald, as hostages, for his answering to his summons of treason. Having haughtily disobeyed these orders, a parliament assembled. He was proclaimed a traitor, and his lands nominally divided among those nobles to whom James owed his late success. It was easier, however, to promulgate than to execute such decrees against so powerful a baron; nor was it till after repeated attacks upon Tantallon, some of them led by the king in person, that the arch-offender was reduced, and compelled to seek an asylum in England.

Scotland.
James V.
A.D. 1528.

State of the borders.

James next directed his attention to the state of the borders; and in an expedition which was long remembered for the vigour, dispatch, and severity of the royal vengeance, inflicted punishment upon the greatest offenders, among whom was the noted freebooter, Johnnie Armstrong, and reduced the district into a state of tranquillity. Scarcely was this accomplished, when the Orkneys were threatened to be torn from the crown by the rebellion of the earl of Caithness; and the Isles became the scene of a fierce struggle between the earl of Argyll and Alexander of Isla, one of the most powerful chiefs of that remote region. The judgment and energy of the monarch were shewn in the speedy re-establishment of peace in both quarters; and the people, aware that the sceptre was once more in a firm hand, readily and gratefully co-operated with their sovereign in all his labours.

Foreign politics.
A.D. 1529–1530.

England and France were now at peace, and Henry the Eighth and Francis the First united in a strict alliance, which had for its object to bridle the increasing power of the emperor Charles the Fifth. Under these circumstances, Henry proposed a matrimonial alliance with Scotland, and the design was encouraged by France; while the emperor, jealous of the power which so near a connexion with James might give to his enemies, offered in marriage to the young prince his sister, the queen of Hungary, or his niece, the daughter of Christiern, king of Denmark, with Norway as her dowry.

James promotes his clergy.

For the present, however, all these offers were declined, and the monarch appeared wholly engrossed with the prosecution of his various plans for the melioration of his kingdom. Finding himself thwarted by the nobles, he was compelled to adopt decided measures, and to promote the clergy to those offices which had been filled by temporal barons. Argyll was thrown into prison, the earl of Crawford stripped of a large part of his estates; the determination that no Douglas should ever bear sway in Scotland became a more stern and obstinate principle than before; and while the archbishop of Glasgow, the abbot of Holyrood, and the bishop of Dunkeld, were principally consulted in affairs of state, many of the nobles who had hitherto enjoyed the royal confidence saw themselves treated with coldness and distrust.

Commercial treaty with the Netherlands.
A.D. 1532.

It was at this time, that the king carried into effect two important measures, the one affecting the commercial interests of his kingdom, the other of still higher moment, as an endeavour to secure to all classes of his subjects an equal and speedy administration of justice. A commercial treaty between Scotland and the Netherlands had been concluded by James the First, for the period of one hundred years. It was now approaching its termination, and an embassy was dispatched to Brussels, which renewed the league for another century. His second measure was the institution of the College of Justice, a court consisting of fourteen judges, one half selected from the spiritual, the other from the temporal estate, of which the idea is commonly believed to have been suggested by the parliament of Paris. The principal design of this new judicature was to put an end to the delay and partiality arising out of the barons' courts; in other words, to remove the means of oppression out of the hands of the aristocracy; but as it was provided, that the king might at his pleasure send three or four members of his council to give their votes, it was evident that the subject was freed from one grievance, only to be exposed to the hazard of another, whenever his rights might happen to come in collision with the crown.

Institution of the College of Justice.

The Douglases sell themselves to England.

During these transactions, the Douglases and their adherents were driven upon violent and discreditable courses, in proportion as their prospect of reconciliation to the king became more hopeless and remote. The earl of Bothwell, also a powerful border baron, whose excesses James had severely punished, entered into a traitorous alliance with Henry the Eighth, in which he engaged, if properly supported, to dethrone his sovereign, and to "crown the English king in the town of Edinburgh within a brief time;"

while the earl of Angus did not hesitate, in the extremity of his resentment, to sell himself to England; and in an original writing which yet remains, engaged to "make unto Henry the oath of allegiance, to recognise him as supreme lord of Scotland, as his prince and sovereign."[1]

War with England. A.D. 1532. Henry VIII. and the Douglases invade the country.

In consequence of these base engagements, war was once more kindled on the borders, and carried on by the Douglases and Henry's captains with such desolating fury, that James was compelled to call out the whole body of the fighting men in the country. These he divided into four armies, to each of which in rotation the defence of the marches was entrusted. The measure effectually checked the power of the English, and there was little prospect of Bothwell fulfilling his threat, of crowning Henry in the capital; but peace seemed more distant than ever, and nothing could be more deplorable than the picture presented by the country. The flames of villages and granges, the destruction of the fruits, and the cessation of the labour of the husbandman, the stoppage put to the enterprise of the merchant, the increase among the people of the spirit of national antipathy, the corruption of the nobles by the money of England, the loss among such pensioned adventurers of all affection for the sovereign, and the decay of the healthy feelings of national independence; all these lamentable consequences sprung out of the continuance of the war, and made the king desirous of securing peace, even if it should be at some sacrifice.

Peace with England.

This he at length accomplished. James agreed that the Douglases, by which was meant Angus, his brother George, and his uncle Archibald, should remain unmolested in England, supported by Henry as his subjects, on condition that Edrington castle, the only spot which they held in Scotland, should be surrendered, and reparation made for any expedition which they or the English king might hereafter conduct against Scotland. On these conditions a pacification was concluded, for the period of the lives of Henry and James, and a year after the death of him who first deceased; and soon after its ratification, the young monarch, whose firmness and talent in the management of his government made him an object of respect to the European princes, received the Garter from England, the order of St. Michael from France, and the Golden Fleece from the emperor.[2]

James was now in his twenty-second year, and his marriage was earnestly desired by the country; but he had hitherto shewn little inclination to gratify the wishes of his people. With all his good qualities, he unhappily inherited from his father an extreme devotedness to pleasure, which had been rather encouraged than restrained by the Douglases; and his passions getting the better of his prudence and principle, sought their gratification in low intrigues, carried on in disguise, and in pursuit of which he not unfrequently exposed his life to the attacks and revenge of his rivals. It was now full time that he should renounce these disreputable excesses; and having evaded an offer made by the Spanish ambassador, of the hand of the princess Mary of Portugal, and declined a similar proposal of Henry the Eighth, who pointed to his daughter the princess Mary, he dispatched an embassy to France, for the purpose of concluding a matrimonial alliance with that crown.

The Reformation.

It now becomes necessary to attend to a great subject, (the rise of the Reformation in Scotland,) the principles of which had been for some time silently making their progress among the people, but which from this period exercised a marked and increasing influence over the history of the government and of the country. It was now nearly six years since Patrick Hamilton, abbot of Ferne, the friend and disciple of Luther and Melanchthon, having renounced the errors of the Roman Catholic church, and embraced the doctrines of these leading reformers, had been delated of heresy, and condemned to the flames. The cruel sentence was carried into effect at St. Andrews in 1528, under the minority of James, and while the supreme power was in the hands of the earl of Angus. On taking the government into his own hand, James, although decidedly inimical to the principles of Angus in all other things, unhappily followed his determination to persecute those whom he esteemed the enemies of the truth. David Straiton and Norman Gourlay, who were disciples of the reformation, were tried for heresy, condemned, and brought to the stake, on the 27th of August 1534; and the intolerant and cruel conduct of the king compelled some who had embraced the same opinions to fly for safety to England.

The Pope sends a messenger to James

About this time Henry the Eighth exerted himself to the utmost to prevail upon the Scottish king to imitate his own conduct, and shake off the yoke of Rome. He endeavoured to open his eyes to the tyranny of the pope's usurpations, sent to him the treatise entitled the "Doctrine of a Christian Man," and dispatched Dr. Barlow and Lord William Howard to request a conference with his royal nephew at York; but the remembrance of the injuries he had sustained, resentment for Henry's intrigues with his discontented subjects, and an attachment to the faith of his fathers, indisposed James to listen to these overtures; and when Paul the Third deputed his legate Campeggio to visit Scotland, the embassy found it no difficult matter to confirm the Scottish monarch in his attachment to the Catholic church. At the same time he addressed him by the title of which Henry had proved himself unworthy, Defender of the Faith, and presented to him a cap and sword which had been consecrated by the pope upon the feast of the nativity.

A parliament. A.D. 1535 Luther's Works proscribed.

A parliament which assembled about this time, made two provisions which deserve attention. The importation of the works of Luther, which had been proscribed by a former act, was again strictly forbidden; any discussion of his opinions, unless for the purpose of proving their falsehood, was prohibited; and all persons who possessed any treatises of the reformer, were enjoined, under the penalty of confiscation and imprisonment, to deliver them up to the ordinary within forty days. The second act, which is well worthy of notice, related to the boroughs, in this dark age the best nurseries of industry and freedom. Hitherto feudal barons had been elected to the offices of magistrates and superintendents over the privileges of these corporations; an unwise practice, by which the provosts, aldermen, or bailies, instead of being industrious citizens, interested in the protection of trade, and the security of property, were little else than idle and factious tyrants, who consumed the substance and invaded the corporate privileges of the burgesses. A law was now made, that no person should be elected to fill any office in the magistracy of the borough, but such as themselves were honest and substantial burgesses, and although not immediately or strictly carried into effect, the enactment evinced the dawning of a better spirit.

The king visits France. A.D. 1536.

War still continued between Francis the First and the emperor, a circumstance which induced the French king to continue an amicable correspondence with England; and being aware that Henry the Eighth was intent upon accomplishing a marriage with Scotland, Francis did not care to disgust this passionate monarch by any very speedy attention to James's desires to unite himself to a French princess. To obviate this, the Scottish king himself took a voyage to France, and landing at Dieppe, proceeded from thence in disguise to the palace of the duke of Vendôme. Here, being received only as a noble stranger, he saw, for the first time, but did not approve of his affianced bride, Marie de Bourbon, the duke's daughter, and transferred his affections to Madeleine, the youngest daughter of the French king, to

Iarriage of
he king.

whom he was soon after married in the church of Notre Dame. In the circumstances in which Scotland was then placed, the church of Rome was inclined to consider this union as one of great importance; and it has been noted that seven cardinals surrounded the altar. Nor were these anticipations disappointed. James remained for nine months in France, and having returned to his own kingdom, it was soon evident that some great changes were on the eve of taking place.

Rupture
etween
Francis I.
nd Henry
VIII.

Francis the First, although still nominally at peace with Henry, had become alienated from him by the violent and dictatorial tone which he assumed. The pope, who considered his own existence as involved in the contest with England, had neglected no method by which he might first terminate the disputes between the emperor and the French king, and then unite them in a coalition against Henry, as the common enemy. We have already noticed the success of the court of Rome in flattering the vanity of James; and it appears that, in 1537, these intrigues were so far successful, that a pacification was concluded between Francis and the emperor. From this moment the cordiality between France and England was completely at an end, while every argument which could have weight in a young and ardent mind was addressed to James, to induce him to join the projected league against Henry.

Iission of
ir Ralph
adler to
cotland.

Nor had the conduct of Henry, during James's absence in France, been calculated to allay those resentful feelings which already existed between them. He had sent into Scotland Sir Ralph Sadler, a crafty and able diplomatist, for the express purpose of completing the system of secret intelligence introduced, as we have seen, with pernicious success by lord Dacre. This minister was instructed to gain an influence over the nobility, to attach the queen-mother to his interest, to sound the inclinations of the body of the people on the subject of peace or war, an adoption of the reformed opinions, or an adherence to the ancient faith. The Douglases were still maintained with high favour in England. Their power, although nominally extinct, was far from being destroyed; their spies penetrated into every quarter, and had even followed the young king to France, whence they gave information of his most private motions; finally, those feudal covenants, termed bonds of manrent, still bound to their interest many of the most potent of the nobles, whom the vigour of the king's government had disgusted or estranged.

From this description we may gather the state of parties at the return of James to his dominions after his marriage. On the one hand was seen Henry the Eighth, the head of the protestant reformation in England, supported in Scotland not only by the still formidable power and unceasing intrigues of the Douglases, but by a large proportion of the nobles, and the talents of his sister, the queen-mother. On the other hand stood the king of Scotland, assisted by the united talent, zeal, and wealth of the Roman Catholic clergy, the loyalty of some of the most potent peers, the co-operation of France, the approval of the emperor, the affection of the great body of his people, upon whose minds the doctrines of Luther had not yet made any very general impression, and the cordial support of the papal court. The course of events, into which we cannot enter minutely, but which we shall touch in their principal consequences, illustrated strikingly these opposing interests.

nes's se-
d mar-
ge.

In the mean time, scarcely had the rejoicings ceased for James's return to his dominions with his youthful queen, when it was apparent that she was sinking under a consumption, which in a short time carried her to the grave. Although depressed by this calamity, the king did not permit it to divert his mind from that system of policy on which he had resolved to act; and an embassy to France, was entrusted to David Beaton, afterwards the celebrated cardinal, who requested for his master the hand of Mary of Guise, the widow of the duke of Longueville, and sister to the cardinal of Lorraine. To this second union, the court of France joyfully assented and the marriage took place at St. Andrews, within a year after the death of the former queen. At this moment the life of the king was twice endangered by conspiracy; and although much obscurity hangs over the subject, both plots were probably connected with the intrigues of the house of Douglas. At the head of the first was the master of Forbes, a brother-in-law of Angus. The chief actor in the second was the lady Glammis, his sister, who, only two days after the execution of Forbes, was accused of an attempt to poison her sovereign, found guilty and condemned to be burned; a dreadful sentence, the execution of which she bore with the hereditary courage of her house.

Scotland.

James V.
A.D.1537.

An event now happened, which drew after it important consequences. James Beaton, archbishop of St Andrews, died, and was succeeded in the primacy by his nephew, cardinal Beaton; a man far his uncle's superior in talent, and still more devotedly attached to the interests of the Roman Catholic church. It was to him, as we have seen, that James had committed the negotiation for his second marriage; and so great appears to have been the influence which he acquired over the royal mind, that the king henceforth selected him as his principal adviser.

Cardinal
Beaton.
Persecution of the
reformers.
A.D.1539.

Beaton's accession to additional power was marked by a renewed persecution of the reformers; and it is worthy of observation, that most of the converts to the reformed faith belonged to the order of the inferior clergy. Keillor, Forret, Simson, and Beveridge, were arraigned before an ecclesiastical tribunal, and soon afterwards Kennedy and Russell, out of which number three, Kennedy, Forret, and Russell, suffered at the stake with great meekness and courage. There can be little doubt that such inhuman executions operated in favour, rather than against the progress of the reformation.

Another
mission of
Sadler into
Scotland.

The coalition between Francis the First and the emperor was now completed under the auspices of the papal court; and Henry the Eighth, aware of the great efforts made to induce James to join the league against him, dispatched Sir Ralph Sadler into Scotland. The object of this able negotiator was to rouse James's jealousy against the increasing power of the clergy, to prevail upon him to throw off his allegiance to the pope, to imitate his example by suppressing the monasteries, and to urge him to maintain the peace with England. To the last request the Scottish king replied, that if Henry's conduct was pacific, nothing should induce him to join any hostile league against him; but he assured Sadler that he found his clergy his most loyal and useful subjects; and although he would be anxious to see a reformation in the general morals of this body, he did not exactly see how that could best be effected by renouncing the authority of his holy father the pope, the terrestrial head of the church, and thus setting an example of rebellion and confusion.

The king's
voyage to
the north.

James had for some time meditated an important enterprise, which he now executed; a voyage to the most northern parts of his dominions conducted by himself, and on a scale such as had not been attempted by any of his predecessors. His fleet consisted of twelve ships, fully armed and provisioned. He was attended by Beaton, and the earls of Huntly, Arran, and Angus; and these barons bringing with them their armed vassals, formed a force which, united to the royal suite and attendants, was equal to a little army. Lindsay, a skilful hydrographer, accompanied the expedition, and his maps and charts, the first rude essays in this science ever attempted in Scotland, are preserved at the present day.[1] The king first coasted Fife, Angus, and

---

[1] In the Harleian Collection, British Museum.

Buchan; he next visited Caithness, crossed the Pentland frith to the Orkneys, doubled Cape Wrath, steered for the Lewis, crossed over to Skye, circumnavigated Mull, swept along the shores of Argyle, and passing Kintyre, inspected Arran and Bute, whence he sailed up the Clyde to Dunbarton, where he concluded his labours.

The effects of this royal progress were salutary and decisive. The force with which James was accompanied secured a prompt submission to his commands, and inspired these remote districts with a wholesome dread of the royal name. Some of the fiercer and more independent chiefs, who affected a show of resistance, were seized and confined in irons on board the fleet; others, more gently treated, were yet compelled to accompany the monarch as hostages for the pacific behaviour of their followers; and all were convinced that any attempt to brave the power of the crown, must for the present be vain and ruinous.

Conspiracy against the king's life.

This exhibition of increasing energy in the king only exposed him the more to the jealousy of those nobles whose power had been nourished by long intervals of license, and who now clearly perceived, that unless they were prepared to resign their rights, a struggle between them and their sovereign could hardly be averted. A proof of this was shown on James's return to court from his northern voyage, when a conspiracy against his life was detected, the third which had occurred within no very long period. Like the rest it is involved in obscurity; but the proof was considered as sufficient, and its author, Sir James Hamilton, commonly called the bastard of Arran, was tried, convicted and executed. It is said that the king was thrown into a state of great despondency and gloom by the discovery of this plot; that it opened his eyes to the manifold dangers which surrounded a prince at variance with his nobles; and that he began to feel that he was engaged in a contest in which they might prove too strong for him.

A parliament. James's decided measures.

Whatever credit we may attach to these reports, the conduct of James gave decided proofs that he was determined to continue the struggle; and in a Parliament which soon afterwards assembled in the capital, he strengthened his own hands by annexing to the crown the whole of the Hebrides, by which we are to understand the isles north and south of the two Kintyres. But this was not all. To these new acquisitions were added the Orkney and Zetland isles, many extensive lordships, Jedburgh forest, and the demesnes of Angus, Glammis, Liddaldale, and Evandale.

In the want of contemporary evidence, it is difficult to decide upon the strict justice of this sweeping measure. It is possible that, by rigidly investigating the history of former rebellions, and present treasons, James may have persuaded himself that he was entitled to the forfeiture of all these large estates and principalities; but in such circumstances it had been the practice of former monarchs to parcel out the forfeited lands among his nobles who had preserved their loyalty; and in the measure now adopted, of annexing the whole to the crown, the aristocracy saw little else than their own intended ruin. It was in vain that the measure was followed by the publication of a general act of amnesty for all former treasons. The earl of Angus, Sir George Douglas, and the whole of their adherents were excepted; and men observed that while the king's generosity was vague and capricious, his aversion to those who had once injured him, was stern and immutable.

The king's conduct regarding the Reformation.

It is not easy to discover James's exact opinions regarding the progress of the reformed doctrines, which now began to create great alarm in the Roman Catholic clergy. On the one hand he seems to have become convinced of the necessity for a reform in the church, and to have looked with a severe eye upon the idleness, corruption, and ignorance of a large portion of the clergy. He encouraged Sir David Lindsay, whose satire upon the three estates contained a bitter attack upon the prelates; and being himself much involved in debt, there is reason to believe he regarded the overgrown possessions and extraordinary wealth of the clergy with certain longings to appropriate some portion of it towards the exigencies of the state. Yet, in the Parliament to which we have just alluded, it was made a capital offence to argue against the supreme authority, or the spiritual infallibility of the pope; the discussion of religious questions in private meetings was interdicted; a law was passed against the demolition of the shrines and images of saints; and it was evidently the opinion of the king that the reformation should be made by the church itself, within itself, and under the sanction of its head the pope.

Mutual an
mosity b
tween
James an
Henry
VIII.

Such seems to have been the feelings and the policy of the sovereign. Those of another influential body in the state, the clergy, are easily detected. To counteract the intrigues of Henry the Eighth, and to check any incipient feelings of favour towards the reformation, the great reliance of cardinal Beaton and the Roman Catholic party was in the prospect of a war with England. To accomplish this, they had unfortunately ample materials to work upon. Henry the Eighth was violent and dictatorial; James proud, and jealous of his independence. The English king had espoused the interests of the banished house of Douglas, and fomented discontent among the rest of the Scottish nobles. James was animated by an unrelenting animosity to the earl of Angus, the head of the house of Douglas, and to all who bore the name. Henry, instigated by the utmost hostility to the Roman see, eagerly desired that his royal nephew should imitate his example, suppress the religious houses, and proclaim his independence; but the instructions to his ambassador, Sadler, upon this subject, contained expressions so personally insolent to James, that if obeyed, his mission must have occasioned disgust rather than conciliation. The English king requested a personal interview at York; and James, after a promise to meet him, broke the appointment with Henry, who had proceeded to that city in expectation of his arrival.

James in
vain desi
peace.
Invasion
England.

At this crisis, the Scottish king evidently dreaded being prematurely hurried into war. He was in debt, he suspected the fidelity of his nobles, he was well aware that a feudal monarch at variance with his barons, the sinews of his strength, was likely to be dishonoured and defeated. He had lately lost his only children, Arthur and James, and he believed that Beaton's anxiety for war was dictated by selfish motives, and influenced by his intrigues with Rome. Under these circumstances, public policy and personal feeling alike made him dread any immediate hostilities with England, and he endeavoured by an embassy to avert the rupture; but Henry, from the moment of his disappointment at York, would listen to no message of conciliation. War was resolved on, the east and middle marches were put into a state of defence, Berwick inspected, musters raised in the north, and soon afterwards Sir James Bowes, with the force of the east marches, marched across the border. The banished Angus, his brother Sir George Douglas, and a large body of the retainers of the Douglases, had joined him; but they were encountered, and completely defeated by Huntly and Home.

The king
makes a l
attempt t
avert hos
lities.

This, however, was merely a preliminary outbreak; and as such border outrages had frequently occurred without drawing after them more serious consequences, James made a last effort to avert the storm, by sending commissioners first to York, and afterwards to meet the duke of Norfolk, who, at the head of an army of forty thousand men, had crossed the Tweed, and already given many of the granges and villages to the flames. It was in vain, however, to attempt negotiation; and aware that the crisis had arrived, the Scottish king commanded Huntly and Home, upon whose fidelity he had most reliance, to watch the progress of Norfolk, while he himself assembled the main force of his kingdom on the Borough-moor near Edinburgh.

ames re- lves on ar.

he nobles fuse to vade ngland.

With this army, which mustered thirty thousand strong, he advanced to Fala-moor, and when encamped there, received the welcome intelligence that Norfolk, compelled by the want of supplies and the severity of the winter, was in full retreat. It was now the time to retaliate, and James issued orders for an immediate invasion of England. But the nobles felt their own strength. They had long regarded the measures of the court with distrust, some even with indignation and a desire of revenge; they recalled to mind the proceedings of the monarch, the threatening attitude lately assumed by the crown towards the whole body of the aristocracy; and when commanded to cross the borders, they haughtily and unanimously refused. It was in vain that James, stung with such an indignity, threatened, remonstrated, and even entreated them, as they valued their own honour and his, to proceed against the English. The feeling of attachment to their prince, or revenge against the enemy seemed to be completely extinguished in a resolution to assert their power, and procure a redress of their grievances; and the sovereign was at last compelled to disband the army, and return outbraved and defeated to his capital.

e assem- es a se- nd army. he Scots tirely uted by e Eng- h. .D.1542.

There can be no doubt that so mortifying a reverse sunk deep into the heart of James, but his pride, and the natural vigour of his character supported him. Though deserted by the majority, he had still some powerful friends among the nobles, the clergy were unanimously in his favour, and it was resolved to make a second effort to re-assemhle the army for the invasion of England. Its success, though partial, once more gave a gleam of hope to the monarch. A force of ten thousand men was collected chiefly by the exertions of Lord Maxwell; with this it was resolved to break across the western marches, and the king took his station at Caerlaverock, where he eagerly awaited the result of the expedition. A distrust of his nobles, however, still haunted him; and secret orders were issued, that as soon as the army reached the river Esk, his favourite, Oliver Sinclair, should be intrusted with the chief command. Nothing could be more unwise than this resolution. It was received with murmurs of discontent; and when the new general exhibited himself to the camp, and a herald attempted to read the royal commission by which he was appointed, the whole army became agitated, disorderly, and almost mutinous. At this crisis, Dacre and Musgrave, two English officers, advanced to reconnoitre at the head of three hundred horse, and approaching near enough to perceive the condition of the Scots, boldly charged them. The effect of this surprise was instantaneous and fatal. Ten thousand Scots fled from three hundred English cavalry, with scarcely a momentary resistance. In the panic the greater number escaped, but a thousand prisoners were taken, and among them many of the leading nobles, Cassillis, Glencairn, Maxwell, Somerville, Gray, Oliphant, and Fleming.

he king es of a oken art.

This second calamity completely overwhelmed the king. He had eagerly awaited at Caerlaverock the first news from the army, and he anticipated a victory which should efface the late dishonour, and restore the feelings of cordiality between himself and his barons. In an instant the hope was blasted, and gave place to the most gloomy despondency. For their unheard-of conduct, James could find no solution but in the persuasion that his nobles had secretly conspired to betray him to England, and to sacrifice the independence of the kingdom to the gratification of their personal revenge. This idea preyed upon his mind. The feeling that his army had exposed themselves, their sovereign, and the Scottish name to contempt, took entire possession of him. He became the victim of a low fever, which had its seat in a wounded heart, and from a proud monarch, lately in the vigour of his strength and the prime of his age, he sunk into a state of silent melancholy. When in this hopeless condition, the news arrived that his queen had given birth to a daughter. He had already lost his two sons, and clung to the hope that his next might be a boy. But here too he was met by disappointment; and wandering back in thought to the time when the daughter of Bruce brought to his ancestor, the steward of Scotland, the dowry of the kingdom, he received the intelligence with the melancholy remark, "It cam wi' a lass, it will gang wi' a lass:" "It came by a girl, and will go with a girl." As he said this, a few of the most faithful of his nobles and councillors stood round his bed; and as they strove to comfort him, he stretched out his hand for them to kiss, and regarding them with great affection, closed his eyes, and placidly expired. He died in the thirty-fifth year of his age, and the twenty-ninth of his reign.

Mary, an infant eight days old, succeeds to the crown.

Somewhat more than two centuries and a half had elapsed since the death of Alexander the Third had left the country under circumstances of calamity and danger strikingly similar to those in which it now found itself in losing James the Fifth. Alexander had been bereft of all his sons, and the crown descended to an only grand-daughter, the Maiden of Norway. James had been visited by a like bereavement. His sons, Arthur and James, had been cut off, and his only daughter, Mary, an infant eight days old, was now queen. On the death of Alexander, the kingdom saw itself exposed to the ambitious designs of Edward the First, who immediately conceived the project of marrying the queen of Scotland to his eldest son. On the death of James, Henry the Eighth, a monarch far inferior in talent to Edward, but equally ambitious, and, where the rights of others were concerned, still more unscrupulous, at once embraced the design of marrying his son the prince of Wales to the infant Mary. Edward, when disappointed of his first object by the death of the infant queen, resorted to intrigue and force to accomplish his purpose; and Henry having been baffled in his ambition, not indeed by the death, but by the betrothment of Mary to the dauphin, resorted to the same weapons to effect his designs. One point of the parallel, and that the most mortifying of all, remains. In the days of Edward, Scotland was basely deserted by her leading nobility, and owed her liberty to the inherent love of freedom and the persevering courage of her people. It was the same under Henry the Eighth and Edward the Sixth. The lapse of two centuries and a half found the great majority of the Scottish nobles as selfish, wavering, and unprincipled as their ancestors in the days of Edward,—supported by the money of England, ready to sacrifice the independence of their country to their individual ambition; and if Scotland preserved her liberty as a separate kingdom, which, by the blessing of God, she did, the agents selected for her deliverance were the great body of her people, and the numerous and influential classes of the clergy. From these general remarks let us return to our historical sketch.

Intrigues of Henry with the prisoners taken at Solway Moss.

The rout at the Solway Moss, followed, as we have seen it, by the death of the king, gave an alarming advantage to Henry the Eighth. The earl of Angus, Sir George Douglas, and the numerous supporters of this house, still powerful though in banishment, had been long devoted to his interests, in the support of which they saw the only sure hope of their own restoration. To these were added the prisoners of highest rank who were taken in the late disgraceful flight. To them the English monarch now proposed an alternative, trying indeed, but in the choice of which no citizen of a free country ought to have hesitated. On the one hand, they were threatened with imprisonment in the Tower, to which they had been conducted immediately after their being taken. On the other, they were promised freedom, and a return to their native country, but coupled with extraordinary conditions. A bond was drawn up which they were required to sign. By it they acknowledged Henry as lord superior of the kingdom of Scotland; they promised to exert their influence to procure for him the government of the kingdom, and the resignation into his hands of all its fortresses; they engaged to have their infant queen delivered to his keeping; and they solemnly stipulated, that if the parliament of Scotland resisted such demands, they would employ their whole feudal strength to co-operate with England in completing the conquest of the country. To this engagement they were required to swear fidelity; and if they failed in accomplishing the wishes of the king, the penalty was to be their immediate return to their prisons in England. It must have been apparent to the Scottish prisoners that such an engagement virtually annihilated the existence of their country as a separate kingdom; and yet it is mortifying to add that it was embraced by the earls of Glencairn and Cassillis, with the lords Maxwell, Somerville, and Oliphant. These were among the chief prisoners taken in the rout of Solway Moss; the rest were of inferior rank, and remained in captivity, while Angus, Sir George Douglas, and the strength of their house, cordially co-operated with Henry.[1]

A.D. 1542.
State of parties in Scotland.

It was the policy of these lords on their return to Scotland, to conceal the full extent of their engagements, and to proceed with great caution. On their arrival they found the country divided into two factions. On the one side, was cardinal Beaton the chancellor, supported by the queen-mother Mary of Guise, the whole body of the clergy, the Roman Catholic nobility, and the interest of France. On the other stood the earl of Arran, nearest heir to the crown, a weak and indolent man, who leaned to the reformed opinions; all the nobles who had forsaken the ancient faith, the adherents of the house of Douglas, and many who, ignorant of the unjust and degrading demands of Henry, considered a marriage with England, under due safeguards, as a wise and politic step. As to the great body of the people, by which we must chiefly understand the middle and commercial classes, their feelings, as far as they can be detected, were somewhat discordant. Many favoured the reformation, and from hostility to the cardinal, gave a virtual support to Henry the Eighth and the English faction; but their feeling of national independence was so strong, that on the slightest assumption of superiority, it was ready to exhibit itself in determined hostility.

Arrival of the Douglases and the Solway prisoners.

Into the details of the struggles between these opposite factions, it belongs not to our plan to enter. We must touch only the great leading events; but these, even in their most general form, are full of interest. On the death of the king, Beaton produced a will which appointed him chief governor of the realm, and guardian to the infant queen; but the paper was thrown aside as a forged instrument; Arran, the nearest heir to the crown, was chosen governor; and the cardinal having contented himself with securing the interest and support of France, prepared for a determined struggle with his opponents. At this moment, the Douglases and the Solway prisoners arrived, of which party Sir George Douglas, brother to Angus, and father of the celebrated regent Morton, was the leader. Their first act was bold and successful. Beaton was arraigned of a treasonable correspondence with France, and hurried to prison; a parliament was summoned for the discussion of the proposed alliance with England; and as the governor, Arran, appeared to be completely under English influence, it was confidently expected that Henry's schemes of ambition were not far from their accomplishment. But they were defeated by his own violent and intolerant conduct. He insisted on having the cardinal delivered up to be imprisoned in England; he upbraided the Douglases for their delay to surrender the fortresses of the kingdom; and instead of being contented with the proceedings of the parliament, which agreed to the marriage between the Scottish queen and his son, he expressed the most violent resentment, because the estates insisted that their country should preserve its liberties as a separate and independent kingdom.

Imprisonment of Cardinal Beaton.

Beaton r gains his berty and places hi self in o position Henry VIII.

Amidst these collisions the secret treachery of the Douglases and the Solway lords began to transpire. Beaton nearly about the same time recovered his liberty, and after an ineffectual attempt to secure a matrimonial alliance with England on just and equal grounds, he placed himself and the great party of which he became the leader in determined hostility to Henry. A last effort, however, was made, and a Scottish embassy sought the English court. In a personal interview, the ambassadors explained to the king the conditions on which the country would agree to the marriage. To their astonishment, the monarch, overcome by passion, proclaimed himself lord paramount of Scotland, and insisted that the government of that kingdom, and the custody of its infant sovereign, belonged of right to him. This disclosure, which was made in a moment of passion, and against the earnest entreaties of the English faction, produced an instantaneous effect. It was received in Scotland, as had been predicted, with a universal burst of indignation. It gave the cardinal and the French party an immediate ascendancy; the governor, Arran, and his friends joined their ranks; and the people became so exasperated, that Sadler, the English ambassador, could not safely shew himself in the capital.

Treaty of marriage with Eng land.

To counteract all these effects, Sir George Douglas exerted himself with indefatigable activity. Henry was prevailed upon to renounce the most obnoxious part of his demands. Arran, with his characteristic caprice, deserted his new friends; and in a convention of the nobles, which was not attended by the opposite faction, the treaties of marriage and pacification with England were finally arranged. Yet although, as far as it was promulgated to the people, the negotiation now concluded, preserved entire the rights and liberties of Scotland, a paper has lately been discovered, drawn up at the same time, and entitled *a secret Device*, in which the earls of Angus and Glencairn, with lord Maxwell, Sir George Douglas, and the rest of their party, once more tied themselves to the service of the English king, and promised that, if he did not accomplish the full extent of his designs, he should at least have the dominion on this side the Forth.[2]

Treachery of the ear of Arran.

To fulfil this treaty, however, was found no easy matter. It was averred by the opposite faction, that it had been carried through by private influence, unsanctioned by the highest nobles, unauthorized by any parliament, contrary to the wishes of the people; and at this very crisis the cardinal obtained possession of the person of the infant queen, who had hitherto been strictly guarded by the governor and the Hamiltons. To balance this success, Arran, whose character had hitherto been only weak, became alarmed at the success of the cardinal; and, flattered by a proposal of the English king to make him sovereign of Scotland beyond the Forth, declared his readiness to co-operate with an English army for the entire subjugation of the country. In the mean time, he held a convention of the nobles in the abbey church of Holyrood, and in his character of governor of the realm, ratified the marriage treaty with England, unmindful of the protestations of Beaton and his party, that they were no parties to such a transaction, and would not hold themselves bound by a decision contrary to the opinion of the majority of the nobles and the wishes of the people.

Violence of the English king.

Henry the Eighth, enraged by this opposition, acted with his wonted impetuosity and want of principle. He intrigued against the life and liberty of the cardinal, but his plots to get possession of the prelate were unsuccessful; he seized the ships of the Scottish merchants which were in English ports, a measure which was deeply resented; and he assumed that tone of haughty defiance, which, when united to his hostile preparations, made it apparent that war could not be long averted. France now offered her assistance to her ancient ally. The earl of Arran, ever wavering and irresolute, once more threw his whole influence into Beaton's hands; and this minister, availing himself of an accession of strength, proceeded with a vigorous hand to suppress heresy, and to inculcate determined resistance to England.

nvasion by
Henry.

Henry, who was thoroughly unprincipled, and cared not what means he used to rid himself of his opponents, attempted to remove the cardinal, by hiring Brunston, Grange, Rothes, and some of the opposite faction, to seize or assassinate him; but he once more failed in this nefarious project, and, foiled and irritated, let loose his vengeance in the shape of a naval invasion. An English fleet of a hundred sail, under lord Lisle, high admiral, appeared suddenly in the Forth, and disembarked a force which plundered Leith, sacked Edinburgh, which had been deserted by its inhabitants, ravaged the adjoining country with merciless cruelty, and left upon land a considerable force, which, in its retreat, was as remorseless in its devastations as the fleet had been in its attack. Such was Henry's mode of wooing, of which it was well observed by lord Herbert, that he did too much for a suitor, and too little for a conqueror.

It might have been expected that the rival leaders and factions in the state, all of whom had suffered by this invasion, would have had their eyes opened to the necessity of saving the country, by uniting their strength; but in vain the cardinal strained every effort to effect so desirable a result. Mutual jealousies, feudal quarrels, renewed intrigues with England, private bonds or covenants among themselves, all co-operated to destroy any cordial union; and the earls of Lennox and Glencairn, two of the most powerful of the Scottish barons, seized this opportunity to sell themselves to Henry, and to conduct a hostile expedition into the heart of Scotland.

ttle of
cram
uir.
D. 1544.

It was at this moment, when all was gloom and despondency, that the earl of Angus, who, with his brother, had been lately restored to his estates, and absolved in Parliament from the sentence of treason, encountered and totally defeated Sir Ralph Evre and Sir Brian Layton at Ancram Muir. These English leaders had procured from Henry a grant of all they could conquer in Teviotdale and the Merse, where Angus's estates chiefly lay; and penetrating at the head of five thousand men to Melrose, they not only ravaged that district, but plundered the abbey, and wantonly defaced the tombs of the house of Douglas; an insult which Angus revenged in the most signal manner, by attacking the English in their retreat, dispersing their force, with the slaughter of eight hundred men, leaving Evre and Layton dead on the field, and making a capture of one thousand prisoners.

This victory, although resulting not from patriotic principle, but personal revenge, had a good effect in restoring confidence to the people; and it was followed up by the resolution of Francis the First to equip a fleet for the invasion of England, and to assist Scotland by an auxiliary force. Beaton, encouraged by this expected aid, having concentrated his party, prevailed upon the majority of the nobles, in a convention held in the capital, to refuse every advance of the English monarch, and to declare the treaty of peace and marriage at an end; while Henry, enraged to the utmost pitch by this success, eagerly encouraged a second plot of the earls of Cassillis, Angus, and Glencairn, for the murder of the cardinal. The king, however, enjoined Sir Ralph Sadler to propose the assassination, as coming from himself, and the conspirators at this moment would not act without Henry's direct approval.[1]

Mary.
A.D. 1544.
Arrival of a
French
fleet.
A.D. 1545.
Hostilities
continued.

In the midst of these dark plots, a French fleet arrived in Scotland with three thousand men. This led to decisive measures. A Scottish army was assembled; but torn as usual by internal dissensions, and betrayed by the Douglases, who held a principal command, its operations were insignificant, and its retreat almost immediate. This was followed by a cruel invasion of the English, in which the earl of Hertford, at the head of an army, whose numbers rendered opposition fruitless, invaded Scotland, and after a desolating progress, sent word to his master, that for three hundred years there had not been such ravages committed. Seven monasteries and religious houses, sixteen castles and towns, five market towns, two hundred and forty-three villages, thirteen mills and three hospitals, were burned down during this atrocious expedition; and there still exists a characteristic letter, in which Henry, on receiving some French deserters into his service, enjoins them to show their attachment by some notable exploit, such as the "trapping or slaying the cardinal." He, at the same time, engaged the earl of Lennox, and Donald, lord of the Isles, to attack Scotland on the west coasts; and having heard that Beaton, his able and indefatigable enemy, meditated a visit to France for the purpose of subsidising a large auxiliary force for the continuance of the war, he determined to make a last effort to cut him off, and with this view, resumed with the laird of Brunston the plot for his assassination.

Conspiracy
to assassinate Beaton.
A.D. 1545.
Murder of
the Cardinal. June
1545.

Into the details of this remarkable conspiracy, and the various parties whom Henry contrived to bring together for the execution of his sanguinary purpose, we cannot here enter.[2] Fanaticism of the sternest kind, which had been worked up into action by the cardinal's cruel execution of George Wishart, commonly called the martyr, united itself to more mercenary motives with some of the conspirators, and with others, to the desire of private revenge; and on the morning of the 28th of May, a band of desperate men, who are now known to have been in the pay of England, and some of whom had been on former occasions urged by the English king to the commission of the murder, broke into the cardinal's apartments in the castle of St. Andrews, beat down the barricades with which the miserable man had attempted to defend the door, and putting him instantly to death, hung out his naked and mangled body over the window of his bed-chamber, in savage and brutal triumph. They then seized the castle, dismissed unharmed the household servants of the cardinal, sent off a messenger to the English court to inform Henry of their success; and being soon afterwards joined by John Knox, and a considerable band of his friends, who considered the death of Beaton as favourable to the reformation, they determined to defend the castle for Henry against any force which might be brought against them.

Death of
Henry
VIII.
Accession
of Edward
VI.
Measures
of the
Protector
Somerset.

These confident anticipations were, for a time, overthrown by the death of Henry the Eighth, an event soon followed by that of his rival Francis the First; but the accession of Edward the Sixth in England, and that of Henry the Second in France, did not materially alter the policy of either kingdom towards Scotland. In England, the protector Somerset, who was placed at the head of the government during the minority of his royal nephew, considered himself bound to enforce the observation of the marriage treaty between Edward and the young queen of Scots; while in France, Henry the Second, devoted to the cause of the Catholic church, and directed in his affairs by the Guises, foresaw at once the necessity of an intimate union with Mary of

[2] The whole of the plot, as it is to be traced in authentic letters in the State Paper-Office, will be found detailed in Tytler's History of Scotland, vol. v. p. 387—391, and in an Appendix to that volume, entitled, "Historical Remarks on the Assassination of Cardinal Beaton."

Mary. A.D.1545.

Guise the queen-dowager, and the governor Arran; his policy being to arrest the spread of the reformed opinions, and to weaken England in the quarter to which Somerset looked for an easy triumph.

Arrival of a French fleet in Scotland.

For nine years after the assassination of Beaton, the earl of Arran continued at the head of the government; and during that period some events took place which drew after them important effects. The warlike preparations of Somerset induced the French government to anticipate his motions; and a French fleet of sixteen armed galleons having entered the Frith, bombarded and carried the castle of St. Andrews, in which the conspirators against Beaton, and Knox the Scottish reformer, had deemed themselves secure.

Knox called to the ministry. A.D.1546.

It was when shut up in St. Andrews, that this extraordinary man first assumed the office of a minister of the reformed religion; but having capitulated with the rest, he was embarked with his associates for France, and on his arrival there, kept a prisoner in chains on board the galleys. He remained on the continent till 1550, when he he returned not to Scotland, but to England, and became one of the chaplains to Edward the Sixth.

Somerset invades Scotland. Battle of Pinkey. A.D.1547.

Immediately after the siege of St. Andrews, the protector Somerset invaded Scotland at the head of an army of fourteen thousand strong, and supported by a fleet of thirty-four ships of war. He was met by Arran, the governor, at Musselburgh, or Pinkey-cleugh, within about six miles distance from the capital, where an army considerably more than double the number of the English had encamped in so strong a position on the banks of the Esk, that with proper military skill on their part, any attempt to dislodge them might have brought ruin on their assailants. The inexperience and folly of Arran, the governor, threw away this advantage. He mistook a movement of Somerset, in which the English leader meant to possess himself of an adjoining height, for an intention to communicate with his fleet and reimbark his army; and contrary to the remonstrances of his best officers, he gave orders for the whole army to strike their tents and cross the river on which he had encamped. The order was at first resisted, at last unwillingly and imperfectly obeyed; and in the midst of the confusion which ensued, the English attacked the Scottish divisions in detail, and after a sanguinary conflict, gained a complete victory. Fourteen thousand were slain in the battle and in the chase, while the English loss was comparatively trifling.

Since the fatal day of Floddon, Scotland had sustained no defeat in the least degree approaching to this at Pinkey, and had it been followed up by the Protector, the consequences must have been of the most serious kind, perhaps fatal to the liberty of the country. But happily Somerset, at the very moment of his victory, received accounts of a conspiracy which his enemies at the English court had organized against him; and impatient to confront them in person, his measures were hurried, confused, and ill-digested. After a brief stay in the capital, he commenced his retreat through Teviotdale, and the fleet at the same time weighed anchor and returned to England.

Mary sent to France, and betrothed to the Dauphin.

The consequences of the defeat at Pinkey, and the effects of a subsequent and cruel inroad into Annandale by Lord Wharton and the earl of Lennox, were to exasperate the feelings of national antipathy, and to throw the governor and the queen-mother more decidedly into the arms of France. A convention was held at Stirling, in which it was determined to request the immediate assistance of a French force, and to send Mary, the young queen of Scots, to be educated at the court of Henry the Second. Soon afterwards, the Sieur Montalembert, commonly called Monsieur d'Esse, one of the ablest officers in the service of that country, arrived in Scotland with six thousand men. In a parliament held at Haddington, the marriage of the French dauphin to the queen of Scots was finally determined; and the infant Mary, then in her sixth year, took her voyage to France, accompanied by lords Erskine and Livingston, her governors, and arrived in safety at the court of St. Germain, in August 1548.

Mary. A.D.154

War with England. Peace c cluded.

It belongs not to an historical sketch of this kind, to enter into the details of that sanguinary and obstinate war which now took place between England and the united strength of France and Scotland. The slaughter at Pinkey, the burning of their sea-ports and shipping, and the pitiless severity with which the repeated invasions of their country were accompanied, had at length animated the Scots with a common feeling of revenge, which gave to the contest a character of peculiar ferocity, and manifested itself in shocking excesses. Happily the struggle did not continue long. The peace of Boulogne, between France and England, led, in 1550, to a cessation of hostilities in Scotland, where for some time before, the tide of success had run in favour of the governor and his foreign auxiliaries; and thus, after a war which had lasted for seven years, dating it from the year 1543, when Henry the Eighth determined to enforce the observation of the treaty, the English saw themselves obliged to abandon the extravagant project of compelling the Scots into a matrimonial alliance.

Mary of Guise obtains the regency A.D.155

This war, for the accomplishment of the marriage, was not long afterwards followed by the still more important and eventful struggle for the establishment of the reformation, the history of which may properly be divided into the war of opinion, which extended from the arrival of Knox in Scotland in 1555, to the attack upon Perth in 1559; and the actual war between the Congregation and their opponents, which was comparatively of short duration, and concluded in the treaty of Edinburgh and the triumph of the party of the Congregation, in 1561. How difficult is it, in the narrow compass allowed us for this picture, to do justice even to its prominent outlines? The queen-dowager, Mary of Guise, a woman, by the confession of her enemies, of good judgment, and sincere and upright principles, succeeded in procuring the retirement of Arran and her own nomination to the regency, (April 1554). She was enabled to accomplish this chiefly by the influence of France, then high in Scotland; but she was assisted also by the leaders of the protestant party, whom she courted and attached to her interest. Her possession of the supreme power was soon followed by the death of Edward the Sixth and the accession of Mary, a princess, as is well known, sincerely devoted to the ancient faith; but these changes were not accompanied by any important political events. The queen-dowager, indeed, when she saw England and Spain engaged in Italy in a struggle with France and the pope, deemed it her duty to suport her country and attack England; but although the Scottish barons assembled an army, it was only to act on the defensive; they refused to cross the border, and the Regent, hitherto on the most amicable terms with the nobles, dismissed them with undissembled resentment.

Marriage of Mary t the Dauphin. A.D.1557. Accession of Queen Elizabeth. A.D.1558.

To make up for this disappointment, the marriage between the young queen of Scots and the dauphin was concluded with much solemnity at Notre Dame; and in a parliament held at Edinburgh, it was agreed that the youthful husband should bear the title of king of Scotland during the continuance of the marriage, that all letters in Scotland should run in the joint names of Francis and Mary, and that the arms of both kingdoms should be quartered in the great seal and the current coin of the realm. These transactions had not been long concluded, when Mary of England, broken-hearted by the loss of Calais and the neglect of Philip, sunk into the grave; and Elizabeth's accession to the throne was hailed with universal delight by the protestant party in Europe.

Progress o the Reformation in Scotland.

When the English queen placed herself at the head of the reformation, this great moral revolution had made no inconsiderable progress in Scotland. The return of Knox to his native country in 1555, and the influence which his ary and rancis. .D.1557.

fiery zeal and popular eloquence soon gained over the Congregation, determined them to make a formal separation from the Catholic Church; and although the reformer was once more compelled, probably by fears for his life, to retreat to Geneva, the danger appears soon to have passed, and the leaders of the Congregation, conscious of increasing strength, entered into that memorable bond or covenant, by which they engaged to establish the word of God, to maintain the gospel of Christ, to labour to have faithful ministers, and to execute judgment upon what they termed the superstitions and abominations of the ancient faith.

This bond was little less than an open declaration of war against the established religion; and lest it should be misunderstood, the lords of the Congregation at the same time passed a resolution, declaring, that in all parishes the common prayer, by which was meant the service book of Edward the Sixth, should be read in the churches by the curates, if qualified to perform this service, if not, by others in the parish who were qualified. It was resolved at the same time, that doctrine, preaching, and the interpretation of Scripture should be used privately, until it pleased God to move the prince to grant public preaching by faithful ministers.

rning of alter ill. D.1558.

The Roman Catholic clergy received such a denunciation of the national faith with alarm and indignation; and resorting once more to those weapons which had already so deeply injured their cause, they deemed it expedient to hold up an example which should strike terror into the new converts. Walter Mill, a priest who had embraced the reformation, was seized, tried, delivered over to the secular arm and burned at St. Andrews. The people, however, only execrated the cruelty of which he was the victim, and his last words were never forgotten. "I am now fourscore and two years old, and could not have lived long by the course of nature; but a hundred better shall rise out of the ashes of my bones, and I trust in God I am the last who shall suffer death in Scotland for this cause." A pathetic declaration, and happily prophetical.

mon- nce of Congre- on. D.1558.

Against this cruel execution, the lords of the Congregation, Glencairn, Argyll, Morton, Erskine of Dun, and others, presented a remonstrance to the queen-dowager. It was impossible, they said, that her Grace could be ignorant of the controversy which had arisen between them and the popish clergy, concerning the true religion and the right worshipping of God. They denounced the power which was claimed by these priests of dictating their creed under the penalty of fire and faggot, and declared, that although hitherto they had remained quiescent under such abuses, they now were persuaded, that they, "as part of that power which God had established in the land," were bound to defend their persecuted brethren. They proceeded still more boldly to state, that a reformation of abuses was necessary, not only in religion, but in the temporal government of the state; and after claiming for themselves the free right of assembling in public or private, hearing common prayers, and having the sacrament of the Lord's Supper administered in the vulgar tongue, they concluded by declaring that they were willing that the controversy between themselves and the Catholic priesthood should be determined by a reference to the New Testament, the writings of the fathers, and the laws of the emperor Justinian. This declaration was soon after followed by a supplication to parliament, in which they requested that all statutes by which churchmen were empowered to proceed against heretics, should be suspended until the controversies in religion were determined by a general council of the church.

P eed- in of the qu n- d ger.

This petition was received by the queen-regent with concealed dissatisfaction, by the great body of the Roman Catholic clergy with undisguised scorn and reprobation. It suited however the regent at this moment to dissemble. She required the aid of the protestant lords to carry her favourite measures in this parliament, the obtaining the crown-matrimonial and the title of king of Scots for the dauphin; and intreating the lords of the Congregation to withdraw their petition and articles for a season, she promised them her protection, and a favourable consideration of their demands. To this they agreed, but under a protestation which was publicly read in parliament. It proved by the manner in which it was worded that they knew their own strength; and, in the event of a refusal, were prepared to enforce their demand for liberty of conscience and a thorough reformation of the church.

Mary and Francis. A.D. 1558.

A.D. 1558. Progress of the Reformation in Scotland.

It was at this crisis, when the lords of the Congregation had taken their stand on the ground which they never afterwards deserted, and when the queen-regent, having obtained her wishes, considered herself independent of their support, that Elizabeth succeeded to the throne, and Knox, who soon after his first return had left Scotland, again arrived in his native country. Both events produced the most important effects. It was one of the great principles of Elizabeth's policy to increase her own security by weakening her neighbours; to accomplish which, she invariably fomented a secret faction which opposed itself to the existing government. We have already seen how lightly the feudal nobility of Scotland were accustomed to regard the power of the crown or the laws of the realm, if they interfered in any prominent manner with their personal freedom or privileges; and the history of the country, from the rebellion in the reign of James the Third, to the moment when they so recently refused to lead their forces against England, had exhibited little else than the total destruction of any balance between the fierce unbridled license of the aristocracy, and the decreasing influence of the crown and the laws.

Of those nobles who had been ready, without any feelings of shame, to renounce their allegiance to their country, and to be bought over by England, many had embraced the principles of the reformation. To men so long accustomed to make their personal interest the measure of their duty, and to think and act as they pleased, a revolution which contended for liberty of conscience and the license of private judgment, must have warmly recommended itself; and when they considered the history of the English reformation, and the appropriation of the church lands by Henry and Edward, they could not, we may believe, be totally dead to the lesson. The church of Rome in Scotland was comparatively as rich as her sister had been across the border; and if the reformation was to be as complete in their own country as in England, it was not difficult for these shrewd barons to persuade themselves that they might imitate, perhaps improve the example.

Influence acquired over the Congregation by Elizabeth.

Over an aristocracy of such a character, Elizabeth and her ministers at once perceived how easy it would be to acquire an influence. Her policy at home was to avoid war, and to enforce in every department of the state the most rigid economy. Her policy abroad, as already observed, was to give her neighbours full employment within their own realm, by secretly encouraging every faction which rose against the government. From the first moment of her accession, therefore, she favoured the leaders of the Congregation, directed their measures, supported them with money, and received from them in return a respect and deference superior to that which they paid to their own sovereign.

Influence of Knox. Change in the feelings of the people.

But if the effects of the accession of Elizabeth upon the body of the Scottish nobles, were important in reference to the reformation, the consequences of Knox's re-appearance were not less momentous upon the character of the people. Hitherto the healthy patriotic feeling, the resolution to defend their independence as a separate kingdom from foreign domination and attack, had existed almost exclusively in the middle and lower orders, the commercial classes, and the labourers of the soil. But among these, the principles of the reformation had taken a deep root. They had adopted

Scotland.

Mary and Francis. A.D. 1558.

them, not like many of the nobles, from interest, but from conviction; and upon their minds the popular eloquence of Knox, his fiery zeal, his denunciations of superstition, his sarcastic attacks upon the ignorance and the vices of his opponents, produced a powerful impression. Till this period they had been wont to regard France as their ancient ally, and England as their ancient enemy. But France was now held forth to them, in the discourses of their favourite preacher, as their bittcrest foe, because the enemy of their soul's health; while England was the land of gospel light, and its queen the princess to whom, as the bulwark of the truth, they ought to look with affection and admiration.

Such were the feelings of the Scottish nobles, and the great body of the people, with reference to the momentous struggle between the reformation and the Roman Catholic faith, which was now about to convulse the country. Had the queen-dowager continued to act with the same judgment and caution which had distinguished the commencement of her government, it is possible that the struggle might have been for a time averted; but at this moment the powerful princes of the house of Guise deemed it expedient to join the league which had been concluded between the pope, the king of Spain, and the emperor, for the destruction of the protestants, and the re-establishment of the catholic faith in Europe. They immediately communicated with their sister, the regent, in Scotland; and such was unfortunately their influence over her mind, that after a feeble resistance she joined the papal coalition.

A.D. 1558. Collision between the Catholics and the Protestants.

This fatal step was followed, as might have been expected, by an immediate collision between the two parties. In a convention of the clergy which was held at Edinburgh, in March 1559, the lords of the Congregation, in addition to the demands which they had already presented, insisted that bishops should not henceforward be elected without the consent of the gentlemen of the diocese, nor parish priests except by the votes of the parishioners. These proposals were met by the queen with a determined refusal. A proclamation was issued, commanding all persons to resort daily to mass and confession. It was declared that no language but the Latin could be used in public prayers, without violating the most sacred decrees of the church; and the protestant ministers who had acted in defiance of these injunctions, were summoned to appear at Stirling, and there answer to the accusations which should be brought against them.

They accordingly did appear; but it was with Knox at their head, and surrounded by crowds of their devoted followers, who were led by the principal barons of Angus and Mearns. On reaching Perth, however, it was judged expedient to attempt a measure of conciliation; and Erskine of Dun, a gentleman of ancient family, and grave experience, leaving his brethren, proceeded to the court at Stirling, where he was admitted to an interview with the regent. He assured her that their single demand was to be allowed to worship God according to their conscience, and to secure liberty for their preachers. She replied, that if he would prevail on the Congregation to disperse, their preachers should be unmolested, the summons discharged, and their grievances redressed.

Duplicity and severity of the queen-regent.

To this Erskine consented. He communicated the agreement to his brethren; the people were disbanded; and when the reformers looked for toleration and redress, the queen-dowager, with a perfidy which was as base as it was unwise, reiterated the summons, and on their failure to appear, denounced the ministers as rebels. Such conduct inflamed the resentment of the Congregation to the utmost degree; and Knox having seized the moment to deliver a stern and impassioned sermon against idolatry, the people were wrought up to a state of high excitement. Observing a priest about to celebrate mass, after the preacher had retired, they burst in upon the altar, tore down its ornaments, shivered the shrines and relics, and speedily demolished every monument which seemed to savour of idolatry. From that moment the fate of the Roman Catholic church in Scotland was decided. Having once broken through restraint, and found their own strength, the multitude rushed to the religious houses of the Black and Grey friars, and inflicted on them an equally summary vengeance. They then attacked the charter-house or Carthusian monastery, which experienced a similar fate; and the infection of tumult and destruction spreading throughuot the country, many excesses of the same kind were committed in the provincial towns. That Knox or his disciples directly advised such spoliation cannot be proved; that the principles which he laid down, and his stern denunciations of his opponents as idolators, led to these excesses, is certain.

The effects of such scenes on the queen-dowager, were to rouse her to instant activity, and to array the two parties in determined opposition to each other; for although some of the protestant leaders, disclaiming all intentions of rebellion, disapproved of the late violence, and still acted with the regent, their neutrality was so short-lived that it scarcely demands attention. It had the effect, however, of producing a momentary spirit of conciliation. The protestants presented an address to the queen, to the nobility, and to the Roman Catholic clergy. In the first they professed their loyalty, deprecated her injustice, and demanded liberty of conscience, and the right of hearing their own preachers. In the second they vindicated their conduct to their brethren of the Roman Catholic nobility from the charge of heresy and sedition, while they upbraided those who first espoused and now deserted their cause. The third epistle to the Roman Catholic clergy, whom they broadly stigmatized as the generation of antichrist, was a denunciation of war, composed in that spirit of coarse and abusive railing which unfortunately marks the style of the early reformers. Such accusations were little calculated to produce pacific feelings; but the queen-regent, who had assembled her army, finding it inferior in strength to the Congregation, proposed an armistice, which on certain conditions was accepted. The Congregation having bound themselves to each other in a new covenant, disbanded their forces, and for the second time, as they allege, were overreached by the treachery of the dowager, who, against a solemn stipulation, occupied Perth with a body of French soldiers, expelled the magistrates who favoured the reformation, and garrisoned the town with troops in the pay of France, though in reality Scots.

This unwise and unjustifiable duplicity had the worst effects. The lord James, afterwards the regent Murray, a young man of great talents and ambition, who had hitherto adhered to the regent, though professing reformed opinions, deserted her. Argyll, a powerful and influential nobleman, followed his example; and, faithful to their renewed covenant, the army of the Congregation assembled in strength at St. Andrews. Knox in the mean time, whose voice, Sadler, the English ambassador, compares in his letters to the sound of a thousand trumpets, set out on a preaching tour through the country. Directing his powerful and popular eloquence against the evils of superstition, and the misery of the thraldom which, by means of foreign mercenaries, the house of Guise were attempting to fix upon their country, he so powerfully excited the people, that they determined to take the reformation into their own hands, and levelled with the ground the monasteries of the Franciscan and Dominican orders. It was in vain that the regent exerted herself to check these popular outrages. The phrensy gained strength; the nobles and leaders of the Congregation felt proportionally encouraged, and advancing with their forces upon Perth, they opened a cannonade, and in a short time made themselves masters of the town. Stimulated to a high pitch of excitement by such success, the multitude, contrary to the entreaties of Knox, attacked and destroyed the abbey church and palace of Scone; after which, a portion of the army of the Congregation, under the lord James and Argyll, made a rapid march upon Stirling, which they occupied, hastened afterwards to Linlithgow, and having in both towns pulled down the altars, destroyed the shrines, and, as they said, purged the places of idolatry, they compelled the regent to make a rapid retreat to Dunbar, and entered the capital in triumph, in June 1559.

This last success, while it gave the highest courage to the party of the reformation, convinced the queen-regent that every hope to avoid a civil war must be abandoned, and that the crisis called for her most determined exertions. She instantly communicated her dangerous situation to France, and received in return a large reinforcement of French troops, whose discipline, skill, and equipment, being superior to the common feudal militia which the Congregation brought into the field, at once gave her a superiority. The reformers, on the other hand, threw themselves upon the protection of England; and Elizabeth, although she scrupled to send them either money or troops, encouraged them with general promises of approval, and, in case of extreme danger, with some hopes of support. In addition to this, her minister Cecil hinted in his letters the expediency of using their present power to "strip the Romish church of its pomp and wealth," and, as he termed it, "to apply good things to good uses;" while the terms in which the Congregation replied, seem to point to a more secret communication, in which this unscrupulous politician had advised the deposition of the regent, and a change of the government. It is certain that the necessity of such a measure had been for some time contemplated by the Congregation, but it was to be resorted to as the last extremity. In a letter from Kirkcaldy of Grange, one of their principal leaders, addressed to Sir Henry Percy, (1st of July 1559), and explanatory of their intentions, he declared that if the regent would consent to a reformation conformable to the pure word of God, cleanse the popish churches of all monuments of idolatry, suffer the book of common prayer published by Edward the Sixth to be read, and send away the French troops, they were ready to obey and serve her, and to annex the whole revenues of the abbeys to the crown.

For the queen-dowager to have agreed to this would have been equivalent to the giving up of the whole question, and would have been to establish protestantism on the ruins of what she esteemed the true church. She accordingly met the demands of the Congregation by a peremptory denial. In return they withdrew from her their allegiance, and in the name of their sovereign, whose authority they unscrupulously assumed, suspended her from the high office which she had abused.

The war now broke out with a violence proportioned to the exasperated feelings of either faction. The Congregation, at first intimidated by the superiority in the discipline of the French troops, began to dread a calamitous result; but they soon saw themselves strengthened by the arrival of an English fleet, while a land force under the duke of Norfolk advanced to Berwick, and after a negotiation with the reformed leaders, pushed forward into Scotland, and was joined at Preston by the army of the reformers.

It belongs not to this sketch to enter into details of hostilities, and happily for both countries the war was of brief duration. The queen-dowager, sinking under a broken constitution, died at Edinburgh, on the 10th of June 1560. The Congregation, disheartened by some reverses, and weakened by disunion among their principal leaders, felt no inclination to prolong the struggle; and Elizabeth having offered her services as a mediatrix between the two parties, a meeting of the English, French, and Scottish commissioners took place at Edinburgh, by whom a treaty of peace was concluded, having for its basis the withdrawal of the French troops from Scotland, and a recognition of the validity of the treaty of Berwick between Elizabeth and the party of the congregation. Into this last proviso the French commissioners sent over by the young queen of Scots and her husband the dauphin, were entrapped by the diplomatic skill of Sir William Cecil, one of the English commissioners, contrary to their express instructions; and its validity was never admitted by the Scottish queen; but in the mean time it greatly strengthened the hands of the Congregation. At the same moment the leaders of this party presented to the commissioners certain "articles" concerning religion; but Elizabeth had directed Cecil and Woolton to decline all discussion upon the subject; and the reformers, who looked to the convention of Estates for the settlement of the question, did not press the point.

Parliament at Edinburgh.
A.D.1560.

A parliament accordingly assembled at Edinburgh, on the 10th of July 1560. The lesser barons who had for some time suffered their rights of sitting in the convention of estates to fall into disuse, were mostly attached to the doctrines of the reformers, and looked with deep interest to the debates which were about to take place on the subject of religion. They accordingly met, claimed their right, and after some opposition, were allowed to take their place. This threw a preponderating weight into the party of the Congregation; and the "Confession of Faith," together with a "Book of Discipline," which embodied the great principles of a reformed church, and protested against the errors, abuses, and superstitions of the Roman Catholic faith, was submitted to Parliament. The Confession of Faith passed with little opposition. This remarkable paper, or rather treatise, professes to be a summary of Christian doctrine founded on the word of God; and although drawn up by Knox and his brethren in a very short space, embodied the result of much previous study and consultation. It is worthy of observation, that at this early period, the church of Scotland, in explaining the articles of its faith, approaches indefinitely near to the Apostles' creed, and the articles of Edward the Sixth; and that where it differs, it leans more to the side of catholicism than ultra-protestantism.

Confession of Faith.

Three acts followed the adoption of this Confession of Faith. The first abolished for ever in Scotland, the power and jurisdiction of the Pope; the second repealed all former statutes passed in favour of the Catholic church; the third inflicted the highest penalties upon any who thenceforward should dare to say or to hear mass.

Book of Discipline.

All this met with little opposition; but the Book of Discipline, by which the future government of the church was to be determined, gave rise to the keenest debates. "Some of the nobles and barons at once refused to sign it; others did sign, but eluded its injunctions; others mocked at its provisions, and called them devout imaginations."[1] The cause of this is attributed by Knox to its interfering with the privileges and property of many powerful barons who had already "griped the possessions of the church." It also discouraged other expectants, "who thought they would not lack their part of Christ's coat."[2] The first class, according to the same authority, had no remorse of conscience, nor intended to restore any thing of that which they had long stolen or reft. The second were no doubt afraid, that if the ministers were first provided for, little or nothing would be left for them.

Provisions of the Book of Discipline.

In considering its provisions it is material to notice, that it committed the election of ministers solely to the people, using, however, the precaution that the minister so chosen, before he was admitted to the holy office, should be examined and approved of by the ministers and elders, upon all points of controversy between the church of Rome and the

---

Scotland.

Mary and Francis. A.D.1560.

Congregation; after which he was to be considered an ordained minister, without any further solemnity, it being observed that although the apostles used the imposition of hands, it was intended to impart, and did impart miraculous powers, and "the miracle having ceased, the using the ceremony was judged henceforth unnecessary." The country was divided by it into ten dioceses, over which ten ministers, named Superintendents, were appointed, whose duty it was to be ambulatory preachers, and to inquire, in the course of their progress, into the lives of the clergy, the provision for the poor, and the proper instruction of youth. It is in this last clause that we meet with the first proposal of that admirable institution of parish schools, to which Scotland has since owed so much of her prosperity. Having thus established their reformation, the Parliament appointed an interim provisional government, confirmed the treaty of Berwick which had been entered into between Elizabeth and the Congregation, and proposed that as a basis of perpetual amity between England and Scotland, there should be a marriage between queen Elizabeth and the earl of Arran, heir apparent to the crown. In conclusion, they dispatched Sir James Sandilands of Calder to carry an account of their proceedings to their sovereigns in France, while Sir William Maitland of Lethington, with the earls of Morton and Glencairn, were sent on a similar mission to Elizabeth.

Mary's feelings towards the Congregation.

She refuses to ratify the treaty of Edinburgh. A.D.1560.

It was not to be expected that their youthful sovereign, educated in the bosom of the Roman Catholic church, and accustomed to look for direction and guidance to the advice of her uncles the Guises, could possibly ratify the extraordinary proceedings of this parliament. It had, by a few sweeping acts, abolished the national faith, confirmed the treaty which a faction of her subjects whom she had all along treated as rebels, had entered into with England; and by sending an embassy to Elizabeth, composed of men of higher rank and greater influence than Sandilands, who was deputed to wait upon their sovereign, it was intimated pretty significantly, that the Congregation were determined to treat the English princess with equal if not superior deference to that with which they regarded their own queen. She accordingly received the Scottish envoy with coldness, and peremptorily refused to ratify the treaty of Edinburgh.

Death of Francis the Second.

At this moment Mary had the misfortune to lose her husband, Francis the Second, the young king of France; an event which made it necessary for her to return to her own kingdom, and at once threw her from a condition of much contentment and prosperity into circumstances of extraordinary trial and embarrassment. She had been educated in the most brilliant and accomplished, but, it must be added, one of the most profligate courts in Europe. From her infancy, as queen of Scotland, and presumptive queen of France, she had been flattered and caressed; and as she was extremely beautiful, possessed of amiable manners, highly accomplished, generous, and kind-hearted, she had received from every class of her French subjects the unaffected homage of their admiration and regard. All was now to be changed; and on turning her eyes from France to her own country a melancholy contrast soon presented itself.

Parliament at Edinburgh. Character of the Lord James.

As soon as the king's death was known in Scotland, a parliament assembled at Edinburgh, of which the proceedings appear to have been overruled by the Congregation. It was resolved to invite their sovereign to return to her kingdom, and for this purpose to send the lord James to France, while the Roman Catholic party dispatched Lesley, afterwards the celebrated bishop of Ross, on the same errand. The lord James, afterwards the regent Murray, was the natural son of James the Fifth by lady Margaret Erskine, who afterwards married the laird of Lochleven. From his earliest years he had exhibited marks of an extraordinary ambition, and a genius for affairs of state. His apparently blunt and careless manner, disposed men to treat him with confidence, and enabled him, when he was least suspected, to carry on the most deep-laid and ambitious designs. At this moment he was regarded as the leader of the reformed party; and it is a remarkable proof of his talents, that, on his arrival in France, although at first suspected by Mary, he acquired an extraordinary influence over her character.

Scot d.

Mary. A.D. 0.

Cond of Eliza and th Lord James.

It was the misfortune of the queen of Scots, who was now only eighteen, that she was surrounded by difficulties which would have required to meet them a matured experience, and the most attached and faithful councillors. Elizabeth, who saw her opportunity, and was determined not to lose it, dispatched the earl of Bedford to demand the confirmation of the treaty of Edinburgh; and when this was refused, she exhibited her resentment by declaring that Mary, who had at first intended to pass through England into her own realm, should receive no safeconduct; a circumstance which made her resolve to sail at once from Dieppe to Leith. But Elizabeth was at least an open opponent, and the young queen, aware of her enmity, could secure herself against it. Murray, on the other hand, to whom she too heedlessly gave her confidence, had already visited the English court on his passage to France, communicated his plans to Elizabeth, and received his instructions from Cecil, her prime minister. On his return from Paris he again passed through England, consulted with the English queen on the best methods of detaining Mary in France, and actually carried his double dealing so far as to devise means for intercepting her, should she persist in her determination and set sail. This she at last determined to do at all risks; and having had the good fortune to escape the English cruisers, which were directed to be on the look out, she arrived at Leith, and was received with the utmost enthusiasm by all classes of her subjects, (August 19, 1561).

Mary rives i Scotla A.D. l.

Difficu s of her u- ation.

These happy indications were of short duration; and when the young queen considered the state of parties in Scotland, the difficulties of her situation appeared complicated and disheartening. She was herself a conscientious Roman Catholic, warmly attached to France and the Guises her uncles. This of itself rendered her an object of suspicion and aversion to Knox, the great leader of the protestant clergy, and to the powerful nobles who had espoused the reformation. She had already peremptorily refused to sanction the proceedings of the Parliament, which had confirmed the treaty of Berwick, abolished the papal supremacy, and substituted the protestant doctrines and worship for the ancient faith. This drew upon her the enmity of England, and the English party in Scotland, led by Murray and Lethington; and as the influence of Knox and the preachers over their congregations was strong and universal, the feelings of the ministers were communicated to the great body of the people, and checked those sentiments of loyalty which manifested themselves upon her arrival. If, from such opponents, Mary turned to the body of her Roman Catholic nobles, among whom the most powerful and influential was the earl of Huntly, she found them animated indeed upon one great subject, by a community of sentiment; but then they, in common with all the nobles, had been so long accustomed to independence, and looked so constantly to the preservation and increase of their own power that, as a party, they were extremely difficult to manage. Lastly, looking to the great body of the Roman Catholic clergy, there was no one who, since the death of Beaton, had possessed that vigour of character and talent for state affairs, which were absolutely necessary in any minister to whom the queen should give her confidence, if we except Lesley, afterwards bishop of Ross.

Lord James made ief minist

It was necessary for her, however, to decide upon a line of policy; and after deliberate consideration, the queen determined to make the lord James her chief minister, and to secure the friendship and good offices of Elizabeth. In this

ary.
D. 1563.

way she hoped to attach to herself the great body of her people, who were mostly protestants; and as from France, torn at this moment by civil and religious dissensions, she could expect little assistance, she deemed it the more necessary to preserve peace with England. Events of much interest now succeeded each other with a startling rapidity, and the history of Mary, in the brief circle of six years, presented an appalling tragedy, of which we can only give the outline.

ary's in-
nded
arriage.
D.1561.

The first point on which the two queens came into collision was on the delicate subject of marriage. Mary's subjects wished her to marry, and she considered it wise and necessary that she should gratify their wishes. She was in the bloom of youth, extremely beautiful, and of manners so engaging and attractive, that few could see her without sentiments of admiration and regard. She was queen of Scotland, and, after Elizabeth, undoubted heir to the English throne; though this queen, from her morbid jealousy upon the subject of the succession, had never recognised her right. Mary's great object, at this moment, was to marry with her approbation, and to procure a declaration of her right of succession to the throne, failing Elizabeth's issue. She accordingly declared that she would regard her advice upon this subject as that of a mother, and consulted her sister of England with an openness and devotion which, if not perfectly prudent, appears to have been perfectly sincere.

lizabeth's
plicity.
D.
62,1563.

In return for this confidence, the conduct of the queen of England was marked by that insincerity, selfishness, and want of truth which too frequently characterised her policy. She was determined that, if Mary did marry, she should lower herself by the alliance; but she would have been still better pleased could she have so ordered matters that she should not marry at all; and, guided by this ungenerous object, Elizabeth commenced a system of intrigue, the sole object of which was mystification and delay, and in which she enjoyed the satisfaction, not only of deceiving Mary and her councillors, but of setting her own ministers at fault, and rendering it impossible for them to decipher her real intentions. In the course of these negotiations, after objecting to every foreign alliance, the English queen at last proposed her own favourite, Leicester, and held out as a bait to Mary, who justly deemed such an alliance beneath her rank, the promise that the issue, if any, of this marriage should succeed to the English throne. Nothing can be more certain than that she had no such intention; but the farce was so well acted, that not only Mary and the lord James, now earl of Murray, but Randolph, the English ambassador at the Scottish court, were deceived; and when at last the bubble broke, and it was discovered that, from first to last, Elizabeth had been playing her usual dark and double game under the mask of friendship, the indignation of the sufferers was roused, as might have been expected, to the highest pitch.

ary is in-
nsed, and

ecipita-
n.

An almost immediate and violent re-action took place. Mary had hitherto confided in Elizabeth, and consulted her upon the marriage. She now trusted her no longer, and determined, without delay, to follow her own inclination. Since her arrival in her dominions, she had favoured the protestants and rather repressed the Roman Catholics. She was now disposed to reverse the system. She had hitherto chosen Murray and Lethington as her chief ministers, had entrusted to the first almost regal power, loaded him with estates and honours, and placed him at the head of her nobility; and it was by Murray and Lethington's advice that she had shaped her policy towards England; but the road they marked out for her had led to insult, mortification, and defeat. Was it possible then, that she could continue to those two men, or to the protestant party, whom they represented, the confidence with which she had regarded them? or rather, was it not natural that, when she discovered their devotedness to Elizabeth, who had deceived and injured her, she should regard them with suspicion and distrust?

Mary.
A.D 1564.
Mary resolves to marry the Lord Darnley.
A.D. 1564
1565.

Under these circumstances, and when agitated by such feelings, Mary saw the lord Darnley, the eldest son of the earl of Lennox, who, with his father, had lately returned to Scotland. This young nobleman could boast of a royal descent, his grandmother being a sister of Henry the Eighth, and he himself, next to Mary, the nearest heir to the English throne. He was now in his twenty-first year, and had not yet discovered that weak intellect and propensity to low vices which betrayed themselves soon after his marriage. It was the misfortune of the Scottish queen that she acted under impulses. She had been deceived by Elizabeth, and she determined to shew her that she could choose for herself. Without giving herself time to study his disposition, and purposely abstaining from any previous communication of her intentions to England, she selected Darnley as her future husband, and dispatched Lethington to Elizabeth, not, as before, to ask her counsel, but to inform her of her resolution.

Elizabeth's opposition.

The consequences of this step were extraordinary. Darnley and his father were strongly suspected of being Roman Catholics. Murray and Lethington saw in this alliance little else than the demolition of their own power; the party of Knox and the kirk anticipated the restoration of the ancient religion; and Elizabeth not only declared herself hostile to the alliance, but bitterly accused the Scottish queen, insisted that Lennox and Darnley were English, not Scottish subjects, and sent them orders to repair instantly to her court. It was hardly to be expected that so ridiculous a command should be obeyed, and the opposition of England only rendered Mary more determined upon the marriage. A convention of her nobility was held at Stirling; it was numerously attended; the queen communicated to them her intention of marrying Darnley; the measure was approved without a dissentient voice; and although Murray, and the faction with whom he acted, attempted to instigate the people to opposition and rebellion, the endeavour was signally unsuccessful, and the queen carried her wishes into effect. She was married to Darnley in the chapel of Holyrood, on the 29th of July 1565.

Mary's marriage to Darnley
A.D. 1565.

The earl of Murray and the party of the kirk revolt, and are driven into England.
A.D. 1565.

Previously to the queen's marriage, Murray, Argyll, Lethington, and the party of the kirk had been encouraged by Elizabeth to rise against their sovereign; and had they received from the English queen the substantial assistance which she promised, the result might have led to the dethronement of her whom they represented as the oppressor of her nobility, and the bitter enemy of the truth. But their schemes were defeated by the energy and promptitude of the Scottish queen and the timid parsimony of her sister of England. It was in vain that Murray and his brother insurgents reminded Cecil of their desperate situation, and the necessity of speedy assistance both in money and in soldiers. Neither the one nor the other could be wrung from Elizabeth. They were proclaimed traitors, driven from one position to another by the queen of Scots, who herself headed the forces which she led against them, and were at last compelled to fly to England and throw themselves upon the protection of Elizabeth. To their dismay she disowned and repulsed them; upbraided Murray as a traitor to his royal mistress; and, although herself the encourager of their revolt, compelled them publicly to declare that she knew nothing of the matter. They were then dismissed from the queen's presence, and permitted to retire to Carlisle, where the earl of Bedford received secret instructions to supply their wants during their banishment.

While such was the course of events in England, Mary's satisfaction in the triumph over her rebels was grievously diminished by discovering that her husband was weak and profligate, the dupe of every artful companion whom he met, and unworthy of the confidence and affection with which she had treated him in the first ardour of her passion. To entrust him with any responsible share in the government was impossible; and Murray's friends who remained at court, and watched the increasing estrangement between the Queen and her husband, determined to turn it to their advantage.

Mary promotes Riccio.
Murder of Riccio.
A.D. 1565.

It was the misfortune of the Scottish queen that she had few or no servants whom she could trust. Her secretary, Maitland of Lethington, had betrayed her interests to Elizabeth, and was in disgrace, and, in the mean time, the queen had availed herself of the services of Riccio, her foreign secretary. This person had entered her service at first as a singer in her band, but afterwards, by his skill and fidelity, he raised himself to this confidential employment, much to the annoyance of the young king, who regarded him with peculiar aversion; and, incredible as it may appear Darnley having persuaded himself that he had stolen from him the affection of the young queen, resolved to assassinate him. Nor was it difficult, among a fierce and unscrupulous nobility, to find associates in his flagitious schemes. His father the earl of Lennox, Morton the lord chancellor, Lethington the ex-secretary, Murray and his friends who were in banishment, and many of the stern supporters of the reformation, who suspected Riccio of intriguing with the papal court, willingly joined in the conspiracy. The parliament was at hand in which it was intended to pronounce sentence against the banished lords: it had been reported that measures were in preparation for the establishment of the Roman Catholic faith; and it was determined to arrest both the one and the other by striking the blow against Riccio. Accordingly, when Mary, who was then six months gone with child, sat at supper in a small cabinet adjoining to her bed-room in the palace of Holyrood, the king led the conspirators up a secret stair which communicated with the apartment, while the earl of Morton and a band of armed soldiers seized the gates of the palace. The countess of Argyll, Erskine, captain of her guard, the comptroller of her household, Riccio her secretary, and one or two domestic servants formed the queen's party, some sitting at table and others being in attendance. Indeed, the little closet or cabinet was so small that three or four persons could with difficulty have seated themselves. But its narrow dimensions prevented escape and favoured the ferocious purposes of the conspirators. Led by the king they burst into the cabinet, overturned the table, and threw themselves upon Riccio, who sprung for protection behind the queen. In a moment his fate was decided. One ruffian threatened Mary with his dagger, another held a pistol to her breast, a third, snatching the king's dagger, stabbed Riccio over her shoulder; and at last tearing him from the closet, amidst the shrieks of the women, and the shouts and execrations of the conspirators, they dispatched him, or rather cut him to pieces in an adjoining apartment, with fifty-six wounds.[1]

Mary escapes, and drives the conspirators out of the kingdom.

After this atrocious murder, which, considering the situation of the queen, might have cost her and her infant their lives, the conspirators detained her as a prisoner in her palace, permitted no one but the king and their own party to hold any communication with her; and having been joined next morning by the earl of Murray and the exiles from Carlisle, it was determined to make a complete change in the government. Darnley, weak and profligate as he was, they rewarded by placing at the head of their new system, being well aware that he would soon be their tool. The queen was to be confined in Stirling till she should consent to the full establishment of the reformed religion; and the earl of Murray and his associates were to be restored to their former favour and power. In a single day all these intentions were overturned. Mary, left alone with her husband, regained her ascendancy over him; she convinced him of the perfidy of Morton, Ruthven, and his associates, obtained from him a confession of all the secrets of the conspiracy, escaped with him to Dunbar, and being instantly joined by eight thousand men, advanced with such rapidity against the conspirators, that they fled in dismay to Berwick, and solicited the protectiou of Elizabeth.

Mary's difficulties.

Birth of James V

Darnley, in his confessions to Mary, had betrayed his brother conspirators, whilst he solemnly asserted his own innocence; but Morton and his associates produced in their own defence various bonds and letters, which were signed by the king, and fully established his guilt; and Mary saw, to her inexpressible grief and disgust, that the cruel outrage was planned by her husband. From this moment this miserable prince became an object of contempt and aversion to all. His conduct had been a tissue of cowardice, cruelty, falsehood, and weakness: to treat him with confidence, or to entrust to him any share in the government was impossible; and the unhappy queen, without a stay to rest on, fell into a state of the deepest despondency. Whom indeed could she trust? Murray and his party had but recently been rebels; Morton and his associates were stained by the blood of her confidential servant, murdered at her knees; the king was the chief conspirator, the queen of England had deceived her, the party of Knox and the Scottish church regarded her with avowed aversion; and even the Roman Catholics were somewhat estranged by the preference which at first she had given to their opponents. Under these complicated difficulties, the queen pursued the course which she deemed most likely to ensure success. She broke with none, pardoned some of the conspirators, affected to believe her husband, hoping even against hope, and restored Murray to some portion of the power of which he had been deprived. Such was the state of things, when, the period for her confinement having arrived, she gave birth to a son in the castle of Edinburgh. The child was named James Charles, and on the death of Elizabeth succeeded to the English throne.

Parties in the state.

When her recovery permitted Mary to attend to the affairs of the country, it was apparent that unless immediate steps were taken to establish something like a strong government, the kingdom would fall to pieces; and yet such was the weakness and treacherous nature of the king, that to admit him to a share in it was impossible. She next turned to her nobles. Of these the most powerful were Murray, Bothwell, Huntly, Argyll, Lennox, Morton, and Lethington; but there had long existed a feud between Murray and Bothwell, while Morton, Lethington, Lennox, and their partizans were still in disgrace for the murder of Riccio. It was necessary to make an effort, and the queen succeeded in reconciling Murray to Bothwell: Huntly was made chancellor, Lethington was pardoned and restored to his office of secretary; while Murray, Argyll his brother-in-law, and Bothwell, were entrusted with the chief management of affairs.

Darnley's violent courses.

Enraged at his exclusion from power, the king sullenly retired from court, threatened to murder the earl of Murray, and at last declared he would leave the kingdom. It was in vain that his father remonstrated against his resolution; in vain that the queen herself, leading him before her council, conjured him to detail his grievances, and if she had injured him in any respect, to accuse her without reserve. He declared she had herself given him no cause of complaint; but afterwards, in a letter, he complained that he had no power in the state, that he was neglected by the nobility, and would bear it no longer. Soon after this the unhappy princess was seized by a fever at Jedburgh, during which her life was despaired of. Her enemies ascribed it to the injurious effects of a rapid ride which she took from Jedburgh to visit Bothwell, who had been wounded in a skirmish with some border thieves; it had more probably its origin in that anxiety which followed the conduct of Darnley; but be

ary.
D.1566.

this as it may, she recovered only to be the victim of more aggravated sufferings. Partial reconciliations were followed by no revival of affection or confidence; and in the anguish of a wounded spirit, she sometimes lamented that she had not died at Jedburgh.

divorce
oposed

It was in this season of depression and despair that Murray and Maitland proposed to her a divorce from the king. They had previously confided their project to Huntly, Argyll, and Bothwell; and at first Mary seemed inclined to follow their advice, provided the divorce could be lawfully procured, and without prejudice to her child. But after weighing the whole matter her opinion changed, and when Maitland urged that means could be found to free her of Darnley without injury to her son, declaring that Murray would look on and say nothing against it, she broke off the conference. "I will," said she, "that ye do nothing through which any spot may be laid to my honour or conscience; let the matter be in the state is is, abiding till God of his goodness put remedy thereto."

onspiracy
r the
urder of
arnley.

Having failed in this device, a conspiracy for the murder of the king was entered into by Maitland, Bothwell, Huntly, Argyll, and Sir James Balfour. It has been disputed whether Murray was, or was not, a party to this atrocious design. It is certain that he did not sign the bond, by which, according to the custom of this age, the conspirators bound themselves to each other. There is a strong presumption, however, that he knew of its existence; and the deed was communicated to Morton and his associates, who signed it, and agreed to support the conspirators in the execution of their purpose. Such was the state of matters when the baptism of the young prince took place at Stirling. From this ceremony the king obstinately absented himself, alleging in excuse the neglect and rigour with which he was treated. Soon afterwards he left the court and retired to Glasgow, where he was seized with the small-pox, and appeared in imminent danger. His situation appeared to awaken the tenderness of the queen. She sent her own physician to wait on him, and soon after visited him herself, and ministered to his wants. When his convalescence permitted him to be removed, she returned with him to Edinburgh, and placed him, for the benefit of the air, in a house in the suburbs called the Kirk-of-Field. It was here that the conspirators determined to carry their dreadful purpose into effect. At the solicitation of Elizabeth and the French king, Morton had been pardoned and permitted to return; and in a secret interview between him, Maitland, and Bothwell, the particulars of the murder were arranged. Bothwell undertook the chief part, and his men having obtained access to the cellars of the Kirk-of-Field, undermined the foundation, and placed gunpowder in the cavities which they had formed. According to another account, they deposited it in the queen's bed-chamber, which was immediately under that of the king. While all this had been secretly carrying into effect, Mary continued her attendance upon Darnley: their reconciliation appeared to be perfect, she often slept in the house, and on the evening of the 9th of February, when she took leave of him to attend a marriage of one of her servants, which was to be held at the palace, it was remarked that she embraced him tenderly, took a ring from her finger, and placed it on his. On that night, after she had retired to her chamber in the palace, a sudden and terrific explosion was heard, which shook the city, and it was soon discovered that the Kirk-of-Field was blown up. The dead bodies of the king and his page were found at a little distance in the garden. It is well known that this miserable catastrophe has given rise to a celebrated historical controversy, in which authors of great name and talents have taken different sides; some insisting that the queen was cognizant of the plot for the murder of her husband, and others as positively asserting the contrary. The limits of this historical sketch render it impossible that we should enter into its details.[1] In the preceding narrative we have carefully avoided the introduction of a single controverted fact; in the sequel we shall as sedulously follow the same rule.

Accusation of
Bothwell
and the
queen.

Scarcely were the citizens of the capital recovered from the horror and dismay which was incident to such a calamity, when bills appeared on the walls of the Tolbooth, which accused Bothwell of the murder, and added that the queen had assented to it. Soon afterwards, the earl of Lennox, the unhappy father of the late king, earnestly required the imprisonment of the persons named in the anonymous handbills, and Bothwell declaring his innocence, demanded an instant trial. It was granted, and Lennox received due notice of it; but on the day of trial Bothwell appeared surrounded by upwards of four thousand of his friends and adherents; and Lennox, intimidated by the array, or finding it impossible to collect sufficient proof, requested an adjournment. This, however, was peremptorily refused, and the accused was acquitted by the jury, who considered it established by sufficient evidence that Bothwell could not have been at the Kirk-of-Field when the explosion took place.

The nobles
recommend
Bothwell as
a proper
husband

queen.

Bothwell
is divorced
from his
wife, and
marries the
queen.

Soon after this acquittal the Parliament assembled, and the majority of the nobility prevailed upon the queen to consent to an act by which all the grants of crown property which had been made during the present reign were confirmed, and herself and her successors deprived of all power of revocation. In the same assembly of the estates, the verdict passed upon Bothwell, which many accused as informal, was declared just and legal, and soon afterwards a bond was drawn up by twenty-four of the principal peers. It affirmed in solemn terms the innocence of this profligate baron, whom the public clamour still denounced as the murderer of the king; recommended him as a proper husband for the queen; and bound its authors, as they should answer to God, to defend him from all danger, and to promote this unhallowed marriage to the utmost of their power and ability. The tragedy now hurried on to its conclusion. Bothwell, at the head of a thousand men, intercepted the queen on her way from Stirling to Edinburgh, and carried her captive, with the slender suite by whom she was accompanied, to Dunbar castle. Among her attendants were Huntly, Maitland, and Melville, but the first two were in Bothwell's interest, and had signed the bond. The last was completely in his power, and so was the unfortunate queen. He proposed marriage, and on her refusal exhibited the bond signed by her nobles. She still, it is said, resisted his request, and hoped for a rescue; but it was a vain expectation. He became more peremptory, and if we may trust the expressions of Mary, corroborated by Melville and her enemies, he compelled her by fear, force, and other unlawful means, to yield to his wishes, and admit him to her bed. From Dunbar he now carried his victim to Edinburgh. A divorce was procured from his wife on the ground of adultery, and the process having been hurried through the court, and the sentence passed, Bothwell was married to the queen at Holyrood, within a month after his acquittal of the murder of her husband, (May 15, 1567.)

The nobles
rise against
the queen.
A.D.1567.

Events of the deepest and most tragic interest now crowded on each other. The nobles who had advised the marriage, who had acquitted Bothwell, and abetted him in his career of ambition and outrage, at once dropped the mask, assembled their forces, and declared their determination to separate the queen from the murderer of her husband. As they advanced and occupied Edinburgh, the earl and the queen retired; but in a few days they found themselves strong enough to confront their enemy on Carberry hill, near Musselburgh. Both factions, however, seemed anxious to avoid a battle, and an extraordinary agreement took place. Bothwell, whom they had declared their determination to seize and punish as the murderer of his sovereign, was permitted, without molestation, to ride off the field. The queen was assured of their unshaken fidelity; and so completely did she credit their asseverations, that she gave her hand to Grange, and suffering him to lead her to his associates, was conducted by them to the capital.

---

[1] The reader who wishes to make himself master of the controversy should consult for the Queen's innocence, the work of Goodall, and that of William Tytler, with the volumes of Stuart, Whitaker, and Chalmers; against her, the Histories of Hume and Robertson, with the Dissertation by Mr. Malcolm Laing.

Mary confined in Lochleven castle.

Within an hour she discovered that she had surrendered herself to her mortal enemies. On her entering the city, a furious mob assailed her with execrations, and displayed before her a broad banner bearing the figure of her murdered husband. Amidst these indignities she was carried to a house, where she was so strictly guarded, that not even her maids were allowed access. And on the succeeding evening she was conveyed by the lords Lindsay and Ruthven a prisoner to Lochleven, a strong castle in the middle of a lake, from which all escape seemed hopeless.

Mary signs her abdication. A.D. 1567.

From those who had thus shamelessly broken their solemn engagement, little else could be looked for but additional indignity and outrage. Mary was soon visited in her prison by lord Lindsay of the Byres, whose fierce temper and brutal manners peculiarly fitted him for the mission on which he was sent. He presented to her three written instruments. By the first she was made to resign the crown in favour of her son; by the second, the earl of Murray was nominated regent during the king's minority; by the third, a temporary regency was appointed to act until Murray returned from the continent. When Lindsay threw these deeds on the table, he plainly informed the queen that no alternative was left, but either to sign them without delay, or prepare for death, as the murderer of her husband. We are not to wonder that, aware that her life was in the hands of her bitterest enemies, Mary instantly obeyed.

Coronation of the young king.

The young king was now crowned, and Murray having arrived from France, assumed the regency, and entered upon the cares of government. He had not, however, for many months enjoyed the sweets of power, when the queen, by the assistance and ingenuity of a youth of sixteen, named Douglas, escaped in the night from Lochleven, and riding first to Seaton, and next day to Hamilton, soon found herself surrounded by a band of her nobles, and at the head of six thousand men. Mary was desirous to avoid war, and addressed repeated pacific proposals to the regent, who was then at Glasgow. She offered to call a free parliament; she was ready to deliver up to justice all whom he accused as guilty of the murder, provided those whom she arraigned of the same crime were also delivered up. This was peremptorily refused, her messengers were arrested, her adherents denounced as traitors; and the queen, aware that it must come to the decision of the sword, determined to await the arrival of additional forces, when she was hurried into an engagement with the regent, who threw himself in her way at Langside, as she was on her march from Hamilton to Dunbar. The result was calamitous. Her army was completely defeated, and she herself compelled to fly from the field with a slender train, who rode to Dundrennan, a distance of sixty miles, before they drew bridle. Next day she intimated her resolution of throwing herself on the protection of Elizabeth. From this step her friends passionately dissuaded her; but she declared she would trust to the assurances which she had received from her good sister; and crossing the Solway, she proceeded through Cockermouth to Carlisle. The return for this act of generous confidence and devotedness is well known. Elizabeth refused to see her, gave orders that she should be detained, kept her in prison a miserable and heart-broken captive for fourteen years, and at last brought her to the scaffold.

Mary escapes from Lochleven. A.D. 1568.

Mary defeated at Langside, Seeks refuge in England. A.D. 1568.

From the imprisonment of Mary, (1568,) till the accession of James the Sixth to the English throne (1603,) there is an interval of thirty-five years. It is occupied by the successive regencies of Murray, Lennox, Mar, and Morton, after whose execution we have that portion of the reign of James which extends from 1581 to 1603. With a rapid review of the most interesting and influential events during this period, we shall conclude our labours.

Regency Murray.

The imprisonment of Mary left Murray the undisturbed possessor of the supreme power in Scotland; but the queen strenuously and indignantly asserted her innocence of the atrocious crimes of which she was accused; and as the English queen could bring forward no possible justification of her conduct in detaining Mary, except her alleged accession to the murder, it was evident that an investigation of the circumstances, if demanded by the accused party, could not in justice be refused. Mary offered to hear the accusation of her enemies in the presence of Elizabeth, and in the same presence to undertake her defence; but this was denied her. It was then proposed by the English ministers that she should consent to a public trial; but this she rejected as beneath the dignity of an independent sovereign. It was lastly suggested that her enemies should be summoned to produce their proofs before certain English and Scottish commissioners, and that the cause should be left to their decision.

Commission at York. Elizabeth partial co duct. A.D.156 1569.

A commission was accordingly held at York, but it led to political intrigues rather than judicial investigation. After some interval Murray was summoned to hold a private interview with Elizabeth at Westminster; and Mary again demanded to be admitted to the same presence, and confronted with her accuser. This was denied, while the English queen permitted Murray to bring forward his charge, and to attempt to substantiate it by letters, affirmed to be in the queen's hand-writing, addressed to Bothwell, and conclusive, as he contended, of her guilt. Again Mary demanded by her commissioners to be heard personally in her defence; and this being refused, they protested against further proceedings, and declared the conference at an end. Cecil, however, insisted that the inquiry should proceed; and having procured all the evidence which he judged necessary, he attempted to persuade the Scottish queen, as the only way of avoiding an ignominious exposure, to resign her crown. Her reply disconcerted him. "They have accused me," said she, "of the murder of my husband. It is a false and calumnious lie. It was themselves that counselled and contrived the murder, some of them were even its executioners. Give me what I am justly entitled to, copies of the letters they have produced; let me see and examine the originals, and I pledge myself, in presence of the queen, to convict them of the atrocious crime they have had the audacity to impute to me." This bold and unexpected tone embarrassed Elizabeth; and Mary having repeated her charge, insisted on having copies of the letters produced against her. The English queen evaded the request, and advised her to resign her crown. To this she declared that no persuasion would ever induce her; and under such circumstances the conferences were abruptly terminated. Murray, with his associates, received permission to return to Scotland. He carried away with him those alleged original letters, which the party whom they inculpated was never permitted to examine; and he left behind him copies, which were also concealed from Mary and her commissioners. It is from these copies, which the accused was never permitted to compare with the originals, that future authors have been obliged to infer the guilt or innocence of the queen; and certainly, if the opinion of Elizabeth is entitled to weight, it is clear that she considered the proof as defective. She and Murray shrunk from a public challenge of Mary; and however suspicious or inexplicable some of the

ames VI.
569.

steps taken by this unfortunate princess may have been, her friends alleged that victory in the conferences at York and Westminster was on her side. Yet was she detained a captive by the very princess who had virtually declared her guiltless. All this might however have been anticipated; and no one who knew any thing of the unscrupulous policy of Elizabeth could have dreamed, that having once possession of the queen, she would ever permit her to return to her dominions. In her detention, she possessed the means of rendering Murray subservient to her wishes, of checking the Roman Catholic party, confirming the ascendancy of the protestants, and destroying the French interest and intrigues in Scotland. These were advantages with which no considerations of the individual guilt or innocence of her royal captive were likely to interfere.

ntrigues of
orfolk
nd Mait-
and.

The subsequent career of Murray was bold and brief. He found himself called to a contest with a party, headed by the duke of Norfolk in England, and by Maitland and Grange in Scotland, whose object was, the restoration of the Scottish queen, and her marriage to Norfolk. The project had been encouraged by the Regent, whether at first sincerely or for selfish and ambitious purposes, is not clear; but in the end he betrayed the plot to Elizabeth, and was the main instrument in bringing this unfortunate nobleman to the scaffold.

urray's
bsequent
reer.

The principles upon which his government was conducted were entirely protestant and English; and Elizabeth, who knew well and valued so able an assistant, cordially co-operated with him to overwhelm the queen's friends, and to extinguish all hopes of the Roman Catholic party in either country. But the task was more difficult than had been anticipated. She succeeded indeed in extinguishing the great rebellion, led by the earls of Westmoreland and Northumberland; but Murray found it impossible to prevent the intrigues of such men as Maitland, Grange, and their associates, who had known him long, and having assisted to raise him to the supreme power, were indignant to find themselves treated with severity or neglect. It was in the midst of this struggle between the regent and his former associates in ambition and guilt, that he was assassinated in the streets of Linlithgow, by Hamilton of Bothwellhaugh, who was incited to this act of revenge by a private injury, of which Murray was only the remote cause.

.D.1570.

His death found Scotland divided between two parties. On the one side were the Protestants who adhered to the young king, and regarded Elizabeth as their protector; on the other the queen's friends, who, being animated with the utmost rancour against their opponents, prepared instantly to appeal to the sword. Previously to this, however, they assembled a parliament at Edinburgh, and fulminated denunciations of treason against their enemies; while the protestants in their turn having chosen the earl of Lennox regent, convoked the estates at Stirling, and soon afterwards having made themselves masters of Dunbarton by a successful night attack, they took prisoner the archbishop of St. Andrews, who had shut himself up in the fortress, and executed him on the instant, without even the semblance of a trial. This outrage led to retaliation, and a civil war, remarkable for its ferocity, began to spread havoc through the country. On Mary's side were the duke of Chastelherault, the earls of Argyll, Athole, Huntly, Crawford, Rothes, and Cassilis, the lords Seton, Boyd, Gray, Livingston, Fleming, with the lairds of Buccleugh, Fernihirst, and many others; to whom we must add the able and crafty secretary Maitland, and the experienced soldier Kirkaldy of Grange. Of the king's party the nobles were neither so numerous nor so powerful. Lennox, Morton, Mar, and Glencairn, lords Lindsay, Glammis, Semple, Methven, Ochiltree, Cathcart, Ruthven, and some others, espoused this side; but if inferior in numbers, they were confident in the assistance of England, and in the support of the church, the commons, and the boroughs.

Scotland.
James VI.
A.D.1571.
The Regent Lennox is slain.

Such was the general comparative strength of each faction. Into the details of the contest we cannot enter; and indeed it had lasted but for a short time, when Lennox was slain in a skirmish at Stirling, and the earl of Mar, one of the most upright-minded and honourable noblemen in Scotland, was chosen to supply the vacant regency. To promote a reconciliation between the two factions, and to restore peace, order, and security of property, to a country distracted by intestine war, was the single purpose to which the new governor devoted himself; but he was thwarted by the ambition of Morton, and many of the higher nobles. These had so long been accustomed to derive individual advantage from public misery, that they laboured as earnestly to increase the contentions of the two parties, as Mar to remove them; and the governor, at last worn out by the struggle, and hopeless of effecting a reconciliation, sank into the grave.

Morton is chosen regent. His character.

He was succeeded in the regency by the earl of Morton, a man who has been justly described as possessing all the faults, some of the talents, but none of the good qualities of the regent Murray, of whom he was an old and tried ally. Sordid and selfish, implicitly devoted to the service of Elizabeth, whose countenance and support he felt necessary to enable him to retain his power, a venal judge, a cruel unrelenting soldier, a hypocrite in religion, and a profligate in private life, it is difficult to find a single virtue to relieve the dark monotony of his vices. Yet Morton had some of the great qualities which distinguished the house of Douglas. He was brave, decisive, politic; and he possessed that rapid power of discerning the instant to act with success, and that deep insight into human character which is commonly acquired by men of talent, bred up in scenes of civil commotion.

State of Mary's party. Intrigues of Norfolk.

On his accession to the supreme power, the regent found the friends of the imprisoned queen still able to make head against him. The duke of Norfolk, who had been pardoned by Elizabeth, resumed his project of marrying Mary, and engaged in a correspondence with her. The duke of Chastelherault, and the earl of Huntly, lord Claud Hamilton, the lairds of Buccleugh and Fernihirst, with the indefatigable Maitland, and Grange, who was reputed the best soldier in Scotland, still supported her cause. Morton, however, strong in his own resources, and supported by Elizabeth, continued the war with success, and at last triumphed over opposition. Norfolk was brought to the scaffold, and the earl of Northumberland, treacherously delivered up by the Scottish regent, shared a similar fate. At last the castle of Edinburgh was invested by Sir William Drury, who joined the Scottish army with a formidable battering train. In this fortress, the single remaining hope of the queen of Scots, Kirkaldy of Grange commanded; and he held it bravely till the walls were destroyed, his guns silenced, and his provisions exhausted. Under these circumstances he surrendered, with his companion Maitland. To this step, Drury had induced him by a promise of favourable terms; but the English queen disregarded the stipulation, and handed over the prisoners to Morton. Kirkaldy and his brother were immediately executed, and Maitland only escaped the same scaffold by taking poison.

Fate of Kirkaldy and Maitland. A.D.1573.

Morton's oppressive government. A.D. 1574-1577.

Morton now deemed himself so strong as to be independent of all parties, and his avarice and spoliations knew no bounds. He oppressed the church, of whom he had formerly affected to be the steadiest patron; and treated the young king and the nobles with so much haughtiness and severity, that he soon became an object of universal dread and hatred. James was now twelve years old, and it was not difficult for a faction of the nobles, who detested the regent, to persuade the young monarch that he ought no longer to be treated as a child. Acting by their advice, he accordingly summoned a parliament. It was numerously attended; and Morton, to the astonishment of all, the moment he learned the king's wishes, declared his willingness

Morton resigns the regency.

to carry them into effect, and instantly resigned his regency. This ready and implicit submission was rewarded by the passing of an act of indemnity, which included a general pardon for any alleged transgressions, and ratified his whole conduct as regent. It is in his anxiety to procure this, that we are to find the secret of his sudden relinquishment of the supreme power; and scarcely was it procured when this extraordinary man, by means of a successful intrigue with a portion of the family of Mar, found means again to become master of the king's person, and re-emerged into as great power and ascendancy as before. His usurpation, however, was this time more short lived. Atholl, Argyll, and some of the most powerful nobles, assembled their forces, and declared their resolution to liberate the sovereign from his ignominious captivity. Instead of a battle, however, the opposite factions came to a compromise, by which the veteran tyrant was shorn of a large part of his power, and the young king recovered something of his independence.

Rise of Esme, duke of Lennox, and the earl of Arran.

A.D.1579.

Morton is tried, condemned, and executed.
A.D. 1581.

James began now to show that strong propensity to favouritism which marked his future career; and the effects of this weakness were seen in the sudden rise into power of Esmé Stewart, duke of Lennox, and captain Stewart, second son of lord Ochiltree, and afterwards the notorious earl of Arran. Of these, the first was a high-born nobleman, of graceful address, amiable feelings, and common-place understanding; but the second, of birth and connections much inferior to Lennox, was ambitious, intriguing, daring, and unprincipled, and soon managed to gain an influence over both the young king, and the duke his favourite. With these advantages, an overwhelming opposition was soon raised against Morton; and as his exactions and cruelty had made him universally odious, it was in vain that his steady friend, the English queen, interposed to save him. Her interference indeed rather accelerated his fate, and the news that she meditated an invasion, roused the spirit of the young king and of his people to instant opposition. When Elizabeth, however, received intelligence that a Scottish army was assembled, she prudently withdrew from the contest; and Morton abandoned to his fate, was arraigned as an accomplice in the king's murder, at the instance of captain Stewart, who had recently been created earl of Arran. Of his guilt there can be little doubt, and he himself, after the jury brought in their verdict, and he had received sentence of death, acknowledged that he was privy to the intended murder. But his trial was conducted, even in those days of prostituted justice, with a reckless disregard of every form of law; and all were aware that the jury, of whom many were his bitter enemies, would, under any circumstances, have found him guilty. He died as he had lived, boldly, expressing a calm contempt of death, and exhibiting all the outward marks of repentance.

The earl of Arran at the head of the government.

influen

Gowri
ecuted.

The death of Morton was followed by the nominal accession of the young king to the supreme power, but by the actual transmission of that power into the hands of his favourites, Lennox and Arran. This last nobleman, owing to the weak and flexible character of Lennox, soon came to rule all, and his rapacity, profligacy, and open defiance of public opinion, completely disgusted the nation. The result was a conspiracy for his ruin, headed by the earl of Gowrie. This nobleman and his associates having contrived to make themselves masters of the king's person, at the castle of Ruthven, and having removed Lennox and Arran from all authority in the state, directed the government as they judged best for their own interests. But the character of the king, although full of many strange contradictions, began now to exhibit a greater degree of talent and energy than his opponents were aware of; and although compelled to dissemble, and showing no symptoms of discontent with this change of masters, James was really disgusted with the durance in which he was held by Gowrie and his faction. With an ability which proved the more successful, because his adversaries were unprepared for it, he contrived to organize a party, and free himself from his servitude; but it happened unfortunately that at this crisis the earl of Arran regained his liberty, and returning to court, soon resumed his baneful influence over the fond and facile monarch. It was by his advice that the king, who had first been inclined to use his victory over the faction of Gowrie with moderation, exchanged this wise resolution for vindictive measures; and although Elizabeth strongly remonstrated against it, he brought Gowrie to the scaffold, and drove his associates into banishment.

Arran banishe
and a ne
government formed.

Arran was now supremely powerful; but the venality, tyranny, and abuses of his government, soon became intolerable, and worked their own cure by producing a counter-revolution, in which the despotic favourite, after having first courted, and then quarrelled with the Scottish church, in vain attempted to recover his influence by means of the English queen, and was at last chased from court by the associated lords, who made themselves masters of the king's person. A government, upon a model which admitted the principal nobility to a share in the councils of the state, was now established; and Arran, deserted by all parties, sank into insignificance.

Mary's trial and
executio
A.D.15

It was impossible that Mary, who had been detained a captive by Elizabeth, contrary to every principle of honour and justice, should not have exerted herself to regain her freedom; and the Roman Catholic party in England were not only interested in her success, but regarded her as their best security against Elizabeth and the Protestant faith. This led to a succession of intrigues, which were discovered by the penetration and activity of Elizabeth's ministers, the discovery only serving to increase the rigour of her confinement. At last the Scottish queen having been arraigned (unjustly as afterwards appeared) of an accession to the conspiracy of Babington, the object of which was the assassination of Elizabeth, and the restoration of the ancient religion, she was brought to trial before a commission, whose jurisdiction she at first peremptorily declined as an independent and sovereign princess. It was unfortunate for Mary that she did not continue in this resolution; but in the idea that a refusal might be construed into an admission of guilt, at last condescended to plead. The consequence was, what might have been expected from the nature of the evidence, the constitution of the court, and the supreme authority of Elizabeth. Mary was found guilty of having compassed divers matters tending to the death of the queen; and after many affected delays, and an atrocious attempt to induce her keeper, Paulet, to dispatch her secretly, Elizabeth signed the warrant for her execution, which was carried into effect on the 7th of February 1587. The meekness with which she received the intimation of her sentence, and the admirable and saintly fortitude with which she suffered, formed a striking contrast to the despair and agony which not long afterwards darkened the death-bed of the English queen.

Elizabet
base conduct.

It might have been expected that if any thing could have roused the king of Scots, it would have been the cruelty and injustice to which his mother had fallen a sacrifice; and for a moment there was an ebullition of indignant feeling. But Elizabeth sent him an artful apology. The blame of the execution was laid upon Davison, her secretary, an innocent and upright man, who simply obeyed her orders; and with that unscrupulous falsehood which this princess seldom hesitated to employ when necessary to carry through her designs, the unfortunate statesman was sacrificed, that his royal mistress might escape. But the English queen had still a firmer hold over the young king of Scots. He regarded the succession to her throne as his undoubted right, and dreaded to irritate her personal feelings, or alienate her Protestant subjects, by appearing to place himself at the head of the Roman Catholic party, who burned to avenge the death of their royal mistress. In vain, therefore, they

looked to the king, who, after a short interval, relapsed into his usual pacific frame of mind, and celebrated his entrance upon majority, by an attempt to abolish those sanguinary feuds amongst his nobility, which had increased to an alarming height, and threatened to pull the country to pieces.

.D.1589.

This laudable endeavour, which did not meet with the success it merited, was followed by James's marriage to the princess Anne of Denmark; an alliance which Elizabeth, with her usual jealous and capricious policy, endeavoured to prevent. But the Scottish king, with unwonted spirit and energy, sought his bride in person in her father's court, and having solemnised his marriage at Upslo, returned with her to Scotland.

he earl of

During his absence the kingdom had been unusually prosperous and happy; but it was soon afterwards embroiled by the intrigues and ambition of the earl of Bothwell, who, leaguing with the Roman Catholic faction, attacked the palace of Holyrood with the design of seizing the king's person, and placing himself at the head of the government. A second attempt of the same kind at Falkland was not more successful; and yet such was at this time the impotent state of the law, and the weakness of the royal authority, that these repeated treasons escaped unpunished, and Bothwell lived not only to defend but to repeat them.

ate of
cotland.

Scotland at this moment presented a melancholy picture. The intrigues of Philip the Second had encouraged the Roman Catholic faction, which was led by the earls of Huntly, Errol, and Angus; and James, aware of the great power possessed by the Romanists, both in Scotland and England, was fearful of treating them with severity, lest he should raise a formidable opposition to his right of succession, which must open on the death of Elizabeth. But this was not the only source of disquiet. The excessive lenity of the king had fostered the feudal quarrels among his nobles, impunity led to new excesses, and the turbulent and audacious Bothwell once more appeared upon the scene, and made repeated attemps to seize the royal person, and administer the government at his pleasure. To these sources of disquiet, were added the interference of Elizabeth, which roused the jealousy of the king, and the intolerant spirit of the protestant ministers, who, horror-struck by the discovery of the intrigues of the Roman Catholic lords, recommended their being treated with the utmost severity.

isters.

These combined causes transformed the kingdom into a scene of almost perpetual tumult and bloodshed; but the monarch at last becoming convinced of the treasonable purposes of the popish earls, assembled an army, and reduced them to the last extremity of distress. Bothwell, too, was driven into exile, and the country began to breath anew, when James found himself involved in a contest with the protestant ministers. The cause of this dispute was the king's wish to lean to the side of mercy in his conduct to the popish lords. It was reported that Huntly, their leader, had been admitted to a secret interview. The clergy, alarmed to the utmost, appealed to their congregations; they defended the conduct of Black, a minister who had openly attacked the court and the queen, in a seditious harangue; they haughtily declined the authority of the privy council; and by their violence, they excited a tumult in Edinburgh, which compelled the monarch to retire to Linlithgow. Under these trying circumstances, the king acted with extraordinary energy, and jealous of so bold an interference with his prerogative, restored tranquillity to the capital, punished the insurgent citizens, compelled the ministers to fly to England, and, according to his original intentions, extended his forgiveness to the popish lords who made a recantation of their errors.

co-

James, who had been alarmed at the late violence exhibited by the presbyterian clergy, now became intent upon a plan for new-modelling the church; but aware, that if the measure originated in any other quarter than that of the clergy themselves, it would inevitably miscarry, he artfully prevailed on the General Assembly to second his views. The commission appointed by this ecclesiastical council were induced to complain that the church was the only body not represented; and the king, whose object it was to restore episcopacy, procured an act to be passed, by which those ministers upon whom he had conferred the vacant bishoprics and abbeys were entitled to sit in parliament. When this measure came again to be debated in the General Assembly, it encountered great opposition. "Deck these intruders as you will," exclaimed one of the most zealous presbyterians, "under all their disguise I see the horns of the mitre." Yet after a long debate, a majority of the General Assembly declared in its favour; and it was resolved that ministers might lawfully accept a seat in parliament, and that fifty-one members should be chosen as representatives of the church in the supreme court of the country. When, however, the question arose regarding the spiritual jurisdiction which should belong to these persons, the General Assembly so effectually shackled and abridged their powers, that they remained wholly dependant upon this great ecclesiastical council, and exercised no separate spiritual jurisdiction. It was James's hope, that, in the course of time, they would shake off these fetters, but, in the mean time, they could claim none of the privileges belonging to the episcopal order.

Scotland.
James VI.
A.D. 1600.

The Gowrie conspiracy.

When the monarch was thus employed, and his kingdom was enjoying a degree of tranquillity to which it had been long a stranger, the minds of the people were suddenly agitated by a sudden and mysterious attempt made at Perth upon the life of the king by the earl of Gowrie and his brother, Alexander Ruthven. These young men were the sons of that earl of Gowrie who had been executed for treason, and it is probable that a desire to revenge their father's death led to their miserable and ill-concerted enterprise; but much obscurity hangs over the whole transaction. It is certain that Ruthven induced the king, by a feigned story, to accompany him with a slender train from Falkland to his brother's house at Perth. Here he contrived to separate James from his attendants, and leading him into a remote apartment, threw himself upon him, seized him by the throat, and drew his dagger. The king struggled to get to the window, and calling out treason, alarmed his nobles, who rushed into the room, stabbed Ruthven to the heart, and when Gowrie attempted a rescue, put him also to death on the spot. Both these unfortunate men being slain, the utmost pains were taken to detect their associates, to unravel the plot, and to ascertain their precise object, but with so little success, that to this day the mystery is not solved.

Death of Queen Elizabeth.

The queen of England, now in her seventieth year, began soon after this to droop, and her constitution, hitherto uncommonly vigorous and unimpaired, was evidently breaking up. Of all this James was well aware. He had secured the friendship and good offices of Sir Robert Cecil, her chief minister, who, unknown to his mistress, carried on a secret correspondence with the Scottish king; and acting by his advice, he had employed every effort to conciliate the affections of the English people, and to acquire the support of the most powerful of the English nobility. These judicious precautions were attended with the wished-for result. James was Elizabeth's undoubted heir; and on the death of this princess, an event which took place on the 23d of March 1603, he succeeded, with the unanimous consent of the nation, to the throne of England. This great and auspicious event closes the history of Scotland as a separate kingdom.

STATISTICS.

Statistics.

Superficial extent.

Scotland, the northern division of Great Britain, is situated between 54° 38′ and 58° 41′ north latitude, and between 1° 47′ and 6° 7′ west longitude from Greenwich; having the sea on all sides, except the south, where it is separated from England partly by the Tweed and other streams, and partly by a line supposed to be drawn along the high grounds in that quarter. The longest line that can be drawn in about the same parallel of longitude is from the Mull of Galloway in Wigtonshire to Cape Wrath in Sutherland, a distance of about 274 miles, though Dunnet-head in Caithness-shire, is the most northerly point; while its breadth is extremely various, ranging from 147 miles to about 30. The greatest breadth is between Buchanness on the coast of Aberdeenshire, and the Rowanmoan Point on the west coast of Ross-shire. There are other points where the width is not much less; while between Alloa on the Frith of Forth and Dunbarton on the Clyde, the distance is only 32 miles, and between Lochbroom and the Frith of Dornoch, it is rather less than 30. The area of Scotland, calculated from Arrowsmith's map, and as given in the *General Survey of Scotland*, contains 25,520 square miles , and 494 square miles of fresh water lakes. This is the extent of the mainland only, exclusive of the islands on the west, known by the name of the Hebrides or Western Isles; and those of Orkney and Zetland on the north, which altogether are computed to extend over 4224 square miles, of which 144 consist of fresh water lakes. Including these islands, the northern limit of Scotland stretches beyond the 61st degree of latitude, and its longitude lies between the meridian of London and 8° 18′ west; its area being computed to comprehend 30,238 square miles, of which the fresh water lakes occupy 638 square miles, or about 1-48th part of the whole.

Table shewing the total extent of the several Counties of Scotland, thirty-three in number, including Buteshire, and the county of Orkney and Zetland, in square miles, and English statute acres; specifying the extent of Land and of Fresh Water Lakes in each County.

ice of the untry.

From what has been already said respecting the extreme variation in the breadth of Scotland at different places, the fact may be inferred, that the outline on the sea-coast is exceedingly irregular, and of great extent, the sea penetrating to a great depth, both on its eastern and western sides. Of these arms of the sea, the most considerable are the Firths of Forth and Tay, and the Moray and Dornoch Firths, on the east; and the Firth of Clyde and the Luce and Wigton Bays, on the west and south-west; whilst there are a very great number of smaller inlets, called lochs, such as Loch Fyne, Loch Long, Loch Etive, Loch Lynnhe, Loch Broom, &c., which indent the country in all directions, to an extent varying from ten to seventy miles. With this irregularity of outline is combined a surface generally rugged and mountainous. With the exception of narrow tracts along its principal rivers, there is very little of the country flat or level, or what would be regarded as productive land in more favoured regions. "To such a degree," says Mr. M'Culloch, "is this the case, that, estimating the whole extent of the country, exclusive of lakes, at 19,000,000 acres, it is doubtful whether so many as 6,000,000 be arable; whereas, taking the extent of England and Wales at 37,000,000 acres, the arable land certainly exceeds 29,000,000; so that, while in Scotland, the proportion of the cultivable to the entire land is less than one-third, in England it exceeds three-fourths. With the exception, indeed, of a few tracts of rich alluvial land, (carses), Scotland has no very extensive vales; the surface of the rest of the country being, even where most level, considerably varied with hill and dale."[1] In the south of Scotland, a tract of mountainous country, known by various names, stretches in a south-west direction, from the Cheviot hills in Roxburghshire, on the borders of England, to the Irish channel, sending off branches on both sides, whilst detached hills prevail over the whole of the contiguous districts. These high grounds, however, are for the most part clothed in green, almost to their summits, and have little of that wild, romantic, and desolate character, which distinguishes many of the mountains of the Highlands. Northward from the isthmus formed by the Firths of Forth and Clyde, the low grounds constitute but a small proportion of the whole. Here, in latitude 57°, the Grampians extend from sea to sea, with a breadth of from forty to sixty miles; and parallel to them, to the south, is another chain, called the Siedlaw, Ochills, and Campsie hills. Between these two ranges lies the fertile valley of Strathmore; whilst, farther north, cultivation is mostly confined to the sea-coast, the banks of the larger rivers, and the narrow glens between the mountains. On the north-west, beyond the line of the Caledonian canal, the country is, with few exceptions, singularly rugged and sterile; consisting of lofty mountains, either covered with heath, or presenting a mass of naked rocks, interrupted only by deep and dark ravines, lakes, and precipitous streamlets. But the eastern coast of Ross-shire is comparatively level and fertile; and Caithness, the north-eastern county of the mainland of Scotland, is generally low, marshy, and unproductive.

ghlands.

Scotland is divided into Highlands and Lowlands. "Those countries, whose inhabitants speak a different language, and wear a different garb," says Mr. Home, in his *History of the Rebellion*, 1745,[2] "are not separated by firths or rivers, nor distinguished by northern or southern latitude. The same shire, the same parish, at this day, contains part of both; so that a Highlander and Lowlander (each of them standing at the door of the cottage where he was born) hear their neighbours speak a language which they do not understand." The line which separates the Highlands from the Lowlands is by no means well defined; but it may be described as beginning at Dunbarton, on the Firth of Clyde, and proceeding northward by Crieff, Dunkeld, and Blairgowrie, it runs through the forest of Morven, in the heights of Aberdeen, to Carron, in Banffshire; from Carron it stretches due west by Tarnoway, in Morayshire, to the town of Nairn; from Nairn the line is continued to Inverness; and from this latter place, it proceeds in a tortuous direction, to Dunistra, on the south side of the Firth of Dornoch, where the line of separation may be said to terminate, the country to the north of this firth being altogether Highland, except a narrow stripe of land along the shores of the German Ocean, which washes the east coast of Sutherland and Caithness. To the west of this line lie the Highlands, which, including the Hebrides, constitute in superficial extent nearly one-half of Scotland, although the inhabitants of this division do not form an eighth part of the population of that kingdom. The face of the country is wild, rugged, desolate, and mountainous. In almost every strath, valley, or glen, there glitters a stream or lake; and numberless firths, or arms of the sea, penetrate the land. The *passes* into the Highlands lie in deep ravines or glens, so narrow, and so overhung by mountains, that they admit of being very easily defended, and till recently, when roads have been made, they were impracticable almost to every one except the natives. To this must principally be ascribed the successful resistance opposed by the Highlanders to the attacks of the Romans and the Saxons; and hence, also, these northern people still form a distinct race, the lineal descendants of the ancient Celtic inhabitants of the country, and differing essentially in language, dress, and manners, from the Lowlanders.

Climate.

The climate of Scotland, as may be expected, from its insular situation and high latitude, is cold, cloudy, and humid. This is its general character, as compared with the greater part of England; yet, even in the south of England, frost is sometimes more intense, and snow falls more copiously than in Scotland. Corn, however, and most of the fruits and vegetables common to both divisions of Great Britain, attain maturity about three weeks earlier in the south of England than in Scotland; and some plants, such as hops and a few others, cannot be profitably cultivated at all in the latter country. The mean annual temperature of Scotland is very high for the latitude, being about 46½° in places near the level of the sea. In the more southerly parts of the kingdom, the climate differs but little from that of the northern parts of England. Sir David Brewster states the mean annual temperature to be 48·36 at Leith. At Edinburgh, which is elevated from 300 to 400 feet above the level of the sea, and situated two miles from it, the annual temperature is 47·8, and this may be taken as a near approximation to the general average of Scotland; the mean temperature of winter being 38·6, of spring, 46·4, of summer, 58·2, of autumn, 48·4, the coldest month being 38·3, and the warmest 59·4.[3] The observations published in the *New Statistical Account of Scotland*, and in the *Transactions of the Royal Society of Edinburgh*, closely approximate to the above estimate. In the parish of Inch, Wigtonshire, the mean temperature for the year 1837 was 48·41. At Applegarth Manse, in the interior of Dumfries-shire, the average annual temperature for seven successive years, ending in 1831 inclusive, was 47·12; that of the spring being 40·31, of the summer, 56·86, the autumn, 54·18, and of winter, 39·92. At Wick in Caithness the mean annual temperature is 46·7, that of the winter being 40·35, the spring, 44·41, the summer, 53·77, and the autumn, 48·82; whilst at Sumburgh-head, the most southerly promontory of the Shetland Islands, in latitude 59° 52′, the mean annual temperature is 45·5, that of the winter being 40, the spring, 43·29, the summer, 50·60, and the autumn, 47·48. The range of the barometer is 2·82 inches, or from 30·92 to 28·10 inches; and in the Orkney and Shetland Islands it is somewhat more, or about three inches. The fall of rain is very different in different districts; but the average is about 31 inches. The quantity which falls on the east coast of Scotland ranges from 22 to 26 inches; whilst, on the west coast and in the Hebrides, it is nearly double, varying, according to situation, from 35 to 46 inches. The number of fair days throughout the year is, on the west coast, only 160; whilst on the east it is 230. The mean annual fall of rain at Edinburgh for the years 1824 and 1825, was $23\frac{1}{2}$ inches; at Glasgow, for an average of thirty years, it was 30 inches; whilst, still farther west, at Mount Stewart, in the Isle of Bute, it was, on an average of seven years, 46·6 inches, the mean average of the whole country being, as just stated, 31 inches. The prevailing winds throughout Scotland are from the westerly points; but on the east coast it blows from the easterly points about a third of the year. Easterly winds generally prevail in March and April, and often in May and part of June, and not only check vegetation, but are attended with slightly unfavourable effects on the health of the inhabitants, particularly such of them as are nervous, dyspeptic, consumptive, or rheumatic. But the climate of Scotland is eminently salubrious. There are, properly speaking, no fens or marshes. The low grounds are, in general, highly cultivated. From whatever point the wind may blow, except the east, a wide expanse of sea is passed over; and the air, though moist, is purified from injurious emanations, which are readily absorbed by the ocean. Hence it has been affirmed, that the mean duration of life is greater in Scotland than in almost any other country.[1] "We are pretty confident, from extensive observation in different countries, that the proportion of the population that reaches seventy or eighty years of age, and the vigour then remaining, are greater in Scotland than almost any where else."

[3] Ibid.

Mountains. The mountains of Scotland consist either of detached groups, more or less closely wedged together, or of ridges or chains. These latter may be characterized as running in a north-east and south-west direction. The most celebrated chain, the Grampians, mentioned by Tacitus,[2] extend from the south-eastern boundaries of Argyleshire, with a more or less defined line, to the heart of Aberdeenshire. This chain may be regarded as a natural rampart, forming the south-eastern boundary of the Highlands. With the exception of Ben Nevis, the highest mountains in Scotland are comprehended in the Grampian range. Another chain, to the south of the Grampians, and nearly parallel to them, stretches from Montrose to the Clyde, in Dunbartonshire; but being intersected by the Tay and the Forth, it is divided into three distinct portions, which bear different names. From Montrose to the Tay, this chain is called the Siedlaw hills; from the Tay to the Forth, it is known by the name of the Ochills; and the remainder passes under the names of the Dundaff, Fintry, and Campsie hills. The low country, or strath, which separates this range of hills from the Grampians, is called Strathmore, or the great valley. There is also a chain of mountains in the south of Scotland, stretching from the Cheviot hills, on the borders of Northumberland, to Loch Ryan, in Wigtonshire. There are other smaller ranges, such as the Monagh Lea mountains, which run parallel to and along the western side of the Spey; the Lomond hills in Fifeshire; the Pentland hills in Mid-Lothian, and others. The altitude and situation of the principal hills and mountains in Scotland having already been given under the head of Physical Geography, it is unnecessary to repeat the information here.

In the neighbourhood of the village of Leadhills, in Lanarkshire, 1564 feet above the level of the sea, is the highest cultivated land in Scotland. In Aberdeenshire, the plough sometimes reaches the height of about 1300 feet; but, with few exceptions, an elevation of 600 feet seems to be the limit of the tillage lands of Scotland. None of the Scottish mountains ascends to the line of perpetual congelation; yet snow may be found all the year round in some of the dark recesses, on which the sun never shines.

Vales. From the rugged and mountainous character of the surface of Scotland, the vales or level tracts cannot be expected to be extensive or numerous. They are, indeed, when compared with England, very much the reverse. Of these vales, called sometimes *straths* or *carses*, the following are the most important. The vale or *carse* of Stirling and Falkirk is a tract of low alluvial land, which extends on both sides of the Forth, with little interruption, and to a greater or less width, from Borrowstonness to about twenty miles north of Stirling, including the vales of the Teith and the Allan, two tributaries of the Forth. These lands are peculiarly fertile, and produce the richest crops of wheat and other grain. The vale of the Earn, a tributary of the Tay, known by the name of Strathearn, is of a similar character, but of comparatively limited extent. The carse of Gowrie, which lies on the north of the Tay, from Dundee to Perth, is incomparably the most fertile and productive district in Scotland, and is thought not to be surpassed in these respects by any other district of equal extent in the united kingdom. Strathmore stretches from Lawrencekirk in Angusshire to the neighbourhood of Perth, lying between the bases of the Siedlaw hills and the Grampians. This valley is not entirely flat, but is characterised by occasional gentle eminences. The *Merse*, or level lands of Berwickshire, stretch from the confluence of the Leader and the Tweed to the town of Berwick, occupying most of the low and generally level part of the country, or nearly the half of its surface. The carse of Baldoon, lying south of the river Bladenoch, and on the east shore of the bay of Wigton, is of limited extent, but of nearly equal fertility to the carse of Gowrie. There are other less important straths or carses, such as those along the Teviot in Roxburghshire; Tynedale, or the vale of Tyne, in East Lothian; and the Howe, or vale of Eden, in Fifeshire. These lands are either loamy or alluvial.

Moors. By this term we mean tracts of land composed of morasses, intermixed with rocks, lakes, and peat-moss. The moor of Rannoch, lying between Schehallion, Ben Cruachan, and Ben Nevis, is one of the most lonely, wild, and dreary districts in Scotland. It may be said to be entirely devoid of value, and would not of itself bring any rent. It is not inhabited, and very seldom visited. There is a tract about ten miles inland on the west coast of Sutherlandshire, not very dissimilar, but, though more rugged, it is not quite so dreary as that of the moor of Rannoch. The *flow* of Glenluce lies between Newtonstewart and Luce Bay, stretching along the public road for about ten miles, composed chiefly of peat and morasses, and forming one of the bleakest and most dreary rides in Scotland.

Rivers. From the rugged and mountainous nature of the country, the rivers of Scotland are characterised by a more rapid course, are more diversified by rocks and cataracts, and are more limpid than those of England. Their course is also necessarily shorter, and few of them are navigable, at least to any great extent. Being generally mountain streams, they are peculiarly liable to sudden overflowings, their rise and fall being equally sudden. From a very tedious and elaborate set of experiments, it is computed that they carry out to the sea, on an average, about $\frac{1}{2000}$ the weight of their waters in mud; that is, a film of about $\frac{1}{50}$ of an inch annually, or one inch in fifty years over the whole surface from which they draw their waters.

The principal rivers of Scotland, with the single exception of the Clyde, are exclusively confined to the east. Three inconsiderable rivers flow in a south-easterly direction, the

---

[1] Malthus, i. cap. x.

[2] Agricolæ Vita, c. 29.

Dee, which falls into the Solway Firth about six miles south of Kirkcudbright, and is navigable for small vessels two miles above that town; the Nith, which rises in the north of Dumfries-shire, and falls into the Solway Firth more than seven miles below Dumfries, being navigable to within two miles of that place; and the Annan, which rises on the south side of Hartfell, near Moffat, and falls into the same estuary at the town of Annan. The last is not navigable beyond this burgh. The rivers which flow in a northerly or north-easterly direction are the Ness, which flows from Loch Ness, and, after a short course, falls into the Moray Firth near Inverness; the Findhorn, which, rising in the Monagh Lea mountains, falls into the same estuary at Findhorn, after a winding course of upwards of 50 miles; and the Spey, the most rapid of the Scottish rivers, which flows from Loch Spey towards the west of Inverness-shire, and, after receiving innumerable tributaries, and traversing the best wooded portion of the Highlands, falls into the Moray Firth. The course of the Spey is nearly 100 miles; it drains above 1300 square miles of country, but is not navigable. With the exception of the Ayr, which is likewise not navigable, and falls into the sea at the town of the same name, the only river on the west coast worth mentioning, is the Clyde, (the *Glotta* of Tacitus), which, in a manufacturing and commercial point of view, is the most important stream in Scotland. It rises on the west of the Moffat mountains, and, after a circuitous course of nearly eighty miles, falls into the Firth of Clyde below Dunbarton. It receives various tributaries, and is navigable to Glasgow, passing in its course the principal manufacturing and commercial towns in Scotland; Glasgow, Hamilton, Lanark, Paisley, Port-Glasgow, and Greenock. The navigation of the Clyde was formerly much obstructed; but under the management of a Parliamentary board, called the River Trust, these obstructions have been nearly removed, and the channel rendered so deep and straight that vessels of 400 tons can now resort to the Broomielaw at Glasgow. The falls of Clyde, which are about 30 miles south-east of Glasgow, are very striking and celebrated. The first considerable fall is that of Bonnington, its height, including that of a little one immediately above it, being about thirty feet. The second is Corra Linn, where the water dashes from one shelving rock to another, its perpendicular height being about seventy feet. Dundaff fall is only ten feet in height; whilst that of Stonebyres, which includes three distinct falls, is not less than seventy-six feet.[1] All the other rivers are on the east coast, namely, the Tweed, the Forth, the Tay, the North and South Esk, the Dee, and the Don. The Tweed rises near the sources of the Annan and Clyde, and running past Peebles through a beautiful pastoral country, falls into the German ocean at Berwick-upon-Tweed, after a winding course of about a hundred miles. The descent from its source to its embouchure is about 1500 feet; and it is navigable only to Berwick. The Forth, (the *Bodotria* of Tacitus), rises on the east of Ben Lomond, and receiving the waters of the Teith and the Allan, it becomes a considerable stream at Stirling, to which the tide flows, and to which it is navigable for vessels of about seventy tons. From Stirling to Alloa is only six miles by land, but the stream of the Forth is so tortuous that it is no less than sixteen by water. The river may here be said to terminate in the Firth, which extends to the German ocean, a distance of forty miles. Its width is various. At Queensferry, eight miles west of Edinburgh, it is two miles; at Leith it is six; and thence it gradually expands till it is lost in the open sea. It is navigable for vessels of 300 tons as far as Alloa. The only low water pier of which it can boast is that of Granton, about a mile and a half west of Leith. The Tay rises to the north of Loch Lomond, and expanding into the romantic sheet of water called Loch Tay, it flows in a circuitous route past Dunkeld and Perth, and falls into the Firth of Tay at the confluence of its waters with the Earn, about twenty miles from the mouth of the estuary. It is navigable to Dundee for vessels of 500 tons burthen, and to Perth for those of 100 tons. It receives many tributaries, of which the Earn, just mentioned, is the most important. The Tay is the largest of the Scottish, and, in respect to the volume of water it conveys to the sea, even of the British rivers. The North and South Esk have their source in the Grampians, and fall into the sea at Montrose, within three miles of each other. The South Esk is navigable to Montrose, about a mile and a half from its mouth. The North Esk is not navigable. The basin of Montrose, through which the South Esk flows, and which bounds the town on the west, comprehends about 2000 acres of land; it is covered by water at full sea, and exhibits nothing but bare sand at ebb tide. This expanse, it has been calculated, might be reclaimed at a gross cost of L.11,938.[2] The Dee and the Don have also their rise in the Grampians, and fall into the sea, the former at New Aberdeen, and the latter at Old Aberdeen. The Dee is navigable for about a mile from its mouth; the Don is not navigable.

The Scottish rivers, as stated at the beginning of this head, are of such a character, that there is no room for reclaiming waste land from their channels. This is prevented by the rapidity of their streams and by their rugged course. But several attempts have been made to reclaim lands from innundation on the shores of the Firths of Forth and Tay. Without entering into particulars the following results may be given:[3]

FORTH.	Acres.	Cost.	Rent.	Value at 30 years' purchase
Formerly reclaimed	40	£ 2,000	£ 160	£ 4,800
Recently reclaimed	366	18,063	1464	43,920
TAY.				
Formerly reclaimed	105	3,050	600	18,000
Recently reclaimed	142	5,730	920	27,600
Totals......	653	£30,843	£3144	£94,320

In addition to this, it has been stated that the extent of land now in process of being reclaimed, on different estates on the shores of the Tay, may be computed at 1140 acres, at a gross cost of L.50 per acre. The following extract, on the subject of embankments, from a work just published,[4] contains minute and interesting information: "About 68 Scots acres of land have been here, (the parish of St. Madoes,) at different times reclaimed from the Tay by embankments. In 1826, in consequence of an arrangement between Sir John Richardson, the proprietor, and Mr. R. W. Rannie, tenant, Pitfour Mains, by which the latter agreed to raise an embankment at his own expense, and after being allowed to take the first crop free, to pay L.4, 10s. annually, per Scots acre, for the reclaimed land, during a lease of nineteen years; operations were commenced, which resulted in the complete reclamation of 50 acres during the autumn of that year. The whole expense of embankments, sluices, levelling, water cuts, and trenching amounted to L.1530. So productive, however, did the new soil turn out, that Mr. Rannie has been amply rewarded for his enterprise. According to his own account, he has had, before liming and manuring, on some parts of a field, about 60 bolls of potatoes per acre, the average produce being from 40 to 50 bolls. After liming and manuring, he has had, on some parts of a field, 70 bolls per acre, the average being from 50 to 60 bolls, of 32 stones Dutch to the boll. He has had of oats, before liming and manuring, from 10 to 11, after liming and manuring, from 12 to 13 quarters per acre; and of wheat from 6 to 7 quarters per acre. He commenced liming in 1829 and manuring in 1835, the rotation, up to that period, being potatoes, and wheat, or oats, alternately. In 1833, Sir John Richardson reclaimed 18 acres more at an expense of L.1200; and, by means of head-dikes, break-waters, and other contrivances, which he is from time to time throwing out into the river, for the purpose of accommodating silt, upwards of 150 acres more may ultimately be added to the parish; of these, from 15 to 20 may be banked off in the course of two years."

Lakes.

From a table already given, under the head of Superficial Extent, we have already found that the fresh water lakes in Scotland occupy an area of 638 square miles, or cover an aggregate extent of 408,320 English statute acres. The only counties that are devoid of lakes are those of Berwick, Clackmannan, the Lothians, and Peebles; whilst those of Roxburgh amount to only 320 English acres. The greatest extent of lakes are in Inverness-shire, (84,480 English acres,) Argyleshire, exclusive of islands, (38,400,) Ross-shire, (38,400,) Perthshire, (32,000,) and Sutherlandshire, (30,080.) The lakes, generally speaking, occupy the valleys or ravines amongst the mountains, and are thus distinguished for their length, their breadth being comparatively trifling. The only Lowland lakes worth specifying are Loch Leven, St. Mary's Loch, and Loch Ken. The first, situated in Kinross-shire, is four miles in length by two in breadth, having the Lomond hills on its east, and Benarty hill on its south; whilst the towns of Kinross and Milnathort lie on its western margin. This lake is remarkable for a peculiar species of red trout, which is highly valued;[1] and it also produces char, perch, pike, and other species of fish. The fishery is let for a considerable sum; and it is a remarkable fact that Loch Leven is the only Scottish lake that yields any revenue to its proprietors. There is not even an attempt made to derive any profits from any other lake; nay, they are not fished for the domestic consumption even of the neighbouring inhabitants. But Loch Leven is principally celebrated for an island in the lake in which are the picturesque ruins of a castle, where Queen Mary was confined by her subjects, and from which she effected her escape (1568) a few days previous to the fatal battle of Langside. There are other small islands in the lake, the principal of which is St. Serf's, where was once a famous monastery, of which Andrew Winton, author of the *Chronykil of Scotland*, was prior. St. Mary's Loch, a most beautiful and picturesque sheet of water, three miles in length by from half a mile to a mile in breadth, is in Selkirkshire. Loch Ken is formed by the expansion of the river Ken in Kirkcudbrightshire, and forms part of the river. It is ten miles in length by rather less than a mile in breadth. The other lakes are all north of the Firths of Clyde and Forth. Loch Lomond is the most celebrated as well as the largest lake in Scotland; indeed, it is the largest in the British dominions. This noble sheet of water is above twenty-four miles in length, its greatest breadth is ten miles, but, towards its upper part, it is not more than half a mile. Its depth varies from twenty to a hundred and twenty fathoms, and its greatest depth is towards the north. It is studded with numerous and richly wooded islands, some of them being very small, but the largest, Inchmurrin, is two miles in length and one in breadth. Some of them, particularly Inchmurrin, are stocked with deer. Both sides of the lake are flanked by high and rugged mountains, among which "the lofty Ben Lomond" stands conspicuous, its height being 3195 feet above the margin of the water. The surface water of Loch Lomond is from three to five feet higher in winter than in summer; but its mean height is about twenty-two feet above the level of the sea at Dunbarton. Its surplus water is conveyed to the Clyde, a distance of six miles, by the river Leven. Loch Katterin, so celebrated in Sir Walter Scott's *Lady of the Lake*, lies in the district of Menteith, Perthshire, and is one of the most romantic in Scotland. Its length is eight miles, and its greatest breadth less than one. It does not seem necessary to give a minute description of the other lakes; but the following table, taken from the *General Report of Scotland*, will shew their number, dimensions, and situation.

Name.	Length in miles.	Greatest breadth in miles.	Square miles.	Counties where situated.
1. Lomond....	24	7	45	Dunbarton and Stirling.
2. Awe........	25	2½	30	Argyle.
3. Ness........	22	2½	30	Inverness.
4. Shin........	20	1½	25	Sutherland.
5. Maree......	12	3	24	Ross, west coast.
6. Tay.........	15	2	20	Perth.
7. Arkeg......	12	2	18	Inverness.
8. Shiel........	16	1	16	Inverness, west coast.
9. Lochy......	16	1	15	Inverness.
10. Laggan	8	1½	12	Inverness.
11. Morrar	9	2	12	Inverness.
12. Fannich ...	7	1½	10	Ross, centre.
13. Ericht......	14	2	10	Perth and Inverness.
14. Earn........	8	1¼	9	Perth.
15. Naver......	6	2	9	Sutherland.
16. Stennis	8	2	8	Orkney, mainland.
17. Rannoch...	9	1	8	Perth.
18. Leven......	4	2	7	Kinross.
19. Fuir.........	4	2	6	Ross.
20. Lydoch.....	6	1	6	Perth and Argyle.
21. Dee & Ken	10	0¾	6	Kirkcudbright.
22. Loyal	6	1	6	Sutherland.
23. Glass.......	5	1	5	Ross, east.
24. Katterin...	8	0¾	5	Perth, Menteith.
25. Doon.......	9	1	4½	Ayr.
26. Huichart ...	3	1	3	Ross.

Geolog

In a general point of view, Scotland may be separated, geologically as well as geographically, into three portions. By passing a line on the map nearly straight from Stonehaven, through Dunkeld, to the middle of the Isle of Bute, and thence with a slight curve to the Mull of Cantyre, we shall have traced the southern boundary of the primary non-fossiliferous system of rocks. Another line, but much more irregular than the former, drawn from St. Abb's Head in Berwickshire, passing near Peebles, Sanquhar, and New Cumnock, to the south of Girvan on the western coast, will form a general parallelism with the former line, and will contain the old greywacke, now named the Cumbrian system, lying to the south, and extending to the boundary between England and Scotland, whilst the land included between the two lines comprehends the old red sandstone, and great central basin of Scotland.

That extensive tract of Scotland which constitutes the northern division, is composed chiefly of gneiss, mica slate, chlorite slate, and clay slate, with subordinate masses of hornblende slate, talc slate, and primitive limestone. These, with granitic centres, often rise into magnificent mountains, of which the Grampians form a part. In many of these deposits, particularly in the mica slate, garnets of a brown colour are very abundant. In the primary deposits no organic remains have ever been discovered.

These, however, are not the only stratified formations which constitute this extensive district. The old red sandstone fringes the extremities of the land, commencing near the

---

[1] Statistical Account of Scotland.

Moray Firth, extending on both sides of Loch Ness till within a short distance of Fort Augustus, and then proceeding northward, expanding the whole breadth of Caithness, and constituting the principal formation of the Orkney Isles. On the western site of the mainland, the old red sandstone is deposited in numerous patches on the gneiss formation, as at Loch Broom, Gairloch, and Applecross.

The new secondary rocks have been but sparingly observed in Scotland; yet it is a curious fact that the few patches that have been discovered are superimposed on the old red sandstone, and have not been reposing in uninterrupted order in the secondary series. Thus the lias shales, highly micaceous, and some of the upper beds of the oolitic system, occur at the mouth of the Cromarty Firth, from Dunrobin Castle to the ord of Caithness, Applecross, and other points on the mainland, and in the Western Islands, on the borders of Mull, the south and east of Skye, and near to the rocks of Arran. The equivalent of the fresh water deposits of the wealds of Sussex, geologically situated above the oolitic group and below the chalk, is seen in Moray and Skye. In the central and southern divisions of Scotland, these newer groups of rocks have not been detected. In this division of Scotland very few metallic ores have been found. Lead mines were formerly wrought at Tyndrum, to the west of Loch Tay. Lead mines are at present wrought at Stronbean in Argyleshire, at which place the carbonate of strontian was first discovered. At Glen Strathfairer, in Inverness-shire, there have been detected veins of plumbago running between the laminæ of the mica slate.

We may here briefly refer to the geological character of the Western Isles. Dr. M'Culloch[1] calls the Long Island, consisting of a series of islands lying in a south-west and north-east direction, the gneiss island, from the predominance of that species of rock. Another group, embracing Skye, Rum, Canna, Mack, Egg, and Mull, he denominates the trap islands. There are five basaltic islands off the north-west side of Mull, of which the smallest but the most celebrated is Staffa, which is well known for its basaltic columns and cavern, called Fingal's cave. This cave, one of the most remarkable natural excavations in the world, is formed of the columnar bed of basalt, where it declines to the level of the sea, which washes the feet of the columns, that are like the pillars of an immense cathedral, placed close to each other, the sea forming the floor. The top of the arch, at the entrance, is 66 feet; but it gradually declines to 40 at the extremity, at the distance of 227 feet. The breadth of the cave is about forty feet. There are other similar caverns of less note on the island. The basalt of which the columns in Staffa are composed, is similar to that of the Giant's Causeway in Ireland; and it is probable that they are both of submarine origin, having been raised by the sea. St. Kilda, the most western of the Hebrides, is composed of several varieties of the trap rock. Arran, in the Firth of Clyde, even to the top of the highest mountains, is principally granitic.

In tracing the geological features of the country in the ascending order of the groups, we come next to the transition or greywacke system, now divided into two principal sections, the lower or Cumbrian, and the upper or Silurian. As far as has hitherto been ascertained, the Silurian division is unknown in Scotland; and the Cumbrian rocks, destitute of organic remains, cover the greater part of the area of the south of Scotland. These greywacke strata stand at high angles of from sixty to ninety degrees, and consist chiefly of coarse slaty strata, seldom divisible into thin roofing slates, and often alternating with arenaceous and coarse conglomerates. Amongst them, limestone is seldom found, and, when it is, the quality of it is inferior. In the division of which we now treat, coal and its accompaniments are known in few places; it is, however, wrought at Canonby, near Langholm, and at the Carter Fell. The only other rock formation, found in connexion with the old transition group here, with the exception of igneous rocks, is a red sandstone, ascertained, in some situations, to be the old red, but in others, considered as the new red sandstone, particularly in Dumfries-shire.

In the third geological division of Scotland, namely, the centre of the kingdom, is placed the great coal basin; but, adhering to our rule of marking the successive formations in the ascending order, we shall first treat of the old red sandstone, the most ancient rock in this subdivision of the country. This rock abuts against the line of the primary rocks, and stretches across the whole country from the German Ocean to the Atlantic, pursuing, like the mountain ranges, a south-westerly, or north-easterly direction. Its line forms a long, uninterrupted, extensive, and fertile valley. In the north-western part, it rises into hills, on the sides of one of which, east of Menteith, are deep and hideous fissures, the effect of some convulsion of the earth.

The formation appears to be of vast thickness, especially towards the north, and may, it is supposed, be divided into three portions; the lower, the middle, and the upper beds. In what are considered as the lower strata, the remains of fishes have been found in a high state of preservation. The well known Arbroath pavement belongs to the old red sandstone series.

But the most important group in this central district is the coal formation, consisting of limestone, ironstone, freestone, coal, and clays. The extent from east to west is bounded only by the extremities of the land. To the north, it is cut off from the old red sandstone by a range of trap hills, crossing the country from east to west. On the south, it is bounded by the greywacke and the old red sandstone. Its breadth, extending on both sides of the Forth and Clyde, averages forty miles, and its length about seventy miles.

The mountain limestone forms generally the basis of the group, although it is frequently found interstratified with other members of the series, and abounds with great numbers of organic remains. Below the mountain limestone, however, but belonging to the same group, a bed of limestone is worked at Burdie-house, near Edinburgh, in which the organic remains differ essentially from those which have been just named. These remains consist of many of the plants which distinguish the coal formation; but that alluded to includes also the teeth, scales, and other bones of fishes which partake of the reptile character, some of which must have been of gigantic dimensions. Small fishes are also found in a fine state of preservation. The same limestone has been found in other parts of the country, and is of superior quality to the common limestone, for mortar, plaster, and the smelting of iron.

The clay limestone is found in beds and nodules, the workable kind containing from twenty-seven to forty-five per cent. of iron. The kind termed black band is in high request. From this ore is smelted vast quantities of pig iron. The iron works in Scotland have been increasing beyond all example; at Carron, Gartsherrie, Shotts, Cleland, Airdrie, Clyde, and other places. The quantity of iron produced in Scotland in 1830 amounted to 37,500 tons. But four years afterwards, in 1834, the latest date of which we have any correct accounst, the quantity had nearly doubled, being about 72,000 tons. These works are generally within ten or a dozen miles of Glasgow.

The coal is found in beds varying from a few inches to forty feet in thickness, is extracted in great quantity, and is used as fuel, both for domestic and manufacturing purposes. One variety, cannel coal, is of superior quality for the preparation of gas. From the fire clay are manufactured fire brick and gas retorts; and the sandstone furnishes an inexhaustible store of substantial and beautiful material for building.

---

[1] Western Islands of Scotland, Vol. II.

These several deposits contain in abundance the impressions of the vegetables which distinguish the carboniferous period; and, what is remarkable, the remains of animals, the same as occur in the Burdie-house limestone, are found in the shales, and even in the coal itself. In the island, no strata newer than the carboniferous system is known to exist. All is covered over with accumulations of clay, gravel, sand, and soil.

Roads.

Until after the middle of last century there was scarcely a good road in Scotland. Soon after the rebellion of 1715, Government began to open up the country by roads made by the military, hence called military roads, which extended in all about eight hundred miles; but these being confined for the most part to the Highlands, intended for military purposes, and formed with little or no regard to such ascents and descents as do not impede the passage of an army, were of little advantage in an economical point of view. It is in the recollection of persons still living, when corn, coals, and other heavy articles, were usually carried upon the backs of horses, even in the southern counties of Scotland; the roads, or rather the tracks, being for the greater part of the year unfit for wheel-carriages. But so great a change has been made in this respect, particularly within the last forty years, that mail-coaches, and other carriages, now run day and night at the rate of from eight to ten miles an hour through every part of the country, from the borders of England to the northern extremity of Great Britain.

The only funds formerly applicable to the making and the repairing of the roads in Scotland were what is called the Statute Labour, or the labour of the occupiers of the land, for six days annually, upon the roads passing through their respective parishes, and a small assessment imposed upon the proprietors. This labour, which has been converted into payment in money, and also the sums raised by assessment on the proprietors, under the name of road and bridge money, are now applied to bye-roads, or such as communicate with the great turnpikes. Almost every county has procured an act of Parliament which fixes the rate of these assessments; but this varies in different counties according to circumstances.

The turnpike roads and bridges in the Lowlands have, for nearly a century, been made, and are kept in repair by means of tolls exacted from those who use them, under the authority of private acts of Parliament. The first of these acts was obtained in 1750, at which time the roads were so bad that the journey from Edinburgh to Glasgow, a distance of forty-two miles, occupied 1½ days, whereas it is now effected in from 4½ to 5 hours. The trustees named in these acts are commonly empowered, whether wisely or not, to borrow money upon the security of the funds to be received; by which means the work is more speedily executed. The board of trustees consists of the sheriff-depute, his substitute, and the justices of the peace in the county, together with all individuals, and their eldest sons, who are owners of estates worth L.100 Scotch a-year, and upwards, of valued rent. The result of this is, that "in consequence of the excellent materials which abound in all parts of Scotland, and of the greater skill and science of Scotch trustees and surveyors, the turnpike roads in Scotland are superior to those in England."[1]

Highland roads and bridges.

In the Highlands, the nature of the country, and the state of the population, did not admit of the same system as in the Lowlands. The military roads had not only been made, but were kept in repair at the public expense, for which L.5000 a-year was usually granted by Parliament; but a great many new roads and bridges were required; and, in 1803, an act was passed, proceeding upon "a survey and report of the coasts and central Highlands of Scotland," by which Parliament agreed to provide half the estimated expense of the necessary roads and bridges, the other half to be defrayed by the landed proprietors; and Commissioners were named to carry into effect the beneficent intentions of the Legislature. It appears from the report just referred to, that, under this act, the Commissioners had, in 1821, expended, on 875 miles of road, and several large bridges, upwards of L.450,000, of which L.240,000 was granted by Parliament, and the rest defrayed by the counties through which the roads passed; and that L.100,000 more had been laid out by them upon harbours, of which L.50,000 was paid out of the funds arising from the forfeited estates in Scotland, and the remainder raised by the burghs, and by the contributions of individuals. If, to these sums, we add the amount of the losses sustained by the contractors, as stated in the Report, and the expense of the new roads made at the sole cost of the proprietors, to communicate with the Parliamentary roads, together with the charges of repairs, the whole amount expended within these twenty years upon the roads, bridges, and harbours of the Highlands of Scotland, may not be too highly stated at a million sterling. The Commissioners have under their charge both the maintaining of their own roads, and part of the military roads, the extent of the whole in 1821 being 1183 miles; and about L.10,000 a-year, of which L.5000 is granted by Parliament, was considered to be necessary for this purpose, including all charges of management.[2] The military roads have been in many instances allowed to fall into disrepair; but nearly three hundred miles of them are still kept up.

Summary Statement as to the Turnpike Roads in Scotland in 1829.[3]

Length of turnpike roads miles.	3,666	Debts................	L.1,495,082
Number of turnpike trusts..	190	Income from all sources	187,584
Acts of Parliament,.........	394	Expenditure.............	181,028
		Excess of income over expenditure............	6,556

Canals.

The Caledonian Canal, the greatest work of the kind ever attempted in Great Britain, stretches south-west and north-east across the island, from a point near Inverness to Fort-William, a distance of 60½ miles, including Lochs Ness, Oich, and Lochy, by which nearly two-thirds of it are formed. The excavated or artificial part is twenty-three miles; and there are in all twenty locks. The depth in some places is only seventeen feet, but it was originally meant to be twenty. As it is, however, frigates of 32 guns, and merchant ships of 1000 tons can pass through it. It is 50 feet wide at the bottom, and 122 at top. But with all its magnificence, it has been found to be an improvident speculation. The total cost of the canal, up to 1822, when it was opened, was L.905,258; and the aggregate outlay to the first of May 1839, was no less than L.1,023,628. Besides, the Commissioners have incurred a debt, including cash advanced by the bank, and outstanding claims, of L.39,146. Nor has the income ever met the expenditure. In the year ending on the first of May 1839, for example, the expenditure was L.4170, whereas the income, though above the average, was only L.2532. It has, therefore, become a question with government whether the undertaking should be maintained or abandoned. The Lords of the Treasury, accordingly, employed Mr. James Walker, engineer, to institute a minute investigation of the entire works, and to report. The report was presented to the House of Commons in 1838; and a select Committee was appointed to take the whole subject into consideration. The result of their investigations was, a recommendation that steam tugs should be employed in the locks, so as to ensure a speedy navigation, and that a sum not exceeding L.200,000 be placed at the disposal of the government, to be expended in the repair and improvement of the canal, under the authority of an act of Parliament, which should be procured for the purpose.[1] This recommendation will, it is hoped, be acted upon. (NAVIGATION, INLAND). The Crinan canal is situated in Argyleshire, and is intended to afford a communication between Loch Gilp and the Western Ocean, so as to avoid the difficult and circuitous passage round the Mull of Cantyre. It was originally undertaken in 1793 by subscription of share-holders; but the sum subscribed (L.108,000) being quite insufficient for the completion of the work, the government advanced the money, and the canal was transferred on mortgage to the Barons of Exchequer in Scotland. The management has since 1817 been lodged in the hands of the Commissioners of the Caledonian Canal. It is nine miles long, and twelve feet deep, admitting vessels of 200 tons burden. The income scarcely covers the expenditure.[2] The Forth and Clyde Canal, sometimes called the Great Canal, though begun in 1768, was not finally completed till 1790. The length from Grangemouth on the Forth to Bowling Bay on the Clyde, is 35 miles, and, including the lateral branch to Port-Dundas, Glasgow, 38½. Its depth is ten feet; and it has in all thirty-nine locks. Though iron swift boats and other lighters ply upon it, its staple trade consists in the transit of sailing vessels of 120 tons and under. The Edinburgh and Glasgow Union Canal, which was finished in 1822, stretches from Port-Hopetoun, Edinburgh, until it joins the Forth and Clyde Canal at Port-Downie, near Falkirk, a distance of 31½ miles. Its depth is only five feet, so that its traffic is quite limited. The Monkland Canal stretches from Glasgow to Woodhall, about two miles south-east of Airdrie, a distance of twelve miles, and communicates by a lateral branch with the Forth and Clyde Canal at Port-Dundas. The Glasgow, Paisley, and Ardrossan Canal has not been completed; indeed it is not now intended to complete it. The progress of railways seems partially to supersede the use of canal communication. The canal in question has been constructed from Port-Eglinton, near Glasgow, to the village of Johnstone, a distance of eleven miles, and was opened in 1811. It was on this canal that the experiment was made in rapid travelling by canals, demonstrating that it was practicable for a properly constructed boat, carrying passengers and goods along a canal, to go at a rate of nine or ten miles an hour, without injury to the banks. These light boats are now common on canals suited for such travelling. The Aberdeenshire Canal, completed in 1807, stretches from the harbour of Aberdeen to Inverury. The length is 18¼ miles, and the number of locks is seventeen.

lways.

The first act obtained, in 1808, for a railway in Scotland, was for that between Kilmarnock and Troon, a distance of 9½ miles. The Monkland and Kirkintilloch railway connects the rich coal and ironstone district of New and Old Monkland, and, within fourteen miles of the city of Glasgow, with the Forth and Clyde Canal, near Kirkintilloch. The Ballochney railway, which has been in operation for about ten years, is merely an elongation of the last mentioned line, four miles eastward into the interior. The Glasgow and Garnkirk railway stretches eight miles west from Glasgow, till it communicates with the Monkland and Kirkintilloch line, forming a direct communication with Glasgow, and avoiding the circuitous route of that line. The Wishaw and Coltness railway, which is meant to connect the Monkland and Kirkintilloch branch with the rich coal and ironstone beds of Wishaw, Coltness, and Allanton, has not yet been completed, though the act was passed in 1829. The Slamannan railway, which is in progress of construction, is to extend from the eastern termination of the Ballochney line to the Union Canal, within a mile of Linlithgow, a distance of 12½ miles. An act has been passed (1837) for forming a branch to the town of Bathgate. The Pollock and Govan railway, which was meant to connect these two places, which lye on the south of Glasgow, with that city, an interval of three miles, is in the same unfinished state. The Paisley and Renfrew railway, which extends from Paisley to the river Clyde at Renfrew ferry, a distance of 3½ miles, was opened in 1837. The Glasgow, Paisley, and Greenock railway is meant to connect Glasgow and Greenock by way of Paisley. It runs nearly parallel with the Clyde, and is meant to be completed in 1840. The Glasgow, Paisley, Kilmarnock, and Ayr railway is intended to connect these towns and the adjacent districts. The line from Glasgow to Paisley is declared to be common to the latter line, and that of the Glasgow, Paisley, and Greenock railway, and to be executed at the joint expense of both companies. The Glasgow and Paisley railway is to send branches out to the different towns in the district through which it passes. An act was obtained in 1838 for constructing a railway between Edinburgh and Glasgow. The line is to run nearly on a parallel with the Union Canal, past Ratho, Winchburgh, Linlithgow, and Falkirk, to pass that canal near Port-Downie, and to proceed onward to Glasgow by a line nearly parallel to the Great Canal. The distance will be forty-six miles. The capital of the company is L.900,000. Twenty-nine miles of the line have already been contracted for, and the work will be completed at farthest in 1842. The Edinburgh and Dalkeith railway was opened in 1832. It extends to Dalhousie Mains on the South Esk, but a private branch has been carried over that river by a viaduct, and extends southwards for upwards of a mile. The Dalkeith line is about to be carried over the North Esk, in order to connect extensive coal fields in that quarter with the city of Edinburgh. There are also branches to Leith and Fisherrow. On this railway upwards of 100,000 tons of goods, and 300,000 passengers are annually conveyed. The Edinburgh, Leith, and Newhaven railway is only meant to extend 2¼ miles. It is to commence at Canal Street, at the east end of Princes Street gardens, and proceed by a tunnel of 2800 feet, or rather more than a fifth of the whole line, under St. Andrews Street, St. Andrews Square, Duke Street, Drummond Place, &c. to the foot of Scotland Street, and thence to Newhaven in nearly a straight line, with a branch along the north side of the Water of Leith, to the wet docks at Leith. The work has been begun, but when it will be completed is uncertain. If the terminus of the line were to be united with that of the Edinburgh and Glasgow railway, much advantage would accrue to both speculations. But, according to act of Parliament, a mile intervenes at present between the dépôts of the two. The Dundee and Newtyle railway is eleven miles in length, but branches are in progress to Cupar-Angus and to Glammis. There are on the line three inclined planes, and a tunnel of 340 yards. The Dundee and Forfar railway was opened in 1838. Its length is 16¾ miles. The Arbroath and Forfar railway is just completed. The distance is 15¼ miles.

Land, valuation, rental of, &c.

About the middle of the seventeenth century, the lands of Scotland were valued, with a view to ascertain what proportion of the land-tax and others should be paid by each county; and this valuation, called the "valued rent," which had been undertaken by the authority of Cromwell, was afterwards

---

[1] See Thirty-fourth Report of the Canal Commission, Mr. Walker's Report, and Report of Secret Committee.

[2] Ibid.

Statistics. established by an act of the Scottish Convention in 1667.[1] It is still the standard by which the counties, and the estates of each county, are assessed for payment of the land tax,[2] and all local imposts on land. The "valued rent" of the whole Scottish counties, as it stood in 1674, was L.3,804,221 Scots, or L.317,018, 8s. 4d. sterling. In 1811, the landed property of Scotland was subdivided as in the following proportions,[3] and there is every reason to believe that the document is not very far from the truth at the present time:

Description of the Estates.	Number of Proprietors.
Large properties, or estates above L.2000 of valued rental,................................	396
Middling properties or estates from L.2000 to L.500 of valued rental,.................	1077
Small properties, or estates under L.500 of valued rental,......................................	6181
Estates belonging to corporate bodies,........	144
Total,..........................	7798

The total extent of land in Scotland, exclusive of lakes, is 18,944,000 acres, but of this quantity only a fourth part, or 5,043,450 acres, are susceptible of cultivation.[4] But even of this small proportion, nearly a half, or 2,489,725 acres, are estimated to be in grass. The following table[5] will shew the distribution of the land in tillage, with the quantity and value of the crops:

	Acres.	Produce per acre.	T produce.	Price per quarter.	Value.
				s.	*L.*
Wheat, ...	220,000	3 qrs.	660,000	50	1,650,000
Barley,......	280,000	3½	980,000	30	1,470,000
Oats,.........	1,275,000	4½	5,737,000	25	7,171,875
Beans & Pease,	100,000	...	...	...	...
Potatoes,	130,000	£5, 5s	...	...	2,520,000
Turnips,..	350,000				
Flax, ...	16,000	8, 0s	...	...	128,000
Gardens,....	32,000	13, 0s	...	...	416,000
Fallow,......	150,000	...	...	...	...
Total,........	2,553,000	...	...	...	13,355,875

Such are the average quantity and value of the lands actually in tillage. But the average value per acre of the arable soils in pasture is estimated in the *General Report* at L.2; and on this hypothesis, the produce of 2,489,725 acres of pasture, will be L.4,979,450. But there still remains 14,000,000 acres of mountain pasture, waste land, and plantations,[6] which, at an average rent of 3s. per acre, will be L.2,100,000. Hence the total annual value of the land produce in Scotland will be,

Value of crops and garden,................	L.13,355,875
... pasture land,......................	4,979,450
... mountain pasture land, &c.......	2,100,000
Total,...	L.20,435,325

This is the value of the gross produce of the soil. Most of the land is rented by tenants, only about a tenth part being supposed to be farmed by the landowners. The exact amount of the rental of Scotland cannot be known. The rental for 1810, including mines, fisheries, quarries, and the like,[7] was ascertained to be L.4,851,404; and it is supposed that, though considerable variations have taken place in different districts, the rental of Scotland continues at nearly the same amount; for although many of the rents contracted for, during the last years of the late war, have been greatly reduced, yet others, from the falling in of the older leases, have been proportionally advanced. As the common duration of the lease in Scotland is 19 years, the average term of the current leases must be between 9 and 10 years; so that half the leases current in the beginning of 1810 must have been entered into in the first year of the century, at a period previous to any great enhancement of land having taken place. Hence it is that we regard the rental of 1810 and of the present time as nearly equal to each other. It is conjectured by an eminent authority, that the rental of the 14,000,000 acres of mountain pasture, including wood and waste lands, does not exceed L.850,000, or, in other words, that it averages 1¼s. per acre, whilst he estimates the rental of the arable portion at an average of 16s. an acre.[8] Rent, we may here remark, has advanced more in Scotland during the last seventy years, than perhaps in any old settled country during a similar period. The entire rental of Scotland is not supposed to have exceeded L.1,000,000, or L.1,200,000, in 1770. In 1795, it is believed to have been at least L.2,000,000; and since that time it has a good deal more than doubled.

It is here worthy of remark, that both the law and the practice of Scotland are favourable to agricultural enterprise. What in England are termed "tenants at will," or tenants without a lease, are unknown in this portion of the empire. Leases in Scotland may be said to be universal, extending to 15, 19, or 21 years. It was not uncommon, indeed, about fifty years ago, and before that time, to give liferents, or leases for twice nineteen years, or even longer, a circumstance highly favourable to enterprise on the part of the tenant. With the exception of some districts in the Highlands and Islands, the system of small farms has been abandoned, and has given way to farms of great extent, rented by persons of intelligence and capital. There are no tithes. Poor-rates are entirely unknown in about three-fourths of the parishes of Scotland; and where this assessment does exist, it is of comparatively trifling amount. Besides, so large are the farms, that, exclusive of owners who cultivate their own property or portions of it, there are supposed to be only about 40,000 tenants in Scotland. And as farms are large, so they cannot be divided or sublet without the consent of the landlord. This consent is seldom or never granted; so that in point of fact no such subdivision ever takes place. A lease, moreover, is heritable; and on the death of a tenant, it is not parcelled out amongst his children, but descends entire to his oldest son, or heir at law. All these circumstances combined afford great encouragement to agricultural improvement and enterprise.

---

[1] Burton's Manual of the Law of Scotland, p. 120.

[2] By the Union, the land tax was limited to L.48,000, deducting all expenses. In 1797, it was limited to L.47,954, 1s. 2d., and made perpetual, but liable to be redeemed by the proprietor, for stock in the three per cents. equal in annual value to one-tenth more than the tax.

[3] General Report of Scotland, iii. appendix, p. 4.

[4] The least proportion of cultivated land is in the counties of Selkirk, Sutherland, and Orkney, being only about six acres in the hundred; the greatest is in the county of Haddington, or East Lothian, where not quite a fourth remains uncultivated.

[5] Statistical Account of British Empire, i. p. 537.

[6] The total extent of woodland was estimated in the General Report of Scotland (ii. p. 321,) at 913,695 acres, of which 501,469 were natural woods, and 412,226 plantations. The quantity of the latter has since increased, so that the total of woodland cannot be less than 950,000 acres.

Judicial Establishments of Scotland.

The king. In a remote, and what may be termed the aboriginal period of our judicial annals, the king was chief justice of the kingdom; and, with his council, made progress through the realm for the administration of public justice. At that time, indeed, the king executed in person the principal duties of government; and it was not till comparatively recent times that the different departments of the state began to be exclusively assigned to distinct and responsible officers.

As late as the middle of the fifteenth century, an act was passed, in which "the three estates concluded, that our sovereign lord ride through the realm incontinent, after there be word sent to his council, where any rebellion, slaughter, burning, reif, or thieft happens; and there to call the sheriff of the shire, and ere the king depart out of that shire, to set remeid of the harm, or gif ony sik sall happen to be done, whether the default be in the officers or in the doers, to be punished by the king; the quhilk conclusion and ordinance, all the barons of common assent and consent are obliged to assist baith with their power in bodies and gudes." This act was passed in the third parliament of king James the Second; and in the fifth parliament of his successor, when the courts of justice were regulated by statute, there was a special proviso to the effect that, "nevertheless, it sall be lawful to the kingis highness to take decision of ony matter that comes before him, at his compleasance, like as it was wont to be of before," 1469, c. 26. Two centuries afterwards, Charles the Second claimed a like power and prerogative; and "in a dutiful and humble recognisance thereof," the estates of parliament declared, that notwithstanding of any jurisdictions or offices whatsoever, "his sacred majesty may, by himself or any commissionated by him, take cognisance and decision of any cases or causes he pleases," all government and jurisdiction within the kingdom originally residing in him, 1681, c. 18. Such a right, however, formed one of the grievances complained of at the Revolution; and since that event it has been deemed a settled part of the constitutional law of the land, that the king has committed all judicial power to the judges, and cannot himself administer justice in the courts.

The justiciar (*justiciarius*) was anciently the king's more Justiciar.

immediate and principal officer. He seems to have been derived from Normandy; and agreeably to the mixed constitution of that country, he was here, as in England, *caput legis et militiæ*, at the head both of the law and of the military force of the kingdom. He accompanied the king in his progresses through the realm, or represented him in his absence; and he had thus powers and jurisdiction as universal in their nature as they were unlimited in extent. We find, accordingly, repeated instances of the military prowess as well as judicial firmness of our early justiciars; and, not to mention other instances, in the middle of the thirteenth century, Durward, when thwarted in the project he had conceived of securing the throne to his descendants, joined Henry the Third in France, and served in his army, till, by the influence of the English monarch, he was re-instated in his high office of lord justiciar.

It does not appear, however, that the justiciar ever became here the formidable officer which he proved to be in England, where he was at one time a terror both to the king and to his subjects. Various circumstances concurred to limit his power. The chief of these, no doubt, was the influence of his adversary, the Lord Chancellor, as the head and organ of the ecclesiastics; but much also was owing to the early partition of the office into a justiciary of ancient Scotland, or the territory north of the Forth, and of Lothian, or the territory south of the Forth. This partition of the office, indeed, is observed in the very earliest notice of our justiciars. The series begins in the reign of Malcolm the Fourth, and from that time we have distinct and separate justiciars for Scotland and for Lothian. In neither of these was Galloway comprehended, that district enjoying its own peculiar laws and customs;[1] but in 1258 it also got a separate justiciar. This state of matters continued till the invasion of Scotland by Edward the First.

In 1296, Sir William de Ormesby, a justice of the common pleas, and justice in ayre in England, was constituted lord justiciar of Scotland by Edward, who also associated with him William de Mortimer, an English justice of assize; and the next year the same king made Roger de Skotre, an English lawyer, justiciar of Galloway. But in 1299, John earl of Buchan was *justiciarius Scotiæ;* he was son of the last regular justiciar of Scotland, Alexander earl of Buchan, who was upwards of thirty years in office previous to his death in the year 1289. In 1305, however, Edward again put down the Scotch; and thereupon distributed the kingdom into four districts, appointing for each district two justices, an Englishman and a Scotchman. These officers were of the nature of the English justices of assize; and when we take into consideration the nature of the appointments which were at the same time made in the counties, the object in view cannot be mistaken. Edward evidently contemplated putting the whole island under one judicial system, which had shortly before been introduced into England, namely, that of having annual or temporary sheriffs with a limited jurisdiction, and confining the law business of the country to a few courts and judges; a system very different from that which previously existed both in England and Scotland, where the great object was to bring justice home to every man's door in permanent local courts. The project, however, was stopped by Edward's death; the justiciars of Scotland and Lothian were then displaced, and permanent sheriffs restored. Robert the Second also restored to the people of Galloway their ancient laws.[2] Matters appear to have generally continued in this state till the disastrous battle of Flodden. On that event, which united all classes of the community, the office of lord justiciar, or, as he was now styled, lord justice general, (in contradistinction to the special justiciars now frequently appointed, as well for particular trials as for particular places and districts,) came into the hands of a single individual, and comprehended the whole kingdom. The High Court of Justiciary also began to be settled at Edinburgh, and from that time commence the regular series of its books of adjournal.

The Justiciar or Justice-General might now have become formidable; but circumstances again concurred to reduce his power. The office fell into the noble family of Argyll, where it continued hereditary for a century; the Court of Session was established with a universal civil jurisdiction; and as that court was co-ordinate with it on the land, the admiral of Scotland came to be co-ordinate with it on the seas. By statute 1587, c. 82, eight senators or advocates of the College of Justice, were appointed as justiciar-deputes for the different quarters into which the realm was then divided; and by 1672, c. 16, instead of the justice-deputes, five lords of session were constituted commissioners of justiciary, along with the lord justice-general, and the justice-clerk, which latter was now made vice-president of the court. By statute 1681, c. 16, too, the high admiral was declared the king's lieutenant and justice-general on the seas. By a recent act, however, the Court of Justiciary re-acquired a jurisdiction in crimes at sea; and by Will. IV. c. 69, which entirely abolished the court of admiralty, the office of lord justice-general was made to devolve on, and remain with that of lord-president of the Court of Session. The effect of this seems to have been to place the justice-general at the head of the administration of the law; and thus, by a singular revolution, to restore him, after the lapse of three hundred years, to his former situation as lord chief-justice of Scotland.

It may, in conclusion, be remarked here, that in the Court of Justiciary, which, being a superior or at least co-ordinate tribunal, was but indirectly affected by the changes in the law introduced by the Court of Session, several usages of our most ancient common law have been preserved to this day. The court meets about eleven o'clock, which was *the hour of cause* of old, (1587, c. 87) whereas the Court of Session, in direct contrast, rose at that time, meeting, agreeably to the early hours of the ecclesiastics, at eight in the morning, (1537, c. 49). So also, jury trial, when laid aside by the other courts, continued here; the verdict is still by a majority; and in the *assizes oath*, we may trace at once the original character of a jury as an inquest of the vicinage, and also the rhythmical measures of our old legal formulæ. The circuits of the Court of Justiciary were arranged in their present form by the act 1587, c. 82. Previous to that time the justiciar made a progress through the realm, from shire to shire, successively; but, by the above act, the realm was divided into four districts, or quarters. The present circuits are, besides the Lothians or home circuit, the southern, western, and northern circuits. The assize towns of the south, are Jedburgh, Dumfries, and Ayr; those of the west, Glasgow, Inverary, and Stirling; those of the north, Perth, Aberdeen, and Inverness.

Court o
Session.

The Court of Session, that is to say, the first court so called, was erected in 1425, the year following King James the First's return from his long captivity in England. It was composed of the "chancellor, and with him certain discreet persons of the three estates, chosen and depute by the king;" and was to have a like jurisdiction as that exercised by the king and his council. It was, however, but of short duration; for, on the king's death, or rather on that of Bishop Wardlaw of St. Andrews, by whose influence it was in all likelihood erected, Bishop Cameron, the chancellor, was removed from office, and the court of the session expired. Attempts were afterwards made to revive it by Bishop Horsewood, secretary to king James II.; and, thirty years afterwards, by Bishop Elphinstone, whose zeal for the establishment of the Roman law is well known. Accordingly in 1503, the court of daily council, which was essentially a revival of the former court of the session, was established by means of Bishop Elphinstone. And at length, whilst the kingdom was yet in a state of distraction from the fatal losses at Flodden, the present Court of Session or College of Justice was instituted; and of the numerous attempts of the clergy to establish the Roman law as the common law of the land, this was the last and most successful.

---

[1] Stat. Alex. II. c. § 1. fin.

[2] 2 Rob. I. c. 35.

According to the simple principles of our old law, all suits originated by plaint, claim, or summary application to the judge, setting forth the cause of action; and the judge was bound of common right to administer justice therein. But afterwards, a maxim was introduced that the judges were substitutes of the crown, and consequently should take cognisance only of what was specially referred to them. Brieves or mandatory letters from the king to the judges were then invented; and the chancel of the royal chapel became the great *officina justitiæ*, the shop or mint where the king's writs were framed, and sold out to parties injured, according to the exigency of the case. These writs issued out from the chancel or chancery until the institution of the College of Justice, when the chancellor and clergy, who were the principal judges there, began a mint or shop of their own in the *Bill chamber* of the court, so called because the brieves, or, as they are here termed *letters*, issue out, not on the oral application of the party, but on his "bill" or written supplication. This course of proceeding was adopted from the court of Rome; and it is observable, that in both cases the language employed is sometimes identical. Thus, when the request or prayer of the bill is granted, the judgment is, *Fiat ut petitur*, which are the very words used by the Pope in the like case; and the odd phrase, "Finds the letters orderly proceeded," is but a verbal translation of the *Male appellatum et bene processum* of the papal court. The names of the letters are also the same, letters of advocation, suspension, and reduction, being equally well known in both places; and letters of horning, caption, and relaxation, have their papal origin impressed upon them. The comparison might be carried through our whole process to its minutest technicality, and also to the style and habit of the judges. After the manner of the ecclesiastical tribunals, too, the judges deliberated in secret conclave with shut doors, parties and their counsel, and all others being removed (1537, c. 66); and there was no report of the judges' opinions, or of the reasons of the judgment, but only of the vote or sentence. At the Revolution, however, the court was thrown open; but so powerful is custom over all men, that to this day the great body of the practitioners continue to walk the Outer House.

In modern times the court has been altered in almost every particular; its constitution and jurisdiction, the number of the judges, the distribution of the business, and the forms of proceeding. The machinery was indeed bad, but the spirit which pervaded it was worse; and the best antidote to this would perhaps be the full force of public opinion, that is, perfect publicity, not merely of hearing and judgment, but of every step in the administration of justice.

According to its first institution, the court consisted of a president and fourteen ordinary lords, half of the temporal estate and half spiritual, of which the president likewise was one. The Lord Chancellor, who was also an ecclesiastic, was made principal of the college, as it was termed, and as such had a vote with the judges; and there was a reserved power to the king to appoint, at his pleasure, three or four extraordinary lords, a power which the crown always exercised, and also sometimes greatly abused. It was the Reformation which gave the first blow to the court. From that event it began to lose its ecclesiastical, which had been its earliest and most distinguishing feature. The Revolution followed, and opened up to the public eye the heretofore secret tribunal. And at the union with England it ceased to be supreme, though this last peculiarity, and that by which *the Lords* became so formidable in the country, was long struggled for, and is yet perhaps but imperfectly given up by the court. These important changes, however, affected the spirit and character of the court, rather than its external form, which remained much as it was before. But they prepared the way for alterations there too; and during the last thirty years, a great number of public statutes have been passed, altering the details of the court, and otherwise regulating the administration of justice throughout the kingdom.

In 1808, the commencement of the period just referred to, the court was formed into two divisions; or, in effect, two communicating but equal and independent courts. The reason assigned for this change, was the greatly increased number of lawsuits from the great extension of agriculture, commerce, manufactures, and population, and the consequent multiplication of transactions in Scotland. There is every ground to believe, however, that much of the supposed business was caused by the tedious methods of proof and written pleadings adopted by the court, and its endless judgments and rehearings; for in the degree in which these have been abolished, the court has been able to absorb and dispatch the business of the other superior courts, and still to allow a decrease in the number of its judges. These are now only thirteen in all. Each division is composed of four judges; the Lord President, who is properly head of the whole court, presiding in the First Division, and the Lord Justice-Clerk presiding in the Second. The remaining judges sit separately in the Outer House, as Lords Ordinary. This term was originally given to all the judges under the president, and they served in the Outer House by rotation; but amongst other recent changes, the five junior judges were at first made permanent Lords Ordinary, as attached to a particular division of the Inner House, but now without any such relation. The junior or youngest Lord Ordinary of all is Ordinary on the Bills, and has a peculiar class of cases assigned to him. But it is to be observed, that from him, and from the other Ordinaries, an appeal lies, or a proceeding in the nature of an appeal, to the Inner House; which, besides this appellate, has also some original jurisdiction. It is not necessary to add, that there is much imperfection in this whole system of judicature. There appears to have been little unity of design in its formation; there is considerable complexity in its actual working, and there is no great satisfaction in its results.[1]

Let us now turn our attention to the local courts throughout the kingdom.

Celtic Judge.

In early times the realm was divided into provinces, clanships, or counties, in each of which was a maormor, maor, mayor or mair, as the king's executive and ministerial officer; and in every county or province there were divers judges, each exercising judicial functions. The provinces and judicial districts of those times, however, are now but imperfectly known; and, as might be expected, the series of mayors and judges cannot by any means be made out. With re-

---

[1] In the year 1800, the number of causes enrolled in the Outer House, was 2413; in 1810, it was 2643; in 1820, it was 2069; and in 1831, it was 1956. In the years 1836 and 1837, the business stood thus:—

Year.	Causes Enrolled.	Decrees in Absence.	Decrees in force by Lords Ordinary.	Reclaiming Notes to Inner House.	Decrees in force by Inner House.	Average Number of Appeals to House of Lords.
1836,	1,770	546	710	456	382	45
1837,	1,565	564	600	356	375	

spect to the latter, viz., the Celtic judge, we have not traced him to a later period than the beginning of the fourteenth century. He was in all probability extinguished during king Edward's invasion of Scotland in the unhappy times which followed on the death of king Alexander the Third. The sheriff was then universally established; and as that officer engrossed to himself the functions both of the judge and mair, the former disappeared entirely from our annals, whilst the latter gradually degenerated into the sheriff's officer, with whom, accordingly, he is, to the present day, found mixed up in some of the northern counties.

Sheriffs.

The most ancient sheriff was certainly the *comes* or earl. There is no direct evidence to that effect, however; and from a remote time, the officer so called was the *vice-comes.* The office was not a century in existence amongst us, when, falling into the hands of the great local proprietors, it began to descend to heirs with the paternal estate. The sheriffship of Ayr, which was erected in the year 1221, out of the bailiaries of Kyle, Carrick, and Cuningham, was from the first hereditary. It is not surprising that the hereditary *vice-comes* should soon cease to perform in person the duties of his office; these were accordingly devolved on a deputy or *sub-vice-comes.* The earliest officer of this sort we have met with, is *Alan de Pilch*, or Alan of the hairy garment, sub-vice-comes de Inverness, temp. Robert I.;[1] but sheriff-deputes are mentioned much earlier,[2] and to such an extent was the abuse of deputation carried, that in some counties, that of Cromarty for instance, the district was partitioned into various deputy-sheriffships, and individuals appointed, such as officers of the army, medical men, and others, in situations of life perfectly incompatible with the due discharge of the office. The office also in many instances became hereditary; and another was required to execute the active duties of the place, or *pro-sub-vice-comes.* Thus, at the time of the jurisdiction act in 1747, there were in most or all of the counties, omitting the *comes*, count or earl, a sheriff-principal or high sheriff, and sheriff-depute, and a sheriff-substitute. All these were continued by the above act; but the judicial powers were confined to the two last, whose duties and qualifications have also been repeatedly regulated. It would undoubtedly have been more agreeable to principle, however, to have abolished offices which grew out of the abuses of the times, and assigned to every sheriff a reasonable district in respect of extent and population, with constant residence therein, and the exercise of judicial functions only. In determining the number, character, and situation of courts in a country, the great problem evidently is, so to distribute them as to secure two things, namely, to bring justice home to every man's door, and to mature a sound and fixed system of jurisprudence. In England, the latter object appears to have been principally regarded since the days of Edward the First, before whose time England and Scotland were equally distinguished for their local courts. But what, we may ask, avails the best system of law, if it be remote or difficult of access? The end is in such case sacrificed to the means; and a multitude of petty courts, with a few practitioners in each, would prove the ruin not only of the legal profession, but of the law itself.

The sheriff-principal, or high sheriff, is lord lieutenant of his county, and appointed at pleasure by the crown. The sheriff-depute, so called, is also appointed by the crown; but he is quite independent of the high sheriff. He must be an advocate of at least three years' standing; he holds his office during life, or good behaviour; and he receives a salary, varying, according to the shire, from L.350 to L.1200 a-year. The sheriff-substitute must be of the profession of the law, though not necessarily a member of the bar. He is named by the sheriff-depute of the shire, but paid by the crown, and is otherwise an independent officer. In every county there is a high sheriff or lord lieutenant. The same may be said of the sheriff-depute, except as to the united shires of Clackmannan and Kinross, Elgin and Nairn, Ross and Cromarty. Ross, Sutherland, and Caithness, were originally parts of the great shire of Inverness; but in the seventeenth century they became disjoined, and were erected into separate shires. By the jurisdiction act, however, Ross was put under the same sheriff with the ancient shire of Cromarty, and has continued so ever since. Sutherland and Caithness were then also re-united; but in 1806 these were again separated. Kinross was originally part of Fife; but it was afterwards separated, then re-united, and in 1807 disjoined again, and united to Clackmannan. With respect to the sheriff-substitute, in every shire there is at least one; but Edinburgh, Fife, Forfar, Perth, Renfrew, and Sutherland, have each two, Kirkcudbright and Argyle have each three, Lanark and Inverness have each four, and in one of the districts of Ross there is a sort of assistant substitute.

The jurisdiction of the county courts was originally most extensive; and as to civil suits in particular, there seems to have been scarcely any limitation. It was the policy of the Court of Session, however, to make itself the great law court of the kingdom; and as it gradually absorbed the civil jurisdiction of the justiciary, so, by a bold stratagem, it stripped the sheriff of all power to decide upon questions of real property. Such questions were formerly tried under the brieve of right, a judicial writ so named, because issued to try what was esteemed the highest right, that of property in land; and it is clear that this brieve was *in viridi observantia*, and competent to sheriffs, till within a very few years of the institution of the Court of Session. This is clear from the act 1503, c. 95, which was passed to regulate it; and it is familiarly referred to by the poet Dunbar, in his Dance of the Seven Deadly Sins, where, speaking of the occupations of the damned, he says,

> "Nae minstrels playit to them bot doubt,
> For glee-men there were holden out
>   Be day and eik be night,
> Except a minstrel that slew a man:
> Swa tith his heritage he wan,
>   Entering be *brieve of right!*"

Yet the Court of Session was scarcely established, when it boldly adjudged this brieve "nocht to have bene, nor yet to be thir mony yeires in use;"[3] and having thus, by repressing the writ, ousted the sheriff of his real jurisdiction, soon took it to itself exclusively,[4] by letters prepared for the court in its own Bill-chamber. The sheriff, however, still continued competent to possessory actions; and by a recent statute, his jurisdiction has even extended to all actions and proceedings relative to nuisance or damages, arising from an undue exercise of the right of property, and also to questions touching the constitution or exercise of real or judicial servitudes, which is so far a restoration of his ancient powers. Besides the ordinary jurisdiction, civil and criminal, of the county court, the sheriff is empowered to decide summarily in questions of debt, when the sum in dispute does not exceed eight pounds. These small debt courts were instituted in 1825, with a view to extend and improve the like jurisdiction, which had been conferred upon justices of the peace about thirty years before. The summary redress which such courts afford is of the greatest benefit to trade and to good neighbourhood, in consequence of the little sacrifice of time, money, and feeling they require; and they are accordingly now extensively established, not only in this country, but in England. There can be no doubt, however, that they had their origin in Scotland.[1]

---

[2] Stat. Will. c. 14. Stat. Alex. II. c. 14.

[3] Skene *voce* Breve de recto.

[4] Bishop of Aberdeen *v.* Ogilvy, 3d July 1563.

The courts we have now adverted to comprehend the public and general courts of the kingdom, which have a public and general jurisdiction; but besides these, there are, or rather were, some whose jurisdiction was limited to particular sorts of causes only. We allude to the Court of Exchequer, and the ecclesiastical and maritime courts.

Court of Exchequer.

With respect to the first of these, the old Scotch court, composed of the treasurer and lords auditors of exchequer, was superseded at the union by a Court of Exchequer, composed of a lord chief-baron and four puisne barons; and in addition to certain ministerial powers continued from the old court. it had the like authority, jurisdiction, and course of procedure as the Court of Exchequer in England, after which generally it was modelled. It was an absurdly large and expensive establishment. It had comparatively nothing to do; and as the judges might be, and some of them commonly were, English barristers, it never could be opened up, like the exchequer of England, to the ordinary law business of the country. Accordingly the barons were gradually reduced, and the business is now transacted by a lord of session sitting as a judge in exchequer.

Commission of Teinds.

The Commission of Teinds, which was first erected at the Reformation, was in like manner remodelled at the Union. It was formerly vested with powers for the planting of churches, assigning and modifying stipends, and the valuation and sale of teinds. But by a recent statute, all actions for the valuation or sale of teinds, all actions of suspension or reduction of localities, and all actions of declarator or reduction connected with teinds, must be brought and decided in the Court of Session.

Courts ecclesiastical.

In times of popery, causes ecclesiastical were tried by the archdeacon's official, the bishop's commissary, and the auditor or official principal of the province; from which last an appeal lay to the pope, who generally determined the matter by commission. But at the Reformation, commissaries named by the crown were appointed in every commissariat; and a Commissary Court, with original and appellate jurisdiction, was also established at Edinburgh, of which Sir James Balfour, the former official of St. Andrews, within the archdeaconry of Lothian, was the first chief-judge. The commissary courts continued till recent times, when the office of the local commissaries was abolished, and soon afterwards the Commissary Court of Edinburgh, their powers and jurisdiction being transferred to the Court of Session, and, in as far as regards confirmation of testaments, to the sheriff or county courts.

Court of Admiralty.

The jurisdiction of the Admiralty cannot perhaps be traced to an earlier period than the beginning of the sixteenth century, when the office of lord justiciar, who was of old the supreme judge in all manner of causes, became hereditary in the noble family of Argyll, and the authority of the Admiralty was also long very limited. It was confined to seafaring causes, and in these it had no exclusive jurisdiction.[2] The earliest collection of maritime laws in Scotland, is that contained in Balfour's *Practicks*, and entitled "The Sea Laws, collectit furth of the Actis of Parliament, the practiques and lawis of Oberon, and the lawis of Wisbeig, and the constitutions of Francois, king of France, 1543, 1557." This we conceive was the *Lib. Kintor.* referred to by Balfour, and the work of David Kintore, then judge of the Admiralty. Towards the end of the same century, Alexander King, advocate, filled the same office; and from the date of his *Treatise on Maritime Law*, apparently the first regular treatise on that branch of jurisprudence in Great Britain, the court of Admiralty rose into importance. By the act 1609, c. 15, it was declared a sovereign judicatory, and letters of horning were allowed on its decrees; and the reputation of the court being afterwards sustained by a succession of eminent judges, such as Acheson of Glencairney, Roberton of Beidlay, and Lyon of Carse, all of whom became lords of Session, it began to extend its jurisdiction generally to mercantile, and not, as before, to mere seafaring causes. The above act was then ratified by that of 1681, c. 16, by which the ground of the court was farther cleared and enlarged; the admiral being now also styled the high admiral, and declared the king's lieutenant and justice-general on the high seas. By a later statute, provision was made for a stated salary of L.100 to the judge of the Admiralty. This was renewed by the act 1704, c. 8; and by 26 Geo. III. c. 47, the salary was made L.400, which was afterwards raised to L.800 a-year. The court, however, did not long enjoy this flow of prosperity By the 6 Geo. IV. c. 120, jurisdiction in prize and capture was withdrawn, and vested in the Admiralty of England; and by a later statute the court was altogether abolished, and its remaining jurisdiction transferred to the Court of Session, and Sheriff courts; the High Court of Justiciary having also previously re-acquired, as of old, a co-ordinate jurisdiction in crimes at sea.

Sanctuaries

An ancient species of exempt territory was that of *sanctuary*. The first of the sort were probably churches; and

[2] See Leg. Burg. c. 27; Pitcairn's Criminal Trials, vol. i. part i. p. 129, and part ii. p. 93; and A. S., 16th January 1554.

in regard to them we find a rescript of Pope Innocent III. to the king of Scots,[1] and thereupon the statute Alex. II. c. 6, which is among the earliest regulations on the subject in the Scotch law. There were of old divers sanctuaries, or, as they were termed, *girths*, (1469, c. 35; 1535, c. 23; 1555, c. 31), and mostly ecclesiastical; there being a constant rivalry at all times between the sovereign power and the ecclesiastical. But the only one now in use, is the sanctuary of Holyrood, which, besides usage, has two main foundations, namely, a religious house, and a royal palace, especially the former, the precincts being usually called the sanctuary of Holyroodhouse, and the court there the Abbey court. The jurisdiction of the place is administered by a bailie, who holds a court for debt, and other civil obligations, where the debtor dwells within the precincts.

Regalities and Stewartries.

Regalities were another species of exempt territory. They were rights of exclusive power and jurisdiction, civil and criminal, real and personal, granted by the crown to the higher nobility;[2] and though the impolicy of such grants had long been perceived, yet they were not altogether abolished till the passing of the jurisdiction act, in the middle of last century. By 1455, c. 43, it was enacted that all regalities in the king's hands should be annexed to the royalty and made subject to the king's courts and officers. It was about the date of that act that the great district of Kirkcudbright fell to the crown by the forfeiture of its lord; and a *seneschallis* being thereupon appointed, it has ever since remained the stewartry of Kirkcudbright. But neither this nor the islands of Orkney and Zetland, which were also erected into a stewartry,[3] differs materially from a shire; each having a court perfectly of the nature of a sheriff or county court. Besides these, there were other stewartries, such as Strathern and Menteith in Perthshire, and Annandale in Dumfries; but by the jurisdiction act, they merged into their respective shires.

Burghs.

Burghs form yet another species of exempt territory; the principal character of a burgh being its separate jurisdiction and independent government, but upon reasons altogether different from either sanctuaries or regalities. They arise neither from superstition nor princes' favours. They have their origin in the wants and social tendencies of our nature; they are the chosen seats of civilization and the arts of life; and the distinction between them and shires pervades the entire political constitution of the country. There are three sorts of burghs, namely, burghs of barony, burghs of regality, and burghs of royalty or royal burghs; and in establishing these last, it would seem to have been the general policy of government to divide the realm into districts, in each of which a royal burgh was placed. Several of the burghs are counties of themselves, or counties corporate, such as Edinburgh, Stirling, Perth, Aberdeen, and Inverness; and these obviously contain within themselves all the elements of government and judicature. But it has unfortunately happened, that none of the burgh courts has kept pace with the advance of intelligence, the progress of trade, or the increase of commercial transactions. Justice continues to be administered there just as it was centuries ago. The consequence is, that the peculiar feature of the burghs as independent jurisdictions has in many cases given way; the burgh courts have been forsaken for the sheriff and justice of peace courts; and it seems to have become a public question of policy, whether they should not be altogether abolished. The same causes, however, which gave origin to burghs, remain; and therefore it would seem to be the wiser policy to improve the burgh courts, rather than to abolish them; to improve them, by relieving the magistrates of all, or at least the more important judicial duties, and to devolve these upon fixed and qualified judges.

The superintendence of the royal burghs was in the king's chamberlain, who held *ayres*, or itinerant courts, at which the magistrates and burgesses of burghs were bound to give attendance, and where he heard and determined all charges made against them. He was also in use from the earliest times, to hold, in the southern part of the kingdom, courts of four boroughs; which were so called because composed of delegates from the four burghs, originally of Edinburgh, Stirling, Berwick, and Roxburgh, but afterwards of Edinburgh, Stirling, Lanark, and Linlithgow. These delegates assembled before the chamberlain, and formed for appeals from the chamberlain ayres, and the different burgh courts, a tribunal which was to burgesses what the high court of parliament was to the other inhabitants of the kingdom, the last and highest court of appeal. The northern burghs had been long under a peculiar government of their own. They formed a sort of Hanseatic league; for as early as the reign of William the Lyon, a royal charter was granted to the king's burghers of Aberdeen and of Moray, and all beyond the Grampians, to hold their free "ansum" or hanse, as freely, quietly, fully, and honourably, as their predecessors had done in the time of the granter's royal grandfather.[4] In the beginning of the fifteenth century, a court of four boroughs was holden at Stirling, where it was resolved that deputies from each of the royal burghs south of the Spey should convene yearly to consider and conclude on all matters affecting the commonweal of the royal burghs, their liberty and court. This convention was in all likelihood formed in imitation of the northern Hanse. The inconvenience of having two separate yet similar assemblies in the kingdom, however, must have been quickly felt; and, at the same time, the ease and propriety of uniting them, and thus assimilating the regimen of all the burghs, obvious. Accordingly, in the end of the same century, an act of parliament was passed, (1487, c. 3.) appointing deputies from all the royal burghs, "*baith north and south*," to meet in convention yearly, thus forming the convention of royal burghs which has been ever since continued. The place of meeting was fixed at Inverkeithing, on the north of the Forth, probably from its central situation; but the convention soon removed to Edinburgh, which had long been the seat of the court of four boroughs, and was now become the metropolis of the kingdom. On the institution of the Court of Session, the court of four boroughs and the chamberlain ayres quickly fell into disuse, their judicial, and many of their ministerial functions having been engrossed by that court; and from the time of Malcolm lord Fleming, who fell at Pinkey in 1547, the office of chamberlain, or, as he was now styled, lord great chamberlain, ceased to be exercised. The convention, however, continued its yearly meetings; indeed, its records begin only at this time, when the Lord Provost of Edinburgh became by devolution its standing preses, and the Town-Clerk of Edinburgh its standing clerk.

Let us now return to the general and ordinary courts of the kingdom; the Court of Justiciary and Court of Session, the Sheriff Court, and the Bailie Courts of burghs.

Judicial proceedings.

The Court of Justiciary was originally the great pattern followed in the administration of justice throughout the kingdom; but soon after the institution of the Court of Session, an act passed (1540, c. 72.) requiring all sheriffs and other temporal judges to copy the proceedings, not of the justices, as before,[5] but of the Lords of Session; and the principle of this enactment was adopted in the recent judicature act regulating the forms of process in civil matters. The course of proceeding in ordinary actions is now generally as follows. The defendant, or, as he is called, the defender, is first summoned on the original writ to compear in court peremptorily on a day named, the intervening days being held as *induciæ legales*. If, when the cause is called, the defender do not appear, decree in absence may pass against him. If he appear, he is allowed certain days, termed *induciæ deliberatoriæ*, to see the original writ and productions, and determine whether and how he shall proceed. He then puts in his defence and plea, admitting or denying the facts alleged, stating any other facts which he offers to prove, and subjoining a summary of the pleas in law on which he means to found. The defences and all subsequent steps of procedure must be drawn by counsel; and after the defences are given in, every order in the cause must be moved for in court and determined by the judges. If the parties choose they may go to judgment on the summons and defences; but commonly more specific pleadings are ordered, such as a condescendence and answers, or mutual condescendences, which are similar to the *responsive allegations* of the ecclesiastical courts, and both are borrowed from the *articuli et responsiones* of the papal process. These papers being revised by the parties, the record, ready to be closed, is transmitted to the judge for private consideration; after which, it is put out by him for debate. Parties are then heard in court by their counsel, and the judge may thereupon either give judgment at once, or, as is commonly the case, take the proceedings to chambers again for consideration, and there write out his decision; or, if any difficulty occur in the determination of the case, he may report the point to the Inner House for their direction or decision; or again, if the cause involves details or difficulties, he may order cases, that is to say, full argumentative pleadings, and then either decide the cause or report it to the Inner House. When the Lord Ordinary gives an interlocutor or judgment, it may be carried to the Inner House by reclaiming note, upon which counsel are heard, and the decision of the Lord Ordinary either altered or adhered to, and with or without cost, as the court may determine.

[5] Stat. Rob. III. c. 33.

In jury causes, that is to say, causes appropriated for trial by jury, or in which jury trial is to take place, the course of proceeding now pointed out is but partially followed. In such causes a record is made up in the manner described; but as the system of pleading adopted in the Scotch courts does not, as in the common law courts of England, bring out the issue whether of fact or law, issues must be prepared. This is done by an officer of court, and in settling issues there is frequently considerable difficulty. In the proceedings of sheriff and bailie courts, however, there is something like an approach to the English system, an answer or reply to the defence being allowed. But here the analogy ends. There is no rejoinder unless ordered; and from the multitude of pleas pleadable in each paper, a single issue, or indeed any issue, in the technical sense of the term, is never produced. It is also to be observed, that jury trials in civil causes gradually fell into disuse in the local courts after the institution of the Court of Session, where such mode of trial was unknown till recently introduced by statute; and it has not been re-established except in the Court of Session. The details of a jury trial, when it does take place, need not be specified here, though they differ in some few particulars from the like proceeding in England.

Of the several methods of defence and proof in criminal cases, the earliest, and at the same time the rudest, was battle, in which the parties litigant put the truth of their averment on the issue of a judicial combat.[1] This method of trial, so truly barbarous, was termed the judgment of God, though that appellation came more peculiarly to designate another method of a different origin, but no less uncertain as a criterion of truth. This was ordeal, which, if not introduced, was at least continued and countenanced by the ecclesiastics. It was of various kinds, but those known in Scotland were water, fire, and iron;[2] and accordingly, as the accused was able to bear applications of these, so accordingly was he judged guilty or innocent. Another method of trial used also instead of battle, was that by compurgators, where the defendant exculpated or purged himself of the guilt imputed to him, by declaring his innocence on oath, and also producing a number of persons to swear that they believed he swore truly, which they did in general on their knowledge of his character.[3] But all these methods of trial have been abolished, or have gradually become obsolete, which leads us to notice the course of proceeding now in use in ordinary cases.

The first step is to commit the accused for examination, when, if no case is made out, he is dismissed, otherwise he is committed for trial. From that moment he may sue out and "run his letters," a proceeding analogous to the *habeas corpus*. Trial being determined on, the accused is summoned to the day fixed, being at the same time served with a duplicate of the indictment or criminal letters, and lists of the assize (jurors) and witnesses on his own behalf. On the day of compearance, he must appear personally, (otherwise he is outlawed,) and stand at the bar or pannel whence he is termed the *pannel;* but in all cases he is allowed counsel and agent. If, on arraignment, he has no special matter to plead, the libel is read to him, and his confession, if made, is recorded. If any special plea on the relevancy is offered, it is determined by the judges on oral or written argument. Issue being joined, the evidence on both sides is laid before the court and jury, which are now impannelled for that purpose. The jury are then addressed by the pannel or his counsel, and the evidence is afterwards summed up by the presiding judge, with a direction in law to the jury; when the jury, after deliberation, return, unanimously, or by a majority, a verdict of guilty, not proven, or not guilty, as the case may be. A verdict of not guilty declares the prisoner's innocence; a verdict of not proven indicates suspicion, but insufficient proof of guilt; and in the case of a verdict of guilty, but in that only, sentence is pronounced. The nature of the sentence depends not only on the crime, but also on the public prosecutor; for of a long time past that officer has been in use to exercise a power to restrict the pains of law. This important power is commonly exercised with great discretion; yet undoubtedly it is a dangerous one to hold, and to it more, perhaps, than to any other cause whatever, is to be ascribed the singularly lax state of the criminal law of Scotland in reference to the punishment for crime.

Public Prosecutor.

There seems little doubt but that in early times the king was public prosecutor, as he was also generalissimo and chief justice of the kingdom. His great officer, the justiciar, who followed him, as we have seen, in the two latter capacities, followed him likewise in the capacity of public prosecutor; and what the justiciar did throughout the realm generally, the same did the sheriff in his particular county. Accordingly, we find it enacted in our early law that if any stranger remained in a town longer than a night without finding a pledge or surety for his good behaviour, "the justiciar or the sheriff shall accuse him;"[4] and so late as the middle of the fifteenth century it was enacted "that all mairs and serjeants arrest at the sheriff's bidding, albeit na party follower be, all trespassers, and that the sheriff follow said trespassers in the king's name, gif na party follower appears," (1436, c. 140.) In process of time however, as the principles of civil liberty and the elements of our constitution came to be better understood, distinct officers were appointed to the different departments of the State; and this office of public prosecutor naturally devolved upon the crown counsel. The principal of these is the lord advocate, and next to him is the solicitor-general, an officer derived from the English courts, and probably not known in Scotland earlier than the union of the crowns in the beginning of the seventeenth century. There are also four standing deputies to the lord advocate, or "advocate deputes," as they are termed, who had their origin by the act 1587, c. 82, which divided the realm into circuits for the administration of criminal justice. The procurators fiscal of the county and burgh courts, who are the public prosecutors in their respective districts, may also be regarded as deputies of the lord advocate. It is true they do not derive their authority from him; but they communicate with him in the prosecution of criminals, and in that department have generally the same powers and duties. The following table will shew the great importance of public prosecutor.

[4] Quon. Att. c. 63.

Number of Indictments and Criminal Letters issued from the Justiciary Court.

Year.	For trial in the High Court.	For trial on circuit.	Of both which there were at the instance of the Lord Advocate.
1812	18	56	68
1813	24	62	83
1814	22	60	76
1815	22	108	122
1816	30	120	125
1817	43	176	210
	159	582	684

The following statement will also give some idea of the working of the criminal jurisdictions of Scotland. It relates to the year 1836. In that year there were 2922 persons charged with crime in the several counties and burghs of Scotland. Of these 289 were discharged without trial, and 219 from other causes; and of the remaining 2414, there were tried by the Justiciary, 574, (viz. 173 in the high court, and 404 on circuit); by sheriffs, 1325, (viz. 547 with jury, and 778 without jury); and 515 by burgh magistrates, justices of the peace, and others. Of the above 2414 also, 2152 were convicted; in 194 cases the charges were found not proven; 30 were declared not guilty; 36 were outlawed, and two were found insane on arraignment. And finally, of the 2152 convicted, 1647 were sentenced to imprisonment of different periods, 305 were condemned to transportation for different periods, 187 were punished by fine, 6 were discharged on sureties, 2 had sentence of death, 1 was executed, and 5 received no sentence.

Next in dignity to the crown counsel is the dean of faculty, *facultatis juridicæ decanus;* or rather we should say that between these learned personages there has been a contest waged, the latter claiming precedence of the former. This claim, however, seems to be just a *residuum* of the once greater claims of the whole college of justice, and the dispute but a continuation of the conflict formerly maintained by the court against all power except its own. The place of dean of faculty has been held by some of the first men of the kingdom; and in the course of the last two hundred years there have been no less than three instances of elevation from it at once to the presidentcy of the Court of Session, Sir George Lockhart, Sir Hugh Dalrymple, and Mr. Blair. But in all the common elements of rank there cannot be a doubt of its inferiority to that of crown counsel.

According to the original constitution of the Court of Session, the members were associated into a college, with a view to a collegiate or common life; the judges or lords of Session being "senators" of the college, and the advocates the *facultas juridica*, or faculty of law, subordinate to whom were the students of law, or "servitors," as they were termed, who were attached to particular advocates as their pupils in the study of the law. The celebrated Sir Thomas Hope was in early life a "servitor" to Sir Thomas Nicolson. The term "servitor" was a college term, well known in the University of Oxford; but it has gone out of use with us, those formerly so designed being now termed "advocates' first clerks." But to what extent such intention was ever carried out, or whether any thing existed here in the nature of the English laws of court or Doctors Commons, does not appear. At present there is nothing of the sort. The original entry money to the Faculty was L.40 Scotch, and so it continued till 1672, the year in which the statute for the regulation of the judicatories passed, when the sum was raised to 200 merks. In the beginning of last century it had advanced to L.40 sterling, and now, after repeated advances, the fees of entry are upwards of 250 guineas besides extras. The number of the Faculty which, forty years ago, was about 260, is at present about 470, averaging of late about twelve in the year; but a fourth part only are in attendance on the courts.

Agents.

The distinction of counsel and agents in Scotch practice is of modern origin. The earliest agents properly so called, or practitioners below the bar, were the "servitors" above mentioned, or advocates' first clerks in the Court of Session; and all others were forbidden to act as agents.[1] By the injunctions of their chief officer, the Secretary of State, in 1594, Writers to the Signet were also prohibited from acting as agents; and by a bye law of the body itself in 1676, every member who should take it upon him to act as an agent, was made liable to be prosecuted. They came at length, however, to act likewise as agents, and are now a large and influential body. Sixty years ago they were not more than 100; but about forty years ago they were 280. At present they are upwards of 700 in number, and almost all of them resident in Edinburgh; and the average entries yearly are the same in proportion as into the Faculty. There is another class of agents, the Solicitors before the supreme courts, enrolled under AS. 9 July 1754, and AS. 1772. They are upwards of a hundred in number, which is somewhat more than the enrolled number of advocates' first clerks, a body which has remained much about the same for the last forty years.

Country Procurators.

With respect to the procurators of the inferior courts, they appear to have generally continued, till recent times, on the same close footing on which the practitioners of all the courts stood previous to the institution of the Court of Session; nor are they to this day admitted by the supreme court, or marshalled, like the bar, into one body, but are severally admitted, on varying qualifications, by the respective courts throughout the kingdom. They are of course restricted to the particular court so admitting them; whereas the advocates of the College of Justice form the proper bar of Scotland, and being admitted by the supreme court, may practise in any court of the kingdom. The same principle might be extended with evident advantage; and the local courts opened up to the talent and practical skill of the agents of the Court of Session. The present arrangements are very plainly imperfect, and incapable of maturing a uniform and settled system of jurisprudence in the country. There is not a tenth part of the law business of the country conducted by the counsel and agents of the supreme court. Unless a different provision is made, both the law and the legal profession of Scotland will inevitably suffer.

Advocates in Aberdeen.

In the style of the procurators of Aberdeen, there is a peculiarity which may here be taken notice of and explained. They are styled *advocates*, which name is otherwise appropriated to the advocates of the College of Justice. The truth is that the appellation of advocate is amongst the earliest which we find in our records applied to practitioners of the law, (1424, c. 45); and it appears that persons so designated were formerly in every court of the kingdom, (1424, c. 45, 1429, c. 116—125.) The term was used synonymously with procurators; and at the institution of the Court of Session both terms were applied together, (1537, c. 64.) The sheriff court of Aberdeen was the earliest county court regulated subsequent to the erection of the Court of Session; and in the act of court then passed, the two names were used promiscuously. Hence has arisen the common use of the style of advocate; but the advocates of Aberdeen form no part of the proper bar of Scotland, any more than the practitioners of any of the local courts whatsoever. The entry of procurators of Edinburgh was not regulated by the sheriff till 1765, and for fifteen years more they remained unincorporated. It was still later before the procurators of Glasgow were erected into a corporation; and it was not till above thirty-five years ago that the procurators of Paisley were incorporated.

---

[1] See AS. 13th July 1596, Stat. 1672, c. 16, and AS. 26th February 1678.

Habit of e Bar.

We have now a word or two to say with respect to the garb of the profession. The proper habit of the bar is the long robe which now characterises the profession, and which seems to have been adopted by the advocates of the College of Justice as the ecclesiastical array. Anciently, however, a sort of cloak or tabard of green was worn, (1455, c. 45.) which colour it will be recollected, was symbolical of learning amongst the ancient Britons; and accordingly that class of their priesthood called *Ovats*, and who professed the liberal arts, wore habits of green. In the burgh court of Edinburgh the cloak was worn till the beginning of the seventeenth century, when the procurators were required to wear gowns instead.

xecutive fficers.

It remains to advert shortly to the executive officers of the law. These are, properly speaking, the sheriffs in their respective counties, and the magistrates in the burghs; and in the criminal warrants of the superior courts this is clear. But the ordinary civil process of the Court of Session is executed by the messengers and other officers at-arms; and the like process of the sheriff and bailie courts is executed by the sheriff and burgh officers respectively. The messengers-at-arms amount to upwards of two hundred in number, and are distributed throughout the different shires and districts of the kingdom. They are all associated, however, under the Lyon herald, king of arms, who, as head of the office or college of arms, has authority and jurisdiction over all the members and officers of the establishment. In this respect the Lord Lyon may be regarded as essentially at the head of the civil branch of the executive department of the law; and accordingly it might deserve consideration whether it would not be expedient, with a view at once to give unity of management to the entire department, and also to relieve the sheriff of all but judicial duties, to devolve upon the Lord Lyon and his officers the execution of process of every kind, and the whole ministerial powers of the sheriff, in as far as these are executive, or auxiliary to the courts of law.

In order to give a clear and concise view of the manner in which justice is distributed throughout Scotland by means of the circuit courts of justiciary, and the courts of the sheriffs-depute and sheriffs-substitute, not including the burgh and justice of peace courts, the following Tables are subjoined.

The great divisions of the realm in early times were Lothian, Galloway, and Scotland. In the first of these, justice-ayres were holden at Edinburgh, Peebles, and soon afterwards Glasgow; and if we credit the *Reg. Mag.* lib. ii, c. 20, the *loca capitalia Scotiæ* were, Scone for Gowry, Cluny for Stormonth, Rait for Athole, Dalguish for Fife, Perth for Strathearn, Forfar for Angus, Aberdeen for Mar and Buchan, and Inverness for Ross and Moray. The judicial districts assigned by king Edward I., in 1305, were Lothian, Galloway, beyond the Forth to the Grampians, and beyond the Grampians. At the institution of the Court of Session in 1532, the realm was divided, for the purposes of civil judicature, into four quarters, as follows:—

Forfar, Kincardine,
Aberdeen, Banff,
Elgin, Forres, Nairn,
Inverness, Cromarty.

Edinburgh, Haddington,
Linlithgow, Berwick,
Roxburgh, Peebles,
Selkirk.

Dumfries, Annandale,
Kirkcudbright, Ayr,
Wigton, Lanark,
Renfrew, Stirling.

Dunbarton, Argyle,
Bute, Clackmannan,
Kinross, Fife,
Perth.

By 1587, c. 82, the realm was divided, for the purposes of criminal judicature, into four quarters, of seven shires each, but these are not stated.

Civil divisions.

The divisions which are recognized under this head are counties or shires, and parishes. Of the *counties*, the origin of which is very ancient, and has not been ascertained, a list, and other particulars respecting them, have already been given. They are thirty-three in number, but most of them are subdivided by local acts of parliament into two or more districts, for the purpose of police and internal economy; and several of them comprehend a variety of territorial divisions, founded on the natural circumstances of the country. Thus the county of Berwick is popularly divided into the three districts of the Merse, Lauderdale, and Lammermuir; Lanarkshire into the upper, middle, and lower wards; Ayrshire into Kyle, Cunningham, and Carrick; and in the extensive Highland counties, the subdivisions are still more numerous. There is no trace in Scotland of the minor divisions of the English counties, called hundreds, wapentakes, and the like. Of the judicial divisions of Scotland an account will be found in this article under the head of Judicial Establishments. Respecting the date of the erection of *parishes*, there have been various conjectures. They were purely an ecclesiastical regulation, and could not have been formed till the Christian system had been generally received, and its preachers become numerous; and as this division, and the necessary previous ecclesiastical establishment, infer no inconsiderable degree of civilization, it is highly probable that it did not take place before the ninth or the tenth century.[1] Mr. Chalmers supposes that parishes were gradually formed after the year 843; but that they existed in the time of Malcolm III., who died in 1093, is ascertained by authentic records.[2] The number of parishes has not been uniform. Previously to the Reformation the bishops possessed the power of uniting or disjoining parishes. Between this period and the Union, in 1707, the authority was transferred from the bishops and vested in several successive commissions of the Scottish parliament. In 1707, parliament vested this power in the Court of Session, but confined the power of the court to cases where consent had previously been given by persons possessing three-fourths of the valued rental of the parish; and this is the existing law. The disjoining or union of parishes is, therefore, attended with considerable difficulty, and very rarely takes place, except in cities where the consent of the municipal authorities, if patrons of the parish, and of the presbytery of the bounds, is sufficient for the purpose. Hence in Edinburgh five new parishes have been erected out of the parish of St. Cuthbert's, within the last forty years. The number of parishes is at present 916, exclusive of what are commonly called *quoad sacra* parishes. These latter parishes have been formed in either of the two following ways. First, owing to the inconvenient extent of parishes in the Highlands, and the consequent distance of many of the people from the parish church, missionaries supported by a royal grant, were appointed to certain localities with the privileges *quoad spiritualia* of parochial clergymen, except that they could not be constituent members of any of the church courts, and could not even have sessions of their own. But in the year 1833, these localities were, by an act of the General Assembly, converted into parishes *quoad sacra*, and their ministers declared to be constituent members of the ecclesiastical courts. The number of these new parishes is forty-one. Secondly, from the many difficulties attending the erection of new parishes, means have been introduced, in addition to the establishment of the new *quoad sacra* parishes referred to, to supersede the necessity of such a step; and this object was accomplished by the institution of "chapels of ease," or subsidiary places of worship, without any assigned locality. These parishes, the first of which was erected in 1798, amounted in 1834 to sixty-six, when the General Assembly conferred on them the same rights and privileges which belong to parish ministers, and appointed them a certain defined locality *quoad sacra*. Since that period they have greatly increased in number, and are yearly increasing, so that it would be both difficult and unnecessary to ascertain the exact amount. But they do not affect the original parishes in any way, except in regard to the spiritualities.

Religious instruction.

Church of Scotland. The reformation from popery began at an early period in Scotland, but was not triumphant until the year 1560, when popery was abolished, and the protestant religion established by act of parliament in its stead. But whilst popery was abolished, the protestants could not agree amongst themselves as to the system of ecclesiastical polity which should be established in its place. Episcopacy, or the government of the church by bishops, received the support of the king and of many of the most powerful families; whilst presbytery, or the polity introduced by Knox from Geneva, where he had studied under Calvin, was embraced by the great body of the people. But amidst the struggle for pre-eminence, the presbyterians, who constituted five-sixths of the protestant population, took matters into their own hand, and embodied their ecclesiastical system in a work entitled *The Second Book of Discipline*,[1] which was ordered by the General Assembly that met in 1581, to be engrossed in the registers of the church as ecclesiastical law, and which has ever since formed the basis of the polity of the established presbyterian church of Scotland. This Assembly first divided the country into presbyteries and Synods.[2]

But whilst presbytery was thus the religion of the people, it did not receive the sanction either of the Privy Council or Parliament. On the contrary, in 1584, episcopacy was established as the national church; presbytery was declared illegal; and the presbyterian clergy were exposed to much obloquy and persecution. But the public voice again got the ascendancy; and presbytery was for the first time ratified by act of parliament, in 1592, as the national church. But not being acceptable to the king and the court, this polity was superseded by episcopacy in 1606; nor did it again obtain the supremacy till the famous General Assembly, held at Glasgow in 1638, which abolished prelacy, and restored the presbyterian form of worship. The proceedings and acts of this Assembly were afterwards confirmed by the king and the parliament. But in 1660, on the restoration of Charles II., presbytery was compelled again to give way to episcopacy, which maintained the predominance till the Revolution. The act of William and Mary, re-establishing presbytery, was passed in 1690.[3]

Standards of the Church. To the celebrated Assembly of Divines that met in Westminster in 1643, the presbyterian church of Scotland, which was represented in that meeting by commissioners chosen by herself, is indebted for her standards both as to her formularies and her doctrines. To the deliberations of this assembly she is indebted for a Directory of Public Worship, a Form of Ordination, the Larger and Shorter Catechisms, and the Confession of Faith; all which were adopted by the General Assembly, and confirmed by the Scottish parliament, as agreeable to the word of God.[4] The doctrines of the church are Calvinistic, the leading tenets being predestination, original sin, particular redemption, irresistible grace, justification by faith, and the perseverance of the saints.

Parishes. Every parish in Scotland enjoys the privilege of having a resident clergyman; residence being obligatory by law as early as the year 1563. The number of parishes, according to the civil law, is 916; and of these 27 are collegiate, that is, have each the services of two clergymen, who preach alternately in the same place of worship. The whole number of parishes, both civil and *quoad sacra*, was, in 1836, 1023; so that, including the collegiate charges, the whole number of clergymen is 1050.

Church Judicatories. The Kirk-session is the lowest court. It is composed of the minister of the parish and the lay-elders. The minister is officially moderator or president of the session. This court takes cognizance of cases of scandal, of the poor's fund, and of parochial ecclesiastical discipline. There is a power of appeal from the session to the presbytery, which is the next court in dignity.

The *Presbytery* is composed of a number of contiguous parishes. A presbytery consists of the ministers of all the parishes within its limits; of the professor of divinity, if there be any university within its bounds, and of a lay-elder from each parish. The presbytery takes young men on trial as students of divinity, and candidates for licence; ordains presentees to vacant livings; and has the superintendence of religion and education within its precincts. Its decision is not final, if an appeal be lodged to the synod. A presbytery generally meets monthly; and it must necessarily meet at least twice a-year. The number of presbyteries is eighty.

The *Synod* is composed of two or more presbyteries. It consists of every parish minister within its limits, and of the elders who last represented the different sessions in the presbytery. There is a power of appeal from the synod to the General Assembly. The number of synods is sixteen.

The *General Assembly* is the highest ecclesiastical court, its decisions being final. It meets annually in the month of May, and sits for ten successive days. It is honoured with the presence of a nobleman as representative of the sovereign, under the title of Lord High Commissioner. But this high functionary has no voice in the deliberations of the court; and even his presenee is not absolutely necessary. The Assembly, unlike the inferior courts, consists of representatives from the presbyteries, royal burghs, and universities of Scotland, formerly from the church of Campvere, now extinct, and from the churches in the East Indies, connected with the Church of Scotland.[1]

---

[1] The *First Book of Discipline* was presented by the reformers to the parliament of 1560, which abolished popery; but it was not ratified by the legislature, though it was subscribed by a great many of its members as private individuals. But the parliament, though it did not give the sanction of its authority to *The First Book of Discipline*, accepted and confirmed *the Confession of Faith* drawn up by the protestants, the object of which being not so much to establish any particular set of doctrines as to abjure popery; and hence it is called the *Negative Confession.* Another *Confession of Faith*, or *National Covenant*, as it was called, was drawn up in 1580, and subscribed by the king, his household, and by persons of all ranks in the state, but not confirmed by parliament. (Knox's History of the Reformation. Peterkin's Compendium of the Law of the Church of Scotland.)

We may here state that the course of study for the church is abundantly ample, extending at least to eight years in one or more of the Scottish universities. The first four years are devoted to literary and philosophical study; the other four to Hebrew, church history, and theology properly so called. After this course of study is ended, a young man can be taken on trials by the presbytery for licence as a preacher or probationer. The average annual income of the Scottish clergy, which is generally derived from teinds or tithes,[2] is supposed to be about L.200, exclusive of the manse and glebe. In parishes where the teinds have been exhausted, or do not produce to the clergyman an income of L.150, the government has provided a fund, so as to raise such income to this minimum amount. The parishes thus assisted are called bounty livings, and amount to 208.[3]

Dissenters. The great body of the Scottish dissenters are presbyterians, entertaining Calvinistic opinions, and recognising the same confession of faith and the same standards as the members of the established church; they abandoned that church in consequence of certain alleged errors in discipline, and particularly the undue exercise of patronage, for lay-patronage has always obtained, with more or less vigour in the Scottish establishment, except for more than twenty years prior to 1712. (See SECEDERS.)

The dissenting body next in importance to the United Associate Synod, is the Relief, which was founded in 1755. The founders of this sect professed to differ from the Established Church on no other point than the right of patrons to appoint ministers against the inclinations of the people.[4] But the breach between this body of dissenters and the Establishment has now become wider; while the different sections of dissenters seem more disposed to union among themselves. The two numerous bodies of the Secession and the Relief, are at present (1839) engaged in making advances towards a union of these denominations. The Original Burgher Associate Synod declined to join the coalition formed between the Burghers and Antiburghers in 1820. The different congregations belonging to this sect are, with few exceptions, disposed to join the Established Church; indeed, some of them have already done so. There is another class of presbyterian dissenters, generally called Cameronians, but who assume the title of the Reformed Presbyterian Synod, who are the successors and representatives of the Covenanters in the time of Charles the First and his son. This small but interesting body refused to accept the settlement of Presbytery, as established by law in 1690, unless the king should consent to subscribe the Solemn League and Covenant, and the standards of the Church. The Cameronians are, perhaps to this day, the most rigid presbyterians in Scotland. But without descending into particulars, the following table will afford a pretty correct view of the extent and importance of the different religious bodies in Scotland.[5]

Summary of the Religious State of Scotland.

Established Church, including the *quoad sacra* parishes, up to 1836,		1023

[1] Hill's Constitution of the Church of Scotland, *passim.* Burton's Manual of the Law of Scotland, pp. 85, *et seq.*

[2] The history of tithes, or *teinds* in Scotland, since the Reformation, is involved and intricate. We need not enter on the consideration of the subject here, but merely state that, at the approach of the Reformation, most of the teinds, and much of the property of the church were alienated, and bestowed on laymen, or devolved on the crown. But to overlook the intermediate steps, the greatest change which took place in the matter was in the reign of Charles the First, who revoked all the ecclesiastical grants (except the church lands) which had been made during the two preceding reigns. This revocation having taken place, though with difficulty, it was provided that the lands, except such as had been already appropriated to the payment of stipend, should be valued and sold. The landholders were entitled to sue for a valuation or *modus*, and to purchase the teinds of their own estates. To facilitate the inquiry into the value of teinds, commissioners and sub-commissioners were appointed, the latter of whom were enjoined to visit their several parishes, and to report to the commissioners. Some of their reports, when made, were sanctioned; others have been brought forward for approval at later periods. The result was, that by far the greater part of the teinds have been bought up by the proprietors of the respective lands, after stipends, commuted into a money payment, had been modified to the clergymen, the teinds being held by these proprietors under the condition of augmenting, if necessary, such stipends to the extent of their value; in other words, there are in these cases no tithes or teinds, but part of the rent of the proprietors constitutes ministers' stipend, and a certain additional portion, in cases where the valuation is not exhausted, is still liable to augmentation of stipend. In cases where no valuation has taken place, the value of the teinds is calculated at one-fifth of the existing rent, and is also paid in money. The body of commissioners just spoken of, continued to act from the date of their appointment, to the Union in 1707, at which period the Court of Session was authorised to supply their place, and to determine in all cases of valuation and sale of teinds. As the commissioners had been empowered to modify the stipends of the ministers, the same power was transferred to the Court of Session. A clergyman is entitled, when the teinds of the parish are not exhausted, to apply to the Court for an augmentation of his stipend, which it is competent for that Court either to grant or refuse. But, whether granted or not, twenty years must elapse before such applications can be renewed. The stipend generally consists of so many chalders of grain. The value of the grain is determined by the *fiar* prices, which are struck in each county in Scotland in the month of February or March annually; and this value, which necessarily varies yearly, is then payable in money. The teinds are also appropriated to the building of parish churches and manses, and the keeping of them in repair. The ministers of Edinburgh and Montrose are paid not by teinds, but by a local tax, levied on the occupiers of houses; a circumstance that has been the source, particularly in Edinburgh, of much irritation and discontent. (Sir J. Connel on Teinds, *passim.* Dunlop's Parochial Law. Burton's Manual of the Law of Scotland, pp. 100—116.)

[3] Peterkin's Supplement. Dunlop's Parochial Law.

[4] M'Kerrow's History of the Secession, vol. i. p. 361–8.

[5] M'Culloch's Statistical Account of the British Empire, ii. p. 430.

We have not included the Jews in the foregoing enumeration, as they do not perhaps amount to above a hundred in all Scotland. Some of the dissenting congregations, besides, are very small; and we do not think it probable that the dissenters amount to much more than the fourth part of the whole population of Scotland, assigning to the Established Church all who do not attend any dissenting place of worship.

Schools.

The subject of education engaged the attention of the Scottish Parliament even in comparatively rude times, viz. as early as the year 1494. The protestant church zealously took up the subject, and many acts of the General Assembly were passed in support of it. But it was not till 1616 that the Privy Council interposed and passed an act in favour of parish schools; nor was it till seventeen years afterwards, that this act of Council was ratified by Parliament. The disturbed state of the times prevented the act from becoming operative; and it was not, in truth, till some time after the Revolution, namely, in 1696, that the celebrated statute of William and Mary was passed, which forms the foundation of the present parochial system. The provisions of this act were immediately carried into effect in most parishes; and now the system is in universal operation throughout Scotland. The landowners and clergymen have it in their power, according to law, to establish more than one school in a parish, if circumstances seem to demand it; in which case the salary assigned to each of the teachers is less than the maximum sum (L.34, 4s. 4½d.) given when there is only one schoolmaster in a parish. From a Parliamentary paper,[1] we learn, that the number of parochial schools in Scotland is 1047; that the number of teachers is 1170; that the aggregate amount of the salaries paid to them is L.29,642, 18s. 11¼d.; and that their total income, including salaries, fees, and all other emoluments, but exclusive of their dwelling-house and garden, is L.55,339, 17s. 1½d., being an average of only L.47, 5s. 11¾d. to each teacher. But ill-paid though the teachers be, they are, generally speaking, a well educated and meritorious class of men; and the parochial system has given such a stimulus to education, that the endowed schools have been found, in the progress of society, to be too few to answer the demand for instruction on the part of the people. Hence it appears from the same official document, that the number of schools not parochial, is not less than 3995, and the number of teachers 4469, being nearly four times the amount of the parochial schools and teachers.[2] The greatest number of pupils attending the parochial schools between Lady-day and Michaelmas 1833, was 71,426; and the lowest number was 50,029. The greatest number attending the schools not parochial, between the same dates, was 189,427; and the lowest number was 139,237. What the incomes of the non-parochial teachers may be, we have no data to judge. They are pretty high in our large towns, but miserably low, perhaps not above ten shillings a-week, in rural districts. Taking the average of the preceding number of pupils, attending both the parochial and non-parochial schools, namely, 225,061, the inference is, that 10½ out of 100 of the population are at school; but when we take into account the number of female seminaries, of private boarding schools for boys, and children taught in private families by governesses and tutors, not to mention Sabbath evening schools and classes for religious instruction, we may with propriety conclude, that at least 9½ out of every 100 of the population are at the same time under tuition; a larger proportion than is known to be similarly situated, excepting in particular districts, in any other country of Europe.

Universities.

The origin of the Scottish universities is not of any remote date. But as early as the year 1282, Dervorgille, wife of John Balliol, founded and endowed a college at Oxford for the reception of Scottish students; and, in 1326, a college, known by the name of the Scotch college, was founded and endowed at Paris by David Murray, bishop of Moray, for a similar purpose.[3] But at length Scotland enjoyed the advantages of universities within the limits of her own territory. That of St. Andrews, the oldest in the kingdom, was founded by papal authority in 1413; that of Glasgow, by the same authority, in 1450; that of Aberdeen, also under the sanction of the pope, in 1494, though education did not commence there till 1500; and that of Edinburgh, founded by the presbyterians, in 1582. The university of St. Andrews consisted at one time of three colleges, instituted at different periods, viz. St. Salvador's, St. Leonard's, and St. Mary's; but in 1748, the two first were united, and the buildings of St. Leonard's were alienated and converted into dwelling-houses. The university of Aberdeen consists of two colleges; King's, founded, as just stated, in 1494; and Marischal college, instituted and endowed by George Keith, Earl Marischal, in 1593. The universities of Glasgow and Edinburgh contain one college each; but embrace all the faculties in their course of instruction. The following table shews the number of professors in the different universities, with the date of their foundation.

	When founded.	Principals.	Professors.
St. Andrews,............	1413	2	11
Glasgow, ...	1450	1	19
Aberdeen, King's College,...	1494	1	9
———— Marischal College,	1593	1	12
Edinburgh,.......................	1582	1	30

Each of these universities enjoys the privilege of conferring literary honours in all the faculties. The aggregate number of students attending all these seminaries is about 2900, of whom about 1300 belong to the university of Edinburgh; 1100 to that of Glasgow; and the remainder to Aberdeen and St. Andrews, the attendance on the latter not exceeding 130. There are no religious tests to exclude students from any of our Scottish colleges. Jews, Catholics, Protestants, enjoy the same privileges. But the professors should, according to law, belong to the Established Church, and are liable to be called upon to sign her standards. This condition, however, is not always exacted. The session extends from the beginning of November till the end of April. There are a few summer classes in the universities of Edinburgh and Glasgow, but these extend only to three months preceding the first of August. A Royal Commission was appointed in 1826 for visiting the universities and colleges of Scotland, and in 1830 gave in a voluminous report. Another Commission was nominated in 1836, for visiting the university of Aberdeen. Their report has just been presented. But though a bill was brought into Parliament in 1836, founded on the former report, providing for a general board of visitors appointed by the crown over all the universities, that bill was withdrawn; and no measure on the subject has since been brought forward.

Poor.

Though poor-rates are not generally imposed in Scotland, yet a law involving a compulsory assessment for the support of the impotent poor, was passed as early as the year 1576. But the very existence of such a statute seemed nearly unknown till about the middle of last century "As long as there was no secession of presbyterians from the Established Church, the weekly collections, under the

[1] Educational Inquiry, Scotland, Session 1837, vol. xlvii.

[2] Under the head of schools non-parochial, are included those established by the Society for Propagating Christian Knowledge, namely, 340; those founded by the General Assembly's Education Committee, namely, 89; and those instituted by the different dissenting congregations.

[3] Irving's Lives of Scottish Poets, 2d edit. vol. i. p. 61.

Statistics.

management of the kirk-session, were in general found sufficient for the management of the poor. In some years of peculiar hardship or scarcity, such as the four last years of the seventeenth century, or the year 1740, voluntary assistance was no doubt given; and in some instances temporary assessments were resorted to, to enable the kirk-sessions to meet the usual emergencies. But on all ordinary occasions the resources of the kirk-sessions were considered as sufficient, and continued to be so at least as late as 1755."[1] And as legal assessments were reluctantly introduced, notwithstanding the existence of a law in their favour, so they have spread tardily. At this moment they embrace only 236 parishes, being little more than a fourth of the total parishes of Scotland. These assessments have not only been introduced, but are the heaviest, in the parishes bordering on England; and with the exception of our larger towns, they decrease or disappear as we recede from the infectious example of the sister kingdom. Thus every parish in the synod of Merse and Teviotdale is burdened with assessment. In the midland synods, less than the half of the parishes are assessed; whilst in the northern synods, embracing 157 parishes, only three are exposed to that burden.

Table, shewing the proportion of parishes assessed or not assessed, the number of permanent or occasional poor, the average relief given to each, &c.[2]

	Not Assessed.	Voluntarily Assessed.	Legally Assessed.	Total.[3]	Rate per cent. to the population.	Average relief given to each.

Savings Banks and Friendly Societies.

Both these institutions have long existed in Scotland, but were based till recently on an insecure foundation. With the view of putting them on a sound footing, the act of 10 Geo. IV., c. 56, and of 4 and 5 Will. IV., c. 40, were passed. All friendly societies, claiming the benefits of these acts, are obliged to submit a statement of their rules and regulations for the approval of the officer appointed by government for the purpose; and these must receive his sanction ere the parties become entitled to the privileges conferred by the act in question, namely, the being allowed to invest the funds of the society in government securities at a minimum rate of interest ($2\frac{1}{2}$d. per cent. per day), and in the funds of savings banks. Upwards of five hundred friendly societies have been instituted on the principle of these acts. The act as to savings banks, which has been in operation in all other parts of the empire since 1819, was extended to Scotland in 1835. According to the provisions of this act, the money of savings banks can be invested in government securities at the rate of L.3, 16s. $0\frac{1}{2}$d. per cent.; but the interest paid to depositors is not to exceed $2\frac{1}{2}$d. per cent. per day, or L.3, 8s. $5\frac{1}{4}$d. per cent. per annum. No individual can deposit more than L.30 in any one year, exclusive of interest, nor more than L.200 in all. Savings banks have been established under the law in Edinburgh, Glasgow, Cupar, Kirkaldy, Dunfermline, Dalkeith, and other towns. The deposits in the Edinburgh institution amount to about L.170,000, in rather less than $3\frac{1}{2}$ years; and the other savings banks in Scotland have been equally successful.

Parliamentary representation.

The peers of Scotland, by the treaty of union, elect sixteen of their number to be their representatives in the House of Lords. This election takes place in the palace of Holyrood on the dissolution of parliament. These sixteen peers, who are not elected for life, as is the case with the Irish representative peers, but for the continuance of the parliament for which they are chosen, enjoy all the privileges of the peers of England. The other peers of Scotland have all the privileges of the House of Lords, except the legislative and judicial powers, and the privileges thence arising. The number of Scottish peers at the union was one hundred and fifty-four; and there has been since restored five, making one hundred and fifty-nine; but the present number is eighty-three, namely, seven dukes, four marquises, thirty-nine earls, three countesses, six viscounts, twenty-three barons, and one baroness. Thirty-six of these are also British peers; and two are likewise peers of Ireland.

Scotland, before the passing of the reform bill in the year 1832, was represented in the House of Commons by forty-five members, thirty being returned by the counties, and fifteen by the royal burghs, sixty-six in number. The number of the Scottish representatives since the passing of the reform bill, is fifty-three, thirty being, as before, chosen by the counties, whilst the burghs and towns, seventy-six in number, of which ten are not royal burghs, send twenty-three. The counties, thirty-three in number, return only thirty members, because, for parliamentary objects, Kinross and Clackmannan, Elgin and Nairn, and Ross and Cromarty, are respectively united. The aggregate number of the county freeholders or voters, at the passing of the reform act, was 3211. The burgh constituencies were still more limited. With the exception of Edinburgh, which sent a member of itself, the other burghs were parcelled out in groups, and each burgh in the group voted by a delegate chosen by the magistrates and town-council, amounting, upon an average, to twenty in each, or 1320 in all. The aggregate number of the county constituencies, in 1838-39, was 46,480, or nearly fifteen times the former amount; and of the burgh constituencies, 36,373, or fully twenty-seven times its former extent. The total constituency of Scotland is 82,853.[4]

Populatio

The population of Scotland was supposed to be 1,050,000 in the year 1700; it was ascertained by Dr. Webster to be 1,265,380, in 1755; and the authors of the *Statistical Account of Scotland* afford the means of estimating its amount about 1798, when it appears to have been 1,526,492. Since the year 1801, inclusive, we have had four decennial census. The following table gives the population of Scotland at the different periods referred to, with the rates of increase in each decennial period since 1801, and the number of males and females in 1831.

---

[1] Sir Henry Moncreiff's Life of Dr. Erskine, p. 468.

[2] Report of a Committee of the General Assembly on the management of the poor in Scotland, 1839.

[3] This is not the correct total, inasmuch as Edinburgh is in fact divided into thirteen parishes, although it is sometimes reckoned but one parish, and is here accounted only one, as far as poor-rates are concerned.

[4] Burton's Manual, *ut supra*, p. 29, *et seq.*

Year.	Numbers.	Increase per cent.	Males.	Females.
1700	1,050,000	...	...	...
1755	1,265,380	...	...	...
1798	1,526,492	...	...	...
1801	1,599,068	...	...	...
1811	1,805,688	14	...	...
1821	2,093,456	16	983,552	1,109,904
1831	2,365,114	13	1,114,816	1,250,298

The amount of square miles, as stated under a previous head, being 29,600, the average population is within a fraction of eighty to the square mile. Great as has been the advance of population since the beginning of the last century, and particularly since 1801, it has been considerably less than its progress during the same period in England or Ireland. This desirable result seems to have been owing principally to the consolidation of farms in the low country; the extinction of the cottier system in the Highlands, and the substitution in its stead of large sheep farms; the comparative want of poor-laws; and the obstacles interposed by the law of Scotland to the sub-letting of farms, and to the subdivision of land. But however it may be accounted for, the fact is certain that, as compared with the increase of wealth, the population of Scotland has increased less rapidly than that of either of the two sister kingdoms. The Scotch have therefore advanced much more rapidly than the English or Irish in wealth, and in the command of the necessaries and conveniences of life. Their progress in this respect has, indeed, been quite astonishing. The habits, diet, dress, and other accommodations of the people, have been signally improved. It is not too much to affirm, that the peasantry of the present day are better lodged, better clothed, and better fed, than the middle class of landowners were a century ago.

Table, shewing the aggregate number of acres in Scotland, with the number of persons, families, and inhabited houses, according to the population returns of 1831, *and also the number of acres corresponding to each family and house.*

Aggregate number of acres.	Number of		Inhabited houses.	Number of acres corresponding to			Number of persons corresponding to	
	Persons.	Families.		each person.	each family.	each house.	each family.	each house.
18,944,000	2,365,114	502,301	369,393	8.009,761	37.714,438	51.204,133	4.708,554	6.402,703

The classification of individuals, principally of males, of twenty years of age and upwards, in different departments of industry in Scotland, according to the census of 1831, is

Occupations.	Numbers.
Occupiers employing labourers,................	25,887

It appeared from a previous table, that the entire population of Scotland had increased sixteen per cent. during the ten years ending in 1821, and thirteen per cent. during the subsequent ten years. But it is evident from the preceding table, that the increase in the population of the larger towns is considerably greater during the same periods, being

26¼ and 26½ per cent. respectively. The advance of Glasgow, in particular, has exceeded that of any of the large towns in the empire, not even excepting London, Manchester, and Liverpool, having been 33 per cent. for the ten years ending in 1821, and 37 per cent. for the subsequent ten years.[1]

Revenue.

But the great prosperity and advancement which Scotland has undergone, is best proved by the state of her public revenue.[2]

The revenue of Scotland at the union, including taxes then imposed,	L.160,000
And her net revenue for the year 1804,	1,934,276
Ditto for 1813, including the property-tax, and other war taxes,	4,155,599
Revenue for 1822, the property-tax, &c. having been repealed,	3,436,642
Ditto for 1836,	4,592,797
Ditto for 1838,	4,692,724

Thus not only has the revenue of Scotland risen from L.160,000 to L.4,692,724 since the Union, or is now twenty-nine times greater than it then was, but the people are undoubtedly now more able to pay the larger sum than they formerly were to contribute the smaller.

Shipping.

The following table, illustrative of the state of Scottish shipping at different periods, bears also unequivocal testimony to the great prosperity and advancement of Scotland.[3]

Year.	No. of vessels.	Tonnage.	No. of men.
1707	215	14,485	...
1760	976	52,818	...
1800	2155	161,511	13,883
1822	3071	276,931	29,830
1837	3244	334,870	24,292

Steam navigation.

The first boat successfully impelled by steam in Europe was the Comet, which began to ply on the Clyde in 1812, and was the result of the skill and ingenuity of the late Henry Bell. Nor was there more than one steam-boat in Scotland for two years afterwards. In 1819, they had increased to 11; in 1830, to 61; and in 1837, to 109, (tonnage, 13,368), of which 63, or considerably more than the half, belonged to the Clyde.[4] The following table shews the rapidly increasing number and tonnage of the steam-boats which entered the different ports of Scotland, and cleared out, at different periods, since 1820.

Year.	Inwards.		Outwards.	
	Ships.	Tons.	Ships.	Tons.
1820	9	505	...	...
1825	498	57,709	731	72,811
1830	1886	240,270	1717	212,167
1837	3340	563,438	2851	483,586

Manufactures. Linen.

On the subject of the Scottish manufactures our notices, derived from official or other documents, shall be brief, particularly as under the articles Dundee, Glasgow, &c., we have already given pretty ample information on the different manufactures for which the country is distinguished. The linen manufacture was the earliest, and long regarded as the staple, branch of industry carried on in Scotland. But such were the narrow limits within which it was confined, that, at the Union, in 1707, it was not supposed to exceed 1,500,000 yards a-year. In 1727, a board of trustees was established for the superintendence and encouragement of the linen manufacture; and bounties and premiums were given on its production and exportation. The regulations as to the inspection and stamping of the linen intended for exportation, by which the trade was much annoyed, were abolished in 1822; and the bounties ceased in the year 1830. The quantity produced for sale in 1728 was 2,000,000 yards; in 1775, 12,000,000 yards; in 1822, 36,000,000 yards; and the exports alone, in 1835, exclusive of home consumption, was between 60,000,000 and 70,000,000 yards, worth about L.1,600,000. Dundee and the east of Scotland, including Fifeshire, are the great seats of the manufacture, particularly in Osnaburghs, sail-cloth, and the coarser fabrics; and Dunfermline and the neighbouring towns and villages, the principal seat of damask, diaper, and the finer fabrics. Previously to 1791, all the yarn used in the manufacture was spun upon the common hand-wheel; but the spinning by machinery began at that time to be introduced; and such has been the facility of production consequent on the erection of flax-mills, that the cost of the yarn, including the raw material, is now less than the spinning amounted to thirty years ago. The number of flax, hemp, and tow factories was, in 1837, 175, employing no fewer than 15,462 workers, of whom 4231 were between thirteen and eighteen years of age, and 163 between nine and thirteen.

Cotton.

Lanarkshire, which includes the city of Glasgow, and also the contiguous county of Renfrew, has always been the principal seat of the cotton manufacture. Some of the fabrics made at Glasgow and Paisley are of almost unrivalled beauty and fineness. The first steam-engine for the spinning of cotton erected in Scotland, was constructed so late as 1792. The number of cotton factories in 1837 was 177, all those of considerable size being situated at Glasgow, and in the neighbouring districts, comprehending twenty or thirty miles around Glasgow, excepting five in Aberdeenshire, two in Perthshire, one in Dumfries-shire, and one at Gatehouse, in Kirkcudbrightshire. But, with no exception, all these country mills are connected with Glasgow houses, or the Glasgow trade, at least so far as the raw material is concerned. The number of hands from eight years of age upwards employed in the Scottish cotton manufacture, is 34,418, of whom 13,567 are between thirteen and eighteen years of age, and 1096 between nine and thirteen.

Woollen.

The woollen manufacture of Scotland has never been considerable. It was formerly the custom for the occupiers of land in this country to spin the whole of their wool with the hand in their own houses, and to send the yarn to the village weaver to be woven into a species of coarse cloth called *plaiding;* but this mode, which is indicative of a rude and backward state of society, is now entirely abandoned, having been superseded by machinery. Factories for the making of fine cloth have been established in Aberdeenshire, and in some other counties; but comparatively coarse fabrics still continue to be the staple article of Scotch manufacture. The number of woollen or worsted factories in 1837 was 104, situated chiefly at Aberdeen, in Clackmannanshire, at Hawick, Galashiels, and Jedburgh, Roxburghshire, and in the counties of Stirling, Argyle, and Inverness. Hawick has almost entirely withdrawn from this species of manufacture, and devotes its energies principally to the production of woollen hose, of which it annually produces about 500,000 pairs, with blankets, and flannels. The towns of Stirling and Bannockburn are almost the exclusive seat of tartans. Kilmarnock is chiefly celebrated for its manufacture of carpets and shawls, besides large numbers of night-caps, bonnets, and foraging caps for the army. Bonnets in Scotland, however, have been pretty generally superseded by hats. The woollen factories, in 1837, contained 4339 workers, of whom 1856 were between thirteen and eighteen years of age, and 156 between nine and thirteen.

Statistics.

ilk.

The silk manufacture in Scotland is still less considerable than that of woollen. The principal seats of it are at Paisley, Glasgow, and Edinburgh. Broad silks, or manufactured goods of entire silk, sold by the yard, viz. gauzes, Persians, satins, and, in general, all broad silks, plain or figured, are made at these places, particularly the two first. Silk mills were established in Edinburgh so late as the year 1838. Handkerchiefs, such as Bandanas and Barcelonas, are made at Paisley and Glasgow, and a few adjacent places in connexion with these towns. Paisley is celebrated for "mixed goods," that is, all varieties of manufacture in which silk forms a component part. Edinburgh is eminent chiefly for its shawls of the finest fabrics, but perhaps is surpassed even in this its staple silk production by Paisley. The silk factories contain about 1000 workers. The whole of the factories, of all kinds, in Scotland, namely, those of linen, cotton, woollen, and silk, amounted, in 1837, to 462, (of which 102 are situated in Lanarkshire, 94 in Forfarshire, including Dundee, Arbroath, and other manufacturing towns, and 62 in Renfrewshire,) employing 55,159 persons; but the number of both has increased considerably since that time.

oap.

Soap has long been manufactured to a very great extent in Scotland; and the principal seats of the manufacture are Glasgow, Leith, Paisley, Aberdeen, Prestonpans, and Montrose. The quantity made, in 1837, was 12,958,856 lbs., viz. of hard soap, 9,553,855, and of soft, 3,4050,01. The quantity exported was 450,956 lbs., the rest being retained for home consumption. The number of licences issued to soapmakers was twenty-one.

pirits.

The quantity of whisky produced in Scotland cannot be ascertained before the year 1823, because, previously to that time, owing to the high rate of duty, (5s. 6d. per English wine gallon,) smuggling prevailed to a great extent in almost every district of the country, particularly in the Highlands. But in 1823 the duty was reduced to 2s., though subsequently, namely, in 1826 and 1830, it has been successively raised to 2s. 10d. and 3s. 4d. The following table will shew the quantity that paid duty for home consumption since that time:

Year.	Number of gallons.
1824	4,350,301
1831	5,700,689
1833	5,988,556
1835	6,013,935
1838	6,124,035

This is exclusive of the quantity produced for the foreign market. In 1838 there were exported to England, at a duty of 7s. 6d. per gallon, 2,215,329 gallons; and to Ireland, at a duty of 2s. 4d., 861,069 gallons.

Official account of the number of distillers, rectifiers, dealers in, and retailers of, spirits in Scotland in 1833 *and* 1834.

	1833.	1834.

Retailers at L.10 and under L.20....	4301	4109
—— L.20 — L.25....	259	222
—— L.25 — L.30....	131	133
—— L.30 — L.40....	151	156
—— L.40 — L.50....	64	63
—— L.50 and upwards........	165	166

Statistics.

Ale and beer.

The principal seat of this manufacture is Edinburgh and its neighbourhood; but it prevails extensively in other places. By the following statement it appears that the quantity of strong ale brewed on an average of five years previous to 1830, was 119,551 barrels annually, (the duty being 9s. 10d. per barrel,) and of table beer, on an average of the same time, 250,698 barrels, the duty being 1s. 11½d. But the duty being repealed in 1830, there are no later accounts of the quantity brewed. The duty on malt is 20s. 8d. per quarter, and on hops 2d. per lb. The following table gives the number of brewers in Scotland in 1833 and 1834.

	1833.	1834.
Brewers of strong beer, not exceeding 20 barrels......................	145	154
Ditto above 20 and not above 50.....	43	45
—— 50 —— 100.....	43	33
—— 100 —— 1000.....	209	204
—— 1000..............................	103	116
Brewers of table beer..................	62	52

Kelp.

The manufacture of kelp, which was formed by the incineration of the common sea-wrack, has altogether ceased; but during the late war it was prosecuted to such an extent, particularly on the shores of the Highlands and Islands, that the total amount produced in Scotland was about 20,000 tons, which usually brought about L.10 per ton, or L.200,000 yearly. At some periods it brought L.20, at others it was as low as L.4 per ton. But since the reduction of the duty on barilla and salt, the manufacture has altogether ceased.

Scotland has long been famous for its fisheries, which were for a time the subject of bounties and premiums on the part of government; but it is questionable whether such factitious encouragement was productive of any real or permanent good. Boards for protecting, extending, and encouraging the fisheries were instituted in 1749, 1786, and 1808. But all bounties and premiums have now ceased; and the branch of industry in question is now thriving at least as well as when encumbered with factitious aid. The salmon fishery of Scotland has long been very considerable. The fishery in the Tweed is the most important, not only in Scotland, but in the empire, though there has of late years been a great decline in the quantity caught. About the end of the late war, the Tweed fishery yielded a rental of from L.15,000 to L.18,000 a-year; but owing to the falling off in the quantity caught, it does not now yield above L.4000 a-year. In addition to the Tweed, the other most valuable salmon fisheries are in the Forth, Tay, Dee, Don, Findhorn, Spey, Ness, Conon, and other rivers throughout Scotland. The London market is supplied with salmon chiefly by Scotland. The total value of the salmon caught in Scotland has been estimated at L.150,000 a-year.[1] Salmon fisheries north of the Tweed and Solway, but not these rivers themselves, are to be shut from the 14th of September to the 1st of February. In the Tweed and its tributary streams, the taking of salmon with the net is prohibited between the 15th of October and 15th February, or with the rod between 7th of November and 15th February. The Solway fisheries, according to the act of Parliament, include all streams that fall into the Solway Firth, embracing the Piltanton, the Luce, and the Bladenoch in Wigtonshire; the Cree, Fleet, Dee, and Urr in the Stewartry of Kirkcudbright; as well as the Nith and other rivers in Dumfries-shire. The close season with all of these rivers begins on the 25th of September, and terminates with Piltanton, Luce, Bladenoch, and Cree, as early as the 31st of December; with the Fleet and the Dee on the 1st of February; and on the Solway Firth itself, properly so called, including the Urr and the other streams that enter it, it extends to the 10th of March. The penalties for transgressing any of these regulations are heavy.[1] The herring fishery has long been extensively cultivated, and much capital has been invested in it. The chief seat is the east of Scotland, of which Wick, and its suburb, Pultneytown, in Caithness, are important stations. Pultneytown, indeed, has, owing to this circumstance, grown up with something like the rapidity of a manufacturing village. During the fishing season, from 1500 to 2000 boats, each averaging a crew of five men, rendezvous here. Of these about 500 belong to the town; the rest resort thither from all quarters of the kingdom. Of 436,098 barrels of herring cured in the year ending the 5th of April 1834, no fewer than 134,738, or between a third and a fourth of the whole, were cured at Wick. The following table contains an account of the total number of barrels of herring which were cured in Scotland in the year just referred to, distinguishing the stations where landed or cured:

---

[1] Loudon's Encyclopedia of Agriculture. General Report of Scotland, iii. 327.

Stations.	Number of barrels cured.
Ayr, Irvine, and Saltcoats	3,158
Campbelton	3,394½
Dumfries and Stranraer	3,343
Fort William	2,259
Glasgow	8,946½
Greenock	12,817½
Inverary	3,931
Loch Broom	1,054
Dunvegan and Loch Carron	953½
Lochgilphead	656
Lybster	34,712
Orkney, north isles	3,196

Helmsdale	27,432
Leith	41½
Thurso	8,890
Tongue	9,353
Wick	134,738½
Total	436,098¼

About an eighth part of the whole was cured at sea, and the remainder on shore. About the same proportion was cured ungutted; the rest were gutted, and generally within twenty-four hours after the fish were caught. In addition to the herring, the Scottish coast abounds with various kinds of white fish, such as haddock, cod, ling, and the like, as also oysters, flounders, and other flat fish. The persons who carry on the white fishing reside in the sea-ports, or the numerous villages on the coast. They use lines and nets, but principally the former; and their business can be carried on throughout the year. Steam navigation gives them a readier and a wider command of a market than they formerly enjoyed. In 1834 the herring, cod, and ling fisheries employed 9,263 boats, decked and undecked, 48,700 fishermen and boys by whom the boats were manned, 1893 coopers, and 28,645 in gutting, packing, &c; the total number of persons employed in these fisheries being 79,238.

Banks.

This article would not be complete if it did not refer, however briefly, to the system of banking for which Scotland has become so celebrated. The Scottish banks are joint-stock establishments with large constituencies, the National bank having no fewer than 1238 partners, and the North of Scotland bank 1418; and, except in the case of chartered banks, each partner is responsible to the extent of his private fortune. With the chartered banks the responsibility is limited; but then the charter guarantees a certain amount of capital. For example, the capital of the bank of Scotland is L.1,500,000, for which sum the shareholders are responsible; and of it two-thirds, or L.1,000,000, has been actually paid up. These establishments, based on wide constituencies, with unlimited responsibility on the part of the shareholders, or, if chartered, with large capitals paid up or guaranteed, enjoy the perfect confidence of the public. Besides, they are severally under the management of a body of Directors chosen by the partners out of their own body, and directly and periodically responsible to their constituents; and under their superintendence the banking business is carried on in these establishments on the most judicious and approved principles. Nor is this all. The different banks periodically exchange notes with each other; in Edinburgh, twice weekly, and in the country generally once a-week. Over-issuing is thus completely checked, for if any one bank has, after an exchange is made, an overplus of the notes of any other, this latter must redeem those notes either by a payment in specie, or in Exchequer bills, or an order on the bank of England. For any of these institutions to become insolvent or bankrupt seems next to be impossible. Indeed, no joint-stock bank, of any importance, ever did become insolvent; but in cases when, in provincial towns, such banks have suspended payment, (which has happened only in a very few instances, and these originating in ignorance or fraud,) the public, or the holders of their notes, have suffered no loss, each partner being responsible to the amount of his private fortune. The Scotch banks receive sums as low as L.10, or sometimes lower, as deposits, and allow interest on them at about one, or one and a half per cent, below the market rate. The system of "cash accounts" is peculiar to the Scottish mode of banking. A cash account is a credit given by a bank to an individual with two or more collateral securities, for a certain sum, which he may draw out wholly or partially as he pleases, replacing it in the same way, being charged interest only on the portion he withdraws. The act prohibiting the circulation of small notes in England did not extend to Scotland; so that the currency consists almost exclusively of paper, namely, notes of the value of L.1 and upwards. Indeed, there is very little gold in circulation. The Scotch banks draw on London at twenty days date. The Bank of Scotland, the oldest banking establishment in Scotland, was established in 1695, and issued notes for L.1 as early as 1704. The Royal Bank of Scotland was founded in 1727; and the British Linen Company in 1746. The total number of joint-stock banks at present in Scotland is 25, having altogether 306 branches. There are also seven private banking establishments. The aggregate amount of the sums deposited in the different Scottish banks was calculated to be in 1826 about L.20,000,000 or L.21,000,000; and it must have since increased considerably. The circulation is supposed to be between L.3,000,000 and L.4,000,000, seldom exceeding the latter sum.[2]

As in the progress of this article we have minutely referred to the authorities on which the truth of the statements depends, except when we spoke from our own personal knowledge, we have thought it unnecessary to give a collected list of such authorities in this place; but we cannot conclude without stating, that the Geological part was contributed by Mr. Alexander Rose, Lecturer on Geology, and that the article Judicial Establishments was furnished by James Stark, Esq., advocate.

cott, John || Scott, Thomas.

SCOTT, JOHN, an eminent English divine, was born in 1638, and became minister of St Thomas's in Southwark. In the year 1684 he was collated to a prebend in the cathedral of St Paul's. Dr Hickes tells us, that, after the revolution, "he first refused the bishopric of Chester, because he would not take the oath of homage; and afterwards another bishopric, the deanery of Worcester, and a prebend of the church of Windsor, because they were all places of deprived men." He published several excellent works, particularly the Christian Life, and died in the year 1695. He was eminent for his humanity, affability, sincerity, and readiness to do good; and his talent for preaching was extraordinary.

SCOTT, *Thomas*, an eminent divine of the Church of England, was born on the 16th of February 1747. His father was a grazier in Lincolnshire, in humble circumstances, with thirteen children, of whom Thomas was the tenth. The father was ambitious that one of his sons should belong to a learned profession, and with this view sent the subject of this memoir, when about fifteen years of age, to be apprentice to an apothecary and surgeon at Alford. In this situation he conducted himself so improperly, that after a short time he was dismissed by his master, and sent home in disgrace. His father, mortified and vexed by the conduct of his son, treated him with great harshness, and employed him only in the lowest and most laborious drudgery about the farm. For nine years after his return home in disgrace, he was exposed to great hardships, associated with persons in the lowest stations of society, and often joined in their riotous and abandoned pursuits. Conceiving himself used with unjust severity by his father, his temper was soured, and he became exceedingly irritable and discontented.

His employment of tending the sheep left him often in solitude. At these seasons his mind was filled with bitter reflections on the past, and gloomy anticipations of the future; and although his education had been very superficial, yet he had acquired so much as awakened in him an insatiable longing after the pleasures and distinctions of literature; and every thing conspired to disgust him with his present employment.

When about twenty-five years of age, to the astonishment of every one, he declared his resolution of entering into the church. This scheme was strongly opposed by his father, treated as chimerical by his friends, and ridiculed by his neighbours. At length, however, his unconquerable fortitude and patient perseverance overcame every obstacle, and he was admitted to priest's orders in the year 1773, and shortly thereafter was appointed curate of Weston Underwood, with a salary of L.50 a year. While here, he applied with indefatigable zeal and industry to the study of sacred and profane literature. His sentiments at first were decidedly Socinian; but a candid and diligent study of the Scriptures gradually opened his eyes to the fallacy and the dangers of the doctrines which he had espoused; and being in the neighbourhood of John Newton, the friend of Cowper, who was strongly evangelical and Calvinistic in his views, his acquaintance with that eminent individual may have contributed to this change in his religious sentiments. In the year 1779 he published a small autobiography, entitled the Force of Truth, in which he gave a candid statement of the change in his opinions, and the steps by which he was gradually led to adopt the orthodox and evangelical creed. This publication made a great sensation at the time, and has gone through many editions since. He married, in 1774, Jane Kell, who proved a valuable helpmate to him in his future struggles. In 1780 he succeeded John Newton at Olney, and in 1785 he accepted the situation of lecturer at the Lock Hospital, with a salary of L.80 a year. This, with small sums for occasional lectureships, furnished but a scanty allowance for the support of an increasing family; and when, a few years afterwards, a proposal was made to him by a London bookseller to write a Commentary on the Bible, to be published in numbers, the offer of a guinea a week, as remuneration for his writings, decided him to engage in the undertaking.

This valuable work was well received by the public, and, under proper management, ought to have been a very profitable speculation; but, owing to the bankruptcy of the bookseller, Mr Scott not only received no remuneration for his labour, but lost all his little savings, and was involved in considerable debt. The first edition, of two thousand copies, commenced in 1802, and was finished in 1809; a second of two thousand copies, in 1807–11; the third, of three thousand copies, in six volumes 4to, 1812–14. The fourth was stereotyped, and sold to a great extent. He published a volume of Essays in 1793–94. He also published, in two volumes 8vo, Remarks on the Bishop of Lincoln's Refutation of Calvinism; and Sermons on various subjects, from time to time. His Theological Works were collected and edited by his son, the Reverend John Scott, and published in ten volumes 8vo, in 1823.

In 1803 he left London for the rectory of Aston, Sandford, where he died on the 16th of April 1821. He was a man of eminent piety, somewhat eager and impetuous, but of great sincerity, and sterling honesty of character; of a vigorous intellect, indefatigably diligent in his studies, and a useful and practical preacher.

Scott, Sir Walter.

SCOTT, *Sir Walter*, was born at Edinburgh on the 15th of August 1771. "My birth," says he, "was neither distinguished nor sordid. According to the prejudices of my country, it was esteemed *gentle*, as I was connected, though remotely, with ancient families, both by my father's and mother's side." His paternal great-grandfather was a cadet of the border family of Harden, which has been ennobled within the last few years, and sprung in the fourteenth century from the great house of Buccleuch; his grandfather became a farmer in Roxburghshire, and married a lady who was a relation of his own; and his father, Walter Scott, was a writer to the signet in the Scottish capital. The poet's mother, Anne Rutherford, who was likewise of honourable descent, was the daughter of one of the medical professors in the university of Edinburgh.

Neither Scott's poetical turn nor his extraordinary powers of memory seem to have been inherited from either of his parents. His early years displayed as little precocity of talent as did the steady development of his mind in riper days; and the uneventful tenor of his childhood and youth, although their impressions can now be traced vividly in his works, must have seemed, but for these, as little calculated as possible to awaken in his mind a love of the imaginative or romantic.

Delicacy of constitution, accompanied by a lameness which proved permanent, exhibited itself before he had completed his second year, and caused soon afterwards his removal to the country. There, at his grandfather's farmhouse of Sandyknowe, situated beneath the crags of a ruined baronial tower, and overlooking a tract of many miles studded with spots famous in border-history, the poet passed his childhood till about his eighth year, with scarcely any interruption but that of a year spent at Bath. From this early period there are related some interesting anecdotes of his sympathy with the grandeur and beauty of nature. The tenacity of his infantine recollections gave promise of what was afterwards so remarkable a faculty in his mind; and the ballads and legends, which were recited to him amidst the scenes in which their events were laid, co-operated in after-days with family and national pride to decide the bent of the border-minstrel's fancy.

His health being partially confirmed, he was recalled home; and from the end of 1779 until 1783 his education was conducted in the High School of Edinburgh, with the assistance of a tutor resident in his father's house. In the years immediately preceding this change, he had shewn decided activity of intellect, and strong symptoms of its diversion towards literary pursuits; but now, introduced with imperfect preparation into a large and thoroughly trained class, and thrown, for the first time in his life, among a crowd of boisterous boys, his childish zeal for learning seems to have been quenched by ambition of another kind. His memory, it is true, was still remarkable, and procured for him from his master the title of historian of the class; while he produced some school-verses, both translated and original, which were at least creditable for a boy of twelve. Even his intellectual powers, however, were less active in the proper business of the school than in enticing his companions from their tasks by merry jests and little stories; and his place as a scholar scarcely ever rose above mediocrity. But his reputation stood high in the play-ground, where, possessed of unconquerable courage, and painfully eager to defeat the scorn which his physical defects excited, he is described as performing hazardous feats of agility, and as gaining pugilistic trophies over comrades who, that they might have no unfair advantage over the lame boy, fought, like him, lashed face to face on a plank. At home, his tutor, a zealous Presbyterian, initiated him, chiefly by means of conversation, in the facts of Scottish history, political as well as ecclesiastical, though without being able to shake those opinions which the boy had already taken up as an inheritance descending from his Jacobite ancestors; and he pursued with eagerness, at every interval which could be stolen from the watchfulness of his elders, a course of reading utterly miscellaneous and undigested, and embracing much that to most minds would have been either useless or positively injurious. “I left the High School,” says he, “with a great quantity of general information, ill arranged, indeed, and collected without system, yet deeply impressed upon my mind, readily assorted by my power of connexion and memory, and gilded, if I may be permitted to say so, by a vivid and active imagination.”

His perusal of histories, voyages, and travels, fairy tales, romances, and English poetry, was continued with increasing avidity during a long visit which, in his twelfth year, he paid to his father's sister at the village of Kelso, where, lying beneath a noble plane-tree in an antique garden, and beholding around him one of the most beautiful landscapes in Scotland, the young student read for the first time, with entranced enthusiasm, Percy's Reliques of Ancient Poetry. This work, besides the delight which was imparted by the poems it contained, influenced his mind by giving new dignity, in his eyes, to his favourite Scottish ballads, which he had already begun to collect from recitation, and to copy in little volumes, several of which are still preserved at Abbotsford. “To this period, also,” he tells us, “I can trace distinctly the awaking of that delightful feeling for the beauties of natural objects, which has never since deserted me. The romantic feelings which I have described as predominating in my mind, naturally rested upon and associated themselves with the grand features of the landscape around me; and the historical incidents or traditional legends connected with many of them gave to my admiration a sort of intense impression of reverence, which at times made my heart feel too big for its bosom. From this time the love of natural beauty, more especially when combined with ancient ruins, or remains of our fathers' piety or splendour, became with me an insatiable passion, which, if circumstances had permitted, I would willingly have gratified by travelling over half the globe.”

In November 1783, Scott became a student in the university of Edinburgh, in which, however, he seems to have attended no classes but those of Greek, Latin, and logic, during one session, with those of ethics and universal history at a later period, while preparing for the bar. At college the scholastic part of his education proceeded even more unprosperously than it had previously done. For science, mental, physical, or mathematical, he displayed no inclination; and in the acquisition of languages, for which he possessed considerable aptitude, he was but partially industrious or successful. Of Greek, as his son-in-law and biographer admits, he had in later life forgotten the very alphabet. He had indeed entered on the study with disadvantages similar to those which had formerly impeded his progress in Latin; he had, as he informs us, petulantly resolved on despising a study in which he found himself inferior to his competitors; and Professor Dalziel, irritated not only by his carelessness, but by an essay in which he maintained that Ariosto was a better poet than Homer, solemnly pronounced of him, “that dunce he was, and dunce would remain.” His knowledge of Latin does not appear to have ever extended farther than enabling him to catch loosely the meaning of his author; although we are informed that for some writers in that tongue, especially Lucan, Claudian, and Buchanan, he had in after life a decided predilection. About the time now under review, he also acquired French, Italian, and Spanish, all of which he afterwards read with sufficient ease; and the German language was learned a few years later, but never critically understood.

It was some time between his twelfth and his sixteenth year that his stores of romantic and poetical reading received a vast increase, during a severe illness which long confined him to bed; and one of his schoolfellows has given an interesting account of excursions in the neighbourhood of the city, during this period, when the two youths read poems and romances of knight-errantry, and exercised their invention in composing and relating to each other interminable tales modelled on their favourite books. The vocation of the romance-writer and poet of chivalry was thus already fixed. His health likewise became permanently robust. The sickly boy grew up into a muscular and handsome youth; and the lameness in one leg, which was the sole remnant of his early complaints, was through life no obstacle to his habits of active bodily exertion, or to his love for out-of-door sports and exercise.

The next step in his life did not seem directed towards the goal to which all his favourite studies pointed. His father, a formal though high-spirited and high-principled man, whose manners are accurately described in his son's novel of Redgauntlet, designed him for the legal profession; and, although he always looked wishfully forward to his son's embracing the highest department of it, considered it advisable, according to a practice not uncommon in Scotland, that he should be prepared for the bar by an education as an attorney. Accordingly, in May 1786, Scott, then nearly fifteen years old, was articled for five years as an apprentice to his father, in whose chambers he thenceforth continued, for the greater part of every day, to discharge the humble duties of a clerk, until, about the year 1790, he had, with his father's approbation, finally resolved on coming to the bar. Of the amount of the young poet's professional industry during those years of servitude we possess conflicting representations; but many circumstances in his habits, many peculiarities in the knowledge he exhibits incidentally in his works, and perhaps even much of his resolute literary industry, may be safely referred to the period of his apprenticeship, and show satisfactorily that at all events he was not systematically negligent of his duties. Historical and imaginative reading, however, continued to be prosecuted with undiminished ardour; summer excursions into the Highlands introduced him to the scenes, and to more than one of the characters, which afterwards figured in his most successful works; while in the law-classes of the university, as well as in the juvenile debating societies, he formed, or renewed from his school-days, acquaintance with several who became in manhood his cherished friends and his literary advisers. In 1791 the Speculative Society made him acquainted with Mr Jeffrey and those other young men whose subsequent celebrity has been to a small extent reflected on the arena of their early training.

Scott's attempts in poetry had now become more ambitious; for, it is said, about the completion of his fifteenth year, he had composed a poem in four books on the Conquest of Granada, which, however, he almost immediately burned, and no trace of it has been preserved. During some years after this time, we hear of no other literary compositions than essays for the debating societies.

In July 1792, being almost twenty-one years of age, he was called to the bar. Immediately after his first circuit, he commenced that series of " raids," as he playfully called them, or excursions into the secluded border-districts, which in a few years enabled him to amass the materials for his first considerable work. His walks on the boards of the Parliament House, the Westminster Hall of Scotland, if they gained him for a time few professional fees, speedily procured him renown among his fellow-lawyers as a storyteller of high excellence; his father's connections and his own friendships opened for him a ready admission into the best society of the city, in which his cheerful temper and his rich store of anecdotes made him universally popular; and his German studies produced, in 1796, his earliest poetical efforts that were published, namely, the translations of Burger's ballads, Lenora and the Wild Huntsman. The same year witnessed the disappointment of a long and fondly-cherished hope, by the marriage of a young lady, whose image, notwithstanding, clung to his memory through life, and inspired some of the tenderest strains of his poetry.

In the summer of 1797, however, on a visit to the watering-place of Gilsland, in Cumberland, he became acquainted with Charlotte Margaret Carpenter, a young lady of French birth and parentage, whose mother, the widow of a royalist of Lyons, had escaped to England, and there died, leaving her children to the guardianship of their father's friend the Marquis of Downshire. A mutual attachment ensued; and, after the removal of prudential doubts, which had arisen among the connections on both sides, Scott and Miss Carpenter were married at Carlisle in December of the same year.

The German ballads, which, though they met with very little sale, had been justly praised by a few competent critics, served as the translator's introduction to the then celebrated Matthew Gregory Lewis, who enlisted him as a contributor to his poetical Tales of Wonder; and one cannot now but smile to hear of the elation with which the author of Waverley at that time contemplated the patronising kindness extended to him by the author of The Monk. Early in 1788 was published Scott's translation of Goethe's Goetz von Berlichingen, which, through Lewis's assistance, was sold to a London bookseller for twenty-five guineas; but, though favourably criticised, it was received by the public as coldly as the preceding volume. In the summer of 1799, the poet wrote those ballads which he has himself called his " first serious attempts in verse;" the Glenfinlas, the Eve of St John, and the Grey Brother.

After Scott's marriage, several of his summers were spent in a pretty cottage at Lasswade near Edinburgh, where he formed, besides other acquaintances, those of the noble houses of Melville and Buccleuch. The influence of these powerful friends, willingly exerted for one whose society was agreeable, whose birth connected him, though very remotely, with the latter of those titled families, and who in politics was decidedly and actively devoted to the ruling party, procured for him, in the end of the year 1799, his appointment as sheriff-depute of Selkirkshire, an office which imposed very little duty, while it gave him a permanent salary of L.300 per annum. His father's death had recently bestowed on him a small patrimony; his wife had an income which was considerable enough to aid him greatly; his practice as a lawyer yielded, though not much, yet more than barristers of his standing can usually boast of; and, altogether, his situation in life, if not eminent, was at least strikingly favourable when compared with that which has fallen to the lot of most literary men. Scott, however, now twenty-eight years of age, had done nothing to found a reputation for him as a man of letters; and there appeared as yet to be but little probability that he should attach himself to literature as a profession, or consider it as any thing more than a relaxation for those leisure hours which were left unoccupied by business and the enjoyments of polite society.

In 1800 and 1801 those hours were employed in the preparation of the Border Minstrelsy, the fruit of his childish recollections, and of his youthful rambles and studies. The first two volumes appeared in the beginning of the next year, and the edition, consisting of eight hundred copies, was sold off before its close. This work, however, the earliest of his which can be said to have given him any general fame, yielded him about eighty pounds of clear profit; being very far less than he must have expended in the investigations out of which it sprang. In 1803 it was completed by the publication of the third volume. Besides the value which the Minstrelsy possesses in itself, in the noble antique ballads, so industriously, tastefully, and yet conscientiously edited, in the curious and spiritedly-used information which overflows through all the prose annotations, and in those few original poems which gave the earliest warning of that genius which as yet had lurked unseen, the work has now a separate value and interest, as forming the most curious of all illustrations for the history of its editor's mind and of his subsequent works. " One of the critics of that day," remarks Mr Lockhart, " said that the book contained ' the elements of a hundred historical romances;' and this critic was a prophetic one. No person who has not gone through its volumes for the express purpose of comparing their contents with his great original works, can have formed a conception of the endless variety of incidents and images, now expanded and emblazoned by his mature art, of which the first hints may be found either in the text of those primitive ballads, or in the notes which the happy rambles of his youth had gathered together for their illustration."

But before the publication of the Border Minstrelsy, the poet had begun to attempt a higher flight. " In the third volume," says he, writing to his friend George Ellis in 1803, " I intend to publish a long poem of my own. It will be a kind of romance of border chivalry, in a light-horseman sort of stanza." This border romance was the Lay of the Last Minstrel, which, however, soon extended in plan and dimensions, and, originating as a ballad on a goblin story, became at length a long and varied poem. The first draught of it, in its present shape, was written in the autumn of 1802, and the whole history of its progress has been delightfully told by the author himself, and is well illustrated by his biographer.

In 1803, during a visit to London, Scott, already familiarly acquainted with Ellis, Heber, and other literary men, and now possessing high reputation himself in virtue of the Minstrelsy, was introduced to several of the first men of the time; and thenceforth, bland as he was in manner, and kind in heart, indefatigable and successful in his study of human character, and always willing to receive with cordiality the strangers whom his waxing fame brought about him, it is not surprising to find, that not to know personally Walter Scott, argued one's self unknown. The toleration and kindliness of his character are illustrated by the fact, that firm as his own political opinions were, and violently as excitement sometimes led him to express them, not only did he always continue on friendly terms with the chief men of the opposite party in Edinburgh, but several of them were his intimate friends and associates; and he even was for some years an occasional contributor to the Edinburgh Review.

In 1804 was published his edition of the ancient poem of Sir Tristrem, so valuable for its learned dissertations, and for that admirable imitation of the antique which appears as a continuation of the early minstrel's work.

During that year and the preceding, the Lay was freely communicated to all the author's friends, Wordsworth and Jeffrey among the rest; and after undergoing various changes, and receiving enthusiastic approval in several quarters from which commendation was wont to issue but sparingly, it was at length published, in the first week of 1805. The poet, now thirty-three years of age, took his place at once as a classic in English literature. Its circulation immediately became immense, and has since exceeded that of any other English poem.

But exactly at this culminating point of the poet's life, we must turn aside from the narrative of his literary triumphs, to notice a step of another kind, which proved the most important he ever took. In one of those interesting communications of 1830, which throw so much light on his personal history, he has told us, that from the moment when it became certain that literature was to form the principal employment of his days, he determined that it should at least not constitute a necessary source of his income. Few literary men, perhaps, have not nourished a wish of this sort; but very few indeed have possessed, like Scott, the means of converting the desire into an effectual resolution. In 1805, as his biographer tells us, he was, "independently of practice at the bar and of literary profits, in possession of a fixed revenue of nearly, if not quite, L.1000 a year." To most men of letters this income would have appeared affluence; but Scott has frankly avowed, that he did not think it such. The truth is, that his mind was already filled with the feeling which speedily became its master-passion, namely, the ambition, not of founding a new family (for that was too mean an aim for his pride of birth to stoop to), but of adding to his own ancestral pretensions that claim to respect which ancient pedigree does not always possess when it stands alone, but which belongs to it beyond challenge when it is united with territorial possessions. The fame of a great poet, now within his reach, if not already grasped, seemed to him a little thing, compared with the dignity of a well-descended and wealthy Scottish landholder; and, while neither he nor his friends could yet have foreseen the immensity of those resources which his genius was afterwards to place at his disposal for the attainment of his favourite wish, two plans occurred and were executed, which promised to conduct him far at least towards the goal.

The first of these was the obtaining of one of the principal clerkships in the Scottish Court of Session, offices of high respectability, executed at a moderate cost of time and trouble, and remunerated at that time by an income of about L.800 a year, which was afterwards increased to L.1300. This object was attained early in 1806, through his ministerial influence, aided by the consideration paid to his talents; although, owing to a private arrangement with his predecessor, he did not receive any part of the emoluments till six years later.

The second plan was of a different sort, being in fact a commercial speculation. James Ballantyne, a schoolfellow of Scott, a man possessing a good education, and considerable literary talent of a practical kind, having become the editor and printer of a newspaper in Kelso, had been employed to print the Minstrelsy, and acquired great reputation by the elegance with which that work was produced. Soon afterwards, in pursuance of Scott's advice, he removed to Edinburgh, where, under the patronage of the poet and his friends, and assisted by his own character and skill, his printing business accumulated to an extent which his capital, even with pecuniary aid from Scott, proved inadequate to sustain. An application for a new loan was met by a refusal, accompanied, however, by a proposal, that Scott should make a large advance, on condition of being admitted as a partner in the firm, to the amount of a third share. Accordingly, in May 1805, Walter Scott became regularly a partner of the printing-house of James Ballantyne and Company, though the fact remained for the public, and for all his friends but one, a profound secret. "The forming of this commercial connexion was," says his son-in-law, "one of the most important steps in Scott's life. He continued bound by it during twenty years, and its influence on his literary exertions and his worldly fortunes was productive of much good and not a little evil. Its effects were in truth so mixed and balanced during the vicissitudes of a long and vigorous career, that I at this moment doubt whether it ought, on the whole, to be considered with more of satisfaction or of regret."

From this time we are to view Scott as incessantly engaged in that memorable course of literary industry whose toils advancing years served only to augment, and from which neither the duties of his two professional offices of clerk of session and sheriff, nor the increasing claims made on him by society, were ever able to divert him. He now stood deservedly high in the favour of the booksellers, not merely as a poet and man of genius, but as one possessed of an extraordinary mass of information, and of such habits as qualified him eminently for turning his knowledge to account. He was therefore soon embarked in undertakings, not indeed altogether inglorious, but involving an amount of drudgery to which, perhaps, no man of equal original genius has ever condescended. The earliest of these was his edition of Dryden, which, entered upon in 1805, was completed and published in 1808.

But the list of works in which his poetical genius shone forth continued rapidly to increase amidst his multiplicity of other avocations. From the summer of 1804 till that of 1812, the spring and autumnal vacations of the court were spent by him and his family at Ashestiel, a small mansion romantically overhanging the Tweed some miles above Melrose, and rented from one of the poet's kinsmen. In this beautiful retreat, at intervals during twelve months, was chiefly composed the magnificent poem of Marmion, which was published in the beginning of 1808. At the same place, likewise, in 1805, were composed the opening chapters of a novel which, on the disapproval of one of the author's critical friends, was thrown aside and not resumed for years.

Scott's commercial engagements must now again be adverted to. In the year 1808 he took a part, perhaps as suggester, certainly as a zealous promoter, of a scheme which terminated in the establishment of the Quarterly Review in London, as a political and literary counterpoise to the Edinburgh Review, the advocate of Whig opinions. But the poet had other than political grounds for embarking in this opposition. He had seriously quarrelled with the firm of Constable and Company, the publishers of the Edinburgh Review, and of several of his own earlier works; and his wish to check the enterprising head of that house in his attempts to obtain a monopoly of Scottish literature, is openly avowed, in Scott's correspondence at the time, as one of his principal motives for framing another scheme. His plan, as far as it was explained either to the public or to his own friends, amounted only to this: That a new publishing house should be set up in Edinburgh, under the management of John Ballantyne, a younger brother of James; and that this firm, with the acknowledged patronage of Scott and his friends, should engage in a series of extensive literary undertakings, including, amongst others, the annual publication of a historical and literary Register, conducted on Tory principles. But, unfortunately both for Scott's peace of mind, and ultimately also for his worldly fortunes, there was here, as in his previously-formed connection with the same family, an undivulged secret. The profits of the printing-house had been large; Scott's territorial ambition had been growing faster than his prospect of being able to feed it; and these causes, inextricably mixed up with pique towards Constable, and kindliness for his Kelso protégés, led him into an entanglement which at length ruined both himself and his associates. By the contract of the publishing house of John Ballantyne and Company, executed in May 1808, Scott became a secret partner to the extent of one third. The unhappy issue of this affair will force itself on our notice at a later stage.

In the mean time we see him prosecuting for some time his career of poetical success. The Lady of the Lake, published in 1810, was followed by the Vision of Don Roderick in 1811; by Rokeby in 1812; and by the Bridal of Triermain, which came out anonymously in 1813. His poems may be said to have closed in 1815 with the Lord of the Isles and the Field of Waterloo; since Harold the Dauntless, in 1817, appeared without the writer's name, and the dramatic poems of 1822 and 1830 are quite unworthy of him. In the midst of these poetical employments he made his second and last great appearance as an editor and commentator of English classics, by publishing in 1814 his edition of Swift.

But from 1815 till 1825, Scott's name ceased almost entirely to be before the public as an avowed author; and for those who chose to believe that he was not the writer of the Waverley Novels it must have been a question not a little puzzling, if it ever occurred to them, how this man, who wrote with such ease, and seemed to take such pleasure in writing, was now occupying his hours of leisure. A few articles in the Quarterly Review, such works as Paul's Letters, and annotations in occasional editions of ancient tracts, accounted but poorly for his time during ten years.

About 1813 and 1814 his popularity as a poet was sensibly on the decline, partly from causes inherent in his later poems themselves, and partly from extraneous causes, among which a prominent place belongs to the appearance of Byron. No man was more quicksighted than Scott in perceiving the ebb of popular favour; and no man better prepared to meet the reverse with firmness. He put in serious execution a threat which he had playfully uttered to one of his own family even before the publication of the Lady of the Lake. "If I fail now," said he, "I will write prose for life." And in writing prose his genius discovered, on its first attempt, a field in which it earned triumphs even more splendid than its early ones in the domain of poetry.

The chapters of fiction begun at Ashestiel in 1805, which had already been resumed and again thrown aside, were once more taken up, and the work was finished with miraculous rapidity; the second and third volumes having been written during the afternoons of three summer weeks in 1814. The novel appeared in July of that year, under the title of Waverley, and its success from the first was unequivocal and unparalleled. Although we cannot here give a catalogue of Scott's works, yet in truth such a list of the novels and romances does in itself present the most surprising proof, both of his patient industry, and of the singularly equable command which he had at all times over his mental resources. In the midst of occupations which would have taken away all leisure from other men, the press poured forth volume after volume, in a succession so rapid as to deprive of some part of its absurdity one of the absurd suppositions of the day, namely, that more persons than one were concerned in the novels. Guy Mannering, the second of the series, in 1815, was followed in 1816 by the Antiquary and the First Series of the Tales of My Landlord. Rob Roy appeared in 1817; the Second Series of the Tales in 1818; and in 1819 the Third Series and Ivanhoe. Two romances a-year now seemed to be expected as the due of the public. The year 1820 gave them the Monastery and the Abbot; 1821, Kenilworth and the Pirate; the Fortunes of Nigel, coming out alone in 1822, was followed in 1823 by no fewer than three works of fiction, Peveril of the Peak, Quentin Durward, and St Ronan's Well; and the comparatively scanty number of novels in 1824 and 1825, which produced respectively only Redgauntlet and the Tales of the Crusaders, is accounted for by the fact that the author was engaged in preparing a large historical work.

It is impossible even to touch on the many interesting details which Scott's personal history presents during these brilliant years; but it is indispensable to say, that his dream of territorial acquisition was realized with a splendour which, a few years before, he himself could not have hoped for. The first step was taken in 1811, by the purchase of a small farm of a hundred acres on the banks of the Tweed, which received the name of Abbotsford, and in a few years grew, by new purchases, into a large estate. The modest dwelling first planned on this little manor, with its two spare bed-rooms and its plain appurtenances, expanded itself in like manner with its master's waxing means of expenditure, till it had become that baronial castle which we now reverentially visit as the minstrel's home. The hospitality of the poet increased with his seeming prosperity; his mornings were dedicated to composition, and his evenings to society; and from the date of his baronetcy in 1820 to the final catastrophe in 1826, no mansion in Europe, of poet or of nobleman, could boast such a succession of guests illustrious for rank or talent, as those who sat at Sir Walter Scott's board, and departed proud of having been so honoured. His family meanwhile grew up around him; his eldest son and daughter married; most of his early friends continued to stand by his side; and few that saw the poet in 1825, a hale and seemingly happy man of fifty-four, could have guessed that there remained for him only a few more years (years of mortification and of sorrow), before he should sink into the grave, struck down by internal calamity, not by the gentle hand of time.

And yet not only was this the issue, but, even in the hour of his greatest seeming prosperity, Scott had again and again been secretly struggling against some of the most alarming anxieties. On details as to his unfortunate commercial engagements we cannot here enter. It is enough to say, that the printing company of which he was a partner, which seems to have had considerable liabilities even before the establishment of the publishing house, was now inextricably entangled with the concerns of the latter, many of whose largest speculations had been completely unsuccessful; that, besides this, both firms were involved to an enormous extent with the house of Constable; and that large sums, which had been drawn by Sir Walter as copyright-money for the novels, had been paid in bills which were still current, and threatening to come back on him.

In the beginning of 1826, Constable's house stopped payment; and the failure of the firm of Ballantyne, for a very large sum, followed instantly and of course. Probably even the utter ruin which this catastrophe brought upon Scott, was not more painful to him than the exposure which it necessarily involved, of those secret connections, the existence of which even his most confidential friends could till now have at most only suspected. But if he had been imprudent, he was both courageous and honourable; and in no period of his life does he appear to such advantage, as when he stood, as now, beggared, humbled, and covered with a load of debt from which no human exertions seemed able to relieve him. He came forward without a day's delay, and refused to be dealt with as an ordinary bankrupt, or to avail himself of those steps which would have set him free from the claims of his creditors, on surrendering his property to them. He insisted that these claims should, so far as regarded him, be still allowed to subsist; and he pledged himself that the labour of his future life should be unremittingly devoted to the discharge of them. He did more than fulfil his noble promise; for the gigantic toil to which, during years after this, he submitted, was the immediate cause that shortened his life. His self-sacrifice, however, effected astonishingly much towards the purpose which it was designed to serve. Between January 1826 and January 1828, he had realized for the creditors the surprising sum of nearly L.40,000; and soon after his death the principal of the whole Ballantyne debt was paid up by his executors.

We have now briefly to describe the efforts by which this result was accomplished. After spending at Abbotsford, in 1826, a solitary summer, very unlike its former scenes of splendour, Scott, returning to town for his winter duties, and compelled to leave behind him his dying wife (who survived but till the spring), took up his residence in lodgings, and there continued that system of incessant and redoubled labour which he had already maintained for months, and maintained afterwards till it killed him. Woodstock, published in 1826, had been written during the crisis of his distresses; and the next fruit of his toil was the Life of Napoleon, which, commenced before the catastrophe, appeared in 1827, and was followed by the First Series of Chronicles of the Canongate; while to these again succeeded, in the end of the same year, the First Series of the Tales of a Grandfather. The year 1828 produced the Second Series of both of these works; 1829 gave Anne of Geierstein, the first volume of a History of Scotland for Lardner's Cyclopædia, and the Third Series of the Tales of a Grandfather. The same year also witnessed the commencement of that annotated publication of the collected novels, which, together with the similar edition of the poetical works, was so powerful an instrument in effecting Scott's purpose of pecuniary disentanglement. In 1830 came two Dramas, the Letters on Demonology, the Fourth Series of the Tales of a Grandfather, and the second volume of the History of Scotland. If we are disappointed when we compare most of these works with the productions of younger and happier days, our criticism will be disarmed by a recollection of the honourable end which the later works promoted; and as to the last productions of the mighty master, the volumes of 1831, containing Count Robert and Castle Dangerous, no one who is acquainted with the melancholy circumstances under which these were composed and published, will be capable of any feeling but that of compassionate respect.

The dejection which it was impossible for Scott not to feel in commencing his self-imposed task, was materially lightened, and his health invigorated, by an excursion to London and Paris in the course of 1826, for the purpose of collecting materials for the Life of Napoleon. In 1829 alarming symptoms appeared, and were followed by a paralytic attack in February 1830, after which the tokens of the disease were always more or less perceptible to his family; but the severity of his tasks continued unremitted, although in that year he retired from his clerkship, and took up his permanent residence at Abbotsford. The mind was now but too evidently shaken, as well as the body; and the diary which he kept contains, about and after this time, melancholy misgivings of his own upon this subject. In April 1831 he had the most severe shock of his disease that had yet attacked him; and having been at length persuaded to abandon literary exertion, he left Abbotsford in September of that year, on his way to the Continent, no country of which he had ever yet visited, except some parts of France and Flanders. This new tour was undertaken with the faint hope that abstinence from mental labour might for a time avert the impending blow. A ship of war, furnished for the purpose by the Admiralty, conveyed Sir Walter, first to Malta, and then to Naples; and the accounts which we have, both of the voyage and of his residence in Italy, abound with circumstances of melancholy interest. After the beginning of May 1832, his mind was completely overthrown; his nervous impatience forced his companions to hurry him homeward from Rome through the Tyrol to Frankfort; in June they arrived in London, whence Sir Walter was conveyed by sea to Edinburgh; and, having reached Abbotsford on the 11th of July, he there continued to exist, with few intervals of consciousness, till the afternoon of the 21st of September, when he expired, having just completed the sixty-first year of his age. On the 26th he was buried in the beautiful ruins of Dryburgh Abbey.

In the article Romance, observations have been made on Scott's prose works of fiction. It remains here to add a very few words on the character of his poetry. It would be rash for any who have lived only in the same age with a great poet, and still more rash for those whose earliest conceptions of poetical celebrity and poetical beauty are inseparably associated with his name and his writings, to pronounce peremptorily on the rank which may probably be assigned to him by posterity, among the classics of his native language. But without venturing on such ground as this, there are points of comparison with himself and others, which may warrantably be applied to the illustration of his genius.

In regard to the spirit which animates the poetry of Scott, he stands entirely alone in his age; separated indeed so far from the tendencies of the time, that his universal popularity seems at the first glance to have in it something unaccountable. The passionate intenseness and moody self-inquisition of Byron, the calm thoughtfulness and universal sympathies of Wordsworth, and the wildness of Coleridge's lyrical dreams, are in their several kinds allied to those impulses which have widest sway in these generations of our race; while other poets, Campbell with his gentle pathos, Crabbe with his melancholy anatomy of life, and Moore with his overflow of voluptuous imagery, appeal to emotions which are not so much distinctive of particular periods in the history of mankind, as common to the mind in all its ages. But the world which Scott reproduced in the midst of us, the world of feudalism and chivalry, the transition-stage in the annals of Christian Europe, is one with which the men of modern times have very little communion or fellow-feeling; and the boldness with which he chose his themes was even exceeded by that of the tone in which he ventured to treat them; neither jesting with his own fancies, like Pulci or Ariosto, nor, like Tasso, overlaying the essential substance of the chivalrous life with a garniture of poetry and of delicate feeling which left the genuine light of elder times but few openings to glimmer through; but grappling with his materials in the believing and lofty devotion of an historical poet, and painting for us a picture in which the fierce and fiery spirit of martial adventure inspires the leading groups, and gives the outlines of the piece, while interesting local superstitions and the ascetic religion of Catholicism, the absorbing love of country and the anomalous devotedness of feudalism, form, singly or united, the colouring which is spread over different portions of the composition.

For, in essentials, this character of historical truth does belong to the poetry of Scott; not indeed that his view of the old world is one which could have presented itself to those who lived nearer to the times he depicts; but that it is almost as near to truth as consists with the united requirements made by the purposes of his art and the temper of his age, and probably nearer to the truth than any similar attempt which has been made in modern times. Doubtless there are many instances in which he does not preserve this fidelity to the claims of his subject; but it is surprisingly preserved in his best works, and the inferiority of the others is in no small degree owing to their deficiency in it. Indeed he goes even farther than this; for he not only presents to us the scenes of old, but he invests them in a dress substantially the same as that in which they would have been clothed by poets contemporary, or nearly succeeding them, if these, for their metrical romances or their ballads of love and war, had possessed equal appliances, in a formed language, and in extended views as to the principles of the poetical art.

The Lay of the Last Minstrel is really a long border-ballad; and, inspired by the poet's early recollections and studies, and nourished not only by those copious sources of illustration of which the Border Minstrelsy furnishes abundant specimens, but by affectionate familiarity with the landscapes of his story, this work possesses, both in spirit and in details, at once a fervour and a unity superior to any of his others. Very little indeed, either of incident or character, would require to be withdrawn from it, as foreign to its essence. Marmion is pitched in another key, but is still antique, and, though less rich in characteristic details of the olden time, and rather less free from modern admixtures, is pervaded almost throughout by the chivalrous spirit, while that spirit blazes forth at several points with a splendour which the poet elsewhere never equalled. The poem is a metrical romance of history; the full development of a species of composition in which Barbour had but faintly traced the design. The Lady of the Lake cannot be so readily referred to any one class of our old national poems; in which, indeed, that moving panorama of gorgeous landscapes, amidst which the personages exist, is, as a prominent feature, quite unknown. But this very feature, and the placidly romantic air which breathes through most of the adventures, at once determine its type as a kind of pastoral romance (instanced more frequently in foreign literature than in our own), and diffuse over the work a singular charm, which hides from us much vagueness, both in the characters and in the historical details of manners and ideas. Rokeby, the next in the list, is confessedly the weakest of its author's larger poems, as it is also that in which he has removed himself farthest from his ordinary models. Defective alike in unity of spirit and in historical fidelity, it would, but for some poetical gems which sparkle through, deserve no higher name than that of a novel in verse. In the Lord of the Isles we behold a return to the poet's higher sources of inspiration; for we have here another metrical chronicle, a second Marmion, every way inferior to the first.

It is abundantly evident that the task which Scott has thus performed, of creating anew the scenes and characters of a fierce and chaotic stage of society, allowed him ample room for arousing some of the strongest emotions which poetry can awaken. Sometimes, indeed, he errs by applying himself to the excitement of feelings which, though strictly within his limits, are not broadly enough impressed on the minds of most men to found any lively sympathy. Such are the feelings of superstitious awe and delight in supernatural invention, feelings which are chiefly addressed in his two anonymous poems, and to whose prevalence these works, equal in some points to any thing in verse he ever wrote, mainly owe their want of general interest and popularity. But he far oftener throws himself on those principles which are universally sympathized with and appreciated, not indeed arousing all of them with equal skill, but compounding, out of the use he makes of all, a representation which is at once sufficiently true and widely attractive. That which was really the master-feeling of the times he delineates, the love of warlike adventure, is the path in which he has been by far most successful. In tenderness or passion he does not stand by any means first among the poets of our day; and even in those exhibitions of chivalrous generosity and lofty feeling which are so closely consonant to his stories and their actors, he is, although often delightfully felicitous, yet by no means without his equals; but there is no poet of our times, and very few in any age or country, who have portrayed with such admirable force and fire the soldier's thirst for battle, and the headlong fury of the field of slaughter. Throughout all his works there occur bursts of this sort, which would of themselves have placed him high among poets of the class, even though he had never written his noblest passages of warfare, the knightly combat of Fitzjames and Roderick, or the magnificent battle-piece which closes Marmion. His clear and cheerful, yet delicately sketched and poetically elevated descriptions of natural scenery, less strong in their outlines than some poetry of a similar kind, and less vivid in their colouring and chiaroscuro than others, but always pleasing and original, and often far more, may probably be said to be, after their warlike temper, the most distinctive feature of his poems.

If the moral tone of Scott's poetry is not high, it must be at least admitted that it is uniformly inoffensive; and if most passages excite us less violently than those of some other poets, there is none whose works leave on the mind a more pleasing expression of content and hopefulness. Perhaps, in his views of human society, the only thing which can at all jar on the feelings of any, is that tendency to aristocratic hauteur, which, not indeed shrinking from contact with the lower orders, and willingly recognising and esteeming many of their virtues, yet considers them strictly as the dependents of higher men, and is silent on every other relation they can be supposed to hold. This feeling, so palpable both in his poetry and in his romances, is, it must be remarked, quite in keeping as a feature of the times he describes in the former class of writings; and even as an element in modern poetry, there doubtless are, after all, many who will esteem the sentiment a just one.

In skill of execution, as respects both ease of expression and melody of versification, there is in the poems an exceedingly observable progress, not at all corresponding to their respective degrees of real merit. Both in diction and in music there is a very wide distinction between the first few stanzas of the Lay and the most finished passages in Rokeby or the Lord of the Isles. Not less noticeable are the variations in point of poetical ornament, a thing very different from genuine poetical force or beauty. In the Lay, the most poetically conceived of all the works, there are wonderfully few passages of the kind that furnish showy quotations, though those of this class that do occur are of a very high order. Marmion, except in the Introduction, scarcely contains more; the Lady of the Lake possesses such far more abundantly; while Rokeby overflows with couplets poetically sententious; and the Lord of the Isles again returns towards the earlier manner.

There is one point of view in which the poems offer a very interesting subject of consideration, not for their own sake, but in their relation to those more celebrated and certainly higher works which succeeded them. They may be regarded as in some sense preparations, or, in the artist's phrase, studies, for the novels and romances. The field of speculation which is thus presented may furnish some intelligent inquirer with extremely apt materials for illustrating the poet's genius; but the mine is too wealthy to be here so much as opened. It may be remarked, however, that while the latter poems in their spirit approach far nearer to the prose romance than the earlier ones, thus in some degree indicating the operations which were going on in the author's mind, yet it is from the earlier that the romances have derived by far the most plentiful hints and materials. In the slightly sketched personages of the poems we may frequently discover elements which were expanded into the finished characters of the prose works, and this not only in the dignified and poetical, but even in the comic, as one instance of which may be cited the Friar John of Norham as the first outline of Robin Hood's Tuck. In incident, the borrowings from the poems are less direct and palpable ; and the most obvious are the obligations which, both in this and the other particular, the Monastery owes to the Lay, and Ivanhoe to Marmion. The Lady of the Lake, also, both in its scenery and its draughts of Highland character, may be considered as the preface to Waverley. (B. L.)

SCOUGAL, Henry, the second son of Patrick Scougal, bishop of Aberdeen, was born in June 1650, at Salton, in East Lothian, where his father, the immediate predecessor of Bishop Burnet, was rector. At the age of fifteen he entered the university, where he behaved with great modesty, sobriety, and diligence. No sooner had he finished his course of education, than he was promoted to a professorship in the university of Aberdeen, where he conscientiously performed his duty in training up the youth under his care in such principles of learning and virtue as might render them ornaments to church and state. Having been professor of philosophy for four years, he was at the age of twenty-three ordained a minister, and settled at Auchterless, a small village about twenty miles from Aberdeen. About the twenty-seventh year of his age he fell into a consumption, which by slow degrees wasted him away. Upon the twentieth day of June 1678 he died, in the greatest calmness, in the twenty-eighth year of his age, and was buried in the King's College church in Old Aberdeen. His principal work is a small treatise entitled the Life of God in the Soul of Man. This book is not only valuable for the sublime spirit of piety which it breathes, but for the purity and elegance of its style ; qualities for which few English writers were distinguished before the revolution.

SCOUTS, in a military sense, are generally horsemen sent out before, on the wings of an army, at the distance of a mile or two, to discover the enemy, and to give the general an account of what they see.

SCREW, one of the six mechanical powers, is a cylinder cut into several concave surfaces, or rather a channel or groove made in a cylinder, by carrying on two spiral plains the whole length of the screw, in such a manner that they may be always equally inclined to the axis of the cylinder in their whole progress, and also inclined to the base of it in the same angle.

SCRIBE, in Hebrew ספר, *sepher*, is very common in Scripture, and has several significations.

It signifies, first, a clerk, writer, or secretary. This was a very considerable employment in the court of the kings of Judah, in which the Scripture often mentions the secretaries as the first officers of the crown. Seraiah was scribe or secretary to King David (2 Sam. viii. 17). Shevah and Shemaiah exercised the same office under this prince (2 Sam. xx. 25). In Solomon's time we find Elihoreph and Ahia secretaries to that sovereign (1 Kings iv. 4) ; Shebna under Hezekiah (2 Kings xix. 2) ; and Shaphan under Josiah (2 Kings xxii. 8). As there were but few in those times that could write well, the employment of a scribe or writer was very considerable.

Secondly, a scribe is put for a commissary or muster-master of an army, who makes the review of the troops, keeps the list or roll, and calls them over. Under the reign of Uzziah king of Judah, there is found Jeil the scribe, who had under his hand the king's armies (2 Chron. xxvi. 11) ; and at the time of the captivity, it is said the captain of the guard, among other considerable persons, took the principal scribe of the host, or secretary at war, which mustered the people of the land (2 Kings xxv. 19).

Thirdly, scribe is put for an able and skilful man, a doctor of the law, a man of learning that understands affairs. Jonathan, David's uncle by the father's side, was a counsellor, a wise man, and a scribe (1 Chr. xxvii. 32). Baruch, the disciple and secretary to Jeremiah, is called a scribe (Jer. xxxvi. 26) ; and Ezra is celebrated as a skilful scribe in the law of his God (Ezra vii. 6). The scribes of the people, who are frequently mentioned in the Gospel, were public writers and professed doctors of the law, which they read and explained to the people. Some place the original of the scribes under Moses ; but their name does not appear until under the judges. It is said that, in the wars of Barak against Sisera, “ out of Machir came down governors, and out of Zebulun they that handle the pen of the writer” (Judges v. 14). But others think that David first instituted them when he established the several classes of the priests and the Levites. The scribes were of the tribe of Levi ; and at the time that David is said to have made the regulations in that tribe, we read that six thousand men of them were constituted officers and judges (1 Chr. xxiii. 4), among whom it is reasonable to think that the scribes were included. For in 2 Chr. xxiv. 6, we read of Shemaiah the scribe, one of the Levites ; and in Chr. xxxiv. 13, we also find it written, “ Of the Levites that were scribes and officers.”

The scribes and the doctors of the law, in the Scripture phraseology, mean the same thing. And as the whole religion of the Jews at that time consisted chiefly in pharisaical traditions, and in the use that was made of them to explain the Scripture, the greatest number of the doctors of the law, or of the scribes, were Pharisees ; and we almost always find them joined together in Scripture. Each of them valued themselves upon their knowledge of the law, and upon their studying and teaching it (Mat. xxii. 52). They had the key of knowledge, and sat in Moses's chair (Mat. xxiii. 2). Epiphanius, and the author of the Recognitions imputed to St Clement, reckon the scribes among the sects of the Jews ; but it is certain that they formed no sect by themselves, and were only distinguished by their study of the law.

SCRIMZEOR, or Scrimgeour, *Henry*, an eminent restorer of learning, was born at Dundee in the year 1506. He traced his descent from the ancient family of the Scrimzeours of Dudhope, who obtained the office of hereditary standard-bearers to the kings of Scotland in 1057.

At the grammar-school of Dundee our author acquired the Greek and Latin languages in an uncommon degree of perfection, and that in a shorter time than many scholars of his age. At the university of St Andrews, his successful application to philosophy gained him great applause. The next scene of his studies was the university of Paris, and their more particular object the civil law. Two of the most famous civilians of that age, Eguinard Baron and Francis Duaren,[1] were then giving lectures to crowded audiences at Bourges. The fame of these professors occasioned his removal from Paris ; and for a considerable time he prosecuted his studies under their direction. At Bourges he had an opportunity of becoming acquainted with the celebrated James Amiot, Greek professor in that city, well known in the learned world by his translation of Plutarch's Lives, and distinguished afterwards by his advancement to great honours in the church, and finally to the rank of cardinal. Through the recommendation of this eminent person, Mr Scrimzeor engaged in the education of two young gentlemen of the name of Bucherel, whom he instructed in the belles lettres, and other branches of literature calculated to qualify them for their station in life.

---

[1] “ Francis Duaren was the first of the French civilians who purged the chair in the civil law schools from the barbarisms of the Glossaries, in order to introduce the pure sources of the ancient jurisprudence. As he did not desire to share that glory with any one, he looked with an envious eye on the reputation of his colleague Eguinard Baron, who also mixed good literature with the knowledge of the law. This jealousy put him upon composing a work, wherein he endeavoured to lessen the esteem that people had for his colleague. The maxim, *Pascitur in vivis livor ; post fata quiescit*, was verified remarkably in him ; for after the death of Baron, he showed himself most zealous to eternize his memory, and was at the expense of a monument to the honour of the deceased.” (See the Translation of Bayle's Dictionary, of 1710, p. 1143-4.)

This connection introduced him to Bernard Bornetel, bishop of Rennes, a person famed in the political world for having served the state in many honourable embassies. Accepting an invitation from this prelate to accompany him to Italy, Mr Scrimzeor greatly enlarged the sphere of his literary acquaintance, by his conversation and connection with most of the distinguished scholars of that country. The death of Francis Spira[1] happened during his visit to Padua; and as the character and conduct of this remarkable person engaged at that time the attention of the world, Mr Scrimzeor is said to have collected memoirs of him in a publication entitled The Life of Francis Spira, by Henry of Scotland. This performance, however, does not appear in the catalogue of his works.

After he had stored his mind with the literature of foreign countries, and satisfied his curiosity as a traveller, it was his intention to revisit Scotland. He might without vanity have entertained hopes, that the various knowledge which he had treasured up would win him a partial reception among his countrymen. An ambition of being usefully distinguished among them as a man of letters is justly supposed to have been the principal motive of his return; but the most sanguine projects of life are often strangely diverted by accident, or rather perhaps are invisibly turned by Providence from their natural course. Mr Scrimzeor, on his journey homewards, had to pass through Geneva. His fame had long forerun his footsteps. The syndics and other magistrates, on his arrival, requested him to set up the profession of philosophy in that city, promising a compensation suitable to the exertion of his talents. He accepted the proposal, and established the philosophical chair.

After he had taught for some time at Geneva, a fire broke out in the neighbourhood, by which his house was consumed, and he himself reduced to great distress. His pupils, the Bucherels, however, had not forgotten their obligations to him, and sent a considerable sum of money to his relief.

At this time flourished at Augsburg the famous mercantile family of the Fuggers. Ulric Fugger was then its representative; a man possessed of prodigious wealth, passionately fond of literature, a great collector of books and manuscripts, and a munificent patron of learned men. Being informed, by means of his literary correspondence, of the misfortune which had befallen Mr Scrimzeor in the burning of his house, he immediately sent him a pressing invitation to accept an asylum beneath his roof until his affairs should be re-established. Mr Scrimzeor gladly availed himself of such hospitable kindness, and lost no time in repairing to Germany.

Whilst residing at Augsburg with Mr Fugger, he was much employed in augmenting his patron's library, by vast collections purchased from every corner of Europe. Codices of the Greek and Latin authors were then of inestimable value, and seem to have been more particularly the object of Mr Scrimzeor's researches.

When his manuscripts were ready for the press, he was desirous of returning to Geneva to print them. His patron, Fugger, recommended him for that purpose to the learned Henry Stephens, one of his pensioners, and at that time the most celebrated printer in Europe.

Immediately on his arrival at Geneva, 1563, he was earnestly solicited by the magistrates to resume the chair of philosophy. Notwithstanding his compliance, and consequently the dedication of much of his time to the study of physics, he, two years afterwards, instituted a course of lectures in the civil law, and had the honour of being its first founder and professor at Geneva.

As soon as he had settled again in this city, he hoped, amidst his other occupations, to prosecute the great object of his literary fame, the printing of his various works. But a suspicion which Henry Stephens entertained, that it was his intention to set up a rival press at Geneva, occasioned great dissensions between them; and the result of the quarrel was, that the republic of letters, during Scrimzeor's life, was deprived of his valuable productions. At his death most of them fell into the hands of Isaac Casaubon, who has been accused of publishing considerable portions of them as his own.

Some account of Mr Scrimzeor's several performances will serve to convey an idea of his extensive erudition.

He wrote critical and explanatory notes upon Athenæus's *Deipnosophists*, or Table Conversations of Philosophers and Learned Men of Antiquity, having first collated several manuscripts of his author. This work Casaubon published at Leyden in 1600, but without distinguishing his own notes from those of Scrimzeor.

A Commentary and Emendations of the Geography of Strabo were among our author's literary remains. These were published in Casaubon's Parisian edition of Strabo in 1620. Henry Stephens, from an idea of justice due to Scrimzeor's literary fame, notwithstanding the violent animosity which had subsisted between them, reproaches Casaubon for adopting, without acknowledgment, the Scottish critic's lucubrations on Strabo. Dempster assures us, that Scrimzeor, in his manuscript letters, mentions his design of publishing this performance; and hence it is probable that his work appeared to himself of considerable consequence, and had taken up much of his attention. Although Casaubon, in his ample notes exhibited at the foot of Strabo's text, makes no confession of having derived any thing from Scrimzeor, it must not be concealed, that in an epistle to Sir Peter Young, the nephew of the critic through whom the Commentary and Emendations of Strabo came into his hands, Casaubon acknowledges how very useful to him they might be made; for, speaking there of his intended edition of Strabo, he says, "It cannot be expressed how much assistance I may obtain from your notes of Scrimzeor."

Edward Herrison, a Scottish author, in his Commentary on Plutarch's Book concerning the Inconsistencies of the Stoics, informs us that Scrimzeor collated different manuscripts of all the works of Plutarch. This undertaking appears sufficient to occupy half the life of an ordinary critic. Every one knows how voluminous an author was the philosopher, the historian, and the orator of Chæronea. Whether the learned critic meant to publish an edition of Plutarch's works is not known; but such an intention seems higly probable, from this laborious enterprise of collating them.

The ten books of Diogenes Laertius on the Lives, Opinions, and Apophthegms of the Philosophers, were collated from various manuscripts by Scrimzeor. His corrected text of this author, with notes full of erudition, came also into Casaubon's possession, and is supposed to have contributed much to the value of his edition of the Grecian biographer, printed at Paris in 1593.

---

[1] Francis Spira was a lawyer of great reputation at Cittadella, in the Venetian state, about the beginning of the sixteenth century. He had imbibed the principles of the Reformation, and was accused before John de la Casa, archbishop of Benevento, the pope's nuncio at Venice. He made some concessions, and asked pardon of the papal minister for his errors. But the nuncio insisted on a public recantation. Spira was exceedingly averse to this measure; but at the pressing instances of his wife and friends, who represented to him that he must lose his practice and ruin his affairs by persisting against it, he at last complied. Shortly afterwards he fell into a deep melancholy, lost his health, and was removed to Padua for the advice of physicians and divines. But his disorders augmented, and the recantation, which he said he had made from cowardice and interest, filled his mind with continual horror and remorse, insomuch that he sometimes imagined that he felt the torments of the damned. No means being found to restore either his health or his peace of mind, in 1548 he fell a victim to his miserable situation. See Collyer's Dictionary, art. *Spira.*

The works of Phornutus and Palæphatus were also among the collations of Mr Scrimzeor. To the latter of these authors he made such considerable additions, that the work became partly his own. These are two ancient authors who explain the fables of the heathen deities. The former wrote *De Natura Deorum, seu de Fabularum Poeticarum Allegoriis Speculatio*, On the Nature of the Gods, or the Allegorical Fictions of the Poets. The latter entitled his book *De Falsis Narrationibus*, concerning False Relations. These works were printed at Basil in 1570, but whether in Greek or Latin is uncertain. They have been published since that time in both languages. The manuscripts of them were for some time preserved in the library of Sir Peter Young, after that of his uncle Scrimzeor, which was brought into Scotland in 1573, had been added to it. What became of this valuable bequest at the death of the former is uncertain. Our learned philologer also left behind him, in manuscript, the orations of Demosthenes, Æschines, and Cicero, and the Ecclesiastical History of Eusebius, all carefully collated.

Among his literary remains was a collection of his Latin epistles. The men of letters in the fifteenth and sixteenth centuries seem to have kept their republic, as it is called, more united and compact than it is at present, by an epistolary intercourse in the Latin language, then the universal medium of literature and science.

Of the many performances which had exercised his pen, it does not appear that any were immediately published by himself but his Translation of Justinian's Novels into Greek. This was printed at Paris in 1558, and again with Holoander's Latin version at Antwerp in 1575. This work has been highly extolled, both for the purity of its language and the accuracy of its execution, and is likely, according to some, to hold its estimation as long as any use or memory of the civil law shall exist.

A Latin translation of the *Basilica*, or Basilics as they are called by the civilians, is the last we have to mention of this author's performances. This is a collection of Roman laws, which the eastern emperors Basil and Leo, who reigned in the fifth century, commanded to be translated into Greek, and which preserved their authority until the dissolution of the eastern empire. The Basilics comprehend the institutes, digests, code, and novels, and some of the edicts of Justinian and other emperors. Of sixty original books, however, forty-one only remain. Mr Scrimzeor collated them with various manuscripts, probably before he commenced his translation.

Different years have been assigned for the time of his death; but it appears most likely, from a comparison of the different accounts of this event, that it happened very near the expiration of 1571, or at the beginning of the succeeding year, about the sixty-sixth year of his age. He died in the city of Geneva. The characteristic features of Scrimzeor are few, but they are prominent and striking. His industry and perseverance in the pursuit of knowledge and erudition were equalled only by the exquisite judgment which he displayed in his critical commentaries on the errors and obscurities of ancient books and manuscripts.

SCRIPTURE, HOLY.

Under this title are commonly designated the sacred books of the Jews and the Christians, in which are contained the revelation of God's will to mankind, and the principles of that religion which he has inculcated upon us. In other parts of this work the reader will find articles elucidatory of the claims preferred and of the doctrines taught in these books (see especially Inspiration, Miracle, Prophecy, and Theology). In the present article it is proposed to furnish an outline of what may be denominated *the historico-critical knowledge of these books*. In treating of this we have to do with the composition, the history, the reputation, and the literary characteristics of the sacred writings viewed simply as remains of ancient literature.

This department of investigation is comparatively of recent date. In the earlier ages of the church the same necessity for such inquiries did not exist as now, in consequence especially of the efforts which have been made in more recent times to impugn the authenticity of the sacred documents; nor is it probable that the early fathers, from the views which they entertained of the sole agency of the Holy Spirit in the composition of these, would have deemed any inquiry into their peculiarities, as the products at the same time of human agency, other than impious and absurd (1). Since the time, however, when Spinoza issued his attack upon the authenticity of the Pentateuch and the general inspiration of the Scriptures (1670), and Richard Simon, a presbyter and fellow of the oratory at Paris, followed with his acute, learned, and liberal investigations into the critical history of the Old Testament (1678), this subject has occupied the attentive study of critics and theologians of all confessions, and may now be said to have reached the dignity of a *science* (2).

---

1. The prevailing notion among the Jews and the early Christians respecting Inspiration was, that the faculties of the person inspired were completely suspended and superseded during the afflatus, so that the only parts of him actively engaged in the work of composition were his hands and his eyes. Philo speaks of God as "using the organs of the prophets for the manifestation of his will" (Θεου καταχρωμενου τοις ἐκεινων ὀργανοις προς δηλωσιν ὧν ἂν ἐθελησῃ, *De Monarch.* lib. i. ed. Mangey, t. ii. p. 222); Justin Martyr compares them to the strings of a lyre, which produce sounds just as they are touched by the hand of the player (*Cohort. ad Græcos*, c. 8); and Augustin frequently speaks of the Scriptures as the "Chirograph of Deity," and of their writers as "the stylus or pen of the Holy Spirit." The influence of such exclusive views in discouraging any inquiries of a historico-critical nature is seen in the following sentence of Gregory the Great: "Quis librum Job scripserit, valde superflue quæritur, cum tamen auctor libri Spiritus Sanctus fideliter eredatur. Ipse scripsit, qui et in ejus opera inspirator extitit et per scribentis vocem imitandam ad nos facta transmisit." (*Moral. in Job.* t. i. p. 7.) Ideas of a similar kind are found in the writings of several of the older divines subsequent to the Reformation. For the opinions most generally received among Protestant divines in the present day, see Henderson's Lectures on Inspiration, London, 1836, the latest and best book upon this subject.

2. Spinoza's work is entitled "Tractatus historico-politicus, continens dissertationes aliquot, quibus ostenditur, libertatem philosophandi non solum salva pietate et reipublicæ pace posse concedi; sed eandem nisi cum pace reipublicæ ipsaque pietate tolli non posse," Hamburgi, 1670, 4to. Simon's "Histoire critique du Vieux Testament" appeared in one vol. 4to, in 1678 at Paris; but a fuller and more correct edition was published at Rotterdam in 1685, superintended, in all probability, by the author. It produced numerous replies and strictures, from the pens both of Catholic and Protestant divines, of which the most important were those of Spanheim (*Lettre sur l'Hist. Crit. du V. T. du R. Simon*); Du Pin (*Dissert. prelim. ou Prolégomènes sur la Bible*); and Le Clerc (*Sentimens de quelques Théologiens d'Holland sur l'Hist. Crit. du V. T. composée par le D. R. Simon*). Both Du Pin and Le Clerc, but especially the latter, whilst reproving Simon, indulged certain speculations of their own, which were considerably too free for the age in which they lived, and which drew down upon them, along with the object of their strictures, the censures of the acute and ingenious Bossuet (*Divers Traités contre Mr R. Simon, Du Pin, et autres. Œuvres Posthumes*, t. ii. 1753). In more recent times the scholars of Germany have chiefly distinguished themselves in this department of inquiry. Their most valuable works are those of Carpzov (*Introductio ad libros canonicos V. T. omnes*, 4to, Lips. 1721): Eichhorn (*Ein-*

leitung in das A. T. 4te aufl. 5 bde. 8vo, Gött. 1820–24; *In die Apocryphischen Schriften des A. T.* 8vo, Leipz. 1795; *In das N. T.* 5 bde. 8vo, Leipz. 1804–1827); Michaelis (*Einl. in die Göttl. Schriften des A. Bundes*, 4to, Hamburg, 1784; *In die Göttl. Schriften des N. B.* 2 bde. 4to, Gottingen, 4te aufl. 1788 [translated by Bishop Marsh, in six vols. 8vo, with considerable additions, third ed. Camb. 1818]); Bertholdt (*Histor. Kritische Einl. in sämmtliche Kanonische und Apocryphische Schriften des A. und N. T.*, 6 bde. 8vo, Erlangen, 1812–19); Jahn (*Einl. in die Göttl. Bücher des A. Bundes*, 3 bde. 8vo, 2te aufl. Wien. 1802–3; *Introductio in Bibl. Sacr. V. T. in epitomen redacta*, ed. 2da, Vien. 1814, 8vo): Haenlein (*Handbuch der Einleit. in d. Schriften des N. T.* 3 theile 2te aufl. Erlangen, 1801); Hug (*Einl. in die Schriften des N. T.*, 2 thle. 3te aufl. Stuttgart und Tübingen, 1827 [translated by the Rev. D. G. Wait, LL. D. 2 vols. 8vo, 1827, and with much greater accuracy by D. Fosdich junior, Andover, U. S. 1837]); and Schott (*Isagoge Hist. Critica in libros N. T. sacros*, Jenæ, 1830, 8vo). The most valuable works by English scholars are Walton's *Prolegomena in Biblia Polyglotta*, Lond. 1657, of which a separate edition was published, with a preface by J. A. Dathe, at Leipzig, in one vol. 8vo, 1777, and republished with many improvements and additions by Archdeacon Wrangham, in two vols. 8vo, Cambr. 1828; Mill's *Prolegomena in Novum Testamentum*, Oxon. 1707, folio; Harwood's Introduction to the Study and Knowledge of the New Testament, 2 vols. 8vo, London, 1767–1771; Gray's Key to the Old Testament, 8vo, new edit. 1829; Percy's Key to the New Testament, 12mo, 3d edit. London, 1779; and, above all, Horne's Introduction to the Critical Study and Knowledge of the Holy Scriptures, 4 vols. 8vo, 8th edit. Lond. 1839. Many valuable treatises upon separate portions of the general subject are extant in different languages, but these it would be out of place to attempt to enumerate here. See the Bibliographical Appendix to Horne's Introduction; Orme's *Bibliotheca Biblica*; and Winer's *Handbuch der Theologischen Litteratur*.

This subject divides itself into two parts, a *general* and a *special;* the former having reference to the sacred volume as a whole, the latter to the separate books of which it is comprised. In the present article we shall confine ourselves to the former of these, and offer a few general observations on the collected scriptures, as such.

SECT. I.—*The Name.*

Various designations have been affixed to the sacred volume. The Jews called their part of it by such terms as עשרים וארבעה, i. e. *Four-and-twenty*, with reference to the number of separate books; כתב or מכתב, i. e. *Writing*, a term borrowed from Exod. xxxii. 16; ספרי הקדש, i. e. *Books of Holiness;* תורה נביאים וכתובים, i. e. *Law, Prophets, and Hagiographa.* In the Apocrypha they are styled ὁ νομος, και οἱ προφηται, και τα ἀλλα πατρια βιβλια, *Jesus Sirac. Proleg. sub init.* So also in the New Testament, νομος και προφηται, Matt. v. 17; νομος, προφηται, και ψαλμοι, Luke xxiv. 44; frequently ἡ γραφη and αἱ γραφαι; τα ἱερα γραμματα, 2 Tim. iii. 15. At an early period of the Christian era, the term διαθηκη began to be affixed to the Scriptures as the documents unfolding God's *covenant;* and their two great divisions to be designated as ἡ παλαια διαθηκη and ἡ καινη διαθηκη respectively. This usage seems to have been drawn from the language of Paul, 2 Cor. iii. 6 and 14, though it is only in the writings of Origen that it makes its appearance for the first time. The Latins rendered the word διαθηκη by *Testamentum*, according to its primary meaning, though not that in which it is employed by Paul, who uses it evidently in the sense of *Fœdus;* and from this we have the appellation employed by almost all the versions of modern Europe.

Horne's Introduction, vol. i. p. 30; Michaelis, *Einleit.*, bd. i. s. 1; and in Marsh's Translation, vol. i. p. 1; Augusti, *Grundriss einer Histor. Kritischen Einleitung ins Alte Testament*, s. 16, 2te. aufl.

SECT. II.—*Languages of the Scriptures.*

The greater part of the Old Testament Scriptures is composed in pure Hebrew, the most ancient language of which we have any specimen extant. This language belongs to a class of tongues formerly called, by way of eminence, the *Oriental*, but now more appropriately discriminated by the term *Semitic* or *Shemitic*, from Shem, the great progenitor of the races by which they are spoken (1). This class embraces three leading tongues, corresponding in general character and relation to the geographical situations of the respective nations by which they were used; the *Aramaic* abounding in combinations of consonants, and consequently marked by considerable harshness of pronunciation, employed by the nations of the northern and more mountainous districts of Syria, Mesopotamia, and Babylonia; the *Arabic*, remarkable for richness, melifluousness, and the preponderance of vowels, spoken by the inhabitants of the warm and open plains of Arabia and Ethiopia; and the *Hebrew*, the language of the middle district, possessing an intermediate character between the other two, richer than the Aramaie, poorer and harsher than the Arabic (2). The opinion that Hebrew was the original language of the world, and the mother of all the other Semitic tongues, is now generally relinquished by scholars, who content themselves with the more moderate hypothesis, that it is the oldest daughter of the primeval tongue, and that which retains the most striking resemblances to the mother speech of the antediluvian period (3). In the earliest books of the Bible, those of Moses, this language appears in its greatest purity; nor did it sustain any decided deterioration till after the Babylonian captivity. The attempts of some Hebraists to divide its history into a golden, a silver, a brazen, and an iron age, are by the most accurate scholars rejected, as much more fanciful than sound (4). The Hebrew of the Scriptures is the pure classical Jerusalem Hebrew, the language of the temple and of the court. That there were dialects more or less corrupt in the provinces, is attested by the sacred writers themselves. Thus they tell us that the Ephraimites could not distinguish between the שׁ and the ס in pronunciation (Judges, xii. 6); Nehemiah was indignant that part of the people should speak "in the speech (dialect) of Ashdod, of Ammon, and of Moab" (Nehem. xiii. 23–25); and the dialect of Galilee is mentioned in the New Testament (Matt. xxvi. 73) (5).

1. The first to use this term seems to have been Nicolas Fuller, in his *Miscellanea Sacra.* He was followed by Eichhorn, and ultimately by nearly all the orientalists of Germany.

2. Ewald's Hebrew Grammar, translated by Nicolson, p. 1; Gesenius, *Grammatik*, § 1.

3. Morinus *De Lingua Primæva.* Jahn, *Einleitung*, i. th. s. 244.

4. "As the language appears to us at present in the Scriptures of the Old Testament, there are only two distinct periods characteristically discriminated, the one comprehending the books written before, and the other those written during and subsequent to the exile." Gesenius, *Geschichte der Hebr. Sprache und Schrift.* s. 21.

5. Compare Horne's Introd. vol. ii. p. 2–13, and the works referred to by him.

The portions of the Old Testament not in pure Hebrew are Ezra, iv. 8,—vi. 18, and vii. 12–26; Jer. x. 11; and Daniel, ii. 4,—vii. 28. These are in Chaldaic or Eastern Aramaic, and have reference chiefly to the history of the captivity, and the events following its close.

On the Biblical Chaldaic, see Walton's *Prolegomena*, chap. xii. § 2, 3; L. Hirzel, *De Chaldaismi biblici origine et auctoritate Comment. crit.* Lips. 1830; F. Dietrich *De Sermonis Chaldaici proprietate*, Lips. 1839; Rigge's Manual of the Chaldee Language, Boston, Mass. 1832.

The language of the New Testament is the κοινη διαλεκτος of the classical Greek, with many Aramaic words and idioms interspersed, and a few Latinisms.

Horne's Introd. vol. ii. p. 13–30; Schott, *Isagoge Hist. Crit.* p. 495–517; Stuart's Grammar of the New Testament Language; Winer's *Gramatik des N. Testamentlichen Sprachidioms;* Michaelis, Introd. vol. 1. p. 97 (Eng. Tr.), &c.

SECT. III.—*Genuineness and Authenticity of the Sacred Volume.*

As ancient literary documents, the Scriptures lay claim to be regarded as both *genuine* or *authentic*, and *credible.*

A book is *genuine* when it really is what it professes to be, as the composition of a particular individual, or as produced under particular circumstances, and at a certain place and time; as opposed to a book which appears under a *forged* title. A book is *credible* when the statements it contains are physically true; as opposed to a book the contents of which are *false* or *fictitious*. Both these qualities may meet in the same work, or they may exist separately in separate works. Thus the book of Genesis may be the composition of Moses, and yet be fabulous; or it may be true in all its statements, and yet not be the work of Moses; or it may be, as it is generally believed to be, both the production of Moses and true, both genuine and credible.

The genuineness and credibility of the sacred books form matter of separate investigation and proof. At the same time, they are so connected, that the proof of the one paves the way for the proof of the other; for, in the case of such works, it is highly improbable that truth would be issued under a forged name, or that such men as Moses, Samuel, or the Evangelists, would or could issue fictitious narratives as true. It is not, however, matter of indifference which of them we establish first. Before we can set ourselves to prove their credibility, we must be in circumstances to show their genuineness; for unless we can do this, a preliminary difficulty will lie in the way of the former, from the suspicion that these books appear with a falsehood, or at least what has not been shown to be a truth, upon their front; a work of supposititious authorship being always *prima facie* less credible than one which is the genuine production of the writer to whom it is ascribed.

The proof of the genuineness of the Sacred Scriptures rests upon the following considerations:

1. There is no antecedent impossibility that they should be genuine. It cannot be shown that it was impossible for Moses to have written the Pentateuch, Isaiah and the other prophets their prophecies, the Evangelists their gospels, the Apostles their epistles, or for the books which are anonymous to have been composed under the circumstances which they profess; nor that, being composed, it was impossible for them to have been preserved and handed down from generation to generation.

2. Circumstances were favourable to the preservation of these books, supposing them written. The Old Testament books professedly form the national literature, as well as the sacred documents of the Jews, and would naturally be carefully preserved by them. The New Testament books constitute the religious archives and statute-books of the Christian church, and would from their first publication be sacredly conserved by those for whom they were so deeply interesting.

3. It is matter of undeniable history, that both Jews and Christians did possess certain sacred books, which they regarded with the utmost reverence, and preserved with the greatest care. The only question, then, is, Are the books which we possess the same as those thus reverenced and preserved? And, *first*, with respect to those of the Old Testament.

i. These are the books which were recognised in the early church as the sacred books of the Jews. This is placed beyond doubt by the early versions of Scripture, and by the catalogues of Athanasius, Epiphanius, Jerome, Origen, and Melito bishop of Sardis. Lardner, Works, vol. iv. p. 290, 8vo ed.

ii. The books of the Old Testament which we possess must have been extant *at the commencement* of the Christian era. This is evident from the allusions to them, and the quotations from them, in the New Testament, but especially from the testimony of Philo, an Egyptian Jew, who at the latest was contemporary with the apostles, and also of Josephus, himself a priest of the Jews, and consequently accurately informed on all matters relating to their sacred books, and who lived in the latter part of the first century of the Christian era. Philo gives no formal catalogue, but quotes from or refers to nearly all the books of the Old Testament, while no other is mentioned by him as of accredited authority. Josephus, besides frequent quotations and allusions, gives (*Cont. Apion*, lib. i. c. 8) a catalogue of the sacred books of his nation, assigning five to Moses, thirteen to the prophets, and four to the writers of hymns and moral maxims. This, if we regard Judges and Ruth as one book, and add the Lamentations to the Prophecies of Jeremiah, which there is good reason to believe was the case in the days of Josephus, gives exactly the number of the books now extant.

Schmidtii *Historia Antiqua et Vindicatio Canonis Sacri Veteris et Novi Testamenti*, pp, 129–189, Lips. 1775; Ejusdem *Ennarratio sententiæ Flav. Josephi de libris Vet. Test.* Wittenberg, 1787; Hornemanni, *Obss. ad Illustrationem Doctrinæ de Canone Vet. Test. ex Philone*, Hauniæ, 1778; Henderson's Lectures on Inspiration, p. 468, Lond. 1836.

iii. These books must have been written *long before* the Christian era. This is plain from the fact of targums or explanations of them into the Syro-Chaldaic dialect, which was the language of the people, having been made for a long course of years antecedent to the times of Onkelos and Jonathan Ben Uzziel, by whom they were collected in the form now extant, and who lived probably near the days of our Lord; from the allusions to the sacred books of his nation already quoted from the prologue to the work of Jesus the son of Sirach, which was composed about 230 years B. C.; and from the existence of the Septuagint version, which was at least commenced 280 years B. C.

iv. Under such circumstances, the forgery of these books was morally impossible. If such a thing took place, it must have been during the 140 years which elapsed between the death of Malachi, the last of the prophets, and the execution of the Septuagint version. But, first, it is inconceivable that, in so short a period, and in an age when literature was not a trade, a set of men (for the agency of only one man is out of the question) should have appeared in the land of Judæa, all endowed with genius sufficient to share in the composition of such works, and all infected with the spirit of literary dishonesty, so as to act the part of forgers. Secondly, even supposing such a piece of deception attempted, it is inconceivable how it should have succeeded, as, by the holders of this hypothesis, it must be allowed to have done. As the whole nation of the Jews acknowledged these books, we must suppose, either that they were all imposed upon in the matter, or that they all agreed to impose upon the rest of the world. But no ingenuity can suffice to persuade a nation that they have for ages possessed sacred books, when they know they have not; and a national agreement to sanction a forgery and tell the world a lie, is a hypothesis too extravagant to be for a moment entertained. Thirdly, the opinions expressed in these books, the doctrines taught, and the duties enjoined, are so averse from those most cherished by the Jews at the time the supposed forgery must have taken place, and the facts recorded are so little flattering, upon the whole, to the pride of the nation, that it is quite incredible, either that any should have been found to write them, or that, being written, they should have been received by the people with any other feelings than those of execration and abhorrence. The respect in which they were held can be accounted for only on the principle, that it was rendered to the *venerable antiquity* and *indisputable authority* with which they were invested.

v. The force of this conclusion is heightened by the circumstance, that while all testimony is in favour of the genuineness of these books, not one witness can be produced whose evidence is incompatible with this.

vi. When we apply to the contents of these books such tests as are best fitted to try their genuineness, the result is such as to confirm our previous conclusion. 1. They display just such a diversity of talent, style, and character, as we should expect in works composed by different authors at different times. 2. They are written, with a few slight exceptions, in pure Hebrew, a language which we know to have been that of the Jews before the captivity, but the knowledge of which as a vernacular tongue was entirely lost very shortly afterwards. 3. Whilst they use the same language, there are certain grammatical and linguistic differences between the early and the later writers, indicative of such changes as all languages experience in the lapse of time, but less extensive than those found in others of the ancient tongues; which is exactly what might have been expected in the case of persons using, through a long interval, a language which, though exposed to causes of change, was, from the fixed and exclusive habits of those speaking it, less liable to be affected in this way than the languages of more versatile and cosmopolitan nations. 4. The narratives occurring in these books are marked by that minute accuracy and circumstantiality of detail which a forger generally endeavours to avoid, but into which a true witness naturally falls, from having all these details present to his mind as integral parts of the occurrence which he attests, *as it presented itself to his senses.* 5. There is, amidst the greatest elevation of thought and sublimity of conception, a chastened simplicity of language, and, amidst the utmost variety of manner, style, and illustration, an essential unity of doctrine, which comports well with the claims of these books to be regarded as the sacred books of the Jews, and seems strongly incompatible with the supposition that they are forgeries.

For these reasons, it is affirmed that the books which we now possess are the same as those which were always possessed and held genuine by the Jews. We turn, *secondly,* to the New Testament, and inquire whether the same evidence of its genuineness can be furnished.

i. No person doubts the existence of the New Testament books from the close of the *fourth* century of the Christian era downwards, because the fact is so notorious, that to deny it would be to discredit all historical testimony.

ii. As little can it be doubted that they were extant from the *commencement* of that century. Not only are they frequently quoted by writers who lived during that period, but we possess *ten* distinct catalogues of the New Testament books, issued during this century, of which six are identical with our present canon (1), three omit only the book of Revelation (2), and one omits this book and the Epistle to the Hebrews (3), though both are mentioned in other parts of the author's writings.

1. Those of the forty-four bishops at the Council of Carthage (A. D. 397), of Augustin (A. D. 394), of Jerome (A. D. 392), of Rufinus (A. D. 390), of Epiphanius (A. D. 370), and of Athanasius (A. D. 315).
2. Those of Gregory of Nazienzum (A. D. 375), of the bishops at the Council of Laodicea (A. D. 364), and of Cyrill of Jerusalem (A. D. 340).
3. That of Philaster or Philastrius, bishop of Brixia or Brescia (A. D. 380).

Lardner, Works, vol. iv. pp. 280–501, and vol. v. pp. 1–123.

iii. Their existence in the *third* century is placed equally beyond doubt, from the careful and explicit testimony of Eusebius, who wrote A. D. 315; from the references to them in the writings of the apologists Arnobius Afer and Lactantius (cir. A. D. 300); from the testimonies contained in fragments preserved from numerous writers in that century, especially Victorinus bishop of Pettau, in Germany, who refers to nearly every book in the New Testament; from the commentaries upon them and quotations from them of Origen (A. D. 253); from the quotations of Cyprian (A. D. 258); and from references to them in the remains of a number of writers who lived during the first thirty years of the third century.

Lardner, Works, vol. ii. pp. 397–430.

iv. For their existence in the *second* century, we have abundant evidence, in the quotations from them and allusions to them in the writings of Tertullian (A. D. 200), Clement of Alexandria, Athenagoras (A. D. 180), Irenæus (A. D. 170), Justin Martyr (A. D. 150), and Papias (A. D. 113), and in the Harmony of the Gospels by Tatian (A. D. 170).

v. Collateral with these testimonies of the orthodox fathers are those of the early heretics, Cerinthus, the Ebionites, the Basilidians, Marcion, and others, who, by denouncing the writings of the apostles, as containing error, thereby attest the existence and genuineness of these writings; and of the early opponents of Christianity, Celsus, Porphyry, and Julian, who, by the notice they take of these books, show how much in their day their genuineness was matter of public notoriety.

vi. We have thus traced up the existence of these books to the close of the *first* century. To say nothing of the testimony in their favour of the apostolic fathers, Barnabas, Clement of Rome, Hermas, Ignatius, and Polycarp, who flourished during that century, and reached up to the days of the apostles, the supposition of a forgery at that time is clearly absurd. Whilst men were still alive whose fathers were the contemporaries of the evangelists and apostles, how could any one impose upon the community as the production of the latter what was only forged in their name? or whilst the churches at Rome, Colossæ, Corinth, and other places, were still existing, who could have persuaded them to receive as Paul's letters to them what they knew Paul had never sent to them? or how can we conceive that an attempt so audacious would have been allowed to pass, without a single voice being raised in any quarter to denounce the imposture?

vii. The conclusion thus gained by the consideration of external testimony is forcibly confirmed by the contents of the books themselves. The *language* in which they are written is exactly such as a Jew of the first century would naturally fall into in attempting to write Greek, and such as could hardly have been thought of or imitated by a later writer. The *style* of composition is such as a forger could not possibly have hit upon; it has so much of a prevailing simplicity and earnestness, and at the same time is so suitably diversified in the different books, that it bears every indication of having flowed from the pens of the simple-minded, unambitious, uneducated, and honest men to whom it is ascribed. The *sentiments* are such as we cannot suppose men of sufficiently depraved moral habits to act the part of forgers, to have conceived or inculcated. And above all, the *minute circumstantiality* of the narrative is such as, on the one hand, strikingly indicates the agency of an eye and ear witness in the composition of it, and on the other, affords too many tests of the author's personal familiarity with what he narrates, to have been ventured on by a forger. The striking coincidence of one part of the volume with another may also be mentioned as a further evidence of its genuineness.

For these reasons it is concluded, that the Scriptures of the Old and New Testament are the genuine productions of those to whom they are ascribed. They are reasons which must satisfy every person familiar with such inquiries, that we possess in favour of the genuineness of these books a far larger and more unquestionable body of proof, than we have in favour of the genuineness of any of the ancient classics, and indeed of much even of comparatively modern literature.

See on the whole of this section, Horne's Introduction, vol. i. pp. 35–99; Lardner's Credibility, Works, vols. i.–v. 8vo, i. and ii. 4to; Paley's Evidence of Christianity, and *Horæ Paulinæ;* Michaelis's

Introduction by Marsh, vol. i. p. 4–54; Cook's Enquiry into the Books of the New Testament; Taylor's Essay on the Transmission of ancient books to modern times; Schott, *Isagoge*, p. 518–542.

Sect. IV.—*Integrity of the Sacred Books.*

Closely connected with the question of the genuineness of the Scriptures is the question of their *integrity*, or *uncorrupted preservation*. Infidels have often asserted, that extensive and important changes have been made upon the original documents, especially upon those of the Old Testament. But,

1. Of this there is no proof. It is a mere unsupported assertion on their part, resting upon nothing but certain *a priori* conclusions to which they profess to have come, as to the *probability* of such a thing. To prove it, we should require some competent historical testimony to the fact, or an articulate comparison of the alleged interpolations with the original text.

2. Such interpolations could have been perpetrated only by universal consent on the part of all possessing these documents. Had one man altered his own copy, and published his alterations, the only result would have been certain discrepancies between the readings of that family of manuscripts of which his copy was the parent, and those of other families, unless he could have persuaded the whole nation of the Jews, or the entire body of the Christians, as the case might be, to adopt his innovations,—a supposition plainly impossible.

3. Had extensive alterations taken place, the harmony of Scripture would have been destroyed. A number of separate books are written by different persons, for the purpose of unfolding under different aspects and modifications one harmonious system of truth. The result is a harmonious work. But some person, for purposes of his own, sets about interpolating these books. Is it conceivable that this should have been accomplished with such exquisite skill and adroitness, that the original harmony of the work should have been preserved, and all vestiges of a spurious intermixture concealed?

4. It is morally certain, that previous to the Christian era, the Jews did not alter their sacred books. For this we have sufficient security in the habits and circumstances of the people. The Bible was their national statute-book; on it the whole of their civil economy, and all their political and judicial procedure, rested. They were in the habit of giving the utmost publicity to its contents; kings were required to study it continually, priests were appointed to teach it to the people, and fathers were enjoined to inculcate it upon their children, so that the idea of connivance among the members of any class in the community for the purpose of falsifying it is entirely precluded. Their law contains a solemn prohibitory statute against any, the slightest, alterations of these books, Deut. v. 2, xii. 32. The rival sects which arose among them after their return from Babylon served the same purpose, by acting as mutual checks upon each other. And, finally, in the absence of any censure by our Lord upon the Jews, whose crimes he faithfully exposed, for their treatment of the sacred text, and in his continual references to the Old Testament in the state in which it was then extant, as containing an accurate record of God's will, we have the best assurance that no liberty affecting its perfect integrity had been taken with it previous to his advent.

5. Since the commencement of the Christian era, it is equally certain that no intentional corruption of the Old Testament Scriptures can have taken place. The *Jews* have not corrupted them, for they have ever shown too deep a reverence for every word and letter of these books to have done so; they have been too much scattered and disunited to have agreed upon any such attempt; they would not have left so many statements condemnatory of themselves and favourable to Christianity had they set about altering their own Scriptures; and they have since that time been so much under the eye of Christians, that any such attempt on their part would immediately have been detected and denounced by the latter. *Christians* have not done it; for, to say nothing of the fact, that hardly any Christian has been sufficiently master of the Hebrew language to execute skilfully any such alterations, the attempt on their part to do such a thing would have been immediately discovered and exposed by the Jews.

6. As impossible is it that any corruption has taken place in the Christian Scriptures. It is plain that this could not have occurred during the lives of their authors, nor whilst the autographs of their works were extant. But in some cases before, and in others immediately after, the death of the inspired writers, copies of their writings were multiplied to a great extent, and disseminated over the whole Christian world. It could only therefore have been by the general consent of all Christians, that any material alterations could have been made on these writings; for if one sect or party had interpolated their copies, this could not have affected the copies of others, and would have been detected and denounced by them. But the idea of a general consent of Christians in all parts of the world to falsify their own documents, is one too extravagant to be admitted.

7. The agreement of versions and of manuscripts, both of the Old Testament Scriptures and of the New, is a corroborative evidence of their integrity. The number of early versions is considerable, and among them so great a harmony prevails, that it is undeniable they must have been made from a common original, and that that original must have been the same as we now possess. The same conclusion is attested by the agreement of the manuscripts. Of these nearly 1150 containing the whole or parts of the Old Testament, and about 700 containing the whole or parts of the New Testament, have been collated, without any material discrepancy having been elicited (1); a fact which is utterly irreconcileable with the supposition of any designed interpolations having been so much as attempted by any class or party, either of Jews or of Christians (2).

Sect. V.—*Credibility of the Sacred Scriptures.*

That these books, in their narrative parts, contain statements of actual facts, is sufficiently established by various considerations.

1. The things narrated are such as their writers were fully competent to attest. For the most part they were eye and ear witnesses of what they record; and where this was not the case, they were placed in circumstances the most favourable for gaining information from first sources as to the facts they narrate. They are, in fact, with one or two partial exceptions, what very few of the ancient historians are, annalists of their own times.

---

[1] Rosenmüller observes respecting the codices of the Old Testament, "Ii qui hodie exstant codices omnes ita inter se conspirant, ut ex aliquot centenis variis lectionibus vix una deprehendatur quæ sensum mutet. Circa unam duntaxat vel alteram litteram, Vocalem vel Accentum versantur. Quod quidem argumento est, Veteris Testamenti libros, prouti eos nunc legimus, ex unius, quam dicunt, recensionis codicibus ad nos transmissos esse, atque omnes codices, antiquiores æque qui perierunt, ac recentiores quos habemus tanquam a communi fonte fluxisse." (*Præf. ad Edit. Stereotypam Hahnii Bib. Heb.* p. iv.) Language no less strong may be justly held regarding the New Testament.

[2] See Horne's Introduction, vol. i. pp. 100–108; Michaelis's Introduction, vol. i.; Walton, *Prolegom.* vii.; Nolan's Inquiry into the Integrity of the Greek Vulgate, London, 1815; [Bentley's] Remarks on Freethinking by Philoleutherus Lipsiensis, No. xxxi.–xxxiii; Dr J. Pye Smith's Answer to the Manifesto of the Christian Evidence Society, 4th ed., and Rejoinder to Taylor, 2d ed. London, 1830; Ernesti's Principles of Biblical Interpretation, translated by Charles H. Terrot, vol. ii. pp. 1–24, Edin. 1833.

2. The matters which they record were such as they could not possibly be deceived about. They are such as any man with the use of his senses, and an ordinary portion of discrimination, was as fully competent to judge of as the most profound philosopher. The passage of the Red Sea, for instance, or the re-appearance of our Lord after his death, was a fact respecting which no man in his senses could be deceived. Unless the sacred writers were the wildest enthusiasts (of which, however, no trace is discoverable in any other part of their conduct, but the contrary), they could not have been misled into the belief that they had seen such things, if they had not seen them.

3. The blameless character and disinterested fidelity of these witnesses show that they were not themselves deceivers. The mind of man is subject to certain laws, upon which we may calculate with the same security as upon the laws of matter; and one of these is, that no man of generally irreproachable character will deliberately and pertinaciously propagate a falsehood, save under the influence of very strong temptation. Now the sacred writers were men of blameless character, so that if their narrative be false, it can only have been under the stress of very urgent necessity or sinister inducement that they can be supposed to have promulgated it. But where was this stress in their case? What evil had they to shun, what prodigious advantage to gain, by falsehood? On the contrary, did not their adherence to their story expose many of them to the severest privations and the cruelest sufferings, even to death itself? Do men, then, ever so fall in love with falsehood as to consecrate their lives to its propagation, and willingly to endure every species of contumely, persecution, and oppression, rather than relinquish it? Would not such a thing be a moral miracle, infinitely more incredible than any of those which the sacred writers narrate, because, unlike theirs, performed not only without the affirmation of divine agency, but in direct opposition to the law of the God of truth?

4. Their narratives were published at a time when the events they record were so recent that it outrages all probability to suppose, either that they would have had the audacity to publish what was false, or that their falsehoods would have been allowed to descend to posterity uncontradicted. Who can for a moment imagine, that had the Israelites not crossed the Red Sea in the manner described by Moses, he could have persuaded them to believe that they had? or that the facts of our Lord's history could have been palmed upon the world when there were so many still alive both interested in and competent for their refutation, had they not really occurred?

5. These histories account satisfactorily for numerous undeniable facts that are otherwise unaccountable, such as the existence and present state of the Jews, the existence and propagation of Christianity, and the prevalence of certain rites and ceremonies among Jews and Christians, such as circumcision in its religious aspect, the weekly Sabbath, the Lord's Supper, &c. They further tally with the testimony of profane history, in as far as the field is common to both. They "interweave themselves," as Dr Channing has well observed, "with real history so naturally and intimately, as to furnish no clue for detection, as to exclude the appearance of incongruity and discordance, and as to give an adequate explanation, and the only explanation, of acknowledged events of the most important revolutions in society." That such narratives should be fictitious, the same writer justly concludes, "is a supposition from which an intelligent man at once revolts, and which, if admitted, would shake a principal foundation of history." Discourse on the Evidences of Revealed Religion, p. 34, 4th (English) edition, Liverpool, 1831.

6. The credibility of the sacred historians is strikingly confirmed by the traditions and histories of all the ancient nations, by many facts of natural history, and by numerous monuments of human art which are still existing, such as coins, medals, and inscriptions.

See Faber's *Horæ Mosaicæ*, vol. i.; Bryant's Antient Mythology, three vols. 4to, 1774; Edwards on the Truth and Authority of Scripture, vol. i.; Gray's Connection of Sacred and Profane Literature; Lardner's Credibility, and Jewish and Heathen Testimonies, &c. Works, vol. i.-viii.; Redford's Lectures on the Divine Authority of the Bible, as confirmed by Science, History, and Human Consciousness, 1837; Horne's Introduction, vol. i. 116–20.

SECT. VI.—*Canon of the Sacred Scriptures.*

The Greek word *ϰανων* signifies originally a *straight line* or *rod;* hence tropically a *rule*, and hence a *list* or *catalogue*, as that which contains the rule or order of the things contained in it.

In this last sense it is applied to the Scriptures, but with a different reference, according as it is used in inquiries of a dogmatical or in inquiries of a historico-critical nature. In the former, it means the list of books deemed *inspired;* in the latter, the list of books recognised as *genuine* by Jews and Christians. In either case, such books are opposed to those that are *apocryphal* (ἀποκρυφα, "ea scripta quibus *publice* ecclesia non utebatur, sed *privatim* habebat legebatque qui vellet." *Ludovicus Vives ad Augustin. de Civ. Dei*, l. xv. c. 23.).

In regard to the sacred writings, both these lists are so far identical, that all the books which are found in the former are found also in the latter.

An ancient and not improbable tradition represents Ezra as the person who formed the Jewish canon in its present state; but this can only mean that he made it up as far as the books composing it were written in his day. It is generally supposed that Nehemiah, who is said to have collected a βιβλιοθηκη of the sacred books (2d Macc. ii. 13), and Malachi, the last of the prophets, closed the canon by adding to it their own writings; though some affirm that the list was not finally made up until about the time of the Syrian invasion under Antiochus Epiphanes, in the third century B. C. Certain it is that by that time all the books now extant had been composed and arranged in their present order, as they not only were then translated into Greek, but are spoken of by Jesus Siracides, who lived about two hundred years B. C., as divided into three classes, and as of considerable antiquity.

At what time the canon of the New Testament was made up we have not the means of accurately determining. We are sure, however, that from a very early age these writings were collected, and were referred to in their collected character, as the received documents of the Christian community. Tertullian does so repeatedly in his writings, denominating them sometimes "the New Testament," and sometimes "the Divine Instrument," in the singular number. The collection was doubtless made gradually; and from what we learn from Eusebius respecting a distinction between books ὁμολογουμενα and books ἀντιλεγομενα (*Hist. Ecclesias.* lib. iii. c. 25, ed. Heinichen, vol. i. p. 244), it would appear that the claims of every book were carefully weighed before its canonicity was admitted.

See Cosin's Scholastical History of the Canon of the Holy Scripture, London, 1672; Jones's New and Full Method of Settling the Canonical Authority of the New Testament, Oxford, 1798; Alexander' Canon of the Old and New Testaments Ascertained, London, 1828; Ch. F. Schmidtii *Historia Antiqua et Vindicatio Canonis Veteris et Novi Testamenti*, Lipsiæ, 1775; Haenlein's *Einleitung in die Schriften d. N. T.*, bde. i. s. 341, Erlangen, 1801; Henderson's Lectures on Inspiration, lect. ix.

The apocryphal books of Scripture may be divided into two classes, the one containing those that are simply dogmatically, the other those that are both dogmatically and historico-critically apocryphal. To the former belong the books of Maccabees, Wisdom, Ecclesiasticus, and perhaps those of Tobit and of Judith, which are genuine, though not inspired; to the latter all the rest of the apocryphal books, both of the Old Testament and the New, none of which are inspired, or can be shown to be genuine.

SECT. VII.—*History of the Original Text of the Old Testament Scriptures.*

The history of the Hebrew text may be divided into three great epochs. The *first* of these reaches from the completion of the Alexandrian Greek version to the times of Origen, Jerome, and the Talmud, B. C. 300—A. D. 500. During this period the use of the Greek version had very much superseded, even in Palestine, the original Hebrew; but ample compensation for this has been rendered by the aid which the existence of this and of other versions has afforded the critic in settling the Hebrew text. Important service was rendered by Origen's critical revision of the Greek, and Jerome's revision of the Latin versions. Nor were the Jews behind the Christians in this respect, for we find from the Talmud evidence that already had various readings begun to be collected by them.

In the *Talmud, Hierosol. Tract. Thaanit.* fol. lxviii., it is said of certain various readings, that "they have come down from the times when the temple was yet standing." Capelli *Critica Sacra*, tom. i. p. 444-458; Waltoni *Prolegom.* viii. § 20–28; Kennicott, *Dissert. Generalis*, p. 275; Horne's Introduction, vol. ii. p. 35, 36.

The *second* epoch reaches from the times of Jerome and the Talmud to that of Ben-Asher and Ben-Naphthali, that is, from the sixth to the eleventh century. About the commencement of this period the Masorah, or collection of traditionary observations, orthographical, critical, grammatical, and exegetical, which had been accumulating for upwards of three centuries among the Jewish rabbin, was made by a college of learned Jews at Tiberias in Palestine. To this mass of scholia additions were continually made, as well as corrections proposed on it, by the *Lords of the Masorah* (בעלי המסורה), as they were called, until the time of Jacob Ben Ha-yim, by whom the whole was completed and printed along with the Hebrew text in the year 1526. The commencement of the eleventh century is memorable in the history of the Hebrew text, from the circumstance of two recensions having been issued by the heads of two celebrated Jewish academies; by Aaron Ben Asher, principal of the academy of Tiberias, and Jacob Ben Naphthali, principal of the academy of Babylon. These have given rise to the various readings denominated the occidental and the oriental respectively. By them also the last hand was put to the pointing of the Hebrew text.

Capelli *Crit. Sacra*, t. i. p. 439–443; Simon, *Histoire Critique*, ch. i. p. 24–26; Kennicott, *Dissertationes*, ii. p. 279; Buxtorf, *Tiberias*, 1610; Marsh's Lectures, lect. viii. ed. 1828; Walton, *Prolegom.* viii.; Horne, vol. ii. p. 39, 40.

The *third* epoch reaches from the beginning of the eleventh century to the middle of the eighteenth. About the year 1040 many learned Jews, banished from the east, took refuge in Europe, and brought with them their Scriptures and their critical learning. Maimonides, Jarchi, Ebenezra, Kimchi, and others, rendered additional service as to the interpretation, so also to the criticism, of the sacred text. In the thirteenth and fourteenth centuries Todrosius, Menachem, and Sal. Norzi, collected various readings. In 1477 the first scriptural book in Hebrew, in 1488 the entire Hebrew Bible for the first time, was printed; the latter at Soncino, the former at some place unknown. Of great importance is the so-called *Rabbinical Bible*, printed at Venice in 1526, and edited by Ben Ha-yim. Among Christian editors, Sebastian Münster was the first who issued an edition of the Hebrew Bible, with various readings, Basil, 1535. The editions of Jablonski, Berlin, 1699, and of Van der Hooght, Amsterdam, 1705, are worthy of notice as critical editions. John Henry Michaelis published his edition at Halle in 1720, for which he collated five manuscripts and nineteen editions. In 1753, at Paris, appeared the edition of Charles Francis Houbigant, for which twelve manuscripts were collated, but the value of which is greatly impaired by the editor's propensity to conjectural emendation, and by his attaching such undue importance to the readings of the Septuagint. The splendid work of Kennicott (Oxford, t. i. 1776, ii. 1780) presents the largest mass of various readings yet collected; but the want of scientific discrimination as to their relative value has impaired the usefulness of the collection. The same may be said of the various readings collected by De Rossi, Parma, 1784–1788.

Marsh's Lectures, lect. ix.; Horne, ii. p. 41, 42; Augusti, *Einleitung*, s. 85–92.

SECT. VIII.—*History of the Original Text of the New Testament Scriptures.*

In regard to the *Greek* text of the New Testament, the first thing to be considered is the variety of opinion among critics respecting the different *recensions*, as they have been termed, or *classes* of documents containing the original text. Of these documents, some more, and others less, closely resemble each other as respects the nature and selection of their readings, and not unfrequently traces of a common origin in the older codices and versions are apparent. This has led to the idea of arranging these into *classes*, or *families*, or *recensions*, an idea first started by Bengel and Semler (1), and which has been carried out by several more recent inquirers. Bengel concluded that there are two families of manuscripts, the African and Asiatic, of the former of which the Alexandrian manuscript is the sole representative (with which agree the Ethiopic, the Coptic, and the ancient Latin versions), whereas the latter is very numerous. After Bengel came Griesbach (2), who contended for a threefold recension, the Western, the Alexandrian or Eastern, and the Constantinopolitan or Byzantine. Of these, the two former are the oldest, and are by him attributed to the same age. They differ, in that the Western text is more replete with Hebraisms, with explanatory additions, and with occasional substitutions of a perspicuous formula for one more difficult; whilst the Eastern prefers those readings that are accommodated to the classic Greek, corrects phrases that are less pure, and is less deformed by errors of the transcriber, though particles and synonyms are occasionally omitted through haste. The Constantinopolitan has arisen from the mingling of the readings of the other two. It properly consists of *two* recensions; a senior (fourth century), even more fond of pure Greek forms, and richer in glosses, than the Alexandrian itself; and a junior (fifth or sixth century), which appears to have been formed after a new collation of the senior with the Eastern and Alexandrian recensions, by the labours of some learned men of the Syrian Church. Griesbach defends his system with great learning and ingenuity; but it is open, as Schott observes, to the following objections: 1*st*, His positions respecting the origin assigned to both recensions are destitute of a solid basis; 2*dly*, Many reasons concur to prevent our admitting that any state of the text of the New Testament peculiar to the Western Church, such as could from its singular character be entitled to the name of a recension, existed (3); 3*dly*, The features of the text followed by the very ancient Peschito version cannot well be accounted for on the principles of Griesbach; and, in fine, all who seek accurately to arrange codices, versions, and extracts found in the fathers, according to different recensions, labour under this difficulty, that none of those documents of the New Testament which are of great age exhibits any such pure and perfect recension (4).

1. Bengel, *Apparatus Criticus ad Novum Test.* p. 425, Tubingæ 1763; Ejusdem *Introductio in Crisin N. T.* § 26, &c., p. 385, Tubingæ, 1734; Semler, *Vorbereitungen zur Hermeneutik*, Halle, 1760–1769.

2. Griesbach, *Opuscula Academica*, ed. Gabler, vol. i.

3. From the writings of the fathers of the second century, we learn that those various readings which are said to be peculiar to the western and to the eastern texts respectively, do not, as respects their *origin*, belong to different recensions. (See Eichhorn, *Einl.* bde. iv. p. 265 and 269, &c.) Nor is it probable that the doctors of the Western Church, who were but little skilled in Greek, should have thought of preparing a recension of the New Testament.

4. Schott, *Isagoge*, p. 562–565.

A different theory of recensions has been adopted by Hug. He thinks that the text which we find in those early codices which Griesbach referred to the Western recension, in the oldest Latin versions, in the Sahidico-Coptic version, in the quotations of the fathers till the time of Origen, and in Origen himself, was the κοινὴ ἔκδοσις, or common edition, conformed to no recension in particular, and containing various readings of different sorts and of different origins mingled together, especially such as serve to explain the text. At the same time those codices which were written in Syria and other parts of the east (the inhabitants of which understood better than most others the Hebræo-Greek dialect of the New Testament) preserved the primitive text more correctly; and hence it happened that the oldest Syriac version, though upon the whole belonging to this common edition, not unfrequently dissents from the readings of the other documents of the same edition. About the middle of the third century, Hesychius, an Egyptian bishop, first set about correcting the errors of the recension of the common edition used in Egypt, purging out all interpolations and glosses, restoring words that had been omitted, but aiming too much at producing a text that should be remarkable for its Greek purity and elegance. Almost at the same time, Lucian, a presbyter of Antioch, in Syria, revised the common edition as it appeared in the Peschito version, following chiefly the authority of this version, but at the same time comparing other codices found in Syria, and produced a text differing from that of Hesychius in this, that it showed less desire to amend the Greek of the New Testament. Besides these, a third recension was undertaken by Origen in Palestine, based upon the common edition used by the Christians there, which conformed in some respects to that of Hesychius, in others to that of Lucian, whilst frequently it differed from both, and which subsequently became the one commonly used in Palestine and the adjoining districts. Of these recensions none is preserved in any of those documents which we now possess, as the transcribers frequently compared their recension with the common edition and with other recensions. Hug's theory rests so far on an historical basis, that it appears certain that Hesychius and Lucian did undertake some such labour as he ascribes to them; but that codices of their recensions were either very numerous or very widely disseminated, cannot be shown. The labour attributed to Origen is more than doubtful.

Hug, *Einleitung*, bd. i. s. 126 (Eng. Trans. vol. i. p. 134, &c.); Schott, *Isagoge*, p. 566; Horne, ii. p. 56

Matthæi thinks that no recensions of the text of the New Testament were anciently made, and he prefers dividing the documents from which the text is to be determined, into, 1*st*, *Codices textus perpetui*, in which there are neither scholia nor commentaries, and which excel all the others in the purity of the text they exhibit; 2*d*, *Lectionaria*, which contain the lessons read in churches, and exhibit a text less free from scholiary interpolation than the preceding; 3*d*, *Codices mixti*, which contain scholia and interpretations partly on the margin, but chiefly interpolated. Matthæi thought the Moscow manuscripts, which he had himself diligently collated, the best; and this perhaps led him to a very unjust estimate of the worth and authority of many other documents of the text of the New Testament.

Schott, *Isagoge*, p. 570; Horne, ii. p. 50.

Scholz, the most recent editor of the Greek New Testament, adopts neither the opinion of Griesbach nor that of Hug. He concludes that there are two classes of critical witnesses for the text of the New Testament, the Alexandrian and the Constantinopolitan; to the former of which belong all the codices executed in Egypt and western Europe, the most of the Coptic and Latin versions, the Ethiopic version, and the quotations by ecclesiastical writers of these districts; and to the latter all the codices written in Asia Minor, Syria, Palestine, and eastern Europe, the Philoxenian Syriac version, the Gothic, the Georgian, the Sclavonian, the quotations by the fathers living in these regions, and all printed editions. To manuscripts of the latter class he attributes superior value, because of their greater harmony, and of their having been more faithfully copied from original documents than those of the former, which often exhibit a text altered at the will of grammarians. A twofold difficulty presses upon this theory of Scholz; for, first, the Western text of the New Testament has a character considerably different from that of the Alexandrian; and, secondly, the text divulged at Constantinople by order of Constantine and Constans was, as Scholz himself admits, collated with the Alexandrian text, so that the readings of both recensions were intermixed. It is, moreover, rather assumed than proved that that form of the text which, during the first three centuries, prevailed in Asia Minor and Greece, was the same which was afterwards divulged principally in the Constantinopolitan codices; nor is it sufficiently clear that Alexandria was the primary seat of the arbitrary corruption of the New Testament text.

Scholz, *Proleg. ad editionem N. T.* vol. i.; Schott, *Isagoge*, p. 570; Horne, ii. 58–66.

The theory of Eichhorn is that which perhaps approaches nearest the truth. He grants, that from a very early age, different readings, derived from various sources, existed, and were vastly augmented in the third century by various efforts of an exegetical nature, so that as early as the second century there were two species of texts, the Asiatic and the African, but neither of them was determined by any very certain critical laws. He denies that Origen was the author of a peculiar recension, but admits the services of Hesychius and Lucian in this respect, although he questions the possibility of ascertaining accurately the primitive character of either recension from ancient documents. There thus arose a threefold text of the New Testament, the African (Alexandrian), the Asiatic (Constantinopolitan), and a Mixed, which had its source from this, that many, notwithstanding the authority acquired by the recensions of Hesychius and Lucian in the churches of Africa and Asia, preferred following the authority of older codices. No change of a critical kind took place upon the text thus formed until editions of the New Testament began to be printed. No opinion so fully accords with what may be regarded as best ascertained as this of Eichhorn, though it is still doubtful whether the efforts of Hesychius and Lucian exerted a very wide or lasting influence upon the form of the text of the New Testament.

Eichhorn, *Einleitung in das N. T.* bd. iv. s. 183, &c.; Schott, *Isagoge*, p. 572, from which work the above account has been principally taken; Horne, ii. p. 57.

With the exception of some detached portions, the first printed editions of the New Testament were those of the Complutensian Polyglott, 1514, and of Erasmus, Basil,

1516. The next possessing any critical value were those of Robert Stephen,[1] viz. that of 1546, 12mo, commonly called, from the first words of the preface, the "*O Mirificam*" edition, that of 1549, 12mo, and that of 1550, folio. Beza was the first to issue an edition of the New Testament with a copious critical apparatus; and his edition many of the minor editions for several years followed. The beautiful editions of the Elzevirs, which conform partly to the text of Stephen, partly to that of Beza, became so famous that they formed what has been called the *textus receptus*. In 1707 the edition of Mill was published at Oxford, in which not only is there a larger collection of various readings furnished, but also a more scientific discrimination of these aimed at, than in any preceding edition. His example was followed by Bengel in Germany and Wetstein in Holland, both of whom have rendered important service to the text of the New Testament. All these, however, have been outstripped in diligence, learning, and acuteness, by Griesbach, who issued his first edition, which embraced only the historical books of the New Testament, at Halle, 1774–75. In the mean time, the researches of Matthæi, Alter, Birch, and others, had greatly enlarged the mass of materials for a critical revision of the New Testament, and of these Griesbach eagerly and ably availed himself in preparing a critical edition of the whole New Testament. This he published in two volumes large octavo, the former in 1799, and the latter in 1806, at Halle. Subsequent editors have chiefly followed the scheme of this recension, at the same time exercising their own judgment upon the readings it supplies; but recently Professor Scholz of Bonn has issued a new recension, for which he has subjected most of the manuscripts already used to a new collation, and collated some not hitherto examined. It appeared in two vols. 4to, in 1830–36, at Leipzig. A beautiful and exceedingly useful edition of the New Testament has been recently issued in this country by Dr S. T. Bloomfield, formed upon a careful collation of all previous critical recensions; the third edition, two vols. 8vo, appeared at London in 1839.

Marsh's Lectures, lect. iii.–vii.; Schott, *Isagoge*, pp. 631–642; Horne's Introduction, vol. ii. part ii. pp. 11–35; Michaelis, Introduction, by Marsh, vol. ii. p. 159 and 429; Ernesti's Principles of Interpretation, vol. ii. p. 47.

Sect. IX.—*Manuscripts of the Sacred Text.*

Hebrew manuscripts are of two classes, *the rolled* and *the square*; the former prepared for the use of the synagogues, and written only on parchment; the latter for private use, and written sometimes on parchment and sometimes on paper. In all the ancient manuscripts the words are written continuously without any division, and in the square Chaldaic character. They are divided by De Rossi into three classes, viz. 1. *The more ancient*, or those written before the twelfth century; 2. *The ancient*, or those of the thirteenth and fourteenth centuries; 3. *The more recent*, or those written at the end of the fourteenth or beginning of the fifteenth century. The number of manuscripts collated by Dr Kennicott was about 630, and by De Rossi 479.

Kennicott, *Dissert. Generalis*; Tychsen, *Tentamen de variis Codd. Heb. MSS.* 1772; Horne, vol. ii. p. 76–90.

Manuscripts of the Greek New Testament were written first on Egyptian papyrus, and then, as this was found too subject to decay, on skins. Subsequent to the twelfth century, silk paper was used for this purpose, until the thirteenth century, when common (linen) paper came into use (1). For the first eight centuries the manuscripts were written in uncial letters, large, erect, and not united either by strokes or hooks. From the beginning of the ninth century the cursive letters were employed, which are smaller, more inclined, and united with strokes; they have, moreover, the iota subscribed (2). At first all the words were written without any diacritical marks or separations; but as this was found inconvenient, and productive of mistakes, especially in the public reading of the New Testament, a plan was introduced to remedy it by Euthalius, then a deacon at Alexandria, in the fifth century, which consisted in so arranging those words that make one sense, as that they should compose one stich (στιχον) or line (3). To save room, subsequent transcribers, instead of arranging these in distinct lines, marked the conclusion of each by a colon or point; and thus by degrees arose a complete grammatical punctuation, which is presented in manuscripts from the tenth century downwards, though it was not till the sixteenth century that it was subjected to fixed rules in the editions then printed. From a very early period the custom prevailed of dividing the text into sections (κεφαλαια), but until the time of Euthalius no uniform order was observed in this respect. About the middle of the third century, Ammonius of Alexandria, in preparing a Diatesseron or Harmony of the Evangelists, divided the text into a number of very short sections; and these having been adopted with slight variations by Eusebius (4) (whence they are frequently denominated κεφαλαια *Ammoniano-Eusebiana*), they were in many manuscripts conjoined with the Euthalian divisions. In the sixth century, some finding use for a division of the text into larger portions, introduced the arrangement by τιτλοι or *breves*; but in the course of time these two modes led to so much confusion, that in the thirteenth century Hugo de Santo Caro, a Spanish cardinal, introduced as a remedy the division into chapters and verses, which was afterwards perfected by Robert Stephen into that now in use. Besides these divisions, there was another for church purposes into περικοπαι, ἀναγνωσεις, or ἀναγνωσματα, containing the sections of the New Testament appointed for lessons in the public service of the church on Sundays and festivals. The commencement of each of these was marked with an α (ἀρχη), and the close with a τ (τελος) (5).

These historical facts are of service in determining the age of the New Testament codices. These are very numerous, but the most famous of them alone required to be enumerated. Very few of them contain the whole of the New Testament. They are arranged as follows.

1. *Manuscripts executed before the stichometric mode of writing was prevalent*, viz. the Cod. Alexandrinus (A[2]), Vaticanus (B), Ephræmi (vel Cod. Regius 9, G), Dublinensis rescriptus (Z).

2. *Stichometric Manuscripts*, viz. Cod. Cantabrigiensis (vel Cod. Bezæ, D), Laudianus III. (E), Claromontanus (D, inter Cod. Paulinos), Bœrnerianus (G, inter Cod. Paulinos), Augiensis (F, inter Cod. Paulinos), Coislinianus (H).

3. *Manuscripts written after the disuse of the stichometric method.* These are very numerous. The most valuable

---

[1] This is commonly written *Stephens*, but the correctness of this may be questioned. The French *Etienne*, which was the vernacular name of this illustrious family, is equivalent to our *Stephen*, and the proper Latin form of Stephens would be *Stephanius*, and not *Stephanus*.

[2] These letters refer to the nomenclature of the manuscripts adopted by Griesbach and Wetstein.

are the following, viz. Cod. Cyprius (olim Colbertinus, K); Basiliensis, b. vi. 21 (E); Basiliensis, b. vi. 27 (vel Reuchlinianus); Stephani Octavus (L); Winchilseanus (106); Regius (M); Mosquenses Bibliothecæ S. Synodi, iv. v. xliii. xcviii.

Schott, *Isagoge*, p. 591–599; Horne, Introd. vol. ii. p. 111–196; Hug, *Einleit.* [Eng. trans. vol. i.].

SECT X.—*Ancient Versions of the Sacred Scriptures.*

These may be arranged either with respect to their history, as *Immediate* and *Mediate*, according as they have been made directly from the originals or from other translations; or with respect to the languages in which they exist, as *Oriental* and *Occidental*. We shall follow the latter arrangement, as the more convenient; at the same time intimating, when it is possible, what place each version has in the former.

I. ORIENTAL VERSIONS.—1. *Chaldaic Targums.* After the return of the Jews from Babylon they brought with them so much of the language of Chaldæa, that they were unable to understand their own Scriptures. Hence arose the necessity of accompanying the reading of these in the synagogues with an interpretation; a practice first introduced by Ezra (Nehem. viii. 8), and which continued to be followed as long as the Jewish service was maintained. These interpretations were at first merely oral, and confined to a literal version of the original into the popular dialect; but gradually they became more paraphrastic, and the idea naturally arose of committing the more valuable of them to writing. From this sprung the Chaldaic Targums, or paraphrastic versions of the Hebrew Scriptures. The oldest now extant is that of Onkelos on the Pentateuch, composed according to some in the first, and to others in the third century of the Christian era. It is the least paraphrastic, and the most correct, of any we possess. Next in point of age and value is that of Jonathan Ben Uzziel on the Prophets. The Jews make him a disciple of Simeon, who took our Lord in his arms; but the probability is that he was later. His Targum is more diffuse and paraphrastic than that of Onkelos, but contains much that is valuable. Both of these are printed in Walton's Polyglott. The remaining Targums, nine in number, are of comparatively recent date, and of little value. Their renderings are very harsh; and they are filled with idle and foolish fables.

Winer *De Onkeloso ejusque Paraphrasi Chaldaica*, Lips. 1820; Jahn's *Einleitung*, i. § 46, 47; Bauer, *Chrestomathia e Paraphrasibus Chaldaicis et Talmude delecta*, 1792; Horne, vol. ii. p. 198.

2. *Syriac Versions.* Eight versions of the whole or parts of Scripture into the ancient Syriac tongue are known to critics, but of these only two deserve particular notice. These are, 1. *The Peschito*, that is, *right* or *correct*, not later than the third century, probably as early as the second. It contains the whole Bible, is pure in diction and faithful in version, and appears to have been made immediately from the original. 2. *The Philoxenian*, so called from Philoxenus, bishop of Hierapolis, under whose direction it was executed by Polycarp, rural bishop of the same district, A. D. 508. It contains only the New Testament, and is literal to servility; but its renderings are not good. Its chief value is to the critic, in helping him to judge of various readings.

Hirzel *De Pentateuchi Vers. Syr. indole*, Lips. 1825; Michaelis, Introd. vol. ii. p. 4–76; Horne, vol. ii. p. 220.

3. *The Samaritan Pentateuch.* This must not be confounded with "the Pentateuch of the Samaritans," which is merely a copy of the original Hebrew in Samaritan characters; whereas the other is a translation of the Hebrew into the Samaritan dialect. This version bears a strong resemblance to the Targum of Onkelos, and even some have deemed it a translation of that. It is probably, however, from the original, but cannot be dated earlier than the second century.

Winer *De Versionis Pent. Samarit. indole*, Lips. 1817; Horne, ii. p. 42; Gesenius *De Pent. Samarit. origine, indole, et auctoritate*, Halæ, 1815.

4. *Other Oriental Versions.* These are, 1. *The Coptic*, embracing the *Memphitic*, or that in the dialect of Lower Egypt, probably of the third century, published by Wilkins at Oxford in 1716; and the *Sahidic*, or that in the dialect of Upper Egypt, ascribed to the second century, and, with the exception of a part of the Gospel of John, still existing only in manuscript: 2. *The Ethiopic*, ascribed to the fourth century, and printed in Walton's Polyglott, but with many inaccuracies: 3. *The Armenian*, made by Miesrob in the beginning of the fifth century, very faithful, but supposed to be in many places interpolated from the Vulgate: 4. *The Arabic*, comprising the Pentateuch, and Isaiah, translated by Rabbi Saadias Phijumensis, in the tenth century, the Pentateuch in Samaritan-Arabic by Abusaïd, the anonymous version of Joshua in the London Polyglott, and the Acts and Epistles published by Erpenius: 5. *The Persic* version of the Pentateuch, by Jacob Ben Joseph, surnamed Dawusi, a learned Jew of the ninth century. All these are mediate versions from the Septuagint or Syriac.

Horne, vol. ii. p. 226–234; Comp. Walton, *Prolegom.* ix.–xv.

II. WESTERN VERSIONS.—1. *Greek Versions of the Old Testament.* The most important of these is the Septuagint, as it is commonly called, or more properly the Alexandrian. Respecting the origin and early history of this version much uncertainty prevails, of which advantage has been taken to clothe the whole in the mist of fable. The common story of Ptolemy Philadelphus having sent, at the instigation of his librarian Demetrius Phalereus, to Judæa for a correct copy of the Hebrew Scriptures, and for seventy-two men of learning (six out of each of the twelve tribes) to translate these into Greek, of his having shut them up in the Isle of Pharos, apart from each other, and of their having produced versions *verbatim et literatim* the same, is now rejected by all scholars. The opinion commonly held by such embraces the following points: 1*st*, That it is highly probable that the work was commenced during the period when Ptolemy Lagus and his son Philadelphus held the joint sovereignty; 2*d*, that the motive prompting to it was the multitude of Jews in Alexandria and throughout Egypt, who were ignorant of Hebrew, and needed the Scriptures in Greek; 3*d*, that it was undertaken under the auspices of the Alexandrian Sanhedrin or council of the Jews, who probably consulted their brethren in Judæa about it, and from whom, being seventy-two in number, in all likelihood the version took its name; 4*th*, that the different books were executed at different times and by different persons, as is evident from the varieties in point of accuracy and purity which they present, the Pentateuch being that first executed; and, 5*th*, that the translators of the Pentateuch were evidently Egyptian Jews, from their introducing into their version many Coptic words, and rendering many Hebrew expressions, not into their Greek equivalents, but so as to give an Egyptian hue to the idea. The version thus executed soon acquired great vogue, not only in Egypt, but also in Palestine, where, in the days of our Lord and his apostles, it had mostly superseded the use of the original Hebrew. In the Christian church it acquired the same reputation. Few of the Fathers understood Hebrew, and consequently almost all their quotations from the Old Testament are made through the medium of the Septuagint. The best editions of this version are those of Grabe, Oxon. 1707, 1709, 1719, 1720, four vols. folio and eight vols. 8vo, reprinted with the addition of various readings from the Vatican manuscript by Breitinger, Tiguri Helvet., 1730–31–32, four vols. 4to; of Bos, Franequeræ, 1709, 4to; and of Holmes, vol. i. Oxon. 1798, vol. ii.–v. (edited after Holmes's death by J. Parsons), Oxon. 1818–1827, folio.

See Aristeæ, *Historia de Legis Div. ex Heb. Lingua in Græcam Translatione per LXX. Interpretes*, Frankfort, 1610; Van Dale, *Dissert. super Aristeam de LXX.*, Amstelod. 1705; Josephus, *Antiq.*, xii. c. 2; Hody, *De Bibliorum Textibus Original.* Oxon. 1705; Walton, *Prolegom.* ix.; Toepler, *De Pentateuchi Interpret. Alexandrinæ indole*, Halæ, 1830; Horne's Introduction, vol. ii. p. 203.

Of the other Greek versions, eleven in number, we have only fragments or traditionary information. That of Aquila, a proselyte Jew of Sinope, a city of Pontus, was executed in the first century, for the purpose of discrediting the Septuagint, which the Christians were in the habit of quoting against the Jews; it is very literal and Hebraistic. That of Symmachus, an Ebionite, time uncertain, seems to have aimed chiefly at elegance and purity of style; it is very free. Between these stands that of Theodotion, also an Ebionite, and nearly contemporary with Aquila; more elegant and idiomatic than that of Aquila, more literal and correct than that of Symmachus. These, with three anonymous versions, enumerated as *editio quinta*, *sexta*, and *septima* respectively, were included by Origen in his splendid work the Hexapla, a sort of Polyglott, which that distinguished Biblical scholar drew up for the use of those who wished to understand accurately the Old Testament, and which contained in parallel columns the Hebrew in the original character, the same in Greek characters, and the Greek versions above enumerated, including the Septuagint. The versions designated as ὁ ἑβραῖος, ὁ σύρος, τὸ σαμαρειτικόν, and ὁ ἑλληνικός, are known to us only from being occasionally referred to on the margins of manuscripts. The extant fragments of these versions may be found in the sixth volume of the London Polyglott, under the title *Flaminii Nobilii Notæ*, and in the edition of the Septuagint by Bos.

Dathe, *Diss. Phil. Crit. in Aquilæ Reliquias*, Opuscula, p. 1, &c. ed. Rosenmüller, 1796; Walton, *Prolegom.* ix.; Horne, vol. ii. p. 216.

2. *Latin Versions*. Translations of the Scriptures into the Latin tongue began to be executed at a very early period, for the benefit chiefly of the Christians in Africa, and those parts of Europe where that language was used. Some have supposed that, as early as the second century, there was a commonly received or authorized version in the Latin churches, but this opinion is hardly tenable. The name *Itala*, which has been supposed to designate this version, was more probably an appellation including collectively the whole. Towards the close of the fourth century, Jerome set himself to revise and correct these versions, and in pursuance of this design issued revised editions of the Psalter, the books of Chronicles, Job, and the writings of Solomon. Unfortunately, the manuscripts containing his revised copies of the other books were lost, either through negligence or fraud on the part of some one to whom he had intrusted them. Satisfied, however, that something more than a correction of existing versions was necessary, he undertook a new translation from the original; and this he executed at intervals, and in the order in which particular books were requested by his friends. At first his undertaking was viewed with no small jealousy, and even St Augustin sought to discourage it, from a fear that a new translation, especially one from the Hebrew, would shake the faith of the ignorant in the certainty of Scripture; nor was it till the sanction of Gregory the Great had been given to it that the version of Jerome was able entirely to supersede the old Itala (1). This version is that commonly denominated the *Vulgate*, of which the Council of Trent decreed an immaculate edition; a decree which gave rise to a Papal dissension, to which Christians have not been slow to point as fatal to the claims of the supreme pontiff to infallibility (2).

1. Augustin *De Doctr. Christiana*, lib. ii. c. 11, c. 15; Jerome, *Præfat. in Iobum, &c. ad Sophron.* Opp. i. p. 833, *ad Damasum*, ii. 563; Hody, *De Textibus*, &c.; Walton, *Prolegom.* x.; Horne, ii. p. 234–240.

2. See James, *Bellum Papale, sive Concordia Discors Sixti V. et Clementius VIII. circa edit. Hieronymianam*, London, 1600, 4to, 1678, 8vo.

3. *The Gothic Version*. Of this, which was executed by Ulphilas, bishop of the Gothic tribes in Wallachia, about the middle of the fourth century, only the four gospels, part of the Epistle to the Romans, and fragments of the other Epistles, are extant; the first in the famous Codex Argenteus, a manuscript in silver letters of the fifth or sixth century; the second in a Codex Rescriptus belonging to the library of Wölfenbuttel; and the third in certain Codices Rescripti recently discovered by Maio in the Ambrosian Library at Milan. This version appears to have been made from the Greek, and particularly from the Constantinopolitan text, but to have been subsequently altered after the Vulgate. The best edition of the gospels is that of Lye, Oxon. 1750, 4to. The fragments were edited by Knittel, in 1762, 4to, and by Ihre, Upsal, 1763, 4to.

Horne's Introduction, vol. ii. p. 240; Hug's Introduction (Eng. Trans.), vol. i. p. 487; Schott, *Isagoge*, p. 613.

4. *The Anglo-Saxon Versions*. The history of these is by no means accurately known. It appears, that as early as the year 709, the Psalter was rendered into Saxon by Adelme, bishop of Sherborne. A few years later, Aldred, who styles himself "Presbyter indignus et miserrimus," "overglossed in English" the Latin of a copy of the four gospels, which had been written by Eadfrith, bishop of the *church* of Lindisfern, "out-attired, and blazoned as well as he could," by Ethilwold, bishop of the *Land* of Lindisfern, and "smoothed, ornamented, and overgilded," by Billfrith the anchoret (1). Nearly about the same time Beda translated the whole Bible into Saxon-English. About two hundred years after this the Psalter was translated by King Alfred. A Saxon translation of the Pentateuch, Joshua, part of the books of Kings and Esther, is attributed to Ealfric, archbishop of Canterbury, in 995. The entire Anglo-Saxon Bible has never been published. Alfred's Psalter was edited by Spelman in 1640; and a translation of the gospels made from the old Latin of the Itala has been thrice edited (2).

1. See Henshall's Disquisition prefixed to his edition of the Gothic Gospel of St Matthew, with the corresponding English or Saxon, &c. London, 1807, 8vo.

2. Newcome's Historical View of the English Biblical Translations, p. 1, Dublin, 1792; Horne's Introd. vol. ii. p. 246.

5. *The Sclavonic Version*. The authors of this version were Cyrill of Thessalonica, and his brother Methodius, who in the ninth century introduced the gospel among the Sclavonians inhabiting Moravia. It seems to have been made from the Greek, and from manuscripts having the Constantinopolitan text. It embraces the whole Bible, and has been frequently printed.

Henderson's Biblical Researches and Travels in Russia, p. 80–102, Lond. 1826; Horne's Introd. vol. ii. p. 245.

These ancient versions are useful, both to the critic and the exegete; to the former, as supplying not a few various readings which are wanting in all or in most of the codices containing the original text, as serving to determine more accurately the age and country of any particular form of the text, and as helping to confirm or refute particular readings occurring in the Greek codices; to the latter, inasmuch as every faithful version is not only a perpetual interpreter of the sentiments of the original into another tongue, but the authors of these ancient versions, from the time in which they lived, and the locality they inhabited, had peculiar advantages, both philological and historical, for the successful interpretation of the sacred books.

Ernesti's Principles of Interpretation, by Terrot, vol. ii. p. 146.

SECT. XI.—*Quotations by the early Ecclesiastical Writers from the Sacred Scriptures.*

Besides the object to which these have been already applied, as showing the authenticity of the sacred documents, they serve also a useful purpose to the critic, in furnishing him with numerous readings, in assisting to determine the age, origin, and country, of remarkable readings, and in illustrating the whole history of the Greek texts of Scripture. Care, however, must be taken to discriminate between passages quoted freely from memory, or adapted to the construction and sentiment of the writer himself who quotes, and those which are formally cited from the codex. We must also be sure that the work in which the quotation occurs is genuine, and that the common text of the places in which the citation occurs is correct.

Ernesti's Principles of Interpretation, by Terrot, vol. ii. p. 90–113; Schott, *Isagoge*, p. 629.

SECT. XII.—*Laws for the Determination of various Readings.*

1. That reading is to be regarded as true, which is supported by far the greater number of copies and witnesses; but still readings supported by a few books are not entirely to be disregarded, especially when they harmonise with the *usus loquendi* of the author. 2. That reading which the better copies exhibit, unless special reasons prohibit it, is to be preferred to the one which the inferior copies exhibit, although most numerous. Neither the antiquity nor propriety of a reading, solely considered, always proves it to be a true one. 3. That reading which is more harsh, obscure, difficult, unusual, or delicately chosen, if supported by the authority of a proper witness, is preferable to one which is plain, easy, usual, and common. 4. That reading which approaches nearest to the popular and familiar method of speaking, if it be supported by external testimonies, is preferable to one which is more artificial and subtle. 5. The shorter reading, when supported by testimony of importance, and not incongruous with the style and design of the writer, is preferable to a more verbose one. Still there are cases where the more copious reading is to be preferred. 6. That reading which gives the best sense is peculiarly preferable. But to determine this, the nature of the whole passage, and the genius of the writer, not the mere opinions and sentiments of particular interpreters, are to be consulted. 7. The reading which produces an unworthy or incongruous sense is to be rejected. Good care, however, must be taken not to condemn a reading as unworthy or incongruous, which a more correct grammatical and historical investigation would prove to be a true reading, or at least a probable one. 8. A reading which agrees with the *usus loquendi* of the writer, is preferable to that which disagrees with it. It must be remembered in judging here, that the style of an author sometimes varies with increasing age. 9. A reading is to be rejected, in respect to which plain evidence is found that it has undergone a *designed* alteration. Such alteration may have taken place, *first*, from doctrinal reasons, Matthew, i. 18; Mark, viii. 31, xiii. 32: *second*, from moral and practical reasons, Matthew, v. 22: *third*, from historical and geographical doubts, Matthew, viii. 28, comp. Mark, v. 1: *fourth*, from the desire of reconciling passages inconsistent with each other, Mark, viii. 31: *fifth*, from desire to make the discourse more intensive; hence many emphatic readings have originated: *sixth*, from the comparison of many manuscripts, the readings of which have been amalgamated: *seventh*, from a comparison of parallel passages. Corrections of the more celebrated manuscripts have been sometimes detected. 10. Various readings are to be *rejected* which spring from the mere negligence of copyists, and from those errors which are very common in all kinds of books. To these belong, *first*, the commutation of unusual forms for those of the common dialect; the Alexandrine or common form, however, has the preference over others in the New Testament; and this dialect itself also admitted some Attic forms: *second*, the commutation of single letters and syllables, by an error of either the eye or the ear; the former resulting from obscure and compendious methods of writing, or from the similarity of certain letters, such as Α Δ Λ, Ο Θ, &c.; the latter, from copying after the reading of one who was misunderstood, or who read erroneously: *third*, the commutation of synonyms: *fourth*, from transferring into the text words written in the margin of copies, and thus uniting both readings, James, v. 2: *fifth*, from the omission or insertion of a word or a verse, by an error of the sight: *sixth*, from the transposition of words and passages, whence it may have happened that some error has crept into most of our books: *seventh*, from words which ended with the like sound, or appeared alike; and from proximate words, one ending and the other beginning with the same syllable: *eighth*, from incorrectly uniting or separating words, which naturally resulted, in some cases, from the ancient method of *continuous writing:* and, *ninth*, from an erroneous interpunction and distinction of passages. 11. A reading is to be rejected which plainly betrays a gloss or interpretation. This may be a word or a whole passage. Sometimes these glosses are united to the true text, and sometimes they have thrust it out. All interpretations, however, are not spurious glosses; for authors themselves sometimes add them, in order to explain their own language. 12. Readings deduced merely from versions or the commentaries of interpreters are to be rejected.

The above are taken, with a few slight alterations, from Beckii *Monogrammata Hermeneutices, Lib. Nov. Test.* Lips. 1803, as translated by Mr Moses Stuart in his Elements of Biblical Criticism and Interpretation, London (reprinted with additional observations by E. Henderson, D. Ph.), 1827. See also Michaelis, Introd. vol. i. p. 246–389; Ernesti's Principles of Interpretation, by Terrot, vol. ii. p. 114; Marsh's Lectures, lect. iii.; Horne's Introd. vol. ii. p. 251–260.

For remarks upon particular books of the Bible, see the articles in this work under the names of the different books, or their authors, as PENTATEUCH, MOSES, JOSHUA, PAUL, PETER, &c. (N. N. N. N.)

SCRIVENER, one who draws contracts, or whose business it is to place money at interest.

SCROLL, in *Heraldry*. See that article.

SCRUPLE, SCRUPULUS, or *Scrupulum*, the least of the weights used by the ancients, which amongst the Romans was the twenty-fourth part of an ounce, or the third part of a dram. The scruple is still among us a weight, containing the third part of a dram, or twenty grains. Among goldsmiths it is twenty-four grains.

SCRUPLE, in Chaldæan chronology, is the $\frac{1}{1080}$th part of an hour, called by the Hebrews *helakin*. These scruples are much used by the Jews, Arabs, and other eastern people, in computations of time.

SCRUPLES of half Duration, an arc of the moon's orbit, which the moon's centre describes from the beginning of an eclipse to its middle.

SCRUPLES of Immersion or Incidence, an arc of the moon's orbit, which her centre describes from the beginning of the eclipse to the time when its centre falls into the shadow.

SCRUPLES of Emersion, an arc of the moon's orbit, which her centre describes in the time from the first emersion of the moon's limb to the end of the eclipse.

SCRUTINY (*Scrutinium*), in the primitive church, was an examination or probation practised in the last week of Lent, upon the catechumens, who were to receive baptism on Easter-day. The scrutiny was performed with a great many ceremonies. Exorcisms and prayers were made over the heads of the catechumens; and upon Palm Sunday the Lord's Prayer and Creed were given them, which they were afterwards made to rehearse. This custom was more in use in the Church of Rome than anywhere else, though it appears, by some missals, to have been likewise used, at a much later period, in the Gallican church. It is supposed to have ceased about the year 860.

Scrutiny is also used, in the *Canon Law*, for a ticket or a little paper billet, in which, at elections, the electors write their votes privately, so that it may not be known for whom they vote. Among us the term *scrutiny* is chiefly used for a strict perusal and examination of the several votes hastily taken at an election, in order to find out any irregularities committed therein by unqualified voters.

SCRUTORE, or Scrutoir (from the French *escritoire*), a kind of cabinet, with a door or lid opening downwards.

SCRY, in falconry, denotes a large flock of fowl.

SCUDDING, the movement by which a ship is carried precipitately before a tempest. As a ship flies with amazing rapidity through the water whenever this expedient is put in practice, it is never attempted in a contrary wind, unless when her condition renders her incapable of sustaining the mutual effort of the wind and waves any longer on her side, without being exposed to the most imminent danger of being overset.

A ship either scuds with a sail extended on her foremast, or, if the storm is excessive, without any sail at all; which, in the sea-phrase, is called *scudding under bare poles.* In sloops and schooners, and other small vessels, the sail employed for this purpose is called the *square sail.* In large ships, it is either the foresail at large, reefed, or with its goose-wings extended, according to the degree of the tempest; or it is the fore-top sail, close reefed, and lowered on the cap; which last is particularly used when the sea runs so high as to becalm the foresail occasionally, a circumstance which exposes the ship to the danger of broaching to. The principal hazards incident to scudding are generally a pooping sea; the difficulty of steering, which exposes the vessel perpetually to the risk of broaching to; and the want of sufficient sea-room. A sea striking the ship violently on the stern may dash it inwards, by which she must inevitably founder. In broaching to, that is, inclining suddenly to windward, she is threatened with being immediately overturned, and, for want of sea-room, she is endangered by shipwreck on a lee-shore.

SCULPONEÆ, among the Romans, a kind of shoes worn by slaves of both sexes. These shoes consisted only of blocks of wood made hollow, like the French sabots.

END OF VOLUME NINETEENTH.

Printed by Thomas Allan & Co. and Balfour & Jack,
and Stereotyped by Thomas Allan & Co.
